INTRODUCTION

Aim of this Book

Animal Behavior Desk Reference, A Dictionary of Behavior, Ecology, and Evolution is an annotated dictionary intended to help aid scientific communication, in particular in the fields of animal behavior, ecology, evolution, and related branches of biology. I created this book for students, teachers, researchers, writers, editors, and others active in science. This third edition contains over 800 new terms and definitions, 48 new figures, and thousands of additions to and improvements of material presented in the second edition.

A book such as this one can never be complete. Therefore, I certainly welcome constructive criticisms and further information that should be included for its improvement, such as previously published definitions, new definitions of existing terms, your view of definitions already in this book, and new terms with their definitions. Your e-mails (barrowse@georgetown.edu) and annotated reprints regarding these subjects are especially welcome. If you have coined a term(s) included in this book, and I do not attribute this properly, please let me know.

Many references are secondary ones, *e.g.*, "Smith (1946 in Jones 1990)," because I wanted to indicate the source of an author's interpreted information, because I could not examine certain primary references, or for both reasons. If I have cited your work secondarily, I would be very pleased to receive a copy of your publication (with highlighted relevant parts) to facilitate quoting your work directly in the future. Further, if I have misinterpreted your writing with regard to a definition(s) or other information, please let me know.

The Need for Precise Terminology

Austin (1957, 7–8) told us "... words are our tools, and, as a minimum, we should use clean tools: we should know what we mean and what we do not, and we must forearm ourselves against the traps that language sets us." It follows that for effective, efficient communication, people should have, or at least understand, the same precise terminology. Such terminology can certainly aid the advancement of basic, theoretical, and applied science. Phenomena are often further elucidated when they are placed into proper order with useful names (Brosius and Gould 1992, 10709). Dawkins (1986, 110–111) discusses how definitions have had an enormous impact on the way people perceive, *e.g.*, in communication. "They have affected what we regard as 'communication' and 'signals' and whether we see communication as involving any sort of transfer of information. . . . Much of the confusion over 'information transfer,' too, appears to have been largely brought about by the way it is defined. Arguments which appear to be over something profound about animal communication (such as whether information is being transferred or not) often turn out to be nothing more than whether a protagonist is adopting the technical or the more everyday meaning of the term." As another example, Dewsberry (1999) discusses terminological problems in a section of his paper called "the mischief of words." He expresses his concern about how biologists use the terms "function," "ultimate," and "ultimate causation."

To promote the understanding of terminology, some societies, *e.g.*, the Animal Behavior Society and American Society of Parasitologists have, or have had, committees dedicated to this subject. Because the Avian Brain Nomenclature Consortium believes "that names have a powerful influence on the experiments that we do and the way in which we think," the Consortium published a new nomenclature for parts of bird brains (Jarvis et al. 2005, 151). The inaccurate evolution-based terminology for vertebrate brains that was used throughout the 20th century became a severe impediment to the communication of scientific discoveries and the generation of new insights (page 155). Some of the many printed dictionaries and encyclopedias that define biological terms (meaning biological in the broad sense) include Allaby 1989, Campbell and Lack 1985, Chapin 1968, Collocot and Dobson 1974, Cumming 1972, Drever 1974, Eysenck et al. 1979, Goldenson 1984, Harré and Lamb 1983, Heymer 1977, Hinsie and Campbell 1976, Hurnik et al. 1995, Immelmann 1977, Immelmann and Beer 1989, Keller and Lloyd 1992, King and Stansfield 1985, Lincoln et al. 1985, Medawar and Medawar 1983, Roe and Frederick 1981, Seymour-Smith 1986, Steen 1973, Storz 1973, Torre-Bueno 1978, and Wolman 1973.

Confusion about Meanings of Terms

Biologists in general strive to obtain a superior terminology, unfortunately not yet with total success. Confusion and controversy about meanings are common as I indicate in many entries of this dictionary. Many terms, not to mention the concepts that they represent, are obviously in need of further study of their already designated meanings. The confusion and controversies arise for many reasons, including:

- A satisfactory definition of a term might not yet exist due to our present state of knowledge; *e.g.*, see aggression, awareness, and consciousness.
- The name of a term is a nontechnical English word(s) which already has a common dictionary definition(s); *e.g.*, see altruism, selfishness, and spite. Such nontechnical words often "have a variety of meanings and are surrounded by a dense atmosphere of values and associations" (Wilson and Dugatkin 1992, 29). Therefore, such words can confound communication even if they are precisely defined in scientific literature. Keller (1992) describes how "competition" with its established colloquial meaning permits the simultaneous transfer and denial of its colloquial connotations when it is used technically. Colloquial connotations can lead plausibly to one set of inferences about a concept and close off others. "Eugenics" was originally defined technically and nonpolitically, yet some people now find it difficult to think of eugenics without negative political connotations.
- The name of a term is a foreign word(s) that may be hard to remember and interpret accurately; *e.g.*, see *umwelt* and *zeitgeber*.

- The name of a term is a technical word that may be hard to remember and understand without an explicit definition; *e.g.*, see apotreptic behavior and epidictic display.
- The term is only implicitly defined with regard to all, or some, of its meanings in the scientific literature. To my dismay, I have omitted some terms and some definitions from this book because I could not formulate a satisfactory definition from information provided in written material.
- The term is explicitly, but not correctly, defined in all scientific literature, textbooks, or both. For example, consider “inclusive fitness.” Grafen (1982) lists fourteen commonly used animal-behavior textbooks that defined this term erroneously or inadequately. Dawkins (1986, 44) later advises, “It is best not to read too much about inclusive fitness as much of what has been written is misleading.”
- The term has more than one technical definition that can vary in their degrees of difference from one word (such as partially, possibly, or potentially) through many words; *e.g.*, see species. In some cases the same term can even have opposite meanings; *e.g.*, see true altruism and overdispersed distribution.
- Many terms have evolved in their meanings as scientists learned more about the concepts that they represent, research focus shifted, or both. Isolation was originally used for both geographical isolation and reproductive isolation; variety was used, for instance by Darwin, for a single individual or a population; and teleological was used for four distinct phenomena (Mayr 1982, 43); *e.g.*, also see communication, evolution, fitness, gene, homology, species, and territory.
- The term may have one through many synonyms, sometimes including a perplexing one that uses the same word(s) for a very different concept; *e.g.*, see adaptation and homology. In some cases, imprecise language led to virtual synonymies of important terms that should retain distinct usages, *e.g.*, these terms and their associated ones: coevolution, guild, and keystone species (Fauth et al. 1996, 282).
- The term has more than one spelling, capitalization, or hyphenation style; *e.g.*, see homeotherm, endosymbiosis hypothesis, the Modern Synthesis, and molecular-clock hypothesis.
- The same concept is referred to using two, or more, of these words: hypothesis, law, rule, and theory. Examples are locale-odor hypothesis and Allen’s rule.
- Authors often shorten a concept’s name; *e.g.*, they use adaptation to mean a specific kind of adaptation such as physiological adaptation and selection to mean a specific kind of selection, such as artificial selection.
- Many scientific words are long. Especially long words are the chemical names for deoxyribonucleic acid (207,000 letters), tryptophan synthetase (1,900), tobacco mosaic virus (1,185), pneumonoultramicroscopicsilicovolcanocinosis (45, a lung disease caused by breathing fine dust), and hepaticocholangiocholecystenterostomies (39, a surgical operation that creates channels of communication between gall bladders and hepatic ducts or intestines) (Ash 1996, 108).
- Different dictionaries define the same term differently; *e.g.*, atavism (Hrdy 1996, 851; Thornhill and Gangestad 1996, 853).
- The original words of a term (*e.g.*, theory of mind, *q.v.*) are confusing, but researchers continue to use such a term because it has been widely used. Further, when a researcher wishes to use a non-confusing name, or less confusing name, for a concept, a publisher may talk him out of it; therefore, the original confusing name continues in the literature (Ashington 1998, 32–33).

Many concerned scientists have tried to rescue us from terminological pitfalls. I applaud them. For instance, Hailman (1976) insightfully suggests how to improve behavioral terminology by emphasizing logic, informational content, and efficiency, rather than historical origins of stability. Brown (1987, 297) lists very helpful guidelines for using biological terms. Fitch (1976) even organized others to petition against a confusing definition of *homology* that refers to similarity of nucleotide sequences (= sequence homology) (Lewin 1987a).

How TO USE THIS Book

Main format. This book uses a dictionary format to present definitions in a standard, quick-to-use way and to help especially users whose first language is not English. The book's body contains terms that are not organism names. Organism names are in Appendix 1. Selected organizations are in Appendix 2, and information on databases is in Appendix 3.

Type of terms emphasized. I emphasize conceptual terms, not anatomical parts or taxonomic names, in this book's main body. However, it does include a small sampling of such parts including some organs and glands. It also defines a few of the millions of taxa in Appendix 1. Biology texts, taxonomic catalogs, primary literature, and Internet files have thousands of definitions of anatomical parts and taxonomic names that I do not include. This book concentrates on definitions of nouns or noun forms, rather than adjectives, adverbs, and verbs due to space limitations.

New terms. A term within quotation marks in an entry line is one that my correspondents, I, or both of us coined as part of producing this book.

Superscripted entries. When needed for clarity, a term with two, or more, distinct meanings is listed as more than one superscripted entry, e.g., ¹sensation and ²sensation.

Term hierarchies. As conceptual structures, relationships among many terms are summarized in tables and many terms with their definitions are organized in hierarchical clusters by conceptual relationships; under key words, combining forms, and groups of letters that they have in common; or both. A term that is not part of a hierarchy, or one that is the first term in a hierarchy (= a first-level term), is preceded by a diamond (◆). Second- through eight-level terms (or names) are increasingly indented. Second-, fourth-, and sixth-level terms are not preceded by symbols. Third-level terms are preceded by arrowheads (►); fifth-level terms, black square (■); seventh-level terms, open squares (□); eighth-level terms, black circles (●); and ninth-level terms, open circles (○).

◆ **chemical-releasing stimulus (CRS)** *n.* A chemical that . . .

semiochemical, semiochemic *n.* A chemical that . . .

► **allelochemic** *n.*

1. A chemical that . . .

allomone *n.* A chemical substance, . . .

■ **allelopathic substance** *n.* A waste product, . . .

Definition sources. Most references do not give definitions in the exact form used in this book. Therefore, almost all definitions are paraphrased for conciseness and to conform with the style of this book. This includes changes from British to American spelling where appropriate. Author-date citations indicate references from which I have obtained, or based, definitions. Many definitions are based on ideas combined from more than one source. In some cases, definitions are my perceptions of what authors mean by their terms because they did not present their formal definitions. I indicate this by stating "inferred from . . .".

See directives. "See . . ." directs you to where a concept is defined under a synonymous name, is part of a term hierarchy in which it is defined, is defined as part of the definition of another term, or is otherwise characterized, e.g., in a table. For example, *prophototaxis* is a sub-subentry under *phototaxis* which is a subentry under *taxis*. The main listing for *prophototaxis*, then, reads as follows:

◆ **prophototaxis** See *taxis*: *phototaxis*: *prophototaxis*.

Note that colons separate main entries, subentries, and sub-subentries in the context of a cross-reference. The first term listed is always a first-level entry; reference to a single term, e.g., See behavior, directs you to the main, alphabetical listing for the term, in this case, in the B's.

Multiple definitions. For many terms, I document some of the diversity of meaning. When I give more than one definition for a term, I list the definitions in *chronological* order with regard to citation date. When I can, I indicate which definition seems appropriate for wide use today. One meaning of a term can often be better understood after its other definition(s), as well as those of associated terms, are examined. Some terms, e.g., evolution and heterochrony, have been modified through descent by "conceptually selective forces" so that they now have families of definitions, even some with opposite meanings (Gould 1992, 158; Richard 1992, 95).

Nontechnical and obsolete definitions. For many terms, especially ones originally developed to refer to Humans and then extrapolated to non-Humans, I first give nontechnical English definitions, and then I list obsolete definitions when I think they are helpful in understanding the evolution of meaning of a term. One, or more, older meanings of a term, e.g., evolution, can lie below the surface of a newer meaning and affect the term's significance (Richards 1992, 95).

Pronunciations. This book lists pronunciations for some of the terms that it defines, particularly for some acronyms and terms with words that are not normally found in standard English dictionaries. For words with more than one syllable, I indicate the stressed syllable(s) by capitalizing it, e.g., apoptosis (a POE toe sis) which has silent second p.

Common-denominator entries. Many terms are grouped as divisions under a main entry (a key word, combining form, or terminal group of letters) that they have in common. This results in many divisions that do not have definitions that relate directly, or at all, to definition(s) in the main entry that precedes a cluster. Also, because authors often did not specify which main-entry definition relates to a division, I often could not specify this information.

The common denominators and main words are that are listed as primary entries (those preceded by diamonds) are: abundance, acme, -acmic, acoustics, action, activity, adaptation, affinity, aggression, agonist, allele, altruism, analysis, angel, animal, animal names, animal sounds, anthropic, area, attachment, attention, -auxesis, awareness, bee, behavior, beneficiary, benefit, benthic, biont (bion), -bios, biota, -biotic, biotope, bite, bond (bonding), bout, breeding, brood, buffering, calling, camouflage, canalization, cannibalism, care, caste, castration, cause (causation), cell, ceremony, chain, character, cheat (cheater), chemical-releasing stimulus, chimera (chimaera), -chore, chromosome, chronology, -cial, -cide, cline, clock, clone (clon), coefficient, -cole, colonial, coloration, communication, community, companion, competition, complementation, conflict, consciousness, consumer, copulation (copulatory behavior), correlation, cost, courtship (courtship behavior), -cron, cross, crossing over, crypsis, cue, curve, cycle, cyclic, dance, Darwinism, datum, definition, deme, density, dialect, difference, discontinuity, dispersal, display, distribution, diurnal, diversity, doctrine, dog, dominance, domatium, dormancy, dress, drift, drive, -dromous, drug, dynamic, effect, efficiency, effort, electrophoresis, elimination, emotion, endemic, energy, environment, equilibrium, error, estrus (oestrus), eugenics, evolution, evolutionism, evolutionist, experiment, experimental design, exploration, extinction, facial expression, facilitation, factor, fauna, fallacy, family, fauna, fear, feedback, feeding, -ference, fight, fitness, flight, food, forager, foraging (foraging behavior), fossil, fostering, frequency, function, game, gamete, -gametic, -gamety, -gamy, gene, gene flow, -genesis, -genetic, genetic load, -genic, -genous, -geny, gland, -grade, gradualism, -gram, -graph, graph, -graphy, greeting, gregarious, grooming, group, growth, guild, -gyny, -haline, heritability, hermaphrodite, hermaphroditism, heterochrony, hierarchy, homeostasis, homolog (homologue), homology, hormone, host, hybrid, hypothesis, illusion, inheritance, inhibition, insemination, instar, instinct, intelligence, investment, isolation, -karyon, kin, -kinesis, kinesis, kiss, Lamarckian, language, law, learning, -lectic, lek, link, locomotion, male, manipulation, map, mate choice, mating, mating system, maze, mechanism, mechanist, meiosis, memory, metamorphosis, method, -metrics, -metrosis, -metry, migration, mimicry, mitosis, -mixis, modality, model, molt, -morph-, -morphic, -morphism, morphology, -morphosis, mortality, mother, movement, mutation, need, nest, nesting, nestling, neurotransmitter (neural transmitter), niche, nucleic acid, object, observation, odor, -oecism, optimality, order, organ, organism, -orial, ovular, ovulator, p (P, p, P), -paedium, pair, parasite, parasitism, parent, parity, parthenogenesis, -patric, pattern, -pelagic, perception, period, -phage, -phagia, -phagy, phase, -phile, phenomenon, -phobe, pigeon, -planetic, plankton, plasticity, -plasia, play, -ploidy, -plont, pollination, polyethism, population, posture, potential, predation, predator, preference, pregnancy, principle, probability, procedure, process, production (rate of production, primary production, productivity, basic productivity, primary productivity), program, provisioning, puzzle box, race, range, reaction, receptor, recognition, reductionism, reflex, regulation, reinforcement, relationship, reliability, repertory, replication, representation, reproduction, resource, response, revolution, rhythm, ritual, ritualization, role, rule, sample, sampling technique, scale, scientist, scratching, secretion, sex, sex termination, -sexual, sexual reproduction, sexuality, shaping, signal, sister, skewness, sleep, sociality, society, -somatic, -somy, song, -sound, speciation, species, -sperm, -sphere, stage, stasis, state, statistical test, stimulus, strategy, stress, study of, substance, success, succession, suckling, swarming, swimming, symbiont, symbiosis, synapse, syndrome, synethogametism, system, taxis, teleology, territory, test, theory, -therm, time, -toky, -topy, tradition, transport, -troph, trophallaxis, -trophy, -tropic, -tropism, -tropous, -trosis, -type, value, variable, variance, variation, vitalism, -voltine, -vore, -welt, -xene, -xenia, -xenic, -xeny, yawning, -zoan, -zoic, -zoite, zone, -zoon, -zygosity, -zygote, and -zygous. Under study of, you will find terms grouped by acoustics, biology, botany, chemistry, chronology, climatology, dynamics, ecology, endocrinology, ethology, evolution, genetics, geography, ichnology, limnology, -metry, morphology, ornithology, paleontology, palynology, pathology, pharmacology, phenology, phycology, phylogeny, physics, physiology, psychology, semiotics, sociality, systematics, taxonomy, toxicology, and zoology.

“In,” “e.g., in,” and “For example, in” statements. I indicate when phenomena relate to particular organism groups, or taxa, by writing phrases such as “In *Apis mellifera* (Western Honey Bees).” or “e.g., in some carpenter-bee and bird species..” When I use “In” without “e.g.,” it means that to my knowledge, the concept relates only to the taxon(a) listed. “For example, in” followed by a list of organisms indicates that the phenomenon relates to these organisms and others that I have not listed.

cf. directives. “cf. . . .” directs you to a related term (sometimes an antonym), related information, or both.

Synonyms. I list synonyms known to me and suggest how each is used when I can. When it is obvious where a synonym is published from the body of a term entry, this synonym occurs in bold type right after a main entry term. Authors have sometimes used the same word for terms with very different meanings, and synonyms of many terms often do not have exactly the same meanings. Thus, synonyms should be used with care.

Notes and comments. A *Note*, or *Notes*, refers to a particular definition of a term, while a *Comment*, or *Comments*, refers to an entire entry.

Hyphens and 1-en dashes. Scientific writers follow different “rules,” or seem to follow no rules, when they use hyphens and 1-en dashes, resulting in the presence, absence, or different combinations of these marks in the same term. In this book, I attempt to standardize use of these marks by using a hyphen(s) in an adjectival phrase that includes one, or more, nouns, and that precedes the noun that it modifies. I use a 1-en dash to separate hyphenated terms within some adjectival phrases. This avoids the use of a forward slash (/) for a hyphen, or a 1-em dash, except when I am true to original published information. This book does not hyphenate certain names that are capitalized in the literature under key words, e.g., “Biological Dynamics of Forest Fragment Project” and “Deep Green Project.”

Sex-neutral writing. With all due respect for treating female and male Humans and other organisms equitably, in the interest of more direct writing, this book uses “he” to mean “he” or “she,” “him” to mean “him” or “her,” and so forth in many entries. Regarding historical definitions, I refer only to he, him, or his to reflect English style of those definitions.

Nonscientific names. Researchers and others often use nonscientific names (often called common names or English names) for organisms. Many conventions for writing such names occur in the literature. For example, different publications may write the nonscientific name for the skipper butterfly *Staphylus ceos* as Red Head Sooty Wing, Red-Head Sooty-Wing, Red-Head Sooty Wing, Red-head sooty wing, red-head sooty wing, red-head sooty-wing, and so forth. Many species have many nonscientific names which confuses matters even more. This book uses a consistent convention for writing nonscientific names, and adheres to the following “rules.” (1) Capitalize a nonscientific name if it stands for a cultivar, hybrid, species, specific kind of virus, or subspecies: *Rosa ‘Tropicana’*, Leyland-cypress, Human, Cow Pox Virus, Xerces Blue. (2) Capitalize all words in such a name, except for the one(s) joined to another by a hyphen: White-tailed Deer. (3) Capitalize a nonscientific name when it stands for its entire taxon (e.g., genus, family, order, or domain): Algae, Cyanobacteria, Elephants, Fungi, Palms. (4) Use hyphens or word joining to indicate the taxonomic group of an organism: Dragonfly, House Fly, Nodding Ladies'-tresses. Dragonfly is one word because dragonflies are in the Order Odonata, not Diptera (= the “true” Flies). The House Fly is a member of the Diptera. Nodding Ladies'-tresses belongs to the orchid genus *Spiranthes*, called Ladies'-tresses. “Tulip-tree,” for example, is hyphenated because “tree” does not stand for a particular taxonomic group. There is no plant family called the Tree Family. For this reason, one may also correctly write the nonscientific name for this species as “Tuliptree.” More details about nonscientific names are in the entry “nonscientific name” in this book’s body.

Taxon designations in entries. Where it is appropriate, this book includes a scientific name, a nonscientific name, or both for a species, e.g., *Ovis aries* (Domestic Sheep). To indicate all members of a taxon above the species level, I use the scientific name, a capitalized nonscientific name, or both for the taxon; e.g., *Ovis* (Sheep); Family Bovidae (Bovids); Class Mammalia (Mammals); and Kingdom Animalia (Animals). “Human” or “Humans” in this book refers to *Homo sapiens sapiens* (*syn.* Modern Humans). If it is unclear to me what an author means by the name of a particular taxon, I use the name that he uses in his publication. For example, if an author simply writes “sheep,” he could mean one, more than one, or all sheep species; he could mean one or more individuals of one or more species; or he could mean a combination of these animals. Due to lack of information about the author’s exact meaning of “sheep,” I also write just “sheep” when I refer to the author’s work.

Anthropomorphic and teleological writing. This book attempts to eliminate anthropomorphic and teleological constructions in definitions, except in directly quoted material.

Other information. Material within quotes (“”) includes direct quotations, the names of terms in question, and the names of terms that I coined in this book. For selected terms, this book gives further information such as etymologies, term originators, and related information. This book includes some euphemistic and obscene terms and indicates them as such at the request of some foreign scientists.

PLEASE CHOOSE DEFINITIONS AND SYNONYMS CAREFULLY

You should certainly take care in selecting which definition to use for a term. A term can have different shades of meaning to different people and in different contexts, and, as discussed above, its meaning can change as we discover more about the parts of our natural, or hypothetical, world represented by the term. The same phenomenon can have different names depending on a person's frame of reference. One definition of a term allows us to think of certain related concepts, but not others. For example, the environmental concept of niche allows us to conceive of an empty niche, while the population definition of niche, does not (Colwell 1992). Further, perfect definitions for many terms (*e.g.*, aggression or consciousness) may not yet exist or be possible to formulate. Many of the definitions in this book are controversial (Verplanck 1957) and should be used *only* as initial attempts to understand concepts they represent. These definitions should not necessarily be regarded as the final, or best, ones that can be formulated. If you consult references to definitions listed in this book, you will often find more information that relates to their meanings and may discover useful denotations and connotations that I have not included. I indicate areas of controversy regarding terms when they are known to me. I reiterate that definitions within an entry are given in *chronological* order. Many definitions are not necessarily widely used, or considered to be correct today, but I include them because they help to understand earlier work, subsequent definitions, or both.

Some of the listed synonyms may be used by only one, or a few, authors, and their uses may be debatable. Sometimes synonyms are used for terms that have very different meanings, *e.g.*, "true altruism" for altruism involving helping only nonkin or for altruism involving helping only kin. I indicate this kind of information when it is known to me. Some entries have more than one list of synonyms because different lists refer to different meanings of a term.

PLEASE COIN TERMS AND DEFINE CONCEPTS CAREFULLY

Coining new terms and defining them deserves special attention for enhanced communication. These are rules of thumb to consider: (1) thoroughly research your concept and related concepts and their names, (2) choose the best possible word(s) for the name of the term, and (3) write an explicit, full definition in your publication. Full dictionary-style definitions are seldom given in biological papers, yet they could certainly enlighten and reduce confusion. I urge editors to allow authors to include such definitions in their papers when they are appropriate.

Key to Abbreviations and Conventions

<i>abbr.</i>	abbreviation
<i>adj.</i>	adjective
<i>adv.</i>	adverb
<i>ant.</i>	antonym
<i>Brit.</i>	British spelling
<i>cf.</i>	compare [Latin <i>confer</i>]. This indicates related terms that are useful to examine in understanding the term in question
cm	centimeter
<i>comb. affix</i>	combining affix
<i>comb. f.</i>	combining form
<i>Comment(s)</i>	information that refers to an entire entry
<i>def.</i>	definition
dm	decimeter
<i>e.g.</i>	for example
ft	foot
Ga	billion years, billion years ago
gal	gallon
<i>i.e.</i>	that is
in	inch
km	kilometer
lb	pound
m	meter
Ma	million years, million years ago
mi	mile
μg	microgram
μl	microliter
mo	month
<i>n.</i>	noun
nm	nanometer

<i>Note(s)</i>	information that relates to a particular part of an entry
pers. comm.	personal communication
pers. obs.	personal observation
<i>pl.</i>	plural
pt	pint
qt	quart
<i>q.v.</i>	which see [Latin <i>quod vide</i>]
<i>See</i>	"See . . ." indicates where to find a definition of a particular term given under a synonym or with associated terms elsewhere.
<i>sing.</i>	singular
<i>sp.</i>	species
<i>ssp., subsp.</i>	subspecies
<i>syn.</i>	synonym
U.S.	United States
<i>v.i.</i>	intransitive verb
<i>v.t.</i>	transitive verb
yd	yard

AUTHOR

Edd Barrows is a professor of biology and Director of the Center for the Environment at Georgetown University, Washington, D.C. He has had a lifetime interest in the natural world centered on arthropods and plants. Childhood years spent roaming the countrysides of southern Michigan and central Florida fortified his earlier interests. He earned his B.S. in biology at the University of Michigan and his Ph.D. in entomology at the University of Kansas. Since 1975, Edd has been engaged in administration, biological research, and teaching at Georgetown University. His scientific publications primarily relate to insect reproductive strategies, biodiversity, conservation, and ecology. Currently besides studying scientific communication, he is investigating the biodiversity of a freshwater tidal marsh and adjacent habitats. He is a member of many scientific and conservation societies and a former president of the Entomological Society of Washington. This book originated in 1984 as a glossary, compiled as a reference for research and teaching.

ACKNOWLEDGMENT

In addition to people I thanked in the first and second editions, I would like to thank, or thank again the Barrows family; Mr. Michael Orr, Dr. Donald A. M. Mackay, many past and present Georgetown students who have helped with this book (including Ms. Anna Dubinsky, Count P. M. Differding, Ms. Kelly Differding, Ms. Melissa L. Barrows, and Mr. Zachary Kromme, who helped to edit this edition); people who directly helped to produce this book (including Gail Renard, John Sulzycki, and Patricia Roberson of CRC Press); people who sent me specific information for this edition; and many others (whose names can be found in the text) who have discussed terms and definitions with me and contributed definitions and other information. The cover of this third edition celebrates the school colors of Georgetown University which has supported this work with two research grants and other means.

a

- ♦ **ABA** See hormone: abscissic acid.
- ♦ **abandonment call** See call: abandonment call.
- ♦ **abasement** *n.*
1. A person's lowering, casting down, or humbling another person, in rank or character; humiliation (Oxford English Dictionary 1972, entries from 1561); one's lowering in position, rank, prestige, or estimation (Michaelis 1963).
- syn.* cast downness, humbleness
2. A person's being debased, humiliated, degraded (Oxford English Dictionary 1972, entries from 1611).
 3. A person's passive submission to external force; acceptance of injury, blame, criticism, punishment; surrender; resignation to fate; admittance of inferiority, error, wrong-doing, or defeat; confession and atonement; self-blame, belittling, or mutilation; seeking and enjoying pain, punishment, illness, and misfortune (Murray 1938, 1961–1962).
 4. A person's behavior indicative of submission to another person; *e.g.*, accepting aggression or punishment (Cumming 1972, 1).
 5. A person's degradation of himself; excessive complying, surrendering, accepting punishment (Wolman 1973, 1).
- v.t.* abase
- syn.* degradation, disgrace, dishonor, mortification, shame
- cf.* aggression; appeasement; need: abasement
- ♦ **abd-A** See gene: abdominal A.
- ♦ **abdominal A** See gene: *abdominal A*.
- ♦ **abdominal bursting** See behavior: defensive behavior: autothysis.
- ♦ **abdominal-up-and-down movement** See ²movement: abdominal-up-and-down movement.
- ♦ **abient** *adj.* Referring to an animal's avoiding, or moving away, from a stimulation source (Hurnik et al. 1995). *ant.* adient
- ♦ **abiogenesis** See -genesis: abiogenesis.
- ♦ **abiosis** See -biosis: anabiosis.
- ♦ **abiotic pollination** See pollination: abiotic pollination.
- ♦ **ablation** *n.*
1. Surgical removal of an organism's tissue or organ (Oxford English Dictionary 1972, entries from 1846).
 2. An investigator's deliberate destruction of an animal's neural tissue for experimental purposes, *e.g.*, by surgically severing a nerve tract in its brain (Immelman and Beer 1989, 175).
- syn.* lesion (Immelman and Beer 1989, 175)
- cf.* extirpation
- ♦ **abnormal behavior** See behavior: abnormal behavior.
- ♦ **abnormal psychology** See study of: psychology: abnormal psychology.
- ♦ **abominable mystery** *n.* How and when flowering plants (Angiosperms) first evolved on Earth (Charles Darwin in Weiss 1999, 5 August, A1). *cf.* Plantae: plant: *Amborella* (Appendix 1)
- ♦ **abortion** *n.*
1. An artificially produced human miscarriage, including an illegal one (Michaelis 1963).
 2. A mammal's expelling its fetus prematurely; a miscarriage (Michaelis 1963).
 3. The defective result of a premature birth; a monstrosity (Michaelis 1963).
 4. An embryo's partial through complete arrest of development in its early stages (Michaelis 1963).
 5. Anything's failure during its progress and before its maturity (Michaelis 1963).
- [Latin *abortio*, *-onis* < *aboriri*, to miscarry]
- ♦ **selective fruit abortion** *n.* A plant's dropping a particular fruit before it matures (Niesenbaum 1999, 261). *Comment:* *Mirabilis jalapa* (Four-O'clock), tends to produce mature fruits from flowers that have higher and more diverse pollen loads on their stigmas compared to flowers that have lower and less diverse pollen loads (Niesenbaum 1999, 261).
- ♦ **abscissa** *n.* The horizontal, or x-axis, of a graph (Lincoln et al. 1985). *cf.* ordinate
- ♦ **abscissic acid** See hormone: abscissic acid.
- ♦ **abscording** *n.* For example, in *Apis mellifera* (Western Honey Bees): Departure of an entire colony for a new nest site (Michener 1974, 371).
- ♦ **absenteeism** *n.* In some tree-shrew spp.: Parents' nesting away from their offspring and visiting them from time to time only to provide them with food and a minimum of other parental care (Wilson 1975, 577).
- ♦ **absolute-dominance hierarchy** See hierarchy: dominance hierarchy: absolute-dominance hierarchy.
- ♦ **absolute experiment** See experiment: mensurative experiment.
- ♦ **abstract homotypy** See homotypy: abstract homotypy.
- ♦ **abundance, absolute abundance** *n.* The total number of individuals of a taxon, or taxa, in an area, volume, population, or community, often measured as cover in plants (Lincoln et al. 1985).

- relative abundance** *n.* The total number of individuals of one taxon compared to the total number of individuals of all other taxa combined per unit area, volume, or community (Lincoln et al. 1985).
- ♦ **abundant** See frequency (table).
- ♦ **acarodomatum** See domatium: acarodomatum.
- ♦ **acarophile, acarophilous, acarophily** See ¹-phile: acarophile.
- ♦ **Acasta gneiss** See rock: Acasta gneiss.
- ♦ **acceleration** See ²heterochrony: acceleration.
- ♦ **“accept a null hypothesis”** *n.* To consider a null hypothesis (*q.v.*) to be correct because one's statistical test does not reject it (pers. obs.).
- Comment:* Researchers should not use this phrase because one can *provisionally* accept a null hypothesis, but not definitely accept one.
- ♦ **acentric society** See ²society: acentric society.
- ♦ **accessory chromosome** See chromosome: accessory chromosome.
- ♦ **accessory pigment** See molecule: accessory pigment.
- ♦ **acetogen** See -troph-: acetogen.
- ♦ **accidental osmällaxis** See osmällaxis: accidental osmällaxis.
- ♦ **accidental parasitism** See parasitism: accidental parasitism.
- ♦ **acclimation** See ³adaptation: ⁴physiological adaptation: acclimation; ²physiological adaptation (comment).
- ♦ **acclimatization** See ³adaptation: ¹physiological adaptation: acclimatization; ²physiological adaptation (comment).
- ♦ **Ac-Ds** See transposable element: *Ac-Ds*.
- ♦ **acetylcholine** See neurotransmitter: acetylcholine.
- ♦ **ACG** See place: Area de Conservación Guanacaste.
- ♦ **Acheulean Tool Industry** See tool industry: Acheulean Tool Industry.
- ♦ **achievement** See need: achievement.
- ♦ **A-chromosome** See chromosome: A-chromosome.
- ♦ **acid** *n.*
1. A compound that contains hydrogen of which all or a part of the hydrogen may be exchanged for a metal, or basic, radical, forming a salt (Michaelis 1963).
 2. A compound that yields hydrogen ions when dissolved in an ionizing solvent (Michaelis 1963).
- cf.* molecule
See nucleic acid.
- Comment:* Aqueous solutions of acids are sour and reddish vegetable substances such as litmus (Michaelis 1963). [Latin *acidus*, acid]
- ♦ **amino acid** *n.* A molecule composed of an amino group and a carboxyl radical; a building block of a protein (Michaelis 1963).
- Comment:* There are 20 kinds of amino acids that differ from one another only by their side chains and are universally found in proteins (King and Stansfield 1985).
- ♦ **acid rain** See acid deposition.
- ♦ **acid deposition** *n.*
1. A mixture of sulfuric acid and nitric acid that is washed out of the atmosphere by precipitation and is caused by sulfur and nitrogen emissions from volcanoes (Lean et al. 1990, 85).
 2. A mixture of sulfuric acid, nitric acid, and sometimes hydrochloric acid that is washed out of the atmosphere by precipitation and is caused mainly by sulfur and nitrogen emissions from the burning of fossil

- fuels such as coal and oil in power plants, industrial boilers, and car engines (Lean et al. 1990, 85).
- cf.* precipitation: acid precipitation
syn. acid rain (Lean et al. 1990, 85)
- Comments:* Acid deposition decreases the pH of freshwater steams, ponds, and lakes and sometimes soils (Lean et al. 1990, 85). Many bodies of freshwater are now so acidic that fish cannot live in them. Acid depositions may be causing *Waldsterben* (tree death) in Germany. Volcanic acid deposition is slight compared to artificially produced acid deposition. Rain has a pH around 5.6; acid deposition is often from pH 3.5 through 4.3. Acid deposition increases levels of toxic heavy metals in water which kill wildlife. This deposition also greatly alters the nutrient content in forest soils.
- ♦ **acidophile** See ¹-phile: acidophile.
- ♦ **acidosis** *n.* Too much carbon dioxide in an animal's blood that causes excess carbonic acid which can even kill the animal (Browne 1996, 30 July, C10).
- cf.* hypothesis: soda-water hypothesis; hypercapnia
- ♦ **acidotroph** See -troph-: acidotroph.
- ♦ **acme** *n.*
1. A period of maximum phylogenetic vigor in a taxon (Lincoln et al. 1985).
 2. The highest point attained in a taxon's phylogenetic, or ontogenetic, development (Lincoln et al. 1985).
- ♦ **epacme** *n.* The period in a group's, or organism's, phylogenetic, or ontogenetic, development just prior to its point of maximum vigor or adulthood (Lincoln et al. 1985).
- ♦ **heteracme** See -gamy: dichogamy.
- ♦ **paracme, phylogerontic period** *n.* The period of decline after the point of maximum vigor, or peak of development, in the phylogeny of a group (Lincoln et al. 1985).
- ♦ **-acmic**
- ♦ **diacmic** *adj.* For example, in some *Cladocera* species: Referring to a taxon that exhibits two abundance peaks per year (Lincoln et al. 1985).
- ♦ **monacmic** *adj.* For example, in some *Cladocera* species: Referring to a taxon that exhibits one abundance peak per year (Lincoln et al. 1985).
- ♦ **polyacmic** *adj.* Referring to a taxon that exhibits more than two abundance peaks per year (Lincoln et al. 1985).
- ♦ **acoustic eucrypsis** See mimicry: acoustic eucrypsis.
- ♦ **acoustic window** *n.* The sound frequency range to which an animal's environment is most permeable (Immelmann and Beer 1989, 182).
- cf.* melotope
- ♦ **acoustics** See study of: acoustics.
- ♦ **acquired behavior** See behavior: acquired behavior.
- ♦ **acquired character, acquired trait** See character: acquired character; inheritance: inheritance of acquired characters.
- ♦ **acquired-hereditary immunity** See hypothesis: hypothesis of directed mutation.
- ♦ **acquired-releasing mechanism** See mechanism: releasing mechanism.
- ♦ **acquired trait** See character: acquired character.
- ♦ **acquisition** *n.*
1. “Progressive increments in [an animal's] response strength observed over a series of occasions in which the response is measured” (Verplanck 1957).

2. "A modification of [an animal's] behavior in which a response changes in strength or topography, or occurs in new environments" (Verplanck 1957).
- ◆ **acrasin** See chemical-releasing stimulus: semiochemical: pheromone: acrasin.
- ◆ **acridophage** See -phage: acridophage.
- ◆ **acrocentric chromosome** See chromosome: acrocentric chromosome.
- ◆ **acrodendrophile** See ¹-phile: acrodendrophile.
- ◆ **acrophytia** See ²community: acrophytia.
- ◆ **acrophytism** See symbiosis: acrophytism.
- ◆ **acrophobia** See -phobia: acrophobia.
- ◆ **ACTH** See hormone: adrenocorticotrophic hormone.
- ◆ **act** See behavior, behavior act, law.
- ◆ **action n.**
1. A domesticated animal's trained body, or limb, movement (Oxford English Dictionary 1972, entries from 1599).
Note: "Action" now also refers to a movement in any kind of animal.
 2. An organism organ's performing its proper function (Michaelis 1963).
 3. An animal's "behaviour performed in a particular situation" (Maynard Smith 1982, 204).
cf. behavior; ³theory: game theory
- transitional action** *n.* An animal's multipurpose movement, *q.v.*, that occurs in the same, or similar, form in two of its different functional systems, and whose performance can lead to a switch in motivation from one of these systems to another (Immelmann and Beer 1989, 196, 317).
- ◆ **action chain** See chain: action chain.
- ◆ **action pattern** See pattern: fixed-action pattern.
- ◆ **action potential** See potential: action potential.
- ◆ **action-specific energy** See energy: action-specific energy.
- ◆ **action-specific exhaustibility, action-specific exhaustion, behavioral fatigue** *n.* A particular behavior's being refractory to a particular stimulus (quality and intensity) (Immelmann and Beer 1989, 3).
cf. effect: Coolidge effect, fatigue, learning: habituation
- ◆ **action system** See behavior pattern; ²system: action system.
- ◆ **actions** *n. pl.* A person's habitual behavior; conduct (Michaelis 1963).
- ◆ **actium** See ²community: actium.
- ◆ **active** See dominant (genetic).
- ◆ **active-avoidance conditioning** See learning: avoidance conditioning: active-avoidance conditioning.
- ◆ **active-avoidance learning** See learning: avoidance learning: active-avoidance learning.
- ◆ **active competition** See competition: contest competition.
- ◆ **active ingredient (ai)** *n.* The active ingredient in a pesticide formulation, expressed as an amount of active ingredient per unit area, *e.g.*, 140 g (ai) ha⁻¹ (Johansen 1977, 184; Harrahy et al. 1993, 2192).
syn. AI (Barrows et al. 1994), a.i. (Harrahy et al. 1994, 521)
- ◆ **active-nuclear species** See ²species: active-nuclear species.
- ◆ **active process** *n.* A system, or process, that requires metabolic-energy expenditure (Lincoln et al. 1985).
cf. passive process
- ◆ **active replicator** See replicator (comment).
- ◆ **active-sensory system** See ²system: active-sensory system.

- ◆ **active sleep** See sleep: stage-1 sleep.
- ◆ **active space** *n.* The space within which the concentration of a pheromone, or any other behaviorally active chemical substance, is at, or above, threshold concentration; the chemical signal itself (Wilson 1975, 185, 577).
- ◆ **activity** *n.*
1. A person's physical exercise, gymnastics, athletics (Oxford English Dictionary 1972, entries from 1552).
Note: This is an obsolete definition.
 2. An individual animal's general, or specific, movement (Immelmann and Beer 1989, 3).
- instinctive activity** *n.* An ordered sequence of fixed-action patterns (Immelmann and Beer 1989, 151).
cf. pattern: fixed-action pattern
- overflow activity** See activity: vacuum activity.
- spontaneous activity, resting-level activity** *n.* Continuous firing of nerve cells without apparent external stimulation, *e.g.*, in cells of olfactory bulbs and vertebrate eyes (Adrian 1950 and Leyhausen 1954 in Heymer 1977, 49).
- structural activities** *n.* A group of heterogeneous behaviors, including especially feeding, grooming, and scratching, that accompany and surround the aptitude for rest and require no other specific context for their occurrences (Hassenberg 1965 in Heymer 1977, 138).
- vacuum activity** *n.*
1. For example, in some bird species: An instinctive behavior that does not occur for an extended period and eventually occurs without a demonstrable eliciting stimulus (Lorenz 1937 in Heymer 1977, 110); *e.g.*, a well-fed *Sturnus vulgaris* (European Starling), that had no opportunity to catch flies for some time, suddenly goes through all the movements of searching for a fly, catching it, and killing it, although no fly is present (Lorenz 1935 in Hinde 1970, 312).
Notes: Lorenz (1981, 127) indicates that "vacuum activity" cannot be exactly defined. Morris and Moynihan (1953 in Heymer 1977) suggest that "vacuum activity" be replaced with "overflow activity" because one cannot be certain that no stimulus is eliciting the behavior.
 2. A fixed-action pattern that occurs in the absence of any stimulus, because, according to the energy model of behavior, its action-specific energy is very great (Dewsbury 1978, 19).
 3. A behavior that is normally dependent on external stimulation, but occurs spontaneously due to its extreme threshold change, *e.g.*, a weaverbird's showing complex nest-building behavior without nest material or even a substitute object (Immelmann and Beer 1989, 290, 323).
cf. behavior: spontaneous behavior
- ◆ **activity drive**
See drive: activity drive.
- ◆ **activity period**
See period: activity period.
- ◆ **activity range** See ³range: activity range.
- ◆ **actophile** See ¹-phile: actophile.
- ◆ **actualism** *n.* The principle "that the same causes (physical laws) have operated throughout geological time, since the immanent characteristics of the world have always remained the same" (Mayr 1982, 377).
cf. ³theory: uniformitarianism
- Comment:* According to Lyell (1830–1833), it is legitimate to "attempt to explain the former changes of the

earth's surface by reference to causes now in operation" (Mayr 1982, 377).

- ♦ **acyclic** See cyclic: acyclic.
- ♦ **ad hoc adaptations** See habit (def. 3).
- ♦ **ad hoc mimicry** See mimicry: *ad hoc* mimicry.
- ♦ **ad libitum sampling** See sampling technique: *ad libitum* sampling.
- ♦ **adaptability** See ³adaptation: ²physiological adaptation.
- ♦ **¹adaptation** See habituation; learning: habituation.
- ♦ **²adaptation** *n.* "Reproduction of anything modified to suit new uses" (Oxford English Dictionary 1972, entries starting with Darwin 1859).
[Latin *adaptare*, to fit]
- ♦ **³adaptation** *n.* *Comments:* "Adaptation" with, or without, adjectives, is used to refer to both physiological and evolutionary processes as well as the results (organism characters) of these processes; in addition "adaptation" is a kind of learning. Confusion arises because many of these concepts are often simply called

A CLASSIFICATION OF ³ADAPTATION

- I. ¹evolutionary adaptation (*syn.* adaptation, adaption, genotypic adaptation, postadaptation, postadaption)
 - A. coadaptation (*syn.* coadaptation, internal balance)
 - B. idio-adaptation (*syn.* allomorphosis)
 - C. iterative adaptation (*syn.* iterative evolution)
- II. ²evolutionary adaptation (*syn.* adaptation, adaption, adaptive character, genotypic adaptation, phylogenetic adaptation, postadaptation, postadaption)
 - A. alternative adaptation
 - B. exaptation
 - C. juvenile adaptation
 - D. preadaptation
- III. ¹physiological adaptation (*syn.* adaptation)
 - A. acclimation
 - B. acclimatization
 - C. dark adaptation
 - D. light adaptation
 - E. resistance adaptation
 - F. sensory adaptation (*syn.* neuronal adaptation)
 - G. stimulus adaptation (*syn.* habituation)
- IV. ²physiological adaptation (*syn.* adaptation, adaptability, phenotypic adaptation)
- V. Some of the other kinds of adaptation (only some defined in this book)
 - A. *ad hoc* adaptation
 - B. aquatic adaptation
 - C. behavioral adaptation
 - D. counteradaptation
 - E. cultural adaptation
 - F. defensive adaptation
 - G. environmental adaptation
 - H. heritable adaptation (*syn.* genetic adaptation)
 - I. intentional adaptation
 - J. learning adaptation
 - K. local adaptation
 - L. long-term adaptation
 - M. nongenetic adaptation
 - N. ontogenetic adaptation
 - O. sensitive adaptation
 - P. short-term adaptation
 - Q. terrestrial adaptation
 - R. transitory adaptation

"adaptation" without modifying adjectives and some of the concepts have several synonyms.

See ²evolution: adaptation.
cf. study of: teleonomy; trend

¹evolutionary adaptation, adaptation *n.*

1. An evolutionary process that involves a genetic change, creation of a new phenotypic character from this change, and increased genetic fitness of the individual that possesses this character (inferred from Brown 1975, 268; Wilson 1975, 577; Bateson 1979, 241).

Notes: This phenotypic character is often termed an "adaptation." It would be clearer to call it an "evolutionary adaptation" to distinguish it from a "physiological adaptation" or other kinds of adaptations.

2. "The production of a superior variant" in a particular environment ("adaptation" in Wilson 1975, 67).
3. Phyletic evolution ("adaptation" in Mayr 1982, 358).
4. Transgenerational alterations of features and capacities of organisms in a lineage that enable them to "solve (or improve on previous solutions of) problems" posed by their environment, *e.g.*, those of internal integration and reproducing (Burian 1992, 7).

5. "The evolutionary modification of a character under selection for efficient or advantageous (fitness-enhancing) functioning in a particular context or set of contexts" (West-Eberhard 1992, 13).

syn. adaption, genotypic adaptation, postadaptation, postadaption (for all defs., Lincoln et al. 1985)

► **coadaptation** *n.*

1. The evolution of mutually advantageous adaptations in two, or more, interactive species (Lincoln et al. 1985).
2. Evolution resulting in the accumulation of harmoniously interacting genes in a population's gene pool (Lincoln et al. 1985).

syn. coadaptation, internal balance (Lincoln et al. 1985)

► **iterative adaptation** See ²evolution: iterative evolution.

²evolutionary adaptation, adaptation *n.*

Comment: These definitions relate to the result, or presumed result (one or more characters), of the process known as evolutionary adaptation.

1. A distinctive "helpful" character favored by natural selection (Darwin 1859 in Ruse 1984, 102); a character that is "good for" its owner because it enables it to fit better with its environment (Lloyd 1992, 338).

Note: Lloyd (1992, 338) calls this the engineering definition of adaptation.

2. A species', or subspecies', genetically fixed condition or evolution, that favors its survival in a particular total environment (*q.v.*) (given as "genotypic adaptation" in Bligh and Johnson 1973, 943).

3. A character that is a result of natural selection (Dawkins 1982, 292; Burian 1992, 7).

Note: Lloyd (1992, 338) calls this the product-of-selection definition of adaptation.

4. A character that increases an organism's relative fitness in its natural environment (Wilson 1975, 577; Burian 1992, 8).

syn. adaptive character (Wilson 1975, 21)

Notes: This is a widely used concept of "adaptation" in the sense of "evolutionary adaptation." Williams (1966, 4) indicates that "adaptation is a special and onerous concept that should be used only where it is really necessary." "Adaptation" should be used

only as a last resort when less onerous principles, such as those of physics and chemistry, or that of unspecific cause and effect, are not sufficient for a complete explanation (Williams 1966, 11).

5. A character that is the product of selection for the character in question (Sober 1984 in Burian 1992, 8). *syn.* adaption, phylogenetic adaptation (Immelmann and Beer 1989, 4), genotypic adaptation (McFarland 1984, 4), postadaptation (Lincoln et al. 1985).
6. An individual organism's "propensity to survive and reproduce" in a particular environment" (West-Eberhard 1992, 13).

syn. adaptedness (Mayr 1986 in West-Eberhard 1992, 13); general adaptation (West-Eberhard 1992, 13)

cf. ³adaptation: ²evolutionary adaptation: exaptation, preadaptation; ¹physiological adaptation: sensory adaptation; ²evolution: adaptation; postadaptation

Comments: Types of characters resulting from "evolutionary adaptation" include behaviors, developmental traits, physiological processes, and structures. Bateson (1979, 241) uses "adaptation" to refer to an organism's character that *seemingly* enables it to fit better into its environment and way of life. Fitzgerald (1995, 32) metaphorically uses "evolutionary wisdom" for a behavioral adaptation. Burian (1992) and West-Eberhard (1992) discuss the evidence used to determine whether a character is truly an adaptation.

► **alternative adaptation** *n.* One phenotypic character, of a group of different adaptive phenotypic characters, that is maintained in the same life stage of a population, but not necessarily simultaneously expressed in the same individual (West-Eberhard 1986, 1388).

cf. hypothesis: alternative-adaptation hypothesis

► **exaptation** *n.* "Any organ not evolved under natural selection for its current use — either because it performed a different function in ancestors (classical preadaptation) or because it represented a nonfunctional part available for later co-optation" (Gould 1985b, 18).

See ³adaptation: ²evolutionary adaptation: preadaptation (comment).

Comments: Because many organs and traits have long evolutionary histories, it is likely that they changed at least part of their function over time, and this makes most such adapted organs and traits exaptations (Alcock 2006, 148–149).

[coined by Gould and Vrba 1982 in Gould 1985b, 18]

► **juvenile adaptation** *n.* The interpolation of new features into early ontogenetic stages for their own immediate evolutionary utility (Haeckel 1905 in Gould 1992, 160).

cf. -genesis: cenogenesis

► **preadaptation** *n.*

1. A previously existing structure, physiological process, or behavioral pattern that "is already functional in another context and available as a stepping stone to the attainment of a new adaptation" (Wilson 1975, 34).

Note: "Preadaptation" happens, for example, when a population with a certain song dialect (which originally arose through geographical isolation but later acts as a means of reproductive isolation) becomes sympatric with a conspecific population with a different dialect (Immelmann and Beer 1989, 229).

2. "An ancestral characteristic or trait that predisposes a directional evolutionary change to proceed in one direction rather than in another" (Wittenberger 1981, 620).

syn. classical preadaptation (Gould 1985b, 18)

Comments: Gould and Vrba (1981) indicate that "preadaptation" should be dropped in favor of a more inclusive term — "exaptation" (*qv*), because "preadaptation" seems to imply that certain features of organisms are predestined to become adaptations (arise with a different, future use in view), and it does not cover the important class of features that arise without functions (e.g., as developmental consequences of other primary adaptations) but remain available for later cooptation. Campbell (1990, 493) indicates that "preaptation" is gradually replacing "preadaptation."

¹physiological adaptation, adaptation *n.* The process of an individual organism's changing one, or more, of its characters due to its adjusting to its environment, but not changing genetically (Bligh and Johnson 1973, 942; inferred from Brown 1975, 268).

cf. plasticity: phenotypic plasticity

► **acclimation** *n.* Physiological adaptation involving an organism's altering its tolerance of a single environmental factor, e.g., temperature, under laboratory conditions; contrasted with acclimatization (Bligh and Johnson 1973, 942; McFarland 1985, 287).

cf. anticipatory adjustment

Comment: Acclimation and "acclimatization" are etymologically indistinguishable, both terms have several and different meanings, and it is not always clear how an author is using these terms (Bligh and Johnson 1973, 942).

► **dark adaptation** *n.* A person's gradual improvement in visual perception after moving from a bright area to a dark one due to pupil enlargement and retinal chemical changes; contrasted with light adaptation (Storz 1973, 63).

► **light adaptation** *n.* A person's gradual improvement in perception after moving from a dark area to a light one; contrasted with dark adaptation (Storz 1973, 148).

► **resistance adaptation** *n.* An organism's phenotypic adaptation at its tolerance limit (McFarland 1985, 286).

► **sensory adaptation** *n.*

1. "Change, incremental or decremental, in response or response-strength that has been experimentally demonstrated to depend solely upon changes in the state of a receptor organ produced by protracted or repetitive stimulation of, or by recovery from, such stimulation of that organ" (Verplanck 1957); e.g., a person's strong sense of pressure from gloves fades with time while his gloves remain on his hands (Storz 1973, 251).

2. Physiological adaptation in which an animal stops responding to a kind of stimulus because its sense organ is no longer responding to the stimulus; e.g., some kinds of flies stop feeding when their chemoreceptors become sensorially adapted (Hinde 1970, 288–290).

3. A cell, or tissue, showing a response that diminishes to a relatively low level from an initial response due to a regularly repeated, or continuous, stimulus (Brown, 1975, 268).

Note: Cells of the yeast *Saccharomyces cerevisiae* adapt to (i.e., recover from) growth arrest induced by their mating pheromones. Their adaptation is,

therefore, their ceasing to respond to the pheromone (Grishin et. al. 1994, 1081).

syn. neuronal adaptation (Brown 1975, 268)

cf. learning: habituation

²physiological adaptation, adaptation *n.*

1. An organism's change that reduces the physiological strain produced by a stressful component of its total environment (*q.v.*) (given as "phenotypic adaptation" in Bligh and Johnson 1973, 942).
2. A result (organism attribute, or attributes) of the process called physiological adaptation (*q.v.*) (inferred from Brown 1975, 268); a short-term physiological adjustment by a phenotypically plastic individual (West-Eberhard 1992, 13).
3. An organism's receptor cell's adjusting its responsiveness to a stimulation change, either very quickly as in phasic cells, or very slowly as in tonic cells (Gould 1982, 84).

Note: "Physiological adaptation" often also involves a group of cells.

syn. adaptability (Brown 1975, 268)

Comment: Physiological adaptations include the results of acclimation, acclimatization, dark adaptation, learning, light adaptation, resistance adaptation, and sensory adaptation, and a person's breathing faster at higher altitudes, developing calluses on feet and hands in response to wear, and skin tanning due to sunlight (Brown 1975, 268).

preadaptation See ¹adaptation: ²evolutionary adaptation: preadaptation.

♦adaptationist program *n.*

1. A way of thinking that "regards natural selection as so powerful and the constraints upon it so few that direct production of adaptation through its operation becomes the primary cause of nearly all organic form, function, and behaviour" [coined by Gould and Lewontin 1979, 584–585].

syn. adaptationist programme, Panglossian paradigm [coined by Gould and Lewontin 1979, 584]

Note: The adaptationist program does recognize constraints on natural selection, but it usually dismisses them as unimportant or simply acknowledges them, according to Gould and Lewontin (1979, 585).

2. A research paradigm that tries to envision a biological phenomenon as an aspect of adaptation, "some sort of biological machinery or process shaped by natural selection to help solve one or more problems faced by the organism" (Gould and Lewontin 1979, interpreted by Williams and Nesse, 1991, 1–2).

Note: The adaptationist program can predict otherwise unsuspected facets of human biology and provides new insights into the causes of medical disorders (Williams and Nesse 1991, 1–2).

Comment: Many researchers have discussed the adaptationist program as it was defined in Gould and Lewontin (1979, 584). Some people concluded that their definition relates to those authors' noncollegiality and their 16-year campaign against aspects of sociobiology, etc. (Borgia 1994, 373). Neilson (2009, 2487) revisited the adaptationist program. He points out that some researchers still tell "very naïve adaptive stories, particularly about human behavior."

♦adapted system See ¹system: adapted system.

♦adaptedness See ³adaptation: ²evolutionary adaptation.

♦adaptive *adj.* Pertaining to an adaptation, *q.v.*

♦adaptive correlation *n.* Association between an organism's form and function (Immelmann and Beer 1899, 5).

See study of: adaptive correlation.

♦adaptive focus See adaptive peak.

♦adaptive landscape *n.*

1. Fitness of one, or more, kinds of organisms graphed as an ordinate versus phenotype characters (*e.g.*, *x* and *y* axes) (Sewell Wright 1950s in Lewin 1986b, 673; Wilson 1975, 24, illustration; Campbell 1990, 473, illustration).

cf. zone: adaptive zone

2. "A graphical 'map' on which the altitude at any given location indicates Darwinian fitness for a specified combination of alleles or linkage groups" (Wittenberger 1981, 612).

syn. adaptive surface (Slatkin 1987, 792)

Comments: Wright (1931 in Slatkin 1987, 792) did not present an "adaptive landscape" in terms that could be easily related to population-genetic theory. Later definitions of "adaptive landscape" incorporate both R. A. Fisher's fundamental theorem of natural selection and Wright's demonstration that a population's mean fitness is a potential function. When a population descends from an adaptive peak in an adaptive landscape, it is likely to do it quickly based on mathematical models of Lande (1985) and Newman et al. (1985) (in Lewin 1986b, 673). This would give a population a better chance of evading selection while it descends. The models support the hypothesis of punctuated equilibria. Patterns of genetic differentiation among populations of *Wyeomyia smithii* (Pitcherplant Mosquito) provide evidence for a topographically complex adaptive landscape envisioned by Sewell Wright in his shifting-balance evolutionary hypothesis (Armbruster et al. 1999, 509).

♦adaptive management *n.* Natural-resource management in which managers make decisions as part of an ongoing science-based process (United States Geological Survey 2005).

Comment: Adaptive management involves testing, monitoring, and evaluating applied strategies, and incorporating new knowledge into management approaches that are based on scientific findings and the needs of society. Results are used to modify management policy, strategies, and practices (United States Geological Survey 2005). As part of adaptive management, officials may refine and update goals, alternatives, and evaluations (New 2009, 219).

♦adaptive mutation See ²mutation: directed mutation.

♦adaptive neutrality See evolutionary synthesis; ²evolution: neo-Darwinian evolution; ³theory: neutral theory.

♦adaptive peak, Wright's principle of maximization of W, adaptive focus *n.* A small region of high fitness in an adaptive landscape (Futuyma 1979, 329).

♦adaptive radiation *n.* Divergent evolution of members of a single phylogenetic line into a variety of different adaptive forms, usually with reference to their diversification in their use of resources, habitats, or both (Futuyma 1986, 550).

cf. ²evolution

Comment: Examples of adaptive radiation are Agnatha (Jawless Fish) in the Ordovician Period; Amphibians and Insects in the Carboniferous Period, Angiosperms and Insects in the Cretaceous, Australian Marsupials,

Darwin's Finches, Dinosaurs and Mammals beginning in the Triassic Period, East African Cichlid Fish, Fish in the Devonian, Hawaiian Fruit Flies, Hawaiian Honeycreepers, Hawaiian Silverswords, Heliconiine Butterflies, herbaceous plants and Humans in the Pleistocene, and Leiognathid Fish (Futuyma 1986, 550; Weiner 1994, 208).

♦ **adaptive significance, adaptively significant** See statistically significant.

♦ **adaptive significance, biological function, survival value** *n.* The value of an organism's trait to its survival and fitness (Immelmann and Beer 1989, 300).

syn. function (a widely used, confusing synonym, Dewsbury 1999, 193)

cf. adaptive value

♦ **adaptive strategy** See strategy: adaptive strategy.

♦ **adaptive surface** See adaptive landscape.

♦ **adaptive trait** See character: adaptive character.

♦ **adaptive value** *n.*

1. "A measure of the tendency for a particular allele or linkage group to change in frequency within a gene pool" (Wittenberger 1981, 612).

2. The comparative fitness of different genotypes in a given environment (Lincoln et al. 1985).

3. The survival and reproductive value of one genotype compared to another in a population (Lincoln et al. 1985).

cf. fitness: genetic fitness; selective advantage

♦ **adaptive zone** See zone: adaptive zone.

♦ **adaptive significance, adaptively significant** See biologically significant.

♦ **adaptor** See communication: nonverbal communication.

♦ **additive-genetic variance** See variance: additive-genetic variance.

♦ **Addo Elephant National Park** See place: Addo Elephant National Park.

♦ **adelphogamy** See mating: sib mating; pollination: self-pollination.

♦ **adelphohyperparasitism** See parasitism: hyperparasitism: adelphohyperparasitism.

♦ **adelphoparasitism** See parasitism: adelphoparasitism.

♦ **adenosine phosphate** See molecule: adenosine phosphate.

♦ **adenosine monophosphate** See molecule: adenosine phosphate: adenosine monophosphate.

♦ **adenosine diphosphate** See molecule: adenosine phosphate: adenosine diphosphate.

♦ **adenosine triphosphate** See molecule: adenosine phosphate: adenosine triphosphate.

♦ **adequate stimulus** See ²stimulus: adequate stimulus.

♦ **adient** *adj.* Referring to an animal's seeking, or moving toward, a stimulation source (Hurnik et al. 1995). *ant.* abient

♦ **adjunctive behavior** See behavior: displacement behavior.

♦ **adjustable mimicry** See mimicry: adjustable mimicry.

♦ **adolescent** See animal names: adolescent.

♦ **adoption** *n.* For example, in some ant, coati, langur, and macaque species; bird species with creches; Humans; *Ilycaon pictus* (African Wild Dogs); *Pan troglodytes* (Chimpanzees); *Papio hamadryas* (Hamadryas Baboons) and other baboons: An animal's giving essentially full-time parental care to an orphaned

conspecific young; the "parent" varies in genetic relationship to the young (Estes and Goddard 1967, Lawick-Goodall 1968, and Kummer 1986, in Wilson 1975, 352, 512; Immelmann and Beer 1989, 6).

Comment: In *Papio hamadryas*, a young adult male abducts sexually immature females from the female group of an older male; this starts the young male's female group (Immelmann and Beer 1989, 6).

♦ **adoption substance** See substance: adoption substance.

♦ **adrenal corticoid** See hormone: adrenal corticoid.

♦ **adrenal gland** See gland: adrenal gland.

♦ **adrenalin** See hormone: adrenalin; toxin: adrenalin.

♦ **adrenergic synapse** See synapse: adrenergic synapse.

♦ **adrenocorticotropicin** See hormone: adrenocorticotropicin.

♦ **adrenogenital syndrome** See syndrome: adrenogenital syndrome.

♦ **adsere** See ²succession: adsere.

♦ **adult** See animal names: adult.

♦ **adult transport** See transport: adult transport.

♦ **adultery** *n.* A married person's voluntary sexual intercourse with a person of the opposite sex, who is not the person's spouse and is either married or unmarried; "violation of a marriage bed" (Oxford English Dictionary entries from 1366).

See copulation: extrapair copulation.

[Latin *adulter*]

♦ **advantageous altruism** See altruism (def. 6).

♦ **advanced character** See character: derived character.

♦ **advanced species** See ²species: advanced species.

♦ **adventitious mimicry** See mimicry: adventitious mimicry.

♦ **adventive** *adj.* Referring to a group, or species, that has arrived in an area previously unoccupied by it, whether by its own means or due to human activity (Frank and McCoy 1990, 4).

cf. autochthonous, ¹endemic, immigrant, indigenous, introduced, precinctive

Comment: "Immigrant" and "introduced species" are divisions of "adventive species" (Frank and McCoy 1990, 4).

[Latin *advenire*, to arrive]

♦ **advergence** See deceptive advergence.

♦ **advertisement call** See animal sounds: call: advertisement call.

♦ **advertising, advertisement, advertisement behavior** See display: advertisement.

♦ **advertising dress** See dress: advertising dress.

♦ **advertising mimicry** See mimicry: advertising mimicry.

♦ **advocacy method of developing science** See method: advocacy method of developing science.

♦ **aedeagus** See organ: copulatory organ: aedeagus.

♦ **aerial copulation** See copulation: aerial copulation.

♦ **aerial respiration** See breathing: air breathing.

♦ **aerial display** See display: aerial display.

♦ **aerie** See ²group: aerie.

♦ **aerobe** *n.* A prokaryote that can live in the presence of free oxygen; contrasted with anaerobe (Michaelis 1963). [Greek *aero*, air + *bios*, life]

♦ **anaerobe** *n.*

A

1. A microorganism that flourishes without free oxygen; distinguished from an aerobe (Michaelis 1963).
 2. Either a facultative anaerobe or an obligate anaerobe (Campbell 1996, 506).
[New Latin < Greek *an*, without + *aēro*, air + *bios*, life]
- **facultative anaerobe** *n.* A prokaryote that can use oxygen in energy production if it is present and can also grow by fermentation in an anaerobic environment (Campbell 1996, 506).
- **obligate anaerobe** *n.* A prokaryote that cannot use oxygen and is poisoned by it (Campbell 1996, 506).
- ◆ **aerobic** *adj.*
1. Referring to an organism that grows, or occurs, only in the presence of molecular oxygen (Lincoln et al. 1985).
syn. oxybiotic, oxybiontic (Lincoln et al. 1985)
 2. Referring to an environment whose oxygen partial pressure is similar to normal atmospheric levels; oxygenated (Lincoln et al. 1985).
- ◆ **aerobiology** See study of: biology: aerobiology.
- ◆ **aerochore, aerochorous, aerochory** See -chore: aerochore.
- ◆ **aerohyophile** See ¹-phile: aerohyophile.
- ◆ **aerophile** See ¹-phile: aerophile.
- ◆ **aerophobia** See -phobia: aerophobia.
- ◆ **aerophytobiota** See biota: aerophytobiota.
- ◆ **aeroplankton** See plankton: aeroplankton.
- ◆ **aeroscepsy** *n.* An organism's perception of airborne sound or chemical stimuli (Lincoln et al. 1985).
- ◆ **aestidurilignosa** See ²community: forest: mixed forest.
- ◆ **aestilignosa** See ²community: aestilignosa.
- ◆ **aestarifruticeta** See ²community: aestarifruticeta.
- ◆ **aestarisilune** See ²community: aestarisilune.
- ◆ **aestival, estival** *adj.*
1. Of, or belonging to, summer, or the summer solstice (Oxford English Dictionary 1972, entries from 1386).
 2. Appearing, or produced, in summer (Oxford English Dictionary 1972, entries from 1682).
cf. dormancy: aestivation
- ◆ **aestivation** See estivation.
- ◆ **aethogametism** See synethogametism.
- ◆ **aetiology** See study of: etiology.
- ◆ **affect gesture** See communication: nonverbal communication.
- ◆ **affectional drive** See drive: affectional drive.
- ◆ **affERENCE** See -ference: afference.
- ◆ **afferent neuron** See cell: neuron: afferent neuron.
- ◆ **affiliation** *n.*
1. A person's need to draw near and enjoyably cooperate with another person, to form friendships and remain loyal, to please and win affection of important others (Wolman 1973).
syn. affiliative need (Wolman 1973)
See need: affiliation.
 2. A form of social behavior involving an individual animal's tending to approach and remain near conspecifics (Dewsbury 1978, 107).
- ◆ **affiliative drive** See drive: affiliative drive.
- ◆ **affiliative need** See affiliation.
- ◆ **affinity** *n.*
1. A person's relationship by marriage, as opposed to consanguinity; *e.g.*, a relationship between a man and his wife's blood relatives (Oxford English Dictionary 1972, entries from 1303).
 2. A person's relationship, or kinship, generally between individuals or races (Oxford English Dictionary 1972, entries from 1382).
 3. Structural resemblance between two organisms that suggests gradual modification from a common ancestor (Oxford English Dictionary 1972, entries from 1794).
Comment: Lincoln et al. (1985) also define "absolute affinity" and "relative affinity."
- **cladistic affinity** *n.* The degree of recency of common ancestry to two, or more, organisms (Lincoln et al. 1985).
cf. affinity: patristic affinity
- **patristic affinity, patristic similarity** *n.* Organisms' degree of similarity due to their common ancestry, including parallel, but not convergent, evolution (Lincoln et al. 1985).
cf. affinity: cladistic affinity
- ◆ **African-origin hypothesis (of human mitochondrial DNA evolution)** See hypothesis: African-origin hypothesis of human mitochondrial DNA evolution.
- ◆ **African sleeping sickness** See disease: African sleeping sickness.
- ◆ **after-discharge** *n.*
1. "That part of a response that occurs after the termination of the stimulus that elicited it or set the occasion for its occurrence. [Uncommon usage.]" (Verplanck 1957).
 2. "Discharges of nerve impulses in efferent neurons that persist in time after the stimulus that set up the discharge of which they are part is terminated. [This observation forms part of the empirical basis of the concept of synapse.]" (Verplanck 1957).
- ◆ **agamete** See gamete: agamete.
- ◆ **agametic** *adj.* Referring to reproduction without gametes (Bell 1982, 501).
- ◆ **agamodeme** See deme: agamodeme.
- ◆ **agamont** *n.* An individual organism that gives rise to agametes (Bell 1982, 501).
- ◆ **agaricole** See -cole: agaricole.
- ◆ **age** *n.*
1. *v.t.* To become old or attain maturity (Oxford English Dictionary 1972, entries from 1398).
 2. *n.* The period that a thing, *e.g.*, an individual, group of individuals, or species, has existed (Oxford English Dictionary 1972, entries from 1325).
- ◆ **age-1 gene** See gene: *age-1* gene.
- ◆ **age-and-area hypothesis** See hypothesis: age-and-area hypothesis.
- ◆ **age dimorphism** See -morphism: dimorphism: age dimorphism.
- ◆ **age polyethism** See polyethism: age polyethism.
- ◆ **age polymorphism** See -morphism: polymorphism: age polymorphism.
- ◆ **age-specific selection** See selection (table).
- ◆ **agent** *n.* Any force, organism, or substance, that causes a material change (Michaelis 1963).
[Latin *agens, agentis*, present participle of *agere*, to do]
- **oxidizing agent** *n.* In chemistry, in an oxidation-reduction reaction, the atom, or compound, that accepts an electron(s); contrasted with reducing agent (Campbell 1987, 184).
Comment: Oxygen is one kind of oxidizing agent. It has a strong affinity for electrons; that is, it is strongly electronegative.
- **reducing agent** *n.* In chemistry, in an oxidation-reduction reaction, the atom, or compound,

that donates an electron(s) and thereby *reduces* the electron accepting element's, or compound's, charge; contrasted with oxidizing agent (Campbell 1987, 184).

- ◆ **aggregate character** See character (comments).
- ◆ **aggregated distribution** See distribution: aggregated distribution.
- ◆ **aggregation** See ²group: aggregation; ²society: modular society: discontinuous modular society.
- ◆ **aggregation pheromone** See chemical-releasing stimulus: semiochemical: pheromone: aggregation pheromone.
- ◆ **aggregation-attachment pheromone** See chemical-releasing stimulus: semiochemical: pheromone: aggregation-attachment pheromone.
- ◆ **aggregation pheromone** See chemical-releasing stimulus: semiochemical: pheromone: aggregation pheromone.
- ◆ **aggregational hierarchy** See hierarchy: aggregational hierarchy.

◆ **aggression** *n.*

1. A person's "unprovoked attack" on another person; "the first attack in a quarrel; an assault, an inroad" (Oxford English Dictionary 1972, first entry 1611).
2. A person's "setting upon any one;" one's "making of an attack or assault" (Oxford English Dictionary 1972, first entry 1704).
3. An animal's "tendency to initiate a vigorous fight" (King and Gurney 1954, 326).
4. In animals: "A broad class of behavior that includes both threat and attack behavior" (Verplanck 1957).
5. An organism's "response that delivers noxious stimuli to another organism" (Buss 1961 in Dewsbury 1978, 104).

Note: Dewsbury (1978, 104) discusses the problems with this definition.

6. An animal's "fighting" and "the act of initiation of an attack" (Scott 1975, 1).
7. One animal's "physical act or threat of action that reduces the freedom or genetic fitness of another" (Wilson 1975, 242, 577).

Note: Aggression serves very diverse functions in different species. Wilson (1975, 242–243) lists eight categories of aggression: antipredatory, dominance, moralistic, parental, predatory, sexual, territorial, and weaning aggression.

8. "A vague term used to designate an array of behaviors, with various functions, that we intuitively feel resemble human aggression" (Wilson 1975, 22).
9. In population biology, behavior actively directed against competitors that decreases the reproductive prospects of an attacked animal relative to those of an attacker, *e.g.*, by denying access to certain resources (Markl 1976 in Immelmann and Beer 1989, 9).
10. An animal's "overt behavioral act or threat directed at harming another individual with the intent of gaining some advantage" (Wittenberger 1981, 612).
11. An animal's making offensive acts such as threat to and encroachment, or attack, upon another animal (Hand 1986, 203).

syn. aggressive behavior

cf. aggressiveness, behavior: agonistic behavior, meddling, need: aggression, violence

Comments: Aggression "is virtually universal in some form or another in almost every animal which has the necessary motor apparatus to fight or inflict injury" (Southwick 1970, 2). "The term aggression has so

many meanings and connotations that in effect it has lost its meaning ... it is not a simple, unitary concept and therefore cannot be defined as such. There is no single kind of behavior which can be called "aggression" nor is there any single process which represents "aggression." Where only modest levels of precision are necessary, it may be useful to adopt the term *agognostic behavior* as a desirable alternative to "aggressive behavior" (Johnson 1972, 8). "In attempting to define aggression ... one of the difficulties is that aggression may be situationally determined so that a particular behavior may be considered aggressive in one instance and not in another" (Johnson 1972, 17). "The word aggression is widely used and misused in a variety of contexts" (Scott 1975, 1). Dewsbury (1978, 104) states "The solution to the problem of "aggression" is simply to treat the word as a convenient, loosely defined aid to communication and organization, recognizing that we cannot provide an adequate definition and that we are probably lumping together a number of diverse phenomena." Moyer (1968, 1976 in Dewsbury 1978, 104) lists eight kinds of aggression: "predatory aggression," "intermale aggression," "fear-induced aggression," "irritable aggression," "territorial-defense aggression," "maternal aggression," "instrumental aggression," and "sex-related aggression."

antipredatory aggression *n.* Aggression that is purely defensive behavior that can be escalated into a full-fledged attack on a predator, *e.g.*, mobbing (Wilson 1975, 343).

aversion-induced aggression *n.* In psychology, an animal's attack due to an aversive stimulus; *e.g.*, pain, which may be directed at any bystander, or inanimate object, that is within its reach (Immelmann and Beer 1989, 24).

cf. aggression: frustration-induced aggression, redirected aggression

behavioral aggression *n.* Aggression that enables animals "to survive in competitive situations" (Southwick 1970, 2).

cf. aggression: ecological aggression

defensive aggression *n.* In some prey-animal species: An individual's using aggression, often as a last resort, to defend itself, or its offspring, from predators (Wittenberger 1981, 614).

direct aggression *n.* Aggression in which animals confront one another with physical interactions; *e.g.*, a barnacle's displacing another, inter- and intraspecific fights between ants, and cannibalism in some kinds of predaceous insects (Wilson 1975, 244–246).

cf. competition: interference competition

displaced aggression, displacement *n.* Psychologically speaking, human behavior that is somewhat analogous to redirected aggression; contrasted with displacement behavior, *q.v.* (Immelmann and Beer 1989, 247).

dominance aggression *n.* Aggression involving displays and attacks mounted by dominant animals against fellow group members used primarily to prevent subordinates from performing actions for which the dominant animal claims priority (Wilson 1975, 242).

ecological aggression *n.* Aggression that enables animals to invade and colonize new areas and exploit new habitats (Southwick 1970, 2).

cf. aggression: behavioral aggression

frustration-induced aggression *n.* Aggression due to frustration, *q.v.*; *e.g.*, when an investigator

switches a pigeon from constant to partial reinforcement in an operant situation, the bird becomes aggressive and pecks bystanders within range (Immellmann and Beer 1989, 114).

cf. aggression: aversion-induced aggression, redirected aggression

interspecific aggression *n.* Aggression that is frequently physically injurious between, or among, members of different species (Immellmann and Beer 1989, 9).

intrasexual aggression *n.* "Aggression directed at like-sexed conspecifics of the same age class or reproductive class" (Wittenberger 1981, 617).

intraspecific aggression *n.* Aggression that is often ritualized fighting between, or among, members of the same species (Immellmann and Beer 1989, 9).

moralistic aggression *n.* Human aggression used to enforce reciprocation; this "aggression is manifested in countless forms of religious and ideological evangelism, enforced conformity of group standards, and codes of punishment for transgressors" (Wilson 1975, 243).

cf. morality

parental aggression *n.* "Aggression directed at progeny by a parent" (Wittenberger 1981, 619).

parental disciplinary aggression *n.* In some mammal species: Aggression used by parents; *e.g.*, to keep offspring close at hand, urge them into motion, to break up fighting, and to terminate unwelcome suckling (Wilson 1975, 243).

predatory aggression *n.* A predator's aggression toward its prey (Davis 1964 in Wilson 1975, 243).

redirected aggression, redirection *n.* An animal's action that it deflects from an object that arouses it toward a neutral (or substitute) object; *e.g.*, a lower-ranking conspecific, a stone, or a clump of grass which it might pull (grass pulling) (Dewsby 1978, 19; Immelmann and Beer 1989, 246).

cf. aggression: displaced aggression; behavior: displacement behavior

Comments: "Redirected aggression" involves an animal's switching its target while "displacement behavior" involves its changing its kind of behavior. This concept is comparable to the psychological term "aversion-induced aggression" (Immellmann and Beer 1989, 24) and the psychoanalytic term "displaced aggression" (Dewsby 1978, 19).

sexual aggression *n.* A male's aggression involving threats and attacks directed toward a female that forces her into a more prolonged sexual alliance with him (Wilson 1975, 242).

Comment: The ultimate development of sexual aggression in higher vertebrates might be in Hamadryas Baboons (Wilson 1975, 242).

territorial aggression *n.* An animal's aggression used in defending its territory, often involving dramatic signaling behavior to repulse intruders, and with escalated fighting used as a last resort (Wilson 1975, 242).

weaning aggression *n.* In some mammal species: Aggression of parents that involves threatening and even gently attacking their own offspring at weaning time, when the young continue to beg for food beyond that age when it is necessary to do so (Wilson 1975, 243).

cf. weaning

◆ **aggression-frustration hypothesis** See hypothesis: aggression-frustration hypothesis.

◆ **aggressive call** See animal sounds: call: territorial call.

◆ **aggressive-cryptic mimesis** See mimicry: mimesis: cryptic mimesis: aggressive-cryptic mimesis.

◆ **aggressive mimicry** See mimicry: aggressive mimicry.

◆ **aggressive neglect** *n.* A reduction in an animal's parental care that results from its spending time and energy on aggressive interactions, such as territoriality, and reduces its number of courtships, successful copulations, offspring surviving to independence, or a combination of these things (Wilson 1975, 269, Wittenberger 1981, 612).

◆ **aggressive-reproductive mimicry** See mimicry: aggressive-reproductive mimicry.

◆ **aggressive signal** See signal: aggressive signal.

◆ **aggressiveness** *n.*

1. A person's disposition to attack others (Oxford English Dictionary 1972, entries from 1859).
2. An individual animal's "tendency to attack" (Scott and Fredericson 1951, 273); an individual's "level of preparedness to fight," contrasted with the act of aggression (Wilson 1975, 251); a species', or individual's, typical tendency to attack, or an individual's specific tendency to attack on a particular occasion or under a particular circumstance (Immellmann and Beer 1989, 9).
3. An individual animal's behavior shown by threatening or fighting or in a more subtle form expressed simply by independence of action (Collias 1944, 83).
4. A human neurosis brought out by abnormal circumstances and hence, by implication, nonadaptive for the individual (Montagu 1968 in Wilson 1975, 255).

cf. aggression

◆ **agium** See ²community: agium.

◆ **agonist** *n.*

1. A human contender for a prize (Oxford English Dictionary 1972, entries from 1626).
2. An individual organism involved in agonistic behavior, *q.v.*
3. A drug that can substitute for a hormone, or neurochemical substance, at a neural-receptor binding site and produce the same effects as a natural substance or enhance its effectiveness (Immellmann and Beer 1989, 10).

antagonist *n.* A drug that can substitute for a hormone, or neurochemical substance, at neural receptor binding sites, and blocks the effect of a natural substance (Immellmann and Beer 1989, 10).

◆ **agonistic** *adj.* "Referring to any activity related to fighting, whether aggression or conciliation and retreat" (Scott and Fredericson 1951 in Wilson 1975, 242, 578).

cf. behavior: agonistic behavior

◆ **agonistic behavior** See behavior: agonistic behavior.

◆ **agonistic buffer** *n.* An infant used in agonistic buffering, *q.v.*

◆ **agonistic buffering** See buffering: agonistic buffering.

◆ **agoraphobia** See -phobia: agoraphobia.

◆ **agriculture** *n.* The cultivation of soil, growing crops, breeding and raising livestock, and so forth (Michaelis 1963).

syn. agronomy, gardening, farming

- Comment:* Many species of attine ants and some termite species cultivate fungus species (Mueller et al. 1998, 2034).
 [French < Latin *agricultura* < *ager*, field + *cultura*, cultivation]
- ◆ **agrium** See ²community: agrium.
 - ◆ **agrophile** See ¹-phile: agrophile.
 - ◆ **agrostology** See study of: graminology.
 - ◆ **aha experience** *n.* In Humans, possibly in *Pan troglodytes* (Chimpanzees): An individual's sudden recognition of the relationships, causes, and effects of a particular contingency, or occurrence, which is apparently based on familiarity with separate parts necessary to solving a problem (Khler 1963 in Heymer 1977, 25, 60).
cf. learning: insight learning
Comment: According to Büchler (1922) an aha experience is part of insight learning.
 - ◆ **A horizon** See soil horizon: O horizon.
 - ◆ **ai** See active ingredient.
 - ◆ **aichinophobia** See -phobia: aichinophobia.
 - ◆ **aigialophile** See ¹-phile: aigialophile.
 - ◆ **aigicole** See -cole: aigicole.
 - ◆ **ailurophobia** See -phobia: ailurophobia.
 - ◆ **aiphyllophile** See ¹-phile: aiphyllophile.
 - ◆ **aithallium** See ²community: aithallium.
 - ◆ **aithalophile** See ¹-phile: aithalophile.
 - ◆ **aitionomic, aitionomous** See -genic: aitiogenic.
 - ◆ **Akilia Island Rocks** See formation: "Akilia Island Rocks."
 - ◆ **akinesis** See behavior: defensive behavior: playing dead.
 - ◆ **aktology** See study of: aktology.
 - ◆ **alarm** *n.* An alert that an organism communicates to its group mates (Wilson 1975, 211).
v.t. alarm
cf. behavior: alarm behavior
 - ◆ **alarm behavior** See behavior: alarm behavior.
 - ◆ **alarm call** See animal sounds: call: alarm call.
 - ◆ **alarm-defense system** See ¹system: alarm-defense system.
 - ◆ **alarm pheromone** See chemical-releasing stimulus: semiochemical: pheromone: alarm pheromone.
 - ◆ **alarm reaction** See reaction: alarm reaction.
 - ◆ **alarm-recruitment system** See ¹system: alarm-recruitment system.
 - ◆ **alarm signal** See signal: alarm signal.
 - ◆ **ALAS Inventory** See inventory: Arthropods of La Selva Inventory.
 - ◆ **Albert Lasker Award** See award: Albert Lasker Award.
 - ◆ **albinism** *n.* An organism's state, or condition, of being an albino (Oxford English Dictionary 1972, entries from 1836).
 - ◆ **albino** *n.*
 1. A person who has a partial to total absence of pigment in his skin, hair, and eyes so that his skin and hair can be as light as white and his eyes are pink (Oxford English Dictionary 1972, entries from 1777).
 2. A nonhuman animal with lighter than usual pigmentation; *e.g.*, a white rat, rabbit, cat, or elephant (Darwin 1859 in the Oxford English Dictionary 1972).
 3. An individual plant that lacks chlorophyll in its leaves but belongs to a species whose members usually have such chlorophyll (Oxford English Dictionary 1972, entries from 1879).

Note: There are five normal green and three albino seedlings of *Hemerocallis* (daylily) cultivars in this pot (fig. 1). The albino seedlings lived for about 3

weeks, and the green seedlings lived for months in the pot.

[Spanish or Portuguese *albino*, white, originally referring to "white Negroes" on the coast of Africa]

- ◆ **alcohol** See molecule: alcohol.
- ◆ **aldehyde** See molecule: aldehyde.
- ◆ **alertness** See facial expression: alertness.
- ◆ **aletophile** See ¹-phile: aletophile.
- ◆ **alimentary egg** See gamete: trophic egg.
- ◆ **algeny** See genetic engineering.
- ◆ **algicole** See -cole: algicole.
- ◆ **algology** See study of: phycology.
- ◆ **algophage** See -phage: algophage.
- ◆ **algorithm** *n.* In mathematics, a mechanical, or recursive, computational procedure (Morris 1982).
 [variation of algorism < Middle English *algorisme* < Old French < Medieval Latin *alorismus*, after Muhammad ibn-Musa Al-Karzimi (780–850)?]

Basic Local Alignment Search Tool (BLAST)

n. An algorithm that compares base-pair sequences, or amino-acid sequences, and that is optimized for speed (Atlschul et al. 1999, 403; <http://www.ncbi.nlm.nih.gov/Education/BLASTInfo/information3.html>).

- ◆ **ALH 84001 meteorite** See meteorite: Allen Hills 84001 meteorite.

alimentation *n.*

1. A person's taking in nourishment (Oxford English Dictionary 1972, entries from 1605).
2. An individual organism's taking in nourishment (Lincoln et al. 1985).

syn. feeding

- ◆ **alkaliphile** See ¹-phile: alkaliphile.
- ◆ **alkaloid** See molecule: alkaloid.
- ◆ **allautogamy** *n.* See -gamy: autoallogamy.
- ◆ **all-occurrences sampling** See sampling technique: all-occurrences sampling.

- ◆ **all-or-none character** See character: binary character.

- ◆ **all-or-none law** See law: all-or-none law.

- ◆ **All Taxon Biological Inventory** See inventory: All Taxon Biological Inventory.

- ◆ **allaesthetic selection** See selection (table).

- ◆ **Allee effect, Allee principle, Allee law** See law: Allee effect.

- ◆ **allelarkean society** See ²society: allelarkean society.

allele *n.*

1. One of the two, or more, alternate conditions of a particular trait (Mayr 1982, 733).

Note: "Allele" was originally coined as "allelomorph" by Bateson (1901) who did not specify whether it referred to a phenotypic or genotypic character (Mayr 1982, 733). However, prior to about 1910, there was the silent, almost universal assumption that there is a 1:1 relation between a genetic factor (gene) and a phenotypic character (Mayr 1982, 733, 736, 754).

2. "A particular form of a gene, distinguishable from other forms or alleles of the same gene" (Wilson 1975, 578).

Note: This is a widely used modern definition.

3. Alternative forms of a gene found in a population that occupy the same locus on a particular chromosome (Dawkins 1982, 283).

4. One of a series of possible alternative forms of a particular gene (cistron), differing in DNA sequence, and affecting the functioning of a single product (RNA, protein, or both) (King and Stansfield 1985).

A

syn. allelomorph (Mayr 1982, 733)

cf. complementation, gene

[Greek *allelon*, of one another]

amorphic allele *n.* An inoperative allele that does not influence a phenotype (Lincoln et al. 1985).

dominant allele *n.* In diploid organisms: An allele that is phenotypically manifested when it is homozygous or heterozygous (present with its corresponding recessive allele) (King and Stansfield 1985).

syn. protogene (Lincoln et al. 1985)

cf. allele: recessive allele; dominance (genetic dominance)

hypermorphic allele, hypermorph *n.* A mutant allele with an effect greater than that of its corresponding wild-type allele (Lincoln et al. 1985).

hypomorphic allele, leaky gene, hypomorph *n.* A mutant allele with a lesser effect than that of its corresponding wild-type allele (Lincoln et al. 1985).

isoalleles *n. pl.* Alleles that are so similar in their phenotypic effects that special techniques are required to distinguish them (Lincoln et al. 1985).

Lethal hybrid rescue (Lhr) *n.* An allele that restores the viability of hybrid males of *Drosophila melanogaster* and *D. simulans* that would die if they did not have that allele (Presgraves et al. 2003, 715).

meiotic-drive locus *n.* A locus, or allele, that drastically modifies the Mendelian segregation ratio in heterozygotes (Sandler and Novitski 1957 in Rieger et al. 1991).

Comments: Meiotic-drive loci are often found in more than 90% of gametes produced by heterozygotes (Rieger et al. 1991). These loci can severely reduce fitnesses of their bearers.

macromutation *n.* An allele with a major phenotypic effect (Tanksley 1993, 205).

See mutation: macromutation.

Comment: Macromutations at a single locus include dwarf plants, hairless mice, and wingless *Drosophila* (Tanksley 1993, 205–206). Most macromutations are deleterious in nature and are eliminated by natural selection.

multiple alleles *n. pl.* Two, or more, different forms of the same gene that occupy a specific locus (Lincoln et al. 1985).

neomorphic allele, neomorph *n.* A mutant allele that produces a phenotypic effect that is quantitatively different from that of its corresponding wild-type allele (Lincoln et al. 1985).

neutral allele *n.*

1. An allele upon which selection does not act (Wilson 1975, 72).

2. A gene that differs chemically from another one at the same locus but that has indistinguishable effects on its bearer's phenotype (Bell 1982, 510).

syn. neutral mutation

neutral mutation See allele: neutral allele.

null allele *n.* An allele that produces no functional product and, therefore, usually behaves as a recessive allele (King and Stansfield 1985).

cf. allele: silent allele

Comment: Strickberger (1990, 173) suggests that a null allele can also produce a partly functional product or even no product.

pseudoallele *n.* One of two, or more, mutations that have the same effect but are not structurally allelic (Lincoln et al. 1985).

recessive allele *n.* In diploid organisms: An allele that is not phenotypically manifest when it is present with its corresponding dominant allele (Mayr 1982, 715; King and Stansfield 1985).

syn. allogene (Lincoln et al. 1985), latent allele (de Vries in Mayr 1982, 715)

cf. allele: dominant allele; recessiveness

[Mendel probably introduced the term “recessiv” (now used as recessive) independently of others such as Martinin and Sageret (Mayr 1982, 715).]

recognition allele *n.* A hypothesized allele that encodes the production of a recognition cue and simultaneously an organism's ability to recognize this cue in conspecifics, leading to its discriminating kin from nonkin (Wilson 1987, 12).

cf. phenotype matching

Comments: Such recognition is metaphorically called the “green-beard effect,” *q.v.* Existence of recognition alleles has not been demonstrated (Wilson 1987, 12).

revertant *n.* “An allele that undergoes back mutation” (Lincoln et al. 1985).

See revertant.

segregation-distorter allele *n.* A meiotic-drive locus in *Drosophila* (Rieger et al. 1991).

silent allele, silent mutant, silent section (of a chromosome) *n.* “An allele that manifests no detectable phenotypic effect” (Lincoln et al. 1985); “an allele that makes no detectable product” (King and Stansfield 1985).

cf. allele: null allele; gene: pseudogene

t allele *n.* A meiotic-drive locus in mice (Rieger et al. 1991).

wild-type allele *n.* The natural, or typical, form of an allele that is arbitrarily designated as standard, or normal, for comparison with mutant, or aberrant, alleles (Lincoln et al. 1985).

Comment: Wild-type alleles are often selected to be dominant in diploid organisms because they produce advantageous products in the presence of other alleles with less advantageous, or even deleterious, products (Strickberger 1990, 173).

♦ **allelic-replacement hypothesis** See hypothesis: allelic-replacement hypothesis.

♦ **allelic-switch-alternative phenotype** See -type, type: phenotype: allelic-switch-alternative phenotype.

♦ **allelo-** prefix One another (Lincoln et al. 1985).

♦ **allelochemic** See chemical-releasing stimulus: semiochemical: allelochemic.

♦ **allelogenic** See -genic: allelogetic.

♦ **allelomimetic behavior** See behavior: allelomimetic behavior.

♦ **allelopathic substance** See chemical-releasing stimulus: semiochemical: allelochemic: allomone: allelopathic substance.

♦ **allelopathy** *n.* An organism's releasing a chemical (= allelopathic substance) which is an excretory product, metabolite, or waste product, that regulates, or inhibits, the growth of another organism (Lincoln et al. 1985).

Comments: Allelopathic substances include antibiotics, germination inhibitors, growth inhibitors, stimulants, and toxins (International Society of Chemical Ecology 1999, www.isce.ucr.edu/society/). Hundreds of plant species including Arizona Fescue (grass), Australian *Eucalyptus*, Black Walnut, Broomsedge Grass, Cherry-bark Red Oak, Pine-muhly Grass, Sugar Maple seedlings, Tree-of-heaven, Western Bracken Fern, and Yellow Birch show allelopathy (Walker 1990, 180–181).

Some root microorganisms of Peach trees have allelopathic effects on these trees. The Second World Congress on Allelopathy met at Lakehead University, Canada, in 1999 (www.lakeheadu.ca/~allelo99/).

◆ **allelothetic orientation** See taxis: allelothetic orientation.

◆ **Allen Hills 84001 meteorite** See meteorite: Allen Hills 84001 meteorite.

◆ **Allen's law** See law: Allen's law.

◆ **Allende meteorite** See meteorite: Allende meteorite.

◆ **allesthetic character** See character: allesthetic character.

◆ **alliesthesia** See -thesia: alliesthesia.

◆ **allo-** *comb.f.*

1. Other; alien (Michaelis 1963).
2. In biology, extraneousness; different from, or in opposition to, the normal (Michaelis 1963).

◆ **allobiosphere** See -sphere: biosphere: eubiosphere: allobiosphere.

◆ **allocation, principle of** See principle: principle of allocation.

◆ **allochroic** *adj.* Referring to an organism that shows color variation, or has the ability to change color (Lincoln et al. 1985).

◆ **allochronic** See chronic: allochronic.

◆ **allochronic speciation** See speciation: allochronic speciation.

◆ **allochronic species** See ²species: allochronic species.

◆ **allocryptic** See crypsis: allocryptic.

◆ **allochthonous** See -genous: exogenous.

◆ **allochthonous behavior** See behavior: allochthonous behavior, displacement behavior.

◆ **allochthonous drive** See drive: allochthonous drive.

◆ **allodiploidy** See -ploidy: allodiploidy.

◆ **alloethism** *n.* In some ant species: The regular and disproportionate change in a particular behavior category as a function of worker size (Hölldobler and Wilson 1990, 635).

◆ **allofeeding** See feeding: allofeeding.

◆ **allofusion** See chimera: genetic mosaic.

◆ **allogamy** See -gamy: allogamy.

◆ **allogene** See gene: allogene.

◆ **allogenic** See -genic: allogenic.

◆ **allogenous** See -genous: allogenous.

◆ **allogrooming** See grooming: allogrooming.

◆ **allohospitic parasite** See parasite: allohospitic parasite.

◆ **allohyperparasitism** See parasitism: hyperparasitism: interspecific tertiary hyperparasitism.

◆ **allokinesis** *n.* "Passive or involuntary movement; drifting; planktonic transport" (Lincoln et al. 1985). *cf.* kinesis

◆ **allomarking** See behavior: marking behavior.

◆ **allomaternal** See allomother.

◆ **allometry** See auxesis: heterauxesis.

◆ **allomimetic behavior** See behavior: mood induction.

◆ **allomixis** *n.* Cross fertilization (Lincoln et al. 1985).

◆ **allomone** See chemical-releasing stimulus: semiochemical: allelochemic: allomone.

◆ **allomorphosis** See auxesis: heterauxesis: allomorphosis; evolution: allomorphosis.

◆ **allomother** See mother: allomother.

◆ **alloparasitism** See parasitism: alloparasitism.

◆ **allopARENT** See parent: allopARENT.

◆ **allopARENTal care** See care: allopARENTal care.

◆ **allopATERnAL** *n.* Referring to a male allopARENT (Lincoln et al. 1985). *cf.* allomaternal

◆ **allopATRIC** See -patric: allopATRIC.

◆ **allopATRIC speciation, allopATRIC theory of speciation** See speciation: allopATRIC speciation.

◆ **allophile** See ²-phile: allophile.

◆ **alloPLOIDY** See -ploidy: alloPLOIDY.

◆ **alloPREENING** See grooming: alloPREENING.

◆ **alloSEMATIC** *adj.* Referring to coloration, or markings, in one species, that imitate warning patterns of another typically noxious, or dangerous, species (Lincoln et al. 1985). *cf.* behavior: aposematism; mimicry

◆ **alloSPECIES** See ²species: alloSPECIES.

◆ **alloSUCKLING** See ²suckling: alloSUCKLING.

◆ **alloTETRAPLOIDY** See -ploid: allotetraploid.

◆ **allotherm** See -therm: allotherm.

◆ **allotopic population** See ¹population: microdi-chopatric population.

◆ **alloTROPHIC** See -trophic: allotrophic.

◆ **alloTROPIC** See -tropic: allotropic.

◆ **alloTROPOUS** See -tropous: allotropous.

◆ **alloXENIC** See -xenic: alloXENIC.

◆ **alloZYGOUS** See -zygous: alloZYGOUS.

◆ **alloZYME** See enzyme: alloZYME.

◆ **almost certain** See frequency: almost certain.

◆ **alpha, α *n.***

1. For example, in *Canis lupus* (Gray Wolves) and *Gallus gallus* (Domestic Chickens): The highest-ranking individual within a dominance hierarchy (Wilson 1975, 578). *cf.* beta, omega
2. In statistics, *P*, *P* level, stipulated-*p*, etc. (*q.v.*). *adj.* alpha [α , the first letter of the Greek alphabet]

◆ **α -diversity** See diversity: α -diversity.

◆ **α -diversity index** See index: species-diversity index: α -diversity index.

◆ **alpha selection** See selection (table).

◆ **alpha taxonomy** See taxonomy: alpha taxonomy.

◆ **alsOCOLE** See -cole: alsOCOLE.

◆ **alsOPHILE** See ¹-phile: alsOPHILE.

◆ **alternating scratching** See scratching: run scratching.

◆ **alternation learning** See learning: alternation learning.

◆ **alternation of generations** See -genesis: meta-gensis.

◆ **alternative adaptation** See ³adaptation: ²evolutionary adaptation: alternative adaptation.

◆ **alternative-adaptation hypothesis** See hypothesis: alternative-adaptation hypothesis.

◆ **alternative phenotype** See -type, type: phenotype: alternative phenotype.

◆ **alternative strategy** See strategy: alternative strategy.

◆ **altricial** See -cial: altricial.

◆ **altophobia** See -phobia: altophobia.

◆ **altruism, altruistic behavior** *n.*

1. A person's regard for the well-being of others; benevolence (Oxford English Dictionary 1972, entries from 1853 as the *adj.* altruistic). *syn.* motivated altruism (Rosenberg 1992, 18) [coined by Auguste Comte in Mayr (1997, 251)]
2. Evolutionarily, an individual animal's decreasing its own direct fitness while simultaneously helping a

A

relative in a way that increases the relative's fitness (Haldane 1932, 131, 208–209; Hamilton 1963, 1964, 13; Alcock 1979, 400; Wittenberger 1981, 60).

syn. biological altruism (for this def. and others that do not involve intentional motivation to be altruistic, Rosenberg 1992, 18), cooperative altruism, nepotistic altruism (Axelrod and Hamilton 1981, 1391), regular altruism, social donorism (Wilson 1975), true altruism (Axelrod and Hamilton 1981, 1391)

cf. selection: kin selection

Notes: This definition is commonly used or implied. The helper is expected to benefit by its "altruism" because it increases its indirect fitness, but not its direct fitness. "Altruism" in this sense was possibly first suggested by Haldane (1932, 131, 208–209). Some Humans, Naked Mole Rats, Termites, and workers of social ants, bees, and wasps show this kind of altruism. Charles R. Darwin (1859, 259–262) surmised that natural selection could help to produce non-reproducing worker insects (which he called "neuter insects") because these workers helped reproductive individuals of their colonies to reproduce. William D. Hamilton (1963, 1964) helped to clarify how altruism could evolve. It evidently evolved, in part, because an altruist is likely to obtain a fitness gain by helping a relative which shares many of the altruist's genes. The altruist indirectly increases the number of its genes in the next generation because its altruistic behavior increases the number of genes that it and the relative it helped have in common. In other words, the altruist reduces its direct fitness and increases its indirect fitness, thereby gaining in its inclusive fitness, and benefitting genetically by its behavior.

3. Sociobiologically, an individual animal's "self-denying or self-destructive behavior performed for the benefit of others" (Wilson 1975, 578, 1987, 10).

Note: Wilson (1987, 10) indicates that some workers are starting to drop this term in favor of expressions such as "nepotism" and "reciprocation," but he prefers to retain it.

4. Sociobiologically, an individual animal's helping a conspecific nonrelative in a way that increases the nonrelative's fitness but not the helper's fitness (Alcock 1979, 11; Barash 1982, 108).

syn. altruistic altruism (Donald Carr in Alcock 1979), true altruism

cf. altruism: reciprocal altruism

Note: This definition is related to Wynne-Edwards' (1962) concept of nonkin group selection. This kind of altruism occurs in Humans, but is probably, at best, rare in nonhumans.

5. Any behavior that benefits another animal while harming, or imperiling, the individual that performs it (Wittenberger 1981, 613).

Note: Benefit and harm are measured in terms of direct fitness (Wittenberger 1981, 613).

6. For example, in social animal species: Behavior of a focal animal that increases its indirect fitness (West Eberhard 1975, 7).

syn. advantageous altruism (West Eberhard 1975, 7)
cf. cooperation

7. One individual organism's "promoting the welfare of another entity, at the expense of its own welfare" (Dawkins 1982, 284).

A CLASSIFICATION OF ALTRUISM

- I. The actor and recipient are relatives
 - A. advantageous altruism
 - B. biological altruism (*syn.* cooperative altruism, nepotistic altruism, regular altruism, social donorism, true altruism)
 - C. extreme altruism
 - D. imposed altruism
 - E. low-cost altruism
 - F. parental altruism
 - G. reciprocal altruism
 - H. reproductive altruism
 - I. weak altruism
- II. The actor and recipient are conspecific nonrelatives
 - A. altruistic altruism
 - B. imposed altruism
 - C. low-cost altruism
 - D. reciprocal altruism
 - E. weak altruism

Note: Dawkins (1982, 284) indicates that "various shades of meaning of 'altruism' result from various interpretations of 'welfare.'"

cf. behavior: selfish behavior, donor, investment, nepotism, selfishness, spite

n. altruist

adj. altruistic

Comments: Wilson and Dugatkin (1992, 31) explain how the same behavior can be labeled selfish, cooperative, or altruistic depending on one's frame of reference. Some workers consider altruism to be a helper's promoting the fitness of a helped conspecific that may be either the helper's relative or nonrelative. McFarland (1985, chapter 9) includes kin selection, parental care, and cooperation (*q.v.*) between symbionts as altruism (see symbiosis); he also uses "altruism" to refer to an animal's helping a heterospecific individual; other workers do not agree with his classification. Fletcher (1987, 22) indicates that use of the terms "reciprocity," "nepotism," and "parental manipulation," instead of "altruism," can help to solve our semantic problem with "altruism." Intentional motivation is not generally ascribed to altruism of nonhuman animals (Rosenberg 1992, 18). However, the evolutionary definitions of "altruism" appear to rely on something similar to motivation, not of the altruistic animal, but of the evolutionists as he calculates what evolves in an altruistic situation (Wilson and Dugatkin 1992, 32). Uyenoyama and Feldman (1992) give two definitions of altruism based on the functions $f_A(x)$ and $f_S(x)$ which denote the probabilities of survival to reproductive age of altruistic (A) and selfish (S) members of group of N individuals of which x are altruists and $N - x$ are nonaltruists. [French *altruiste* (adjectival form of *altruisme* < Latin *alter*, other)]

advantageous altruism See altruism (def. 6).

altruistic altruism See altruism (def. 4).

biological altruism See altruism (def. 2).

cooperative altruism See altruism (def. 2).

extreme altruism *n.* Altruism (def. 2) of animals that cannot have direct fitness, *e.g.*, altruism of sterile workers in some insect species (West Eberhard 1975, 17).

helping behavior, help, helping See behavior: helping behavior.

human reciprocity See altruism: reciprocal altruism.

imposed altruism *n.* Altruism (def. 2 or 4) that is forced upon an individual by a conspecific, *e.g.*, manipulation of an animal's behavior by an adult that adopts it, and manipulation of behavior and resources of others by dominant animals [coined by West Eberhard 1975, 17].

kin altruism *n.* An organism's altruism towards only its kin (Fletcher 1987, 23).

Comment: Fletcher (1987, 23) differentiates this term from "nepotism," *q.v.*

kin selection See selection: kin selection.

low-cost altruism *n.* Altruism (def. 2) that causes a small reduction in an altruistic organism's indirect fitness, *q.v.*, *e.g.*, alarm calling and social grooming in some circumstances (West Eberhard 1975, 11).

motivated altruism See altruism (def. 1).

nepotistic altruism See altruism (def. 2).

parental altruism *n.* An organism's investment in its offspring (Fletcher 1987, 23).

Comment: Fletcher (1987, 23) differentiates "parental altruism" from "nepotism," *q.v.*

parental care See care: parental care.

reciprocal altruism *n.* In the *Papio anubis* (Anubis Baboons), *Chlorocebus pygerythrus* (Vervet Monkeys), and Humans: Altruism in which an individual helps a relative, or nonrelative, with the expectation that the helped individual will return aid to the helper in the near through distant future (Trivers 1971, 35, 39; Packer 1977, 441; Seyfarth and Cheney 1984, 541; Immelmann and Beer 1989, 246).

syn. reciprocally-altruistic behavior; reciprocation, reciprocity (Brown 1987, 305); temporary altruism *cf.* cheater, reciprocity

Comments: Trivers (1971) and others imply that there is at least a temporary expense associated with each beneficent act. In the long run, each participant experiences a net benefit, provided that neither individual fails to reciprocate (= cheats). Trivers (1985 in Connor 1986, 1562) presents "reciprocity" as a special case of the more general category "return-benefit altruism." Brown (1987, 305–306) discusses confusion about "reciprocal altruism" and the relationships between this term and "byproduct mutualism" and "score-keeping mutualism."

[coined by Trivers (1971 in Brown 1987, 305)]

► **pseudo-reciprocity** *n.* An interaction between two individuals in which the actor (A) performs a beneficent act toward a receiver (B) that is a by-product, or incident effect, of A's egoistic behavior; thus, B is not considered to be a cheater if it does not perform a beneficent act toward A [coined by Connor 1986, 1562].

cf. symbiosis: mutualism: byproduct mutualism

Comment: Conner (1986, 1565) explains why it is confusing to combine the concepts of reciprocal altruism and pseudo-reciprocity as some past authors have done, and he gives possible examples of both interspecific and intraspecific pseudoreciprocitity.

regular altruism See altruism (def. 2).

reproductive altruism *n.* An individual animal's forgoing its reproduction entirely and helping other individuals to reproduce (Honeycutt 1992, 43).

return-benefit altruism (RBA) *n.* All acts of social beneficence in which the return benefit to the initial actor (A) comes from the initial recipient (B)

but the effect of the return benefit on B is not specified (Trivers 1985 in Connor 1986, 1562).

Comments: RBA includes reciprocal altruism and pseudoreciprocitity (Connor 1986, 1562).

social donorism See altruism (def. 2).

temporary altruism See altruism: reciprocal altruism.

true altruism See altruism (def. 2 and 4).

weak altruism *n.* An interaction between an actor and recipient in which (1) the actor has reduced fitness and the recipient has no fitness change, or (2) the actor has no fitness change and the recipient has increased fitness (Gadagkar 1993, 233).

♦ **altruism investment** See investment: altruism investment.

♦ **altruistic altruism** See altruism (def. 4).

♦ **altruistic behavior** See altruism.

♦ **Ahu** See transposable element: *Ahu*.

♦ **amanthicole** See -cole: amanthicole.

♦ **amanthium** See ²community: amanthium.

♦ **amatophile** See ¹-phile: amatophile.

♦ **amatory behavior** See behavior: amatary behavior.

♦ **amber** See fossil: amber.

♦ **ambient temperature (t_a)** See temperature: ambient temperature.

♦ **ambiguity** *n.* A receiver's potential of giving more than one response to a signal due to "noise" in its communication system (Wilson 1975, 195).

♦ **ambisexual mate desertion** See mate desertion: ambisexual mate desertion.

♦ **ambivalent behavior** See behavior: ambivalent behavior.

♦ **ambivalent movements and postures** See behavior: ambivalent movements and postures.

♦ **ambivore** See -vore: ambivore.

♦ **ambush predator** See predator: ambush predator.

♦ **ameiotic parthenogenesis** See parthenogenesis: ameiotic parthenogenesis.

♦ **ameiotic thelytoky** See parthenogenesis: apomixis.

♦ **American behaviorism** See study of: psychology: classical animal psychology.

♦ **American Sign Language** See language: Ameslan.

♦ **Ames room** *n.* A distorted room (with trapezoidal walls, a ceiling, floor, and back wall that slope away from an observer but are shaded to appear rectangular) and that is designed to test human visual perception (Storz 1973, 13).

♦ **Ameslan** See language: Ameslan.

♦ **ametabolous metamorphosis** See metamorphosis: ametabolous metamorphosis.

♦ **amicable behavior** See behavior: amicable behavior.

♦ **amine** See molecule: amine.

♦ **amino** *comb. f.* In chemistry, of, or pertaining to, the NH₂ group combined with a nonacid radical (Michaelis 1963).

♦ **amino acid** See acid: amino acid.

♦ **amino group** See group: functional group: amino group.

♦ **amixis** See mixis: amixis.

♦ **amyloplast** See organelle: amyloplast.

♦ **ammochthium** See ²community: ammochthium.

♦ **ammochthocole** See -cole: ammochthocole.

♦ **ammocole** See -cole: ammocole.

- ◆ **ammonification** *n.* Decomposition of organic nitrogen into ammonia (used as a nitrogen source by algae, some bacterial species, and plants) (Campbell and Reece 2005, 1197).
- ◆ **ammophile** See ¹-phile: ammophile.
- ◆ **amnicole** See -cole: amnicole.
- ◆ **amorphic** See -morphic: amorphic.
- ◆ **amorphic allele** See allele: amorphic allele.
- ◆ **AMPA receptor** See ²receptor: AMPA receptor.
- ◆ **ampherotoky** See parthenogenesis: amphitoky.
- ◆ **amphi-** *prefix*
 1. On both, or all, sides; at both ends (Michaelis 1963).
 2. Around (Michaelis 1963).
 3. "Of both kinds; in two ways" (Michaelis 1963). [Greek *amphi*, around]
- ◆ **amphiclexis** See selection: epigamic selection.
- ◆ **amphigamy** See -gamy: amphigamy.
- ◆ **amphigenesis** See -genesis: amphigenesis.
- ◆ **amphigony** *n.* "Sexual reproduction involving cross fertilization" (Lincoln et al. 1985).
- ◆ **amphimict** *n.* An organism that reproduces by amphimixis (sexual reproduction) (Lincoln et al. 1985).
- ◆ **amphimixis** See -mixis: amphimixis.
- ◆ **amphioecism, amphioecious, amphitopic** See -oecism: amphioecism.
- ◆ **amphiplexus** *n.* "A sexual embrace" (Lincoln et al. 1985).
 - cf.* amplexus
- ◆ **amphitoky** See parthenogenesis: amphitoky.
- ◆ **amphitroph** See -troph-: amphitroph.
- ◆ **amphogenic** See -genic: amphogenic.
- ◆ **amphoterosynthesmia** See ²group: amphoterosynthesmia.
- ◆ **amphoterotoky** See parthenogenesis: amphitoky.
- ◆ **amplexus** *n.*
 1. In many amphibian species: "Sexual embrace" (Oliver 1955, 329).
 2. In most frog and toad species, many salamander species: A mating position in which a male clasps a female with one, or both, pairs of his legs before she releases her eggs and he fertilizes them (Dewsbury 1978, 77, 209; Halliday and Adler 1986, 146; Massey 1988, 205).

Note: *Bufo americanus* (American Toads) show amplexus during nocturnal mating as occurred April in Washington, D.C., U.S. (fig. 2).

syn. clasping hold (Heymer 1977, 48)

cf. amphiplexus; reflex: grasping reflex

[Latin *amplecti*, to embrace, clasp]
- ◆ **amplitude modulation** See modulation: amplitude modulation.
- ◆ **amygdale** See organ: brain: amygdala.
- ◆ **An Inconvenient Truth** See film: An Inconvenient Truth.
- ◆ **anabiosis** See -biosis: anabiosis.
- ◆ **anabolism** See metabolism: anabolism.
- ◆ **anachoresis** *n.* An organism's living in a fissure, hole, or crevice (Lincoln et al. 1985).
- ◆ **anadamide** *n.* A compound produced by human brains that activates the same brain area as marijuana does (Associated Press 1996, 22 August, D18).

Comments: Anadamide that occurs naturally in chocolate might alter human mood (Associated Press 1996, 22 August, D18).

- ◆ **anadromous, anadromesis, anadromy** See -dromous: anadromous.
- ◆ **anaerobe** See aerobic: anaerobe.

- ◆ **anagenesis** See evolution²: anagenesis; -genesis: anagenesis.
- ◆ **anal feeding** See trophallaxis: anal trophallaxis.
- ◆ **anal gland** See gland: anal gland.
- ◆ **anal trophallaxis** See trophallaxis: anal trophallaxis.
- ◆ **analog, analogue** *n.*
 1. A trait of one animal species that is mistaken for a homolog, *q.v.*, of another (Owen 1843 in Hailman 1976, 181).
 2. A part, or organ, in one animal species that has the same function as another part, or organ, in a different animal species regardless of ancestry (Owen 1848 in Mayr 1982, 464; Donoghue 1992, 170). *syn.* analogy
 3. A structure, physiological process, or behavior in one species that is similar to one in another species owing to convergent evolution as opposed to common ancestry (Wilson 1975, 578); *e.g.*, dorsal fins of Dolphins and Sharks, lens eyes of Cephalopods and Vertebrates, echolocation of some bat species and Oilbirds, or distraction displays of some duck and plover species (Immelmann and Beer 1989, 14). *syn.* analogy

Note: This is a commonly used definition.

 4. A species that has a similar habitat, or distribution, as another species (Lincoln et al. 1985).

adj. analogous, nonhomologous

cf. homogeny, homolog, homoplasy

Comment: Hailman (1976) gives more definitions of "analog" and discusses how authors have confounded the definitions of analog, homogeny, homolog, and homoplasy.

[French < Greek *analogon*, originally neutral singular of *analogos*, proportionate, conformable < *ana-*, according to + *logos*, proportion]

- ◆ **analog signal** See signal: analog signal.
- ◆ **analogy** See analog.
- ◆ **analysis** *n.*
 1. A method used to determine, or describe, the nature of a thing by separating it into its parts (Michaelis 1963).
 2. The results of using the method in def. 1 (Michaelis 1963). See analysis: psychoanalysis.
- ◆ **auditory-scene analysis** *n.* For example in echolocating bats: An animal's making sense of dynamic acoustic events in its environment (*e.g.*, a bat's determining the positions of objects with its echolocation as it flies through its environment in pursuit of prey) (Bregman 1990 in Moss and Surlykke 2001, 2207).

Note: In both auditory-scene analysis and visual-scene analysis (*q.v.*), an animal segregates and groups information in developing its coherent representation of its external sensory environment which involves figure-ground segregation, object recognition, and stimulus tracking (Moss and Surlykke 2001, 2207).

cf. analysis: visual-scene analysis, auditory scene

- ◆ **form analysis** *n.* An investigator's close comparison of behaviors within, or among, species to elucidate evolutionary origins of behaviors (Immelmann and Beer 1989, 111).

cf. method: comparative method; analysis: sequence analysis, situation analysis

- ◆ **message-meaning analysis** *n.* Analysis of what a signal expresses about its signaler (the message) and what the signal, in context, conveys to a recipient (the meaning) (Smith 1965 in Immelmann and Beer 1989, 184).

motivational analysis *n.* Analysis of regularities in the occurrences of instinctive behaviors, dealing with the number and type of drive factors mediating a particular behavior pattern (Tinbergen 1939, etc., in Heymer 1977, 119).

multivariate analysis *n.*

1. In statistics, "a method whose theoretical framework allows for the simultaneous considerations of several dependent variables (Kleinbaum and Kupper 1978, 14).

Note: Examples of multivariate analyses include multivariate ANOVA and multivariate multiple regression.

2. In biomedical and health research, "any statistical technique involving several variables, even if only one dependent variable is considered at a time" (Kleinbaum and Kupper 1978, 14).

Note: Kleinbaum and Kupper (1978, 14) prefer "multivariable analysis," instead of "multivariate analysis," for this concept.

cf. analysis: univariate analysis

psychoanalysis *n.*

1. A group of doctrines that are concerned with the study and interpretation of human mental states in terms of the dynamic interplay of conflicting drives and processes originating in one's unconscious (Michaelis 1963).

2. A psychotherapy system, introduced by Freud, that seeks to alleviate human neuroses and other mental disorders by the systematic technical analysis of unconscious factors that are revealed, *e.g.*, in dreams, free association, and memory lapses (Michaelis 1963; Collocot and Dobson 1974).

syn. analysis (Michaelis 1963)

sequence analysis *n.* An investigator's recording the order of behaviors and subsequently examining it to determine whether the order is random or structured (Immelman and Beer 1989, 265).

cf. analysis: form analysis, situation analysis

situation analysis *n.* An investigator's noting the circumstances in which displays are performed to try to elucidate their evolutionary derivations (Immelman and Beer 1989, 271).

cf. analysis: form analysis, sequence analysis

stochastic analysis *n.* An investigator's computing the transition probabilities among items (in mutually exclusive and collectively exhaustive sets) in different sequence combinations and determining whether they depart from randomness (Immelman and Beer 1989, 265, 293–295).

Comment: Communicatory behaviors are often examined by this analysis (Immelman and Beer 1989, 265, 293–295).

univariate analysis *n.* In statistics, a method whose theoretical framework allows for the simultaneous considerations of only one dependent variable (Kleinbaum and Kupper 1978, 14).

cf. analysis: multivariate analysis

visual-scene analysis *n.* An animal's making sense of dynamic visual stimuli in its environment (*e.g.*, a bird's determining the positions of objects as it moves through its environment in pursuit of prey) (inferred from Moss and Surlykke 2001, 2207).

cf. analysis: auditory-scene analysis

analysis method For some specific kinds of analysis methods, see procedure and program.

analysis of variance (ANOVA) See statistical test: analysis of variance.

♦ **anamorphosis** See ²evolution: anamorphosis; metamorphosis: ametabolous metamorphosis.

♦ **anaplasia** See -plasia: anaplasia.

♦ **anautogenous** See -genous: anautogenous.

♦ **anauxotrophic** See -trophic: auxotrophic.

♦ **ancestor, archetype** *n.* A progenitor of a more recent descendant taxon, group, or individual; any preceding member of a lineage (Lincoln et al. 1985). *cf.* -type: archetype

cencestor *n.* The most recent common ancestor of taxa in question (Hasegawa and Fitch 1996, 1750). *syn.* last common ancestor (Vigilant et al. 1991, 1504)

common ancestor *n.* A species that gave rise to one, or more, new species (Mayr 1982, 466).

Comment: The common-ancestor concept replaced the concept of "morphological type" or "archetype" as understanding of evolution improved (Mayr 1982, 466).

♦ **ancestral** *adj.*

1. Referring to the earliest stage in ontogeny, or development, of an organ or system (Lincoln et al. 1985). *syn.* original, primordial, primary, primitive (Lincoln et al. 1985)

2. "Early; simple; poorly developed; unspecialized" (Lincoln et al. 1985). *syn.* plesiomorphic, primitive, primordial (in some cases), protomorphic (Lincoln et al. 1985)

cf. derived, morph

3. Referring to a taxon with relatively many ancestral characters.

syn. lower, primitive

cf. character: ancestral character, Darwin's admonition, derived, genetic: palingenetic, homotenuous, primitive

Comments: Some workers indicate that it is better to use "ancestral" and "derived" to describe organisms, rather than "higher" and "lower" or "primitive" and "modern." "Higher" and "lower" unscientifically can suggest better and inferior. "Primitive" and "modern" are troublesome terms because they are sometimes applied to extant species, which because they are alive now, are thus technically "recent," or "modern." Smith (1984) makes a case for designating vertebrates as "ectotherm vertebrates" and "endotherm vertebrates" rather than "higher" and "lower vertebrates."

♦ **"ancestral-brain hypothesis"** See hypothesis: "ancestral-brain hypothesis."

♦ **ancestral character, ancestral trait** See character: ancestral character.

♦ **ancestral-mitochondrial genome** See genome: ancestral-mitochondrial genome.

♦ **ancium** See ²community: ancium.

♦ **ancocole** See -cole: ancocole.

♦ **ancophile** See ¹-phile: ancophile.

♦ **andr-** *comb. affix* Male, testis, stamen.

♦ **andrenarche** *n.* Turning on of the adrenal androgen dihydroespiandrosterone in a Human which usually occurs around 6 yr of age.

cf. puberty

♦ **andric** *adj.* male.

ant. gynic

♦ **androchore** See -chore: androchore.

♦ **androchromatypic mimicry** See mimicry: androchromatypic mimicry.

♦ **androcyclic parthenogenesis** See parthenogenesis: androcyclic parthenogenesis.

♦ **androgamy** See -gamy: androgamy.

♦ **androgen** See hormone: androgen.

♦ **androgenesis** See parthenogenesis: androgenesis.

- ◆ **androgenous** See -genous: androgenous.
- ◆ **androgyne** See hermaphrodite.
- ◆ **androgynous, androgynal, androgynic** *adj.*
 1. Referring to an individual organism that has characteristics of both males and females (Oxford English Dictionary 1972, entries from 1651).
 2. Referring to an individual plant, or flower, with both stamens and pistils (Oxford English Dictionary 1972, entries from 1793).
 3. Referring to an individual organism that has both male and female reproductive organs (Lincoln et al. 1985).

syn. hermaphroditic
cf. hermaphrodite
[Latin *androgynus* < Greek *androgynos*, hermaphrodite < *anēr*, *andros*, man + *gynē*, woman]
- ◆ **andromorphic** See -morphic: andromorphic.
- ◆ **androphile** See ¹-phile: androphile.
- ◆ **androphobia** See -phobia: androphobia.
- ◆ **androsterone** See chemical-releasing stimulus: semiochemical: pheromone: androsterone.
- ◆ **anemochore** See -chore: anemochore.
- ◆ **anemochorous** See -chorous: anemochorous.
- ◆ **anemodium** See ²community: anemodium.
- ◆ **anemophile** See ¹-phile: anemophile.
- ◆ **anemophobia** See -phobia: anemophobia.
- ◆ **anemotaxis** See taxis: anemotaxis.
- ◆ **anestrus** See estrus: anestrus.
- ◆ **angel, radar angel** *n.* One of a group of discrete radar echoes that are often observed in profusion on radars and that were at first thought to be echoes from a heterogeneous atmosphere, and later identified as flying birds (Eastwood 1967, 60; D. B. Quine, pers. comm.).
- ◆ **ring angel** *n.* A radar angel that starts as a bright blob and then becomes a diffuse ring, or a series of concentric rings (Eastwood 1967, 166).
Comment: Ring angels were first postulated to be attributable to reflections from consecutive wave fronts of a shear-gravity wave moving through the atmosphere, but were later found to be birds leaving their roosts (Eastwood 1967, 166; D. B. Quine, pers. comm.).
[coined by Elder 1957 in Eastwood 1967]
- ◆ **anger** See facial expression: anger.
- ◆ **angiotensin** See hormone: angiotensin.
- ◆ **anheliophile** See ¹-phile: anheliophile.
- ◆ **anhocyclic parthenogenesis** See parthenogenesis: anhocyclic parthenogenesis.
- ◆ **animal** See Appendix 1.
- ◆ **animal behavior** See behavior: animal behavior; study of: animal behavior.
- ◆ **animal communication** See communication.
- ◆ **animal group** See ²group.
- ◆ **animal hypnosis** See playing dead.
- ◆ **animal language** See language.
- ◆ **animal names** *n.* The specific names given to males, females, and young of particular kinds of animals.
cf. ²group: brood, fry, immature
Comments: Some workers informally refer to immatures of any kind of organism, especially mammals and birds as "babies," e.g., hummingbird babies (J. L. Gould 1982, 188). Some animal names are given below. More complete lists of animal names are in Barnes (1974).
- ◆ **adolescent** *n.* A person who is approaching adulthood (Michaelis 1963).

Comments: "Adolescent" can also refer to nonhuman animals. Elephant adolescents are 10.1 through 15 yr old (Lee 1987, 278).

- ◆ **adult** *n.*
 1. A "fully grown, sexually mature (where appropriate) animal" (Immelmann and Beer 1989, 7).
Note: Elephant adults are individuals over 15 yr old (Lee 1987, 278).
 2. A group of coral polyps that is ≥ 4 cm in diameter; contrasted with juvenile (Edmunds 1996, 95).
 3. A plant that is old enough to reproduce, e.g., an adult fig tree (inferred from Nason et al. 1998, 685).
- ◆ **subadult** *n.* A Lion that is 25 through 48 mo old (Schaller 1972 in Hanby and Bygott 1987, 161).
Comment: Two askaris often travel with an older male (Daley 1996, 4).
[African *askari*, a young male warrior in training]
- ◆ **buck** *n.* An adult male deer, elk, goat, hare, kangaroo, moose, rabbit, or rat.
cf. animal names: doe
- ◆ **calf** *n.* An immature Elephant, hooved animal, or pinniped (Sea Elephant, Seals, Walrus).
Comment: Elephant calves are individuals 0 through 24 mo old (Lee 1987, 279).
- ◆ **cheekpadder** *n.* A male *Pongo borneo* (Orangutan) with fleshy checks (Galdikas 1995, 15).
- ◆ **doe** *n.* An adult female *Alces alces* (Moose), deer, elk, goat, hare, kangaroo, or rabbit.
cf. animal names: buck
- ◆ **fry** *n., pl. fry*
 1. A very young fish (Michaelis 1963).
Notes: Many researchers call a very young postembryonic fish, a larva (Balon 1975b). Embryos of many fish species swim.
 2. A small adult fish when in the company of a large number of other such fish (Michaelis 1963).
 3. The young of certain animals, e.g., frogs, when produced in very large numbers (Michaelis 1963).
 4. Young children, or other young animals (Michaelis 1963).
cf. animal names: small fry
 5. A fish larva or juvenile (Balon 1975b; Blumer 1982, 3).
[Old Norse *frið*, seed]
- ◆ **gilt** *n.* A female *Sus scrofa domestica* (Domestic Pig) that has not yet had piglets; a young sow (Michaelis 1963).
- ◆ **hart** *n.* A male *Cervus elaphus* (Red Deer) (Lipton 1968, 13).
- ◆ **hind** *n.* A female *Cervus elaphus* (Red Deer) (Lipton 1968, 13).
- ◆ **jimmy** *n., pl. jimmies* An adult male *Callinectes sapidus* (Blue Crab); contrasted with sook (Phillips 1992).
- ◆ **juvenile** *n.*
 1. A young person; a youth (Oxford English Dictionary 1972, entries from 1733).
 2. A subadult mammal between an infant and adult, not yet sexually mature (Immelmann and Beer 1989, 161).
cf. animal names (table), hebetie, immature
 3. In dragonflies: A young adult (Dunkle 1989, 10).
Notes: In some dragonflies juveniles change color as they mature. Parts of their abdomens, wings, or both, become covered by a waxy powder (pruinescence) which is usually white or pale blue, but in the Slaty Skimmer is black (Dunkle 1989, 10). Elephant young juveniles are 25 through 60 mo

old; old juveniles are 61 through 120 mo old (Lee 1987, 279).

4. A group of coral polyps that is less than 4 cm in diameter; contrasted with adult (Edmunds 1996, 95).

larva *n., pl. larvae* (LAR vah, LAR vee)

1. In many aquatic and marine invertebrates, insects, frogs, toads: A immature stage that is radically different in form from an adult (Michaelis 1963; Wilson 1975, 587).

Notes: "Larva" is used to refer to immature ametabolous, paurometabolous, hemimetabolous, and holometabolous insects. See the table for more specific larval names.

2. In Termites: An immature individual without any external trace of wing buds or soldier characteristics (Wilson 1975, 587).
3. In Fish: A postembryonic stage that is younger than a juvenile fish (Balon 1975, 829, etc.).

cf. animal names: juvenile, pupa

adj. larval

Comment: "Larvas" is the anglicized plural (Buchsbaum et al. 1987, 502).

[Latin *larva*, ghost, spectre, hobgoblin, mask]

mudeye *n.* The larva of a dragonfly that a person sells for fishing bait in Australia (New 2009, 139).

planula *n., pl. planulae* (PLAN new la, PLAN new lee) The freely moving, ciliated embryo of certain cnidarians, including hydroids (Michaelis 1963). See planula under P.

Note: A planula might have evolved into the first Porifera, Cnidaria, and Platyhelminthes.

adj. planular, planulate

[New Latin < Latin, diminutive of *planus*, flat]

pupa *n., pl. pupae* (PEW pah, PEW pee)

1. In holometabolous insects: An individual's usually nonmotile, developmental stage during which it completes its development into adulthood (Oxford English Dictionary 1972, entries from 1815); also, an insect in its pupal stage.

2. In cirriped and holothurian species: A developmental stage (Oxford English Dictionary 1972, entries from 1877).

n. pupation

v.i. pupate

cf. animal names: larva, nymph (table)

[New Latin < Latin *pupa*, girl, doll, puppet]

queen *n.* A female *Felis catus* (Domestic Cat) (Oxford English Dictionary 1972, entry from 1898).

small fry *n., pl. small fry*

1. A small, young fish (Michaelis 1963).
2. A young child (Michaelis 1963).
3. A small, or insignificant, person or thing (Michaelis 1963).

cf. animal names: fry

sook *n.* An adult female *Callinectes sapidus* (Blue Crab); contrasted with jimmy (Phillips 1992).

spawn *n.*

1. The minute eggs of fishes and various other oviparous animals, chiefly aquatic or amphibian, usually laid in large numbers and forming a more, or less, coherent gelatinous mass; also the newly hatched young from such eggs (Oxford English Dictionary 1972, entries from 1491).
2. A fish egg; an undeveloped fish (Oxford English Dictionary 1972, entries from 1563).

See spawn.

v.i. v.t. spawn

cf. group: spawn; gamete: egg

♦ **animal physiology** See study of: physiology: animal physiology.

♦ **"animal piercers"** See ²group: functional-feeding group: animal piercers.

♦ **animal psychology** See study of: psychology.

♦ **Animal Rights Law Project** See project: Animal Rights Law Project.

♦ **animal sounds** This group of terms includes sounds produced by animals' vocalizations, wing movements, and other movements. Only some of the many kinds of animal sounds are included.

cf. behavior: rapping behavior, verbal behavior; carnival; ceremony; communication; jargon; language, message; mocking; panting; repertory; signal; yawn

Comments: Many publications describe animals sounds including Kanwal et al. (1994, and many references within), Peterson (1947), Chandler et al. (1966), Peterson et al. (1967), Peterson and Chalif (1973). Kanwal et al. (1994) describe sounds of Mustached Bats, in particular, present a classification of calls of this species based on statistical analysis of the physical structure of these calls, and compare these calls with those of other species. Further they discuss the importance of such a classification for understanding the use and perception of calls. Poole and Granli (2005) present a large online, database regarding Elephant sounds and other signals, images, conservation, and other subjects.

baa *n.* A sheep, or lamb's, cry; a bleat (Oxford English Dictionary 1972, entries from 1589).

Comment: Some frog and toad species make bleating sounds (Conant 1958).

v.i., v.t. baa

bark *n.*

1. In *Canis familiaris* (Domestic Dogs): A sharp, explosive cry (Oxford English Dictionary 1972, entries from 1562).

2. For example, in some toad, gecko, and squirrel species; *Craugastor augusti* (Barking Frogs); Prairie Dogs; and Foxes: A vocalization similar to a dog's bark (Oxford English Dictionary 1972, entries from 1562; Conant 1958; Wilson 1975, 473; Grady and Hoogland 1986, 108).

v.i., v.t. bark

booming *n.* In *Tympanuchus cupido* (Greater Prairie Chickens): A male's making a hollow three-syllabled *oo-loo-woo* that suggests the sound made by blowing across the mouth of a soda bottle (Peterson 1947, 76).

cf. animal sounds: drumming

call *n.*

1. A person's loud vocal utterance or speech, a shout, a cry; loud vocal address or supplication (Oxford English Dictionary 1972, entries from ca. 1300).

2. In some animal species, especially birds: A cry (Oxford English Dictionary 1972, verb entries from 1486).

3. In the *Apis mellifera* (Western Honey Bees): An individual's buzzing before swarming (Oxford English Dictionary 1972, verb entry from 1609).

4. In some animal species: An individual's vocalization that involves short, rather simple signals that are generally uttered by either sex at any time of the year and with little individual variation (Dewsbury 1978, 168).

5. A communication sound (Kanwal et al. 1994, 1229, 1231).

NAMES OF SEXES AND LIFE STAGES OF SOME ANIMAL TAXA			
ADULT MALE	ADULT FEMALE	OFFSPRING	TAXA
		<u>Sponges^a</u>	
male	female	egg, amphiblastula or parenchymula larva (depending on species)	
		<u>Cnidarians (Coelenterates)</u>	
male medusa	female medusa	egg, planula	Jellyfish ^b
male polyp	female polyp	egg, planula	Coral, Hydra, Sea Anemones
male	female	egg, planula, scyphistoma, strobila, young medusa (= ephyra), adult medusa	<i>Aurelia</i> jellyfish
		<u>Molluscs</u>	
male	female	trochophore, larva	Chitons ^c
male	female	trochophore, veliger	Bivalves ^c
male	female	trochophore	Archaeogastropods
male	female	veliger	nonarchaeogastropods ^d
male	female	juvenile	freshwater and land snails ^e (pulmonate gastropods)
male	female	juvenile	Cephalopods ^b
		<u>Flatworms</u>	
male	female	egg, larva	Monogenetic Trematodes
male	female	egg, miracidium, sporocyst, redia, cercaria, metacercaria	Digenetic Trematodes
male	female	egg, oncospore, cysticercus, procercoïd, plerocercoid	Tapeworms
		<u>Nematodes^c</u>	
male	female	egg, young or larva	
		<u>Annelids</u>	
male	female	egg, trochophore larva	Polychaetes ^c
male	female	leech, young worm	Oligochaetes ^c
		<u>Spiders</u>	
male	female	egg, spiderling	
		<u>Crustaceans^f</u>	
male (some species hermaphroditic)	female	egg, nauplius, postlarva	many marine crustacean species
male	female	egg, zoea, postlarva	more derived malacostracans
		<u>Insects^{g,h}</u>	
male ^a	female	egg, larva	Collembolans, Diplurans, Proturans, Thysanurans
male	female	egg, larva or nymph, pupa	Hemipteroids, Orthopteroids
male	female	egg, larva or naiad, pupa	Odonatans, Plecopterans
male	female	egg, larva, pupa	many neuropteroids
male	female	egg, larva or maggot, pupa	many fly and beetle species
male	female	egg, larva or caterpillar, pupa	Moths, Sawflies
male	female	egg; larva or caterpillar; chrysalid, chrysalis, or pupa	Butterflies
king, soldier, worker	queen, soldier, worker	egg, larva or nymph, subadult	Termites
drone	queen, worker	egg; larva, grub, or maggot; prepupa; pupa	Honey Bees

NAMES OF SEXES AND LIFE STAGES OF SOME ANIMAL TAXA (CONT.)

ADULT MALE	ADULT FEMALE	OFFSPRING	TAXA
<u>Echinoderms</u>			
male	female	egg, bipinnaria larva, brachiolaria larva	Starfish ^c
male	female	egg, echinoplateus or larva	Brittle-stars ^c
male	female	egg, echinoplateus or larva	Sea Urchins
male	female	egg, auricularia, doliolaria, vitellaria (some species), pentacula larva	Sea-cucumbers ^c
male	female	egg, vitellaria, pentacrinoïd	Feather-stars, Sea-lilies
<u>Hemichordates</u>			
male	female	egg, tornaria larva	Acorn worms
<u>Tunicates</u>			
male	female	egg, appendicularia (= tadpole)	Sea-squirts ^a
<u>Arrow Worms</u>			
hermaphroditic		egg, larvae	
<u>Fish</u>			
male	female	egg, larva <i>syn.</i> fry), juvenile	many fish species ^c
male	female	egg, pup	Sharks
<u>Amphibians</u>			
male	female	egg, tadpole (sometimes = fry), froglet (in frogs)	Frogs, Toads
male	female	egg, larva, eft	Newts
<u>Reptiles</u>			
male	female	egg, young or immature	Lizards, Snakes, Tortoises, Turtles
<u>Birds</u>			
gander	goose	egg, gosling	Geese
cob	pen	egg, cygnet	Swans
rooster, cock	hen	egg, chick	Chickens, Pheasants
drake	female	egg, duckling	Ducks
male	reeve	egg, chick	Ruffs
male	female	egg, nestling, fledgling, juvenile	many bird species
<u>Mammals^{i,j}</u>			
buck	doe	joey	Kangaroos
male	female	infant, cub	Koalas
boar	sow	cub (= whelp)	Bears
male	female	cub (= whelp)	Coati, Wolves
dog fox	vixen	cub, kit	Foxes
male	female	kit	Beavers
male	bitch	puppy, pup	Dogs
tom	queen	kitten, kit	Cats
lion	lioness	cub, subadult	Lions
tiger	tigress	cub	Tigers
male	female	pup	Bats, Gerbils, other rodents
buck	female	pup	Rats
buck	doe	kit	Rabbits
buck	doe	leveret	Hares
bull	cow	calf	Cattle, Dolphins, Giraffes, Oxen, Porpoises, Sea Lions, Walruses, Whales

NAMES OF SEXES AND LIFE STAGES OF SOME ANIMAL TAXA (CONT.)			
ADULT MALE	ADULT FEMALE	OFFSPRING	TAXA
bull	cow	calf, juvenile, adolescent	Elephants
bull	cow	calf, pup	Seals
man, "jack"	woman, "dame"	child, infant, toddler, tot, wean, kid, juvenile, subadult, "buck," "colt," "cub," "small fry"	Humans
silverback, male	female	young	Gorillas
stag	doe	fawn	Red Deer, other large deer
buck	doe	fawn	Antelopes, Deer
hart	hind	fawn	Red Deer
buck	cow, "doe"	young	Elk, Moose
buck, billy	"nanny"	kid	Goats
ram	ewe	lamb	Sheep
male, stallion	mare	foal, colt	Horses, Zebras
jack, jackass	mare, sheass	colt	Donkeys (= Asses)
boar	gilt, sow	piglet	Hogs, Peccaries, Pigs

^a Most species are hermaphrodites.

^b A few species are hermaphrodites.

^c Some species are hermaphrodites.

^d Many species are hermaphrodites.

^e All species are simultaneous hermaphrodites.

^f Depending on the species, one or more larval stages may be suppressed (Barnes 1974, 521). The postlarva of a crab is called a megalops; of a sergestid prawn, an acanthosoma. The zoea of lobsters is called a mysis. In some species, later nauplius instars are called metanauplii, and the prezoal instar is called a protozoaea.

^g Some species are parthenogenetic.

^h An adult insect is also called an "imago."

ⁱ Not included in this table is "suckling;" a young mammal that is still feeding at its mother's breast and "weanling," a newly weaned young.

^j Names in quotes are less preferred ones.

v.i., v.t. call

cf. calling: female calling; animal sounds: song; calling song; syllable

Comments: "Calls" are sometimes difficult to distinguish from "songs" and have different functions (Immelmann and Beer 1989, 38). "Call" now sometimes refers to a pheromone release; see "calling." Some of the many kinds of calls are defined below.

► **advertisement call** *n.* In many frog species: A call that indicates a male's motivational state and location to a potential mate or rival (Halliday and Adler 1986, 58).

► **aggressive call** See animal sounds: call: territorial call.

► **alarm call, protective call** *n.* For example, in *Aphelocoma coerulescens* (Florida Scrub Jays) and *Urocitellus beldingi* (Belding's Ground Squirrels): A call made when danger threatens but is still far away (Lincoln et al. 1985).

► **contact call** *n.* In *Amazona auropalliata* (Yellow-naped Amazon Parrots), a vocalization that one bird emits that informs a conspecific bird that it is a member of a particular communal night roost (inferred by Wright and Wilkinson 2001, 609).

Comment: *Amazona auropalliata* has three dialects of this call in Costa Rica and Guatemala (Wright and Wilkinson 2001, 609).

► **coquette call** *n.* In some duck species: An epigamic vocalization (Lorenz 1941 in Heymer 1977, 99).

► **distress call** *n.*

1. In many kinds of vertebrates including Humans: A vocalization made by a young animal that is separated from its parent, surrogate parent, or sibling that can cause these animals to come back in contact with the young (Lorenz 1935 in Heymer 1977, 149).

syn. lost call

2. In many frog species: A frog's call given when it is grasped by a predator (Halliday and Adler 1986, 58).

syn. fright call, mercy call

Note: A distress call is given with an open mouth and sounds like human screaming in some species (Halliday and Adler 1986, 58).

3. In some bird species: A nidifugous chick's call that helps its parent locate it (Brémond and Aubin 1990, 504).

syn. lost call

4. In many bird species, including Corvids, Gulls, Sparrows, Starlings, and other small passerines: A bird's call that it produces when it is struggling with a predator or being handled, or forcibly restrained, by a person (Brémond and Aubin 1990, 504).

syn. fright call, mercy call

cf. animal sounds: gecker

Comment: Avian distress calls are loud, harsh calls of long duration that cover a wide frequency range that make them easy to locate (Stefanski and Falls 1972 in Hill 1986, 590).

- **encounter call** See animal sounds: call: territorial call.
- **food call, food calling** *n.* In *Gallus gallus* (Domestic Chickens): A cluck-cluck sound emitted during ground pecking by a hen that can result in her young's starting to feed or by a cock that can result in a hen's starting to feed (Schenkel 1956, 1958 in Heymer 1977, 72).
v.i. food call
- **fright call, lost call, mercy call** See animal sounds: call: distress call.
- **gargle call** *n.* In *Poecile atricapillus* (Black-capped Chickadees): A vocalization used in agonistic encounters (Miyasato and Baker 1999, 1311).
- **mew call** *n.* In *Larus argentatus* (Herring Gulls): A long drawn out tone given with a bird's neck stretched forward and down and with its bill open wide; possibly used for attracting other gulls or expressing antagonism (Tinbergen 1958 in Heymer 1977, 96).
v.i. mew call
- **milk call** *n.* In some mammal species: A female's vocalization that summons young prior to feeding (Dunbar 1985).
- **predator warning call** *n.* A call note used as a communication of a predatory threat and with properties making it difficult for a predator to locate its sender (Marler 1957 in Wilson 1975, 236).
- **protective call** See animal sounds: call: alarm call.
- **release call** *n.*
 1. In many frog species: A call given by a male that is grasped by another male (Halliday and Adler 1986, 58).
 2. In many frog species: A call given by an unreceptive female that is grasped by a male (Halliday and Adler 1986, 58).
- **territorial call** *n.* In many frog species: A male's call that appears to inform a rival male that he may attack; or in the early stage of a conflict may mainly disrupt the calling of a competitor Halliday and Adler 1986, 58).
syn. aggressive call, encounter call
- **trumpet call** *n.* In Elephants: A call directed at a smaller opponent (Wilson 1975, 495).
cf. animal sounds: trumpet
- **vocalization** *n.*
 1. A person's vocalizing; uttering with his voice; or the fact of being vocalized (Oxford English Dictionary 1972, entries from 1842).
 2. An individual animal's song, call, and other sound produced by its vibrating membranes in its respiratory tracts, *e.g.*, vocal cords in bird syrinxes and mammal larynxes (Immelman and Beer 1989, 324).
- Comment:* Apart from human speech, the more complex vocalizations are songs of some songbird and whale species, howler monkeys, and the gibbon (Immelman and Beer 1989, 324).
- **wiggling call** *n.* In *Mus musculus* (House Mice): A pup's low-frequency call that is emitted when it is struggling in its nest, mainly when pushing for a teat during suckling (Ehret and Bernecker 1986, 821).
- **call note** *n.* A bird's vocalization that consists of one, or a few, short bursts of sound, and is much simpler in structure than a song (Wilson 1975, 236).
cf. animal sounds: call, song

Comments: Call notes are used in situations of alarm, mobbing, distress, contact-maintenance, flight intention, and releasing following in, *e.g.*, chicks or goslings. They include fear trills and predator warning calls, *q.v.* (Wilson 1975, 236).

► **crepitition** *n.* In many species of oedipodine grasshoppers: A peculiar sound made by males by snapping their hind wings while they make display flights that females appear to be watching from the ground (Otte 1970 in Wilson 1975, 228).
See crepitition.

► **croak** *n.* For example, in male frogs and toads when mate calling, young gharials during hatching from eggs: A hoarse, low-pitched vocalization (Michaelis 1963).
v.i. croak

► **cuckoo** *n.* A cuckoo's cry (Michaelis 1963).
See organism: cuckoo.

[Old French *cucu, coucou*, imitative word]

► **drone** *n.* A continued deep, monotonous sound of humming, or buzzing, of bees, some fly species, and the bass of a bagpipe (Oxford English Dictionary 1972, entries from 1500).
See bee: drone.

v.i. drone

Note: Some beetle species also make droning sounds when they fly.

► **drumming** *n.*

1. In *Bonasa umbellus* (Ruffed Grouse): A male's beating his wings and making a booming sound during a mating display (Wing 1956, 508).

syn. booming (Peterson 1947, 75)

Note: This drumming sounds like a distant outboard motor's starting up on a distant lake. It starts off slowly and gains speed until it ends in a whir: "bup... bup... bup... bup... bup... bup... up... rrrrr" (Peterson 1947, 75).

2. A woodpecker's hitting wood with its bill many times (Wing 1956, 508).

syn. tattooing (Wing 1956, 508)

3. In some mammal species: An individual's thumping, or tapping, its paws against an object (Heymer 1977).

v.i. drum

cf. animal sounds: booming

► **footdrumming** *n.* In several rodent species including *Dipodomys spectabilis* (Banner-tailed Kangaroo-rats) and *Meriones unguiculatus* (Mongolian Gerbils): An individual's tapping its hind feet on the ground which produces a sound (Eisenberg 1963, etc., in Randall 1989, 620).

Comment: Banner-tailed Kangaroo-rats have individual footdrumming signatures used in communication (Randall 1989, 620).

► **marking drumming** *n.* In hamsters and mice: An animal's drumming involving its hind paws that it rubbed across its scent glands (Heymer 1977, 129).

cf. scent mark

► **paw drumming** *n.* In many rodent species: An animal's drumming on the ground during a threat display (Heymer 1977, 129).

► **fear trill** *n.* In some bird species: A call note indicating fright (Wilson 1975, 236).

► **gecker** *n.* In *Papio hamadryas* (Hamadryas Baboons): A distress sound (Sigg and Falett 1985, 980).

v.i., v.t. gecker

► **growl** *n.*

A

1. For example, in some bird species, Bears, Dogs, Lions, Tigers, Wolves: An individual's deep, "angry," guttural sound (Oxford English Dictionary 1972, entries from 1727).
2. A person's utterance of anger or dissatisfaction (Oxford English Dictionary 1972, entries from 1821).

v.i., v.t. growl

grunt *n.*

1. A person's deep, guttural sound, sometimes expressive of approbation, or the opposite (Oxford English Dictionary 1972, entries from 1553).
2. In some *Canis familiaris* (Domestic Dogs) and *Sus scrofa domestica* (Domestic Pigs): A deep, guttural sound (Oxford English Dictionary 1972, entries from 1615).

cf. grunt

► **baby-grunt, cough-grunt, chortle, gurgle** *n.*

For example, in *Macaca mulatta* (Rhesus Macaques): A vocalization that is given specifically to newborns (Waal 1989, 107).

[chortle, blend of chuckle and snort; coined by Lewis Carroll in *Through the Looking-Glass*]

grunt whistle *n.* For example, in drakes (Anatidae): A sharp whistling sound followed by a grunt, both caused by released compressed air during neck bending while a animal is rising out of water (Lorenz 1941 in Heymer 1977, 79).

hoot *n.*

1. An owl's cry (Michaelis 1963).
2. An animal species' cry that is similar to an owl's cry.
3. An animal's, or other things, making a sound like, or similar to, an owl's cry (Michaelis 1963).
4. A person's jeer at or mocking with derisive cries (Michaelis 1963).
5. A person's driving off another person with hoots (Michaelis 1963).
6. A person's expressing (disapproval, scorn, etc.) by hooting (Michaelis 1963).

cf. animal sounds: yowl

Comments: *Pan troglodytes* (Chimpanzees) give a long-distance call which is a slowly swelling hoot (Waal and Lanting 1997, 24)

[Scandinavian *cf. Swedish butal*]

howl *n.*

1. In *Canis latrans* (Coyotes), *Canis lupus* (Gray Wolves), and some *Canis familiaris* (Domestic Dogs): A prolonged, mournful cry (Oxford English Dictionary 1972, entries from 1605).
2. A person's loud wail or outcry of anguish; savage yell of rage or disappointment (Oxford English Dictionary 1972, entries from 1599).

cf. animal sounds: yowl

Note: Persons, especially adolescent males in the U.S., sometimes howl, or bark (woof), when viewing a member of the opposite sex who is attractive, or unattractive, to them.

kiss-squeak *n.* In *Pongo borneo* (Orangutans): A vocalization given by an irritated animal (Galdikas 1995, 15).

laugh, laughing, laughter *n.*

1. A person's characteristic explosive, or inarticulate sounds, facial expressions, and other physical manifestations expressive of merriment, elation, amusement, satisfaction, etc. (Oxford English Dictionary 1971, entries from 611).

Notes: During playing, human laughing may indicate friendly intention or mild aggression (Heymer 1977, 109). Laughing (involving particular facial expressions and sounds) occurs in Bonobos (Waal 1989, 219, 225). Human laughing may be a form of ritualized aggression (Eibl-Eibesfeldt 1972, 1973 in Heymer 1977, 109).

2. In nonhuman animals: An animal's sound that resembles, or is suggestive, of human laughter; e.g., in the Laughing Bird (= Green Woodpecker), Laughing Crow, Laughing Dove, Laughing Goose (= White-fronted Goose), Laughing Gull, Laughing Jackass (= Kookaburra, a bird), Laughing Owl, Laughing Thrush, and Spotted Hyena (= Laughing Hyena) (Michaelis 1963; Oxford English Dictionary 1989); an alarm call; "a hoarse, rhythmic *bababa!-babababa!*" in herring gulls (Tinbergen 1958 in Heymer 1977, 109; Tinbergen 1961, 11).

[Old English *bliehan, blæhhān*]

lip smacking, lipsmacking *n.*

1. In more derived primates: An all-purpose conciliatory greeting that consists of rapidly repeated sucking movements, typified by *Papio cynocephalus* (Yellow Baboons) (Wilson 1975, 227).
2. For example, in *Macaca arctoides* (Stump-tailed Macaques) and *Macaca mulatta* (Rhesus Macaques): An individual's series of rapid lip and tongue movements accompanied with brief glances at its partner (Waal 1989, 106).

Comment: Rhythmic lip smacking commonly occurs during grooming, but also occurs when primates are apart from one another. Lip smacking with raised eyebrows signals "friendly intentions" (Waal 1989, 106).

murmuration *n., pl. murmurations* Humans' murmuring; utterance of low continuous sounds; grumbling, complaining (Oxford English Dictionary 1972, entries from 1386).

See ²group: murmuration.

piping *n.* A sound made by new queens within the same colony of *Apis mellifera* (Western Honey Bees) (Wilson 1975, 141).

quack, quacking *n.*

1. A person's state of hoarseness, or croaking in his throat; a now rarely used word (Oxford English Dictionary 1972, entries from 1386).
2. In some duck species: A characteristic harsh vocalization; a sound that resembles or imitates this (Oxford English Dictionary 1972, verb entries from 1617).
3. In some animals species: A harsh sound; a noisy outcry (Oxford English Dictionary 1972, entries from 1624).
4. In some frog species, *Corvus corax* (Common Ravens): A croak (Oxford English Dictionary 1972, entries from 1727 as a verb).

quacking *n.* A sound exchanged between rival queens of *Apis mellifera* (Western Honey Bees) in the same colony (Wilson 1975, 141).

scream *n.*

1. An animal's shrill cry or any similar sound (Oxford English Dictionary 1972, entries from 1513); e.g., in *Papio hamadryas* (Hamadryas Baboons) or Humans, a high pitched distress sound (Sigg and Falett 1985, 980).
2. A person's shrill, piercing cry, usually expressive of pain, alarm, or other sudden emotion (Oxford English Dictionary 1972, entries from 1605).

v.i., v.t. scream

cf. animal sounds: call: yowl

screech *n.*

1. A person's loud, shrill cry, usually expressive of violent and uncontrollable pain or alarm (Oxford English Dictionary 1972, entries from 1560).
2. In Screech Owls: A shrill, harsh cry; shriek (Michaelis 1963).

v.i., v.t. screech

cf. animal sounds: call, scream

Note: Other birds named for their screeching include Screech-hawk, Screech-martin, and Screech Thrush, (Oxford English Dictionary 1972).

snort *n.* For example, in *Odocoileus virginianus* (White-tailed Deer): An individual's relatively high-pitched auditory signal in which it forcibly discharges air through its mouth and nostrils (Richardson et al. 1983 in LaGory 1987, 20).

Comment: Snorting is part of a Deer's alarm behavior and indicates to a predator the Deer has detected it (LaGory 1987, 20). Male White-tailed Deer snort at Humans in their ranges (pers. obs.).

song *n.*

1. A person's act, or art, of singing; the result, or effect, of this, vocal music; that which is sung, in a general, or collective, sense; occasionally poetry (Oxford English Dictionary 1972, entries from *ca.* 1063).
2. In some bird species: A "musical utterance;" also the cry of the sea-hawk and eagle (Oxford English Dictionary 1972, entries from *ca.* 1000).
3. An animal's elaborate vocal signal (Lincoln et al. 1985).
4. In many insect, fish, and bird species; Frogs; Toads; Primates including Gibbons, Howler Monkeys, and Humans: An individual's sound production (vocal and other) of length and complexity that is distinguished from a call which is shorter and simpler (Immelmann and Beer 1989, 281).

cf. animal sounds: call

Comments: "Song" and "call" overlap and can be difficult to differentiate at least morphologically (Immelmann and Beer 1989, 281). The song of *Megaptera novaeangliae* (Humpback Whale), is possibly "the most elaborate *single* display known in any animal species" (Wilson 1975, 220, 478, based on Schevill and Watkins 1962, Schevill 1964, Payne and McVay 1971; D. B. Quine, pers. comm.). Males of *Ostrinia furnacalis* (Asian Corn Borer Moth) produce a quiet ultrasonic courtship song by rubbing specialized scales (Nakano et al. 2008, 11812).

► **antiphonal song, antiphonal singing** *n.* In some cricket and bird species, some mammal species (Gibbons, Humans, some squirrels): A song in which two individuals sing parts alternately (Immelmann and Beer 1989, 17).

cf. animal sounds: song: duet

► **calling song** *n.* For example, in crickets that produce sound by wing rubbing: A male's song that attracts females (McFarland 1985, 44).

cf. animal sounds: call

► **chorus** *n.* The sound of a group of calling insects, frogs, or toads (Wilson 1975, 443, 580; Brush and Narins 1989, 33).

cf. animal sounds: song: communal song; ²group: chorus
v. chorus

dawn chorus *n.* In many passerine-bird species: An early-morning peak in singing (Mace 1986, 621).

Comment: Dawn choruses also peak late in the night as dawn is breaking before 6 a.m. (pers. obs.).

► **communal song** *n.*

1. A number of conspecific animals' singing together (Immelmann and Beer 1989, 50).
2. In many frog species: "The collective production of trains of calls" (Immelmann and Beer 1989, 50).
syn. group song, chorusing (Immelmann and Beer 1989, 50); group calling (Schwartz 1991, 565)

► **courtship song** *n.* For example, in many orthopteran, homopteran, *Drosophila*, and bird species (e.g., Bull Finches, Estrildine Finches, Grassquits): A male's song used only for attracting, or stimulating, a female (Crossley 1986, 1146; Ewing and Miyan 1986, 421; Immelmann and Beer 1989, 64).

► **duet** *n.*

1. A musical composition for two human voices or two performers (Oxford English Dictionary 1972, entries from 1740); performance of a duet.
2. For example, in some orthopteran-insect and bird species; *Hyla* frogs: Calling in which two animals alternate sounds (Goin 1949 in Wilson 1975, 443).
3. For example, in Barbets, Cranes, Cuckoo-Shrikes, Field Crickets, Geese, Grebes, Kingfishers, Megapode Scrub Hens, *Melidectes* Honey-eaters, Quail, Sea Eagles, some katydid species, *Symphalangus syndactylus* (Siamangs), and Woodpeckers: "The rapid and precise exchange of notes between two individuals, especially mated birds" (Thorpe 1963a,b, Diamond and Terborgh 1968 in Wilson 1975, Wilson 1975, 222–223, 583; Wickler 1980 in Immelmann and Beer 1989, 80).
syn. antiphonal song, duetting, duet singing (Immelmann and Beer 1989, 80)

v.t. duet

cf. animal sounds: call, duetting; animal sounds: song: chorus, quartet, trio

Comment: Some researchers believe that duetting keeps mates in contact with one another over long periods (Wilson 1975, 222–223, 583).

► **counter singing, song dueling** *n.* In some bird and cricket species: A duet of an individual and its territorial neighbor (Immelmann and Beer 1989, 81).

► **pair duet** *n.* In some bird species: A highly elaborate duet of a mated pair (Immelmann and Beer 1989, 81).

► **functional song, motif song** *n.* In many bird species: The usual song of an adult male (Immelmann and Beer 1989, 298).

cf. animal sounds: song: subsong

► **group song** See animal sounds: song: communal song.

► **juvenile song** *n.* In many bird species: A young male's subsong given prior to his first utterances of functional song (Immelmann and Beer 1989, 299).

► **luring song, soliciting song** *n.* In some insect species: A male's female-attracting song (Immelmann and Beer 1989, 64).

► **soliciting song** See animal sounds: song: luring song.

► **subsong** *n.* In many bird species: A male's song that is of lower intensity, more variable, of wider frequency range, with longer components and a virtual absence of consistent motifs compared to functional song (Immelmann and Beer 1989, 298–299).

Comment: Depending on the species, a male might utter subsongs prior to functional songs or utter sequentially. Subsongs commonly occur in spring and during a short period of resurgent gonad activity in autumn (autumn song) (Immelman and Beer 1989).

► **territorial song** *n.* Song that advertises an animal's possession of a territory to the same sex (Immelman and Beer 1989, 309).

► **unison-bout singing** *n.* For example, in many frog and insect species: Collective calling by groups of males punctuated by variable periods of relative quiet (Schwartz 1991, 565).

Comment: Males might save energy by using unison-bout singing (Schwartz 1991, 565).

stridulation *n.* For example, in many ant, beetle, cricket, grasshopper, mutillid-wasp species: An individual's producing sound by rubbing one part of its body surface against another, which is a common form of communication (Wilson 1975, 595; Borror et al. 1989, 82–83).

v.i. stridulate

Comments: Different species of arthropods rub different anatomical parts together in stridulating; *e.g.*, a worker leaf-cutter ant scrapes a ridge on her third abdominal segment against a row of finer ridges on her fourth segment, probably using this sound as a distress signal (Wilson 1975, 211). Males of many species of crickets and grasshoppers produce mate-attraction sounds by stridulating. Lewis and Cane (1990, 1003) discuss "aposematic stridulation" and "disturbance stridulation" (= "noncommunicative stridulation"). In a case of social parasitism, larvae and pupae of the lycaenid butterfly *Maculinea rebeli* mimic stridulations of a *Myrmica schencki* queen, and her worker ants evidently perceive the immature butterflies as their queen ant and accept and feed them (Barbera et al. 2009, 782, who present stridulation sounds in the on-line supplement of their paper). Male *Oecanthus fultoni* (Snowy Tree Crickets) stridulate by rubbing their wing ridges together as occurs during summer nights in Maryland, U.S. (fig. 3). This view shows his dorsum and the underside of his forewings. His hindwings are folded against his body.

► **substratum stridulation** *n.* For example, in a sawfly species: A larva's scratching the end of its abdomen, which has fine teeth, over a leaf surface and making a sound (Hograefe 1984, 234).

Comment: This sound, audible to Humans, aids in keeping a group of larvae together and in their locating fresh food (Hograefe 1984, 234).

trumpet *n.*

1. For example, in *Cygnus buccinator* (Trumpeter Swans), Elephants, and some crane and pelican species: An individual's loud, penetrating sound reminiscent of one from a trumpet; especially the vocalization of an "enraged," or excited, Elephant (Oxford English Dictionary 1972, entries from 1850).

2. In some gnat and mosquito species: A shrill hum (made when an individual is about to bite) (Oxford English Dictionary 1972, verb entry from 1900).

v.i., v.t. trumpet

cf. animal sounds: call: trumpet call

whistle *n.*

1. A clear, shrill sound that one makes by blowing a whistle or whistling with one's lips (Michaelis 1963).

2. Any whistling sound, from a missile, the wind, etc. (Michaelis 1963)

3. In *Opsanus tau* (Toadfish): A high pitched sound made by a male's vibrating his swim bladder (Weiss 1996, 12 August, A3).

Notes: A male uses his whistle as a mate-attraction call. His muscle that vibrates his swim bladder contracts up to 200 times per second at 60–75° F, being the fastest vertebrate muscle known (Weiss 1996, 12 August, A3). The fastest vertebrate locomotory muscle (used by a sprinting lizard) vibrates at 35 times per second. A rattlesnake's rattle muscle vibrates at 90 times per second at 95° F and 30 times per second at 60–75° F.

cf. animal sounds: grunt whistle

v.i., v.t. whistle

yowl, yawl *n.*

1. A person's crying out loudly (from pain, grief, or distress); a Domestic Cat's 'wauling'; a Domestic Dog's howling; a Peacock's screaming (Oxford English Dictionary 1972, entries from *ca.* 1225).
2. Formerly, an owl's hooting; a dove's cooing (Oxford English Dictionary).

v.i., v.t. yowl, yawl

cf. animal sounds: howl

Comment: "Yowling" refers especially to a prolonged, wailing cry (Oxford English Dictionary 1972, entries from 1225).

♦ **animal speech** See language.

♦ **animal suffering, suffering** *n.*

1. A person's undergoing, or bearing, pain, distress, or tribulation (Oxford English Dictionary 1971, entries from 1597).
2. A person's painful condition; pain suffered (Oxford English Dictionary 1971, entries from 1392).
3. In many animal species including Humans: An individual's wide range of unpleasant "emotional states;" *e.g.*, fear, pain, frustration, exhaustion, and loss of a companion (Dawkins 1980, 25).

Notes: "A major difficulty with any definition of suffering is to decide how much (that is, how intense, or how prolonged) of an unpleasant emotional state constitutes 'suffering'" (Dawkins 1980, 25). The Littlewood Committee (1965 in Rowan 1986, 82) indicates that suffering includes pain, discomfort (indicated, *e.g.*, by signs such as torpor or poor condition) and stress (*i.e.*, a condition of tension or anxiety). The Brambell Committee (1965 in Rowan 1986, 82) includes fear, pain, frustration, and exhaustion as some examples of "suffering."

4. A person's "unpleasant emotional response to more than minimal pain and distress" (Kitchen et al. 1987 in DeGrazia Rowan; DeGrazia, pers. comm.).

syn. pain (by some people), distress (by some people, DeGrazia, pers. comm.)

cf. anxiety; fear; general-emergency reaction; pain; pleasure; project: Animal Rights Law Project; stress; syndrome: fight-or-flight syndrome, general-adaptation syndrome

♦ **animal welfare** *n.* Physical and mental "well being" of a nonhuman animal while it is alive (Dawkins 1980, 7).

Comment: Some people feel that nonhuman animal welfare does not involve killing a nonhuman animal in question for any reason (Dawkins 1980, 7).

cf. project: Animal Rights Law Project

♦ **aniridia** See gene: *pax-6* (comments).

♦ **aniso-** prefix Unequal.

♦ **anisogamete** See gamete: anisogamete.

♦ **anisogamy** See -gamy: anisogamy.

♦ **anisohologamy** See -gamy: anisohologamy.

- ♦ **anisomerogamy** See -gamy: anisomerogamy.
- ♦ **anisosymbiosis** See symbiosis: anisosymbiosis.
- ♦ **Anlagen** *n.* An element of a trait that remains discrete in hybrids and separates again in the formation of germ cells of these hybrids (Mendel 1866 in Mayr 1982, 722).
- ♦ **annual** *n.*
1. A plant species with individuals that last only one season (Oxford English Dictionary 1972, entries from 1710).
 2. An organism species with a life cycle that lasts one growing season or year (Wilson 1975, 578).
- adj.* annual
cf. biennial, perennial
- ♦ **annual periodicity, annual rhythm** See rhythm: annual rhythm.
- ♦ **annuation** *n.* Fluctuations in an organism's abundance, or behavior, resulting from annual changes in environmental factors (Lincoln et al. 1985).
- ♦ **anoestrus** See estrus: anestrus.
- ♦ **anomaly** *n.*
1. Unevenness, in equality, of condition, motion, etc. (Oxford English Dictionary 1972, entries from 1571).
 2. Irregularity, deviation from the common order, exceptional condition or circumstance; also, a thing that exhibits such irregularity; an anomalous thing or being (Oxford English Dictionary 1972, entries from 1664).
 3. Deviation from natural order, *e.g.*, an animal with an unusual character such as a bird that cannot fly (Oxford English Dictionary 1972, entries from 1646).
 4. An observed fact that is difficult to explain in terms of an existing conceptual framework (Lightman and Gingerich 1992, 690).
- Note:* Anomalies often point to the inadequacy of a current theory and herald a new one (Lightman and Gingerich 1992, 690).
[Latin *anomalia* < Greek *ānomalía* < *ānomalos* < *an-*, not + *homalos*, even < *homos*, same]
- ♦ **anonymous DNA** See nucleic acid: deoxyribonucleic acid: anonymous DNA.
- ♦ **anonymous group** See ²society: open society: anonymous group.
- ♦ **anonymous monogamy** See mating system: monogamy: anonymous monogamy.
- ♦ **anonymous society** See ²society: open society: anonymous society.
- ♦ **anorthogenesis** See -genesis: anorthogenesis.
- ♦ **anosmatic** See anosmic.
- ♦ **anosmatic, anosmic** *adj.* Referring to an animal that has no sense of smell (Lincoln et al. 1985).
- ♦ **anosmize** *v.t.* To cause an animal (*e.g.*, a lab rat) to lose its olfaction, temporarily or permanently by an investigator [coined by Cheal 1975, 3, pers. com.].
syn. make anosmic
[Greek *anōsmē*, without smell + ize, to render]
- ♦ **ANOVA** See statistical test: analysis of variance.
- ♦ **ant cattle, ant cow** *n.* An insect that is a mutualist with ants and tended by them, *e.g.*, an aphid or membracid (Wilson 1975, 354) or a caterpillar (Ross 1985).
cf. honeydew
- ♦ **ant pollination** See pollination: ant pollination.
- ♦ **ant rain** *n.*
1. The dropping of newly fertilized queen ants, *e.g.*, of *Formica* and *Lasius*, from the sky after their nuptial flights (Haemig 1997, 89).
 2. A continuous drift of free-falling ants, *e.g.*, *Formica aquilonia*, from various parts of trees to the ground (Haemig 1997, 89).
- Note:* Ant rain in this species increases with the amount of bird foraging in the trees where the ants occur (Haemig 1997, 89). By raining, an ant can quickly move away from a predator in a tree, and more quickly move from a foraging site in a tree to the ground.
- ♦ **ant worker** See caste: worker: ant worker.
- ♦ **antagonism** *n.*
1. One chemical's (*e.g.*, antiandrogen) interfering with the action of another inside an animal (Immelmann and Beer 1989, 16).
 2. One muscle's having the opposite effect (flexing or extending) of its complementary muscle (Immelmann and Beer 1989, 16).
 3. An individual animal's opposition between two incompatible behavioral tendencies, *e.g.*, attacking and fleeing (Immelmann and Beer 1989, 16).
- ♦ **antagonist** See agonist: antagonist.
- ♦ **antagonistic pleiotropy** See pleiotropy: antagonistic pleiotropy.
- ♦ **Antarctic Oscillation** See oscillation: Antarctic Oscillation.
- ♦ **ante-** *prefix*
1. Before in time or order (Michaelis 1963)
 2. Before in position; in front of (Michaelis 1963).
[Latin *ante*, before]
- ♦ **antebrachial gland** See gland: antebrachial gland.
- ♦ **antecedent variable** See variable: independent variable.
- ♦ **antenatal** *n.* "Before birth; during gestation" (Lincoln et al. 1985).
- ♦ **antepisematic character** See character: episematic character: antepisematic character.
- ♦ **antennapedia** *n.* A mutation in a homeobox gene that results in the development of a leg instead of an antenna on the head of a *Drosophila* fly (Lewontin 2000, 15–16, illustration).
Comment: This phenomenon suggests that an antenna and leg are modifications of the same basic appendage (Lewontin 2000, 15–16).
cf. ²mutation: homeotic mutation
- ♦ **antennation** *n.* In Arthropods: An individual's touching another animal, or some object, with its antennae (Wilson 1975, 578).
Comment: This behavior can serve as a sensory probe, or as a tactile signal, to an antennated arthropod (Wilson 1975, 578).
- ♦ **antepisematic character** See character: episematic character.
- ♦ **anthecology** See study of: ecology: anthecology.
- ♦ **anthogenesis** See -genesis: anthogenesis.
- ♦ **anthophile** See ¹-phile: anthophile.
- ♦ **anthrophobia** See -phobia: anthrophobia.
- ♦ **anthophyte hypothesis** See hypothesis: angiosperm-origin hypotheses: anthophyte hypothesis.
- ♦ **anthropic** *adj.* Referring to Humans' influence on something (Lincoln et al. 1985).
- ♦ **eusynanthropic** *adj.* Referring to an organism that lives on, or in, human habitations (Lincoln et al. 1985).
- ♦ **exanthropic** *adj.* Referring to an organism that lives far from human habitations (Lincoln et al. 1985).
- ♦ **synanthropic** *adj.* Referring to an organism that lives close to human habitations (Lincoln et al. 1985).
- ♦ **anthropocentricity** *n.*
1. A person's regarding Humans as a central fact, or aim, of the universe, or other system, to which all

- surrounding facts have reference (Oxford English Dictionary 1972, entries from 1863; Michaelis 1963).
2. A person's comparing something else with Humans (Michaelis 1963).
 3. A person's interpreting the activities of other organisms with respect to human values (Lincoln et al. 1985).
- adj.* anthropocentric
cf. anthropomorphic, zoocentric
- ♦ **anthropochore** See -chore: anthropochore.
- ♦ **anthropochorous** See -chorous: anthropochorous.
- ♦ **anthropogenesis** See -genesis: anthropogenesis.
- ♦ **anthropogenic** See -genic: anthropogenic.
- ♦ **anthropology** See study of: anthropology.
- ♦ **anthropophagite** See cannibal.
- ♦ **anthropomorphism** See -morphism: anthropomorphism.
- ♦ **anthropophile** See ¹-phile: anthropophile.
- ♦ **anthropophily** *n.* An insect's biting a Human, sucking his blood, or both (Lincoln et al. 1985).
cf. ¹-phile: androphile
- ♦ **anti-** *prefix*
1. Against, opposed to (Michaelis 1963).
 2. Opposite to; reverse (Michaelis 1963).
 3. Rivaling; spurious (Michaelis 1963).
 4. In medicine, counteracting; curative; neutralizing. Usually ant- before words beginning with a vowel; sometimes anth- before the aspirate in words of Greek formation or analogy (Michaelis 1963).
- [Greek *anti*, against]
- ♦ **antiaphrodisiac** See chemical-releasing stimulus: semiochemical: pheromone: aphrodisiac: antiaphrodisiac.
- ♦ **anticipatory adjustment** *n.* An animal's response to some aspect of its environment, or to its biological clock, that predisposes it to climatic changes (McFarland 1985, 288).
cf. ³adaptation: ¹physiological adaptation: acclimation; ²physiological adaptation (comment)
- ♦ **anticipatory visual illusion** See illusion: anticipatory visual illusion.
- ♦ **anticryptic** See cryptic: anticryptic.
- ♦ **antidisplay** See display: antidisplay.
- ♦ **antidiuretic hormone** See hormone: antidiuretic hormone.
- ♦ **antigenicity** *n.* Exhibition of sexual dimorphism (Lincoln et al. 1985).
- ♦ **antigeny** See morphism: dimorphism.
- ♦ **antihormone** See hormone: antihormone.
- ♦ **antimone** See chemical-releasing stimulus: semiochemical: allelochemic: antimone.
- ♦ **antimonotony principle** See principle: antimonotony principle.
- ♦ **antimorph** See gene: antimorph.
- ♦ **anting** *n.*
1. A bird's "bathing" in ant nests or swarms, dressing its plumage with crushed ants, placing ants among its feathers, and all apparent substitutes for these actions (Stresemann 1935 in McAtee 1938, 98).
Note: McAtee (1938, 98) suggests that "all apparent substitutes for these actions" should be omitted from this definition. An early report of anting is by Frazar (1876 in McAtee 1938, 102).
 2. In many bird species including *Piranga olivacea* (Scarlet Tanagers) and *Sturnus vulgaris* (European Starlings): An individual's seizing one, or more, ants and placing it in its feathers under its wing or

elsewhere; crushing the ant with its bill and rubbing its juices on its feathers; dusting itself in an ant hill; or a combination of these activities (Groskin 1945, 55; Groskin 1950, 201).

cf. pharmacognosy: zoopharmacognosy

Comments: Groskin (1950) lists many of the bird and ant species that are involved in anting. Hypotheses for the function of anting include: Anting disinfects a bird with ant exudates which contain acid, the exudates help to rid ectoparasites, and irritants in the exudate produce an "exquisite sensation" on the bird's skin (Groskin 1943, 1950; Immelmann and Beer 1989, 17). Over 200 bird species show anting, but its function is still largely a mystery and a source of controversy. Some birds might ant to prepare ants as food by causing them to discharge their formic acid before they are ingested. Some birds also rub flowers, fruit peels, mothballs, and other items, many of which have anti-parasitic properties, on their feathers (Clayton and Wolfe 1993).

♦ **antipathetic symbiosis** See symbiosis: antipathetic symbiosis.

♦ **antiphonal singing, antiphonal song** See animal sounds: song: antiphonal song.

♦ **antipredator aggression** See aggression: anti-predator aggression.

♦ **antisocial factor** *n.* "Any selection pressure that tends to inhibit or reverse social evolution" (Wilson 1975, 578).

♦ **antithesis, principle of** See principle: principle of antithesis.

♦ **antler** See body part: antler.

♦ **anxiety** *n.*

1. A person's uneasiness, or trouble of mind, about some uncertain event; solicitude; concern (Oxford English Dictionary 1972, entries from 1525).
cf. fear

2. In pathology, a person's condition of agitation and depression with a sensation of tightness and distress in his precordial region (Oxford English Dictionary 1972, entries from 1661).

3. A person's strained, or solicitous desire (Oxford English Dictionary 1972 entries from 1769).

4. A person's diffuse state of tension "... which magnifies and even causes the illusion of an outer danger, without pointing to appropriate avenues of defense or mastery" (Erickson 1950 in DeGrazia and Rowan, pers. comm.).

syn. fear (used by some authors)

cf. fear, suffering

Comment: Behavior and physiological changes in non-human animals suggest that they are anxious (Gray 1982 in DeGrazia and Rowan pers. comm.).

♦ **A_o horizon** See soil horizon: O horizon.

♦ **Appalachian Plateau Province** See geological province: Appalachian Plateau Province.

♦ **Appalachian Mountains** See place: Appalachian Mountains.

♦ **apandry** *n.* An organism's lacking, or having nonfunctional, male reproductive organs (Lincoln et al. 1985).

adj. apandrous

♦ **apeirophobia** See -phobia: apeirophobia.

♦ **aphagia** See -phagia: aphagia.

♦ **aphanic species** See ²species: sibling species.

♦ **aphatic coloration** See coloration: aphatic coloration.

♦ **aphidicole** See -cole: aphidicole.

♦ **aphidivore** See -vore: aphidivore.

- ♦ **aphotometric** *adj.* Referring to organisms, or structures, not affected by light (Lincoln et al. 1985).
- ♦ **aphototaxis** See taxis: phototaxis: aphototaxis.
- ♦ **aphrodisiac** *n.* For example, in Humans: A drug, food, etc. that arouses, or increases, sexual desire or potency (Michaelis 1963).
See chemical-releasing stimulus: semiochemical: pheromone: aphrodisiac.
- ♦ **antilogy** See contranym.
- ♦ **aphydrotaxis** See taxis: hydrotaxis: aphydrotaxis.
- ♦ **aphyletic trogloxene** See -xene: trogloxene: aphyletic trogloxene.
- ♦ **apiculture** See study of: apiculture.
- ♦ **apidology** See study of: mellitology.
- ♦ **aping** See learning: social-imitative learning.
- ♦ **apiophobia, apiphobia** See -phobia: apiphobia.
- ♦ **apivore** See -vore: apivore.
- ♦ **aplanogamete** See gamete: aplanogamete.
- ♦ **apneumone** See chemical-releasing stimulus: apneumone.
- ♦ **Appalachian Trail** See place: Appalachian Trail.
- ♦ **apparatus** Also, see instrument.
self-contained underwater breathing apparatus (SCUBA, scuba), Aqua-lung, aqua-lung *n.* A breathing apparatus, equipped with compressed-air tanks, that is used underwater by divers (Michaelis 1963).
- Secchi disc** *n.* A disc used to measure relative clarity and turbidity of water (www.fishbase.org, 2005).
syn. Secchi disk
Comment: There are different models of Secchi discs (Minnesota Pollution Control Agency 2005). The standard Secchi disc is 20 cm in diameter and has two black and two white opposing quadrants. The Secchi disc reading is the average of the depth at which the disc disappears from sight when one lowers it by a rope into the water and the depth at which it reappears when one raises it in the water (www.fishbase.org, 2005).
[after Fr. Pietro Angelo Secchi (1818–1878), scientific advisor to the Pope and astrophysicist, who invented the Secchi disc]
- ♦ **apparent competition** See competition: apparent competition.
- ♦ **apo-** *prefix* Off; from; away (Michaelis 1963). Also ap- before vowels; aph- before an aspirate.
[Greek *apo*, from, off]
- ♦ **apocrine sweat gland** See gland: apocrine sweat gland.
- ♦ **apoendemic** See ¹endemic: apoendemic.
- ♦ **apogamy** See parthenogenesis: apomixis.
- ♦ **apolegamy** See -gamy: apolegamy.
- ♦ **apomict** *adj.* Referring to apomixis, *q.v.*
- ♦ **apomixis** See parthenogenesis: apomixis.
- ♦ **apomorph, apomorphy** See morph: apomorph.
- ♦ **apomorphic** See -morphic: apomorphic.
- ♦ **apoptosis** See death: apoptosis.
- ♦ **aposematic behavior, aposematism** See behavior: aposematic behavior.
- ♦ **aposematic coloration** See coloration: aposematic coloration.
- ♦ **aposematic stridulation** See animal sounds: stridulation.
- ♦ **apostatic selection** See selection: apostatic selection.
- ♦ **aposymbiotic** *adj.* Referring to a normally symbiotic organism that has been deprived experimentally of its partner (Lincoln et al. 1985).
- syn. symbiont-free
cf. symbiosis
- ♦ **apothermotaxis** See taxis: apothermotaxis.
- ♦ **apotreptic behavior** See behavior: threat behavior.
- ♦ **appeasement, appeasement behavior** See behavior: appeasement behavior.
- ♦ **appeasement display** See display: appeasement display.
- ♦ **appeasement gland** See gland: appeasement gland.
- ♦ **appeasement substance** See substance: appeasement substance.
- ♦ **appeasing signal** See behavior: appeasement.
- ♦ **appetitive behavior** See behavior: appetitive behavior.
- ♦ **applied ethology** See study of: ³ethology: applied ethology.
- ♦ **applied mathematics** See study of: mathematics: applied mathematics.
- ♦ **applied physics** See study of: physics: applied physics.
- ♦ **applied psychology** See study of: psychology: applied psychology.
- ♦ **appraiser** *n.* A component of a signal that allows a responder to react more to one object (or signaler) than to another (Marler 1961 in Wilson 1975, 217).
Comment: Marler's classification of signal components includes "appraiser," "designator," "identifor," and "prescriptor," *q.v.* (Marler 1961 in Wilson 1975, 217).
- ♦ **apprehending error** See error: observer error.
- ♦ **approach-approach conflict** See ²conflict: approach-approach conflict.
- ♦ **approach-avoidance conflict** See ²conflict: approach-avoidance conflict.
- ♦ **approach-withdrawal theory** See ³theory: approach-withdrawal theory.
- ♦ **approximation conditioning** See learning: conditioned learning: approximation conditioning.
- ♦ **aptosochromatosis** *n.* In some bird species: Color change without molting (Lincoln et al. 1985).
- ♦ **apyrene sperm** See gamete: sperm: apyrene sperm.
- ♦ **Aqua-lung, aqualung** See apparatus: self-contained-underwater-breathing apparatus.
- ♦ **aquatic respiration** See breathing: water breathing.
- ♦ **aquatic-surface respiration** See respiration: aquatic-surface respiration.
- ♦ **aquaticole** See -cole: aquaticole.
- ♦ **aquiherbosa** See ²community: aquiherbosa.
- ♦ **aquatosere** See ²succession: aquatosere.
- ♦ **arachneophobia** See -phobia: arachneophobia.
- ♦ **arachnophobia** See -phobia: arachnophobia.
- ♦ **Aragonite** See mineral: Aragonite.
- ♦ **a-rates** See ²evolution: tachytely.
- ♦ **Arber's law** See law: Arber's law.
- ♦ **arboreal** *adj.* Referring to an organism's living in trees; "adapted for life in trees" (Lincoln et al. 1985).
- ♦ **arboretum** See place: arboretum.
- ♦ **arboricole** See -cole: arboricole.
- ♦ **arbovirus** See virus: arbovirus.
- ♦ **arbusticole** See -cole: arbusticole.
- ♦ **archegenesis** See -genesis: abiogenesis.
- ♦ **archetype, archtype** See -type, type: archetype.
- ♦ **archigenesis, archigony** See -genesis: archegenesis.
- ♦ **arching** See display: wing display: arching.

- ♦ **“archipelago metapopulation”** See population: metapopulation: “archipelago metapopulation.”
- ♦ **Arctic Oscillation** See oscillation: Arctic Oscillation.
- ♦ **ardium** See ²community: ardium.
- ♦ **area** *n.* The range, or scope, of something (Morris 1982).
[Latin *area*, open space]
- ♦ **area of occupancy** *n.* The area within a taxon’s extent of occurrence that the taxon actually occupies (New 2009, 21).
Comments: The area of occupancy may show a taxon’s patchy distribution related to its environmental resources (New 2009, 21). Researchers measure areas of occupancy in different ways, but they often use a form of grid mapping to separate occupied from unoccupied grid areas at an appropriate scale.
- ♦ **extent of occurrence** *n.* The area contained within the shortest continuous boundary that one can draw to encompass a taxon’s all known sites, inferred sites, projected sites, or a combination of them that does not include the taxon’s vagrants (New 2009, 21–22).
Comment: Researchers commonly represent an extent of occurrence by the area of a minimum convex polygon that contains all the sites of occurrence and may exclude areas of obviously unsuitable habitat (New 2009, 21).
- ♦ **area effect** See effect: area effect.
- ♦ **area of occupancy** See area: area of occupancy.
- ♦ **area-species curve** See curve: species-area curve.
- ♦ **arena, arena display** See ²lek.
- ♦ **arenicole** See -cole: arenicole.
- ♦ **argillicolle** See -cole: argillicolle.
- ♦ **argillophile** See ¹-phile: argillophile.
- ♦ **argotaxis** See taxis: argotaxis.
- ♦ **argument from design** *n.* Attributing the creation of an organism’s complex character (e.g., behavioral pattern) to a designer (God according to Paley 1802 or natural selection according to Darwinists) because it seems ideally suited for the function in question (D. M. Lambert, pers. comm.).
cf. teleology
Comments: To structuralists, the designer is laws of form and generative mechanisms (D. M. Lambert, pers. comm.). Another view is that the argument from design is strictly a creationist concept and the core of creationist polemics (C. K. Starr, pers. comm.).
- ♦ **aristogenesis** *n.* One of the autogenetic theories, *q.v.* (Osborn 1934; Simpson 1953).
cf. -genesis
syn. orthogenesis (Lincoln et al. 1985)
- ♦ **aristogenic** See -genic: aristogenic.
- ♦ **Aristotelian, Aristotelean** *n.*
 1. An adherent of Aristotle’s teachings; one who tends to be empirical, or scientific, in his method, rather than speculative or metaphysical (Oxford English Dictionary 1972, entries from 1607; Michaelis 1963).
 2. A maligning term used for botanists in the 18th century that implied that they used a deductive approach and a blind reliance on tradition and authority (Mayr 1982, 165).
- ♦ **Aristotelian mimicry** See mimicry: Aristotelian mimicry.
- ♦ **Aristotle’s theory of inheritance** See *eidos*.
- ♦ **arithmetic average, arithmetic mean** See mean.
- ♦ **arithmetic mimicry** See mimicry: arithmetic mimicry.
- ♦ **ARM** See mechanism: releasing mechanism.
- ♦ **arms race** See ²race: arms race.
- ♦ **aromorphosis** See ²evolution: aromorphosis.
- ♦ **arousal** *n.*
 1. A person’s stirring up another person from sleep or inactivity (Oxford English Dictionary 1972, entries from 1593).
 2. A person’s awakening himself from sleep (Oxford English Dictionary 1972, entry from 1822).
 3. An individual animal’s general state of excitability or activation (Immelman and Beer 1989, 20).
syn. drive (sometimes)
cf. drive
Comment: Specific examples of arousal include: an animal’s transition from sleep to wakefulness; its level of responsiveness, as indicated by stimulus intensity necessary to elicit its reaction; its activation level as indicated by its kind of exhibited behavior; *e.g.*, relaxed grooming, frantic fleeing, etc.; its physiological indicators such as heart rate and skin conductances as measured in lie-detector tests; and its attentiveness to sensory stimuli (Immelman and Beer 1989, 20).
- ♦ **archetype** See -type: archetype.
- ♦ **arrestant** See chemical-releasing stimulus: arrestant.
- ♦ **arrested evolution** See ²evolution: arrested evolution.
- ♦ **arrhenogenic** See -genic: arrhenogenic.
- ♦ **arrhenotoky** See parthenogenesis: arrhenotoky.
- ♦ **arrhythmic** *adj.* Displaying no diurnal periodicity.
syn. nonrhythmic
cf. rhythm
- ♦ **arrow greeting** See greeting: arrow greeting.
- ♦ **Arrow’s-impossibility theorem** See ³theory: Arrow’s-impossibility theorem.
- ♦ **Artenkreis, Artenkreise** See ²species: super-species.
- ♦ **arthrogenous evolution** See ²evolution: arthrogenous evolution.
- ♦ **Arthropods of La Selva Inventory** See inventory: Arthropods of La Selva Inventory.
- ♦ **artificial chromosome** See vector: artificial chromosome.
- ♦ **artificial intelligence** See intelligence: artificial intelligence.
- ♦ **artificial parthenogenesis** See parthenogenesis: artificial parthenogenesis.
- ♦ **artificial selection** See selection: artificial selection.
- ♦ **AS** See sleep: stage-1 sleep.
- ♦ **ascaphus reflex** See thanatosis.
- ♦ **Aschoff’s rule** See rule: Aschoff’s rule.
- ♦ **a selection** See selection: a selection.
- ♦ **asexual** See sexual: asexual.
- ♦ **asexual-meiotic parthenogenesis** See parthenogenesis: asexual-meiotic parthenogenesis.
- ♦ **asexual reproduction** See parthenogenesis: asexual reproduction.
- ♦ **aspect** *n.* The mean direction that a sloping land area, *e.g.*, a watershed, faces (inferred from Edwards 1995, 7).
- ♦ **ASR** See respiration: aquatic-surface respiration.
- ♦ **assembly** *n.* One, or more, member’s calling together other members of its society for any general communal activity (Wilson 1975, 211, 415, 579).
cf. ^{1,2}recruitment
- ♦ **assessment signal** See signal: assessment signal.
- ♦ **associate** See helper.

- ◆ **association** *n.* An animal's forming a learned connection between a stimulus and a response or between two stimuli (Immelmann and Beer 1989, 21).
 See ²group: association
cf. learning: associative learning
- ◆ **association element** See ²species: association element.
- ◆ **associationism** *n.* The view that organisms do not have any freedom of will and behavior cannot necessarily be accounted for in physical or physiological terms (McFarland 1985, 362).
cf. instinct, materialism, rationalism, *tabula rasa*
Comment: The empiricists John Locke (1700) and David Hume (1739) held the view that human behavior develops entirely through experience, according to laws of association (McFarland 1985, 362).
- ◆ **associative learning** See learning: associative learning.
- ◆ **assortative mating** See mating: assortative mating.
- ◆ **assortative mating by size** See mating: assortative mating: assortative mating by size.
- ◆ **assortative pair formation** See mating: assortative mating.
- ◆ **asteroid** *n.* A small rocky object in our Solar System (Mitton 1993).
Comments: Asteroids may have formed 4.6 Ga ago when our Solar System formed, and they might be the parent bodies of meteorites (Mitton 1993). Astronomers classify them based on their reflected spectra.
- ◆ **astraphobia** See -phobia: astraphobia.
- ◆ **astrophobia** See -phobia: astrophobia.
- ◆ **asymptotic-species-accumulation curve** See curve: species-accumulation curve: asymptotic-species-accumulation curve.
- ◆ **asymmetric game** See game: asymmetric game.
- ◆ **asynethogametism** See synethogametism: asynethogametism.
- ◆ **atavism** *n.*
1. A person's resembling his grandparents, or more remote ancestors, rather than parents (Oxford English Dictionary 1972, entry from 1833).
 2. The sporadic occurrence of individuals of a species with characteristics of phylogenetically ancestral forms; *e.g.*, a second or third hoof on the leg of a perissodactyl, a second pair of wings on a true fly (Diptera), or display of behaviors of ancestral species in species hybrids of some ducks and some parrots (Oxford English Dictionary 1972, entry from 1872; Immelmann and Beer 1989, 22).
 3. The reappearance of a characteristic in an organism after several generations of absence, usually caused by the chance recombination of genes (American Heritage Dictionary 1992 in Hrdy 1996, 851).
- syn.* reversion (Lincoln et al. 1985)
 See gene conversion.
cf. ²evolution: regressive evolution; -genesis: biogenesis; relict; speciation: saltational speciation
- ◆ **atokous** *adj.* Without offspring; nonreproductive; vegetative (Lincoln et al. 1985).
cf. -toky
- ◆ **atomistic mechanist** See mechanist: atomistic mechanist.
- ◆ **atrophic** See -trophic: atrophic.
- ◆ **ATBI** See inventory: All Taxon Biological Inventory.
- ◆ **attached earlobe** See character: attached earlobe.
- ◆ **attachment** *n.*
1. The fact, or condition, of a person's being attached to another person by sympathy; "affection, devotion,

fidelity" (Oxford English Dictionary 1972, entries from 1704).

2. Relationships between one person and another perceived as stronger, or wiser, than himself, irrespective of their ages.
 [coined by Bowlby 1958, 1969 in Ainsworth and Bell 1970, 50; Hinde 1982, 267].
3. An affectional tie that one animal forms between itself and another specific one and that binds them together in space and endures over time (Ainsworth and Bell 1970, 50).
Notes: The behavioral hallmark of attachment is seeking to gain and to maintain a certain degree of proximity to the object of attachment, which ranges from close physical contact under some circumstances through interaction or communication across some distance under other circumstances (Ainsworth and Bell 1970, 50). An attachment relationship "is developed and mediated through an organized hierarchical behavioral system, the attachment system, which encompasses infant attachment behaviors and maternal behaviors, both designed to promote mother-infant proximity" (Mann 1991, 1).
4. An aspect of the enduring relationship between a human infant and its attachment figure (Hinde 1982, 228).

- 5."A tie between an animal and some place, object, or social companion;" *e.g.*, a retreat, a nest site, a breeding territory, a specific habitat used seasonally (Immelmann and Beer 1989, 22).

cf. behavior: attachment behavior; learning: imprinting; place imprinting

◆ **mother-infant attachment** *n.* In mammals, most markedly in Primates: An especially strong bond between a mother and her young (Immelmann and Beer 1989, 190; figs. 4 and 43 in this book).

cf. affiliation

- ◆ **attachment behavior** See behavior: attachment behavior.

- ◆ **attachment-behavior system** See ¹system: attachment-behavior system.

- ◆ **attack behavior** See behavior: attack behavior.

- ◆ **attack-cone avoidance** See behavior: inspection behavior: attack-cone avoidance.

- ◆ **attend** *v.t.* "To give any response whatsoever to a stimulus. [This term defines what is probably the broadest possible class of behavior]" (Verplanck 1957).

- ◆ **attendant** *n.* A bird that takes care of young in a nest, including the young's parents and helpers (Dow 1980 in Brown 1987, 297).

- ◆ **attendant species** See ²species: attendant species.

- ◆ **attention** *n.*

1. A person's act, or state, of heeding, directing his mind toward, or regarding something (Oxford English Dictionary 1972, entries from 1374).
2. An individual animal's "reification, as faculty or process, of attending" (Verplanck 1957).
3. An individual animal's directing its interest, or concern, toward a particular object at a particular moment (Storz 1973, 29; Immelmann and Beer 1989, 22–23).

- ◆ **selective attention** *n.* Usually, an organism's limiting its responsiveness such that some stimuli control its behavior over a considerable period, and do so to the exclusion of other stimuli that simultaneously impinge on it (Hinde 1970, 125).

♦ **attention structure** *n.*

1. A conceptualization of individual social fields, *q.v.*, as they relate to a whole society (Chance 1967 and Chance and Jolly 1970 in Wilson 1975, 517).
2. The directions of regard among animals in a group in relation to their social statuses and spatial positions (Immelmann and Beer 1989, 23).

cf. ²society: acentric society, centripetal society

♦ **attractant** See chemical-releasing stimulus: attractant.♦ **attractivity, female attractivity** *n.*

1. A female's stimulus value in evoking a male's sexual responses (Beach 1976 in Dewsbury 1978, 237).
2. The full range of stimuli (behavioral as well as non-behavioral) produced by a female, from those that attract males from a distance to those that promote ejaculation (Hinde 1982, 155).

cf. proceptivity, receptivity

♦ **aucuparious** *adj.* "Attractive to birds" (Lincoln et al. 1985).♦ **audience-effected social facilitation** See ²facilitation: social facilitation: audience-effected social facilitation.♦ **audiogenic** See -genic: audiogenic.♦ **audition** See modality: audition.♦ **auditory scene** *n.* For example, in echolocating bats: An animal's perception of the kinds and positions of objects in its environment based on its echolocation (inferred from Moss and Surlykke 2001, 2208).

cf. analysis: auditory-scene analysis

♦ **auditory-scene analysis** See analysis: auditory-scene analysis.♦ **aufwuchs** See ²community: periphyton.♦ **August Krogh principle** See principle: August Krogh principle.♦ **aunt, auntie** *n.*

1. A person's father's, or mother's, sister (Oxford English Dictionary 1972, entries from 1297).
2. A woman who does benevolent, practical things for her acquaintances (Oxford English Dictionary 1972, entries from 1861).
3. A nonreproducing female *Somateria mollissima* (Eider Duck) that joins another female with her brood (Darling 1938, 5).
4. In *Macaca mulatta* (Rhesus Macaques): A female, other than an infant's mother, that helps to care for the infant (Rowell et al. 1964).
5. In some primate species, Elephants: Any female that assists a parent in caring for conspecific young (Wilson 1975, 125, 349, 491, 579).

See mother: play mother.

cf. parent: alloparent; uncle

♦ **aural** *adj.* Referring to hearing or ears (Lincoln et al. 1985).♦ **Aurignacian Tool Industry** See tool industry: Aurignacian Tool Industry.♦ **Außendienst** *n.* In social insects: An individual's work outside of her nest (Wilson 1975, 412).

cf. Innendienst

[German *außen*, outside; *dienst*, duty]

♦ **autallogamy** See -gamy: autoallogamy.♦ **autapomorph** See character: apomorph: autapomorph; -morph: autapomorph.♦ **autarkean society** See ²society: autarkean society.♦ **autecology** See study of: ecology: autecology.♦ **author** *n.*

1. "The original writer of a book, treatise, etc." (Michaelis 1963).

2. "One who makes literary composition his profession" (Michaelis 1963).

3. The name of a person who is responsible both for the name of a taxon and for its diagnostic description (Mayr 1969, 317, 363, who discusses exceptions to this kind of authorship).

4. A person who created a work, scientific name, nomenclatural act, or a nominal taxon (Lincoln et al. 1985).

5. A person who contributes to research that is reported in a scientific paper (Higley and Stanley-Samuelson 1993, 74).

Note: Higley and Stanley-Samuelson (1993, 75) discuss trading authorship, authorship as a payoff for resources, coerced authorship, adding a luminary to the author list to enhance chances of publication, and using an authorship to buy a competing group out of a research area. They conclude that "authorship is an exercise in interpretation, reflection, creativity, written artistry, and, perhaps most importantly, responsibility" (p. 75).

[Anglo-French *autour*; Old French, *autor* < Latin *uctor*, originator, producer < *augere*, to increase]

♦ **autism** *n.*

1. A person's "tendency toward day-dreaming or introspection in which external reality is unduly modified by wishful thinking" (Michaelis 1963).

Note: This definition is not widely used today.

2. A child's active withdrawal from relationships with other people, such as occurs in schizophrenia (Clayman 1989, 145).

Note: This definition is not widely used today (Clayman 1989, 145).

3. A child's condition that involves failure to form relationships with other people and other traits (Clayman 1989, 145).

Notes: Autism is evident before the age of 30 mo and is usually apparent within a person's first year of life (Clayman 1989, 145). Many autism symptoms appear throughout much of a person's life. These symptoms include avoiding eye-to-eye contact; becoming attached to unusual objects or collections; being aloof from parents and others; being hyperactive; being hypersensitive to touch; being indifferent to feelings of others and to social conventions; being obsessed with one particular topic or idea; delaying speaking as a toddler; developing rituals in play; displaying sudden screaming fits; echoing spoken words; extremely resisting change of any kind; failing to form relationships with other humans; flicking or twiddling fingers for hours on end; having a heightened power of concentration; having a heightened visual perception; having an isolated special skill such as drawing, rote memory, or musical ability; having a normal appearance and muscular coordination; making up words; preferring to play alone; self-injuring oneself; showing difficulty in learning manual tasks; showing unusual fears; resisting being cuddled with screaming to be put down when picked up, even if one is hurt or tired; responding to sounds inappropriately; rocking; using immature, unimaginative speech; and walking on tiptoes. Some victims of autism are unable to speak or function in usual ways (Raver 1997, 5 August, C1). Temple Grandin, an animal behaviorist, uses her autism-affected perceptions in designing livestock facilities and making livestock slaughter less traumatic for the animals (Raver 1997, 5 August, C1).

4. A person's being shut off to varying extents from social contact with other people and showing symptoms such as persistent stereotyped movements and reduction of sensory responsiveness (Immelman and Beer 1989, 23).
Note: Captive animals sometimes display behavior similar to autism (Immelman and Beer 1989, 23).
- [aut- + -ism]
- ◆ **auto-** *comb.f.*
1. Arising from some process, or action, within an object; not induced by any stimulus from without (Michaelis 1963).
 2. Acting, acted, or directed upon the self.
Before vowels as aut- (Michaelis 1963).
[Greek *autos*, self]
- ◆ **autoallogamy** See -gamy: autoallogamy.
- ◆ **autobiology** See study of: biology: idioscopy.
- ◆ **autobiosphere** See -sphere: biosphere: eubiosphere: autobiosphere.
- ◆ **autocatalysis** *n.* Any process whose rate is increased by its own products (Wilson 1975, 567, 579).
Comment: Thus, autocatalytic reactions, fed by positive feedback, tend to accelerate until their ingredients are exhausted or some external constraint is imposed (Wilson 1975, 567, 579).
- ◆ **autocatalysis model** See ⁴model: autocatalysis model.
- ◆ **autochore** See -chore: autochore.
- ◆ **autochthonous** *adj.* Referring to a group, or species, that is native, or aboriginal, to a particular geographic area; contrasted with a group, or species, considered to have immigrated from outside the area (Tillyard 1926, etc. in Frank and McCoy 1990, 2).
syn. indigenous, native (Frank and McCoy 1990, 4)
cf. adventive, ²endemic, immigrant, indigenous, introduced, precinctive
- ◆ **autochthonous behavior, autochthonous activity** See behavior: autochthonous behavior.
- ◆ **autochthonous drive** See drive: autochthonous drive.
- ◆ **autocoprophagous, autocoprophagy, autocoprophagous** See -phagy: autocoprophagy.
- ◆ **autodeme** See deme: autodeme.
- ◆ **autodiploidy** See -ploidy: autodiploidy.
- ◆ **autoecology** See study of: ecology: autecology.
- ◆ **autogamy** See -mixis: automixis.
- ◆ **autogenesis** See -genesis: abiogenesis.
- ◆ **autogenetic theories** See ³theory: autogenetic theories.
- ◆ **autogenous** See -genous: autogenous.
- ◆ **autogeny** See -genesis: autogenesis.
- ◆ **autogony** See -genous: autogenous.
- ◆ **autogrooming** See grooming: autogrooming.
- ◆ **autohyperparasitism** See parasitism: hyperparasitism: intraspecific tertiary hyperparasitism.
- ◆ **autoinstruction** See learning: programmed learning.
- ◆ **automarking** See behavior: marking behavior.
- ◆ **automated teaching** See learning: programmed learning.
- ◆ **automatic ovulator** See ovulator: spontaneous ovulator.
- ◆ **automatic selection** See selection (table).
- ◆ **automictic parthenogenesis** See parthenogenesis.
- ◆ **automimicry** See mimicry: automimicry.
- ◆ **automixis** See -mixis: automixis.
- ◆ **autonomic nervous system** See ²system: nervous system: autonomic nervous system.
- ◆ **autonomic temperature regulation** See temperature regulation: autonomic temperature regulation.
- ◆ **autonomous behavior** See behavior: autonomous spontaneous behavior.
- ◆ **autonomy** See need: autonomy.
- ◆ **autoparasitism** See parasitism: autoparasitism.
- ◆ **autoparthenogenesis** See parthenogenesis: autoparthenogenesis.
- ◆ **autophage** See -phage: autophage.
- ◆ **autophagous, autophagy** See -phagy: autophagy.
- ◆ **autophile** See ¹-phile: autophile.
- ◆ **autophobia** See -phobia: arachneophobia.
- ◆ **autopoloidy** See -ploidy: autopoloidy.
- ◆ **autopoiesis** *n.* A cell's, or organism's, metabolic self-maintenance with the use of carbon and energy sources (Margulis et al. 1985, 69).
adj. autopoietic
Comment: "Autopoiesis" is characteristic of all cells, but not of viruses or plasmids (Varela and Maturana 1974 in Margulis et al. 1985, 69).
- ◆ **autopolypliody** See -ploidy: autopolypliody.
- ◆ **autoradiograph** See graph: autoradiograph.
- ◆ **autoselection** See selection: autoselection.
- ◆ **autosex** *v.t.* A person's using sex-linked morphological characters to identify the sex of an immature organism before the development of adult sexual dimorphism (Lincoln et al. 1985).
- ◆ **autoshaping** See shaping: autoshaping.
- ◆ **autosome** See chromosome: autosome.
- ◆ **autotherm** See -therm: autotherm.
- ◆ **autothysis** See behavior: defensive behavior: autothysis.
- ◆ **autotilly** See autotomy.
- ◆ **autotomy** *n.* An animal's, or colony's, shedding part of its whole; *e.g.*, papillae of nudibranch molluscs; legs of daddylonglegs, crabs, and spiders; arms of starfish; tails of some lizard and snake species, and zooids of colonial organisms (Fabre 1928, etc. in Formanowicz 1990, 400 who lists review articles on autotomy in some taxa; Matthews and Matthews 1978, 341).
syn. autotilly (Lincoln et al. 1985), autotomization (Halliday and Adler 1986, 89)
v.t. automize
Comments: In some crab species, individuals autotomize a particular leg if it is pulled by the individual itself or an outside force; in other species, an automizer muscle can shed a leg without its being pulled (Barnes 1974, 615).
[*auto* + Greek *tomē*, a cutting < *temnein*, to cut]
- ◆ **autotroph** See -troph-: autotroph.
- ◆ **autozygous** See -zygous: autozygous.
- ◆ **autumn song** See animal sounds: song: subsong.
- ◆ **autumnal equinox** See equinox: autumnal equinox.
- ◆ **auxesis** *n.* Growth, sometimes used in a restricted sense to refer to the special case of "isauxesis" (Lincoln et al. 1985).
See auxesis: heterauxesis: isauxesis; growth.
- ◆ **heterauxesis** *n.*
1. The differential growth of body parts (*x* and *y*), expressed by the equation $y = bx^a$, where *a* and *b* are fitted constants (Huxley 1932 in Futuyma 1986, 413).
Note: Heterauxesis is important in the differentiation of castes of the social insects, especially ants (Wilson 1975, 578). "Large ants (but small Humans)"

A

- tend to have relatively large heads; the head grows at a different rate from the body as a whole" (Dawkins 1982, 283).
- syn.* allometry, canalization (sometimes), developmental canalization (sometimes), differential relative growth, heterogony (sometimes)
2. Change of shape, or proportion, with increase in size (Lincoln et al. 1985).
- syn.* allometry, heterogony
- **allomorphosis** *n.* Individual, population, specific, or phylogenetic heterauxesis (Lincoln et al. 1985).
- **bradyauxesis** *n.* Heterauxesis in which a , from the equation $y = bx^a$, is less than unity, so that a given structure is relatively smaller in large individuals than in small ones (Lincoln et al. 1985).
- **isauxesis, isometric growth, isometry, auxesis** *n.* Heterauxesis in which a , from the equation $y = bx^a$, equals unity and in which no change in shape occurs with increasing size (Lincoln et al. 1985).
- **monophasic allometry** *n.* "Polymorphism in which the allometric regression line has a single slope" (Wilson 1975, 589).
- Comment:* In Ants, "monophasic allometry" also implies that the relation of some of the body parts measured is nonisometric (Wilson 1975, 589).
- **tachyauxesis** *n.* Heterauxesis in which a , from the equation $y = bx^a$, is greater than unity, so that a given structure is relatively larger in large individuals than in small ones (Lincoln et al. 1985).
- ◆ **auxiliary** *n.* In social insects, especially ants, bees, and wasps: A female that associates with other females of the same generation and becomes a worker (Wilson 1975, 579).
- See helper.
- cf.* caste: worker
- [Latin *auxiliarius* < *auxilium*, help < *augere*, to increase]
- ◆ **auxiliary character** See character: auxiliary character.
- ◆ **auxin** See hormone: auxin.
- ◆ **average** See mean.
- ◆ **avermectins** See drug: avermectins.
- ◆ **aversion-induced aggression** See aggression: aversion-induced aggression.
- ◆ **avian Davian behavior** See behavior: Davian behavior: avian Davian behavior.
- ◆ **aviary** See ²group: aviary.
- ◆ **Avida** *n.* A flexible computer platform for research on artificial organisms (Adami 1998 in Lenski et al. 1999, 661; <http://www.krl.caltech.edu/avida/>).
- ◆ **avifauna** See fauna: avifauna.
- ◆ **aviphobia** See -phobia: aerophobia.
- ◆ **avoidance-avoidance conflict** See ²conflict: avoidance-avoidance conflict.
- ◆ **avoidance, gradient of** *n.* An animal's strength is inversely proportional to the animal's distance from its goal box; its strength is measured as the animal's running, or pulling, away from its goal box and is shown when an investigator places the animal in a series of positions in a runway after the animal has been repeatedly presented with a strongly aversive stimulus, e.g., intense electric shock, in the goal box (Verplanck 1957).
- ◆ **avoidance conditioning, avoidance learning** See learning: avoidance conditioning.

- ◆ **avoiding reaction** See kinesis: klinokinesis.
- ◆ **award** *n.* A badge, citation, medal, money, etc. that a person receives by winning a contest or passing an examination (Michaelis 1963).
- Comment:* Below, I define some of the many prizes given for promise, work, or both in science and related fields.
- Cetacean Behavior and Conservation Award** *n.* An award, established in 2001, that funds graduate student research in cetacean behavior, conservation, or both (Animal Behavior Society 2002).
- John von Neuman Theory Prize** *n.* A prize awarded annually to a scholar (or scholars in the case of joint work) who has made fundamental, sustained contributions to theory in operations research and the management sciences (<http://www.informs.org/Prizes/vonNeumannPrize.html>, 2001).
- Comment:* The award is \$5,000, a medallion, and a citation (<http://www.informs.org/Prizes/vonNeumannPrize.html>, 2001).
- [after John von Neuman, mathematician, 1903–1957, famous for the development of game theory among other things]
- Japan Prize** *n.* A prize, first awarded in 1985, made to scientists and researchers who have made original and outstanding achievements in science and technology (www.meshnpt.or.jp/jst/prize).
- Comments:* The Prize is 50 million yen, a certificate, and a medal (www.meshnpt.or.jp/jst/prize). Biologists who won this award include Robert C. Gallo, Luc Mastagnier, Kary B. Mullis, and Frank Sherwood Rowland.
- Lasker Medical Research Awards** *n. pl.* Awards, established by Albert and Mary Woodard Lasker in 1945, made to physicians, public servants, and scientists whose accomplishments have made major advances in the understanding, diagnosis, prevention, treatment, and even cure of many of the great crippling and killing diseases (www.laskerfoundation.org/intro, 2000).
- syn.* America's Nobels (www.laskerfoundation.org/intro, 2000)
- Comments:* The Laskers sought to raise public awareness of the value of biomedical research to a healthy society (www.laskerfoundation.org/intro, 2000). An award recipient receives an honorarium, a citation highlighting achievements, and an inscribed statuette of the Winged Victory of Samothrace, the Foundation's symbol of victory over disability, disease, and death.
- MacArthur Prize** *n.* A prize, first awarded in 1981, given by the MacArthur Fellows Program of the John D. and Catherine T. MacArthur Foundation to exceptionally creative individuals, regardless of their fields of endeavor (www.macfdn.org).
- syn.* genius grant, MacArthur-Foundation—"Genius" Award (Rimer 1996, B7)
- Comments:* The Prize is an unrestricted 5-yr grant of up to \$350,000, which an individual winner may spend in any way that he chooses (www.macfdn.org). Other biologists who won this prize include Eric L. Charnov, Jared M. Diamond, Philip James DeVries, Paul R. Ehrlich, Michael Ghiselin, Stephen Jay Gould, Daniel H. Janzen, Richard E. Lenski, Jane Lubchenco, Barbara McClintock, George F. Oster, Roger S. Payne, Naomi Pierce, Margie Profet, Nancy A. Moran, Peter H. Raven, Alan Walker, Carl. R. Woese, and Richard Walter Wrangham.

National Medal of Science *n.* An award, enacted by the U.S. Congress in 1959, given to engineers and scientists who made a large impact on behavior or social science, biology, chemistry, engineering, or mathematics (www.asee.org/hstmf/html/medals, 1998).

Comments: This Medal is the highest honor bestowed by the President of the U.S. to a leading scientist. Biologists who won this prize include Seymour Benzer, Carl Djerassi, Theodosius Dobzhansky, Thomas Eisner, Harry F. Harlow, G. Evelyn Hutchinson, Edwin H. Land, Ernst Mayr, Barbara McClintock, Ruth Patrick, Linus Pauling, Wendell L. Roelofs, James D. Watson, and Edward O. Wilson.

National Medal of Technology *n.* An award, enacted by the U.S. Congress in 1980 and first awarded in 1985, whose primary purpose is to recognize technological innovators who have made lasting contributions to enhancing the U.S.'s competitiveness and standard of living (www.asee.org/hstmf/html/medals, 1998).

Comments: This award highlights the national importance of fostering technological innovation based upon solid science, resulting in commercially successful products and services" (www.asee.org/hstmf/html/medals, 1998). This Medal is the highest honor bestowed by the President of the U.S. to a leading innovator. The President awards one annually "to individuals, teams, or companies for accomplishments in the innovation, development, commercialization, and management of technology, as evidenced by the establishment of new or significantly improved products, processes, or services." Awardees include William H. Gates III and Edwin H. Land.

Nobel Prize *n.* A prize, first awarded in 1901, given for exceptional research in the fields of chemistry, literature, peace, physics, and physiology or medicine by the Nobel Foundation (www.nobel.se, 1998).

Comments: Karl von Frisch, Konrad Lorenz, and Nikolaas Tinbergen shared the Nobel Prize in 1973 in Physiology or Medicine for their discoveries concerning organization and elicitation of individual and social behavior. Other biologists who won this prize include Francis Harry Compton Crick, Walter Rudolf Hess, Schack August Steenberg Krogh, Ivan Petrovitch Pavlov, Barbara McClintock, Thomas Hunt Morgan, Nikolaas Tinbergen, and James Dewey Watson (<http://www.almaz.com/nobel/medicine/>, 2000).

Pulitzer Prize *n.* A prize, established by Joseph Pulitzer and first awarded in 1917, given for excellence in education, journalism, or letters and drama or for a traveling scholarship (www.pulitzer.org).

Comments: Joseph Pulitzer, a newspaper publisher, established this Prize in his will. Prizes were for a history of public service by the press, American biographies, American novels, books on U.S. history, and original plays performed in New York (www.pulitzer.org). He established an overseer advisory board and willed it "power in its discretion to suspend or to change any subject or subjects, substituting, however, others in their places, if in the judgment of the board such suspension, changes, or substitutions shall be conducive to the public good or rendered advisable by public necessities, or by reason of change of time." The board later added music, nonfiction books, photography, and poetry as award subjects. In 1997, the board started recognizing online journalism. In 1998,

the board started including American music in addition to classical music. Biologists who won this prize include Jared Diamond, Bert Hölldobler, and Edward O. Wilson.

Tyler Prize *n.* A premier award, established by John and Alice Tyler in 1973, that honors significant achievements in environmental science and environmental protection (www.usc.edu/admin/provost/tylerprize, 1998).

Comments: The prize is \$200,000 and a gold medallion (www.usc.edu/admin/provost/tylerprize, 1998). Biologists who won this Prize include Herbert Bormann, Anne and Paul Ehrlich, Thomas Eisner, Charles Elton, Jane Goodall, Biruté Galdiakas, G. Evelyn Hutchinson, Gene E. Likens, Eugene P. Odum, Peter Raven, George Schaller, and Edward O. Wilson.

♦ **awareness** *n.*

1. A person's being watchful, vigilant, cautious (Oxford English Dictionary 1972, entries from 1095).

Note: One can parsimoniously apply this definition to nonhuman animals as well.

2. A person's being informed, cognizant, conscious, sensible (Oxford English Dictionary 1972, entries from 1205); consciousness, *q.v.*; cognizance (Michaelis 1963).

3. A person's "whole set of interrelated mental images of the flow of events; they may be close at hand in time and space, like a toothache, or enormously remote, as in an astronomer's concept of stellar evolution" (Griffin 1976, 5).

4. A person's "experiencing of interrelated mental images" (Griffin 1981, 12, in Burghardt 1985, 908).

5. A person's behavior that "entails the experiencing of thinking about something" including some "evaluation or recognition of relationships between the objects and events about which we are thinking" (Griffin 1982, 4, in Burghardt 1985, 908).

6. An animal's appearing to know something or responding to stimuli (Burghardt 1985, 908).

Note: "Awareness" is currently preferred to the term "consciousness" (Burghardt 1985, 909).

syn. conscious awareness (Griffin 1981 in Burghardt 1985, 908), consciousness (Burghardt 1985, 905)

*cf.*³consciousness

Comment: Definitions and synonomies for these terms are often confusing: awareness, conscious awareness, consciousness, mental experience, self-awareness, self-consciousness, and true consciousness, *q.v.*

[Old English *gewær*, watchful]

conscious awareness *n.* Human behavior with five levels—proprioceptive body awareness, awareness of situational contingency, awareness of agency, awareness of social agency, and linguistic self-consciousness (Crook 1983).

Comments: "Proprioceptive body awareness" is closed-loop systems' monitoring the interdependence of bodily processes involving a continuous attention to inputs from many sources, *e.g.*, bodily positioning in aerobatic flight or in echolocational pursuit of prey. "Awareness of situational contingency" is an awareness of the relations between bodily positioning and environmental situations at times of intense activity, possibly being concomitant with movement and providing an implicit reference to one's position. "Awareness of agency" is a continuous monitoring of body positions in time and space, suggesting an implicit recognition of one's body as an agent in the tactical expression of a foraging strategy. "Awareness

of social agency" is a continuous monitoring of the relations between self and others in complex mammalian societies, being highly likely in the context of collaborative, manipulative, or cheating behaviors. "Linguistic self-consciousness" is one's insight relating inner feeling and agency in behavior, leading to clear symbolization of self as an agent and using pronouns in language. As language develops, using metaphors in expressions of knowledge means that consciousness becomes primarily concerned with meanings and constrained by words.

self-awareness *n.*

1. A person's perception of himself as distinct from other selves (Hubbard 1975 in Dawkins 1980, 24; Gallup 1979, 418); a person's "capacity to think in terms of one's self-concept, focusing attention, processing information and acting with regard to this concept" (Harr and Lamb 1983).
2. An individual animal's being aware of its own existence, with self-recognition as one criterion (Gallup 1975); an individual animal's being aware of itself as different from all other entities (Bunge 1984, 186–187).
3. An individual animal's "ability to abstract and to form a conceptual framework of its environment so that it can perceive itself and its actions in relation to the environment," (e.g., in Great Apes) (Universities Federation of Animal Welfare workshop 1980 in Crook 1983, 11); an animal's ability to become the subject of its own attention (Gallup 1982, 243).

cf. awareness; awareness; conscious awareness; ³consciousness; self-consciousness; self

Comments: Epstein et al. (1981) question an animal's using a mirror to examine parts of its body as a test of

self-awareness. They report how *Columba livia* (Rock Doves) learn to use a mirror to locate spots on their bodies that they cannot see directly and how their behavior is not likely to be due to self-awareness.

► **objective self-awareness** *n.* A person's evaluating himself and attempting to attain correctness and consistency in his beliefs and behaviors (Wicklund and Duval 1971); a person's focusing on himself as an object to be evaluated (Liebling and Shaver 1973, 298).

Comment: This is very close to "self-consciousness" in everyday usage and is very similar to Wine's concept of "self-attention" (Liebling and Shaver 1973, 298).

► **subjective self-awareness** *n.* A person's focusing his attention outward; being concerned with other persons, objects, and events, and not being cognizant of himself "as a distinct entity to be compared against standards" (Liebling and Shaver 1973, 298).

triadic awareness *n.* For example, in the *Macaca mulatta* (Rhesus Macaques): A focal animal's taking into account the interrelationships of two conspecific individuals when it interacts with each of these individuals; e.g., animal A is likely to be friendly with B in the presence of C if B and C are allies (Waal 1989, 107).

♦ **axenic** See -xenic: axenic.

♦ **axiom** *n.*

1. A self-evident, or universally recognized, truth (Michaelis 1963).
2. An established principle or rule (Michaelis 1963).
3. A self-evident proposition of logic, or mathematics, accepted as true without proof (Michaelis 1963).

cf. doctrine, dogma, law, principle, rule, theorem, ³theory, truism

b

- ♦ **baa** See animal sounds: baa.
- ♦ **Babinski reflex** See reflex; Babinski reflex.
- ♦ **baby coloration** See coloration: baby coloration.
- ♦ **baby grunt** See animal sounds: grunt: baby grunt.
- ♦ **baby schema** *n.* A combination of stimuli (including a relatively large head, forehead arch, and eyes found in young of some bird and mammal species) that release epimegetic behavior of some primate species including humans (Lorenz 1943 in Heymer 1977, 97).
- ♦ **baby sitter** See parent: alloparent.
- ♦ **bachelor group** See ²group: bachelor group.
- ♦ **back mutation** See ⁴mutation: back mutation.
- ♦ **backcross** See cross: backcross.
- ♦ **backcross generation** See generation: backcross generation.
- ♦ **background imitation** See camouflage.
- ♦ **background genotype** See -type, type: genotype: background genotype.
- ♦ **background variable** See variable: independent variable.
- ♦ **backward conditioning** See learning: conditioned learning (comments).
- ♦ **Baconian inductivism** See inductivism.
- ♦ **bacterial pyrogen** See pyrogen: bacterial pyrogen.
- ♦ **bacteriology** See study of: bacteriology.
- ♦ **bacteriophage, bacteriophagous** See -phage: bacteriophage.
- ♦ **bacterioplankton** See plankton: bacterioplankton.
- ♦ **badge of status** *n.* An animal's features, or appearance, that indicates its ability to maintain control of a resource, such as a territory; e.g., the area of black feathers below the bill of a male *Zonotrichia querula* (Harris' Sparrow) or the red epaulet of a *Agelaius phoeniceus* (Red-winged Blackbird) [coined by Dawkins and Krebs 1978 in Immelmann and Beer 1989, 26].
syn. badge (Hansen and Rohwer 1986, 69).
- ♦ **Baer's laws** See law: von Baer's laws.
- ♦ **Baker's law** See law: Baker's law.
- ♦ **Bakerian mimicry** See mimicry: Bakerian mimicry.
- ♦ **balance of nature** *n.* The state of equilibrium in nature that results from the constant interaction between organisms and their environments (Lincoln et al. 1985).
- ♦ **balance-shift theory** See ³theory: balance-shift theory.
- ♦ **balance theories** See ³theory: balance theories.
- ♦ **balanced-genetic polymorphism** See -morphism: polymorphism: balanced polymorphism.

- ♦ **balanced-hermaphrodite population** See ¹population: balanced-hermaphrodite population.
- ♦ **balanced-incomplete block** See experimental design: incomplete block: balanced-incomplete block.
- ♦ **balanced load** See genetic load: segregational load.
- ♦ **balanced polymorphism** See -morphism: polymorphism: balanced polymorphism.
- ♦ **balancing selection** See selection (table).
- ♦ **Baldwin-Waddington effect** See effect: Baldwin-Waddington effect.
- ♦ **ballistrophobia** See -phobia: ballistrophobia.
- ♦ **ballooning** *n.* For example, in some spider species, larvae of *Lymantria dispar* (Gypsy Moths) and *Thyridopteryx ephemeraeformis* (Evergreen Bagworm Moths): An individual's being carried through the air by a strand of silk (a gossamer) that it produces (Haseman 1912; Borror et al. 1989, 112).
syn. Parachuting (Borror et al. 1989, 112)
Comments: Populations disperse by ballooning. A population of the Gypsy Moth can move up to many kilometers per year by this mechanism.
- ♦ **band** *n.* In genetics, one of the many light and dark patterns on chromosomes that results from certain artificial chemical treatment of them; depending on the staining technique used, one sees C, G, Q, R, or T bands (Mayr 1982, 775).
See ²group: band.
- ♦ **banded-iron formation (BIF)** *n.* A rock that consists of alternating bands of iron-rich minerals, generally hematite and chert (or fine-grained quartz) (Bates and Jackson 1984).
Comments: Banded-iron formations date from about 1.8 through 3.8 Ga. The BIFs of the Isua Area of southern Greenland are some of Earth's very old rocks and are 3.8 Ga (Stanley 1993, 195). Other BIFs that are about 2.25 Ga old occur in Ishpeming and Jasper Knob, Michigan, U.S. (exhibit, United States National Museum of Natural History, 2002). The lighter reddish bands are more iron rich than the darker reddish bands. Banded-iron formations evidently represent a time when cyanobacteria were producing oxygen that combined with suspended iron in oceans. After the iron became oxidized, it settled to the ocean bottom and eventually became part of BIFs (Stanley 1993, 218). Most iron that people mine today is from BIFs.
- ♦ **BAP** See plan: Biodiversity Action Plan.
- ♦ **barachore** See -chore: barachore.
- ♦ **bar chart, bar diagram** See graph: bar graph.
- ♦ **bared-teeth display** See display: bared-teeth display.

- ◆ **bared-teeth-scream display** See display: bared-teeth-scream display.
- ◆ **baren, barren** See ²group: baren, barren.
- ◆ **bark** See animal sounds: bark.
- ◆ **barokinesis** See kinesis: barokinesis.
- ◆ **barophile** See ¹-phile: barophile.
- ◆ **barotaxis** See taxis: barotaxis.
- ◆ **Barr body** See chromosome: Barr body.
- ◆ **Barro Colorado Island** See place: Barro Colorado Island.
- ◆ **basal ganglia** See organ: brain: basal ganglia.
- ◆ **base pair** *n.* One base pair composed of two bases that always chemically bond together in a DNA double helix, e.g., adenine with thymine and cytosine with quanine (Rudin 1997, 35).
See unit of measure: base pair, megabasepair.
- ◆ **Basic Local Alignment Search Tool** See algorithm: Basic Local Alignment Search Tool.
- ◆ **basic productivity** See production.
- ◆ **basic rank** See ¹rank: basic rank.
- ◆ **basifuge** See -phobe: calciphobe.
- ◆ **basophile** See ¹-phile: basophile.
- ◆ **bat detector** See instrument: bat detector.
- ◆ **Bateman's principle** See principle: Bateman's principle.
- ◆ **Batesian mimicry, Bate's theory of mimicry** See mimicry; mimicry: Batesian mimicry, deceptive-floral mimicry.
- ◆ **Batesian-mimicry ring** See mimicry ring: Batesian-mimicry ring.
- ◆ **Batesian-Poultonian mimicry** See mimicry: Batesian-Poultonian mimicry.
- ◆ **Batesian-Wallacian mimicry** See mimicry: Batesian-Wallacian mimicry.
- ◆ **bathophile, bathypophile** See ¹-phile: bathophile.
- ◆ **bathophobia** See -phobia: bathophobia.
- ◆ **batrachophobia** See -phobia: batrachophobia.
- ◆ **battered-Earth hypothesis** See hypothesis: battered-Earth hypothesis.
- ◆ **battery** See ²group: battery.
- ◆ **Bauplan** *n.*, *pl. Baupläne* An organism's basic arrangement of its parts that gives it a unity (von Uexküll 1899 in Gherardi 1984, 373).
cf. phylotypic body plan
See -type, type: archetype.
[German *Bauplan*, ground plan]
- ◆ **bay** See habitat: bay.
- ◆ **Bayesian forager** See forager: Bayesian forager.
- ◆ **Bayesian statistics** See study of: statistics: Bayesian statistics.
- ◆ **B-chromosome** See chromosome: B-chromosome.
- ◆ **BCI** See place: Barro Colorado Island.
- ◆ **BC₁, BC₂, etc.** See generation: backcross generation.
- ◆ **BDFFP** See project: Biological Dynamics of Forest Fragments Project.
- ◆ **beacon hypothesis** See hypothesis: firefly-flash synchronization hypothesis: beacon hypothesis.
- ◆ **Beagle** See Dog: Beagle.
- ◆ **bean-bag genetics** See study of: genetics: bean-bag genetics.
- ◆ **bearing-and-caring** *n.* Informally, the sex that invests more in offspring shows more "concern" for its offspring (Dawkins 1976, 117, 186).
- ◆ **beater effect** See effect: beater effect.
- ◆ **Beau-Geste effect, Beau-Geste hypothesis** See effect: Beau-Geste effect.

- ◆ **Bekner-Marshall hypothesis** See hypothesis: hypotheses regarding the origin of the Cambrian explosion: Bekner-Marshall hypothesis.
- ◆ **becoming accustomed** See learning: becoming accustomed.
- ◆ **bed load** *n.*
 1. The parts of a stream's transported materials that move on, or immediately above, its bed, such as the larger, heavier particles (boulders, gravel, pebbles) rolled along its bottom (Bates and Jackson 1984).
 2. The parts of a stream's transported particles that are not continuously in solution or suspension (Bates and Jackson 1984).

syn. bottom load, traction load (Bates and Jackson 1984)

Comment: When researchers quantify bed load, they trap it in a sediment box placed in a stream, remove it, and weigh it.
- ◆ **bee bread** *n.* A mixture of beneficial microbes, pollen, and nectar (or honey) that *Apis mellifera* (Western Honey Bees) store in their open hexagonal comb cells (Buchmann and Nabhan 1996, 242).
- ◆ **bee dance** See dance: bee dance.
- ◆ **bee-language hypothesis** See hypothesis: dance—"language" hypothesis.
- ◆ **beetlephilia** See -philia: beetlephilia.
- ◆ **behavior** *Brit. behaviour* *n.* The manner in which a person, substance, machine, or other thing acts under specified conditions, or circumstances, or in relation to other things (Oxford English Dictionary 1971, entries from 1490; Michaelis 1963).
See behavior: animal behavior, organism behavior.
cf. act; action; activity; aggression; animal sounds; behavior: animal behavior, human behavior, organism behavior; behavior pattern; behavioral act; behavioral type; behavior, classification of; brooding; care; charge-strike, coenotrope; copulation; courtship; dating; display; episode; flehmen, flight foraging; greeting; habit; head-up-tail-up behavior; homing; hunting; kidnaping; kinesis; klinokinesis; language; learning; lingulation; mating; mouse pounce; movement; must; nursing; orientation; panting; phoresy; play; posture; pouting; quivering; recruitment; reflex; response; scratching; submission; suckling; swimming; symbiosis: phoresy; temperature regulation; territoriality; treading; vigilance; and wing fanning
v.i. behave
adj. behavioral, *Brit.* behavioural
Comments: Some workers use "behavior" as both a singular and plural term; other workers use "behavior" as singular and "behaviors" as plural (Edwards 1986). Only some of the many kinds of named behavior are listed below.
[Formed on behave by form analogy with havour; behave; behavior < Middle English *be-*, thoroughly + *have*, to hold oneself, act < Old English *bebaben*, had < Old High German *bibabn* < *be-*, about + *babban*, to hold, have, in senses "encompass, contain, detain" (Oxford English Dictionary)].
- ◆ **abnormal behavior** *n.* In many animal species: A very large mixed category of behavior that includes persistent, undesirable actions; that is shown by a minority of individuals of a population; that is not due to any obvious damage to an animal's nervous system; and that is generalized (not confined to any situation that originally elicited it) (Broadhurst 1960 in Dawkins 1980, 77).
- ◆ **behavioral anomaly** (Immelmann and Beer 1989, 1)

cf. behavioral deficit; captivity degeneration; hospitalism; hypersexuality; hypertrophy; Kasper-Hauser; learning; imprinting; erroneous imprinting; mounting attempt; syndrome: deprivation syndrome, separation syndrome; stereotypy

Comments: Abnormal behavior is damaging or maladaptive to an animal according to Fraser (1968 in Dawkins 1980, 77), but not according to Meyer-Holzapfel (1968 in Dawkins 1980, 77). “Abnormal behavior” may overlap broadly with “fear” and “conflict behavior” (Dawkins 1980, 77). Examples of abnormal behavior include a monkey’s biting itself so hard that it screams with pain, a cockatoo’s pulling out all of its feathers except a single one on the top of its head, and pigs’ biting each other’s ears and tails (references in Dawkins 1980, 77).

► **erroneous imprinting**

See learning: imprinting.

► **deprivation syndrome** See syndrome: deprivation syndrome.

► **separation syndrome, separation trauma** See syndrome: separation syndrome.

► **stereotypy** See stereotypy.

acquired behavior *n.* An individual’s “behavior that has been experimentally demonstrated, in either its topography or stimulus control or both, to be dependent in part upon the operation of variables encountered in conditioning and learning, such as the occurrence of reinforcing stimuli . . .” (Verplanck 1957).

ant. inborn behavior, unlearned behavior (Verplanck 1957)

cf. learning: conditioning

Comment: All animal species might have acquired behavior.

adjunctive behavior See behavior: displacement behavior.

advertising, advertisement (behavior) See display: advertisement.

aggression, aggressive behavior See aggression.

agonistic behavior *n.*

1. In many animal species: A behavior complex that includes all attack, threat, appeasement, and flight behavior (Scott and Fredericson 1951 in Hinde 1970, 336; Verplanck 1957).
2. Animal fighting and competitive behavior that includes threats and offensive attacks as well as defensive fighting (Johnson 1972, 8).

syn. aggression (excluding fleeing, but a clear distinction between “agonistic behavior” and “aggression” is preferred, Immelmann and Beer 1989, 10)

cf. aggression

alarm behavior *n.*

1. In some species of mud snails, sea slugs, sea urchins, and anuran amphibians; many fish species: An individual’s retreating in response to chemicals discharged from a conspecific individual that is injured, alarmed, or both (Frisch 1938, etc., in Hews 1988, 125; Maschwitz 1964).
2. An animal’s behavior shown in response to a predator’s appearance and that alerts conspecifics of a threat, alerts a predator that an alarmer is well aware of its presence, or both; *e.g.*, acoustic warning signals in many bird and some mammal species; ground thumping by some mammal species; releasing alarm pheromones in some insect species; white-tail flashes of some deer and rabbit species; touching in some fish species; and

mobbing in some bird species (LaGory 1987, 20; Immelmann and Beer 1989, 326).

syn. alarm response (LaGory 1987, 20); alarm signaling (Maschwitz 1964, 268); recruitment (sometimes, Wilson 1965, 1065); warning behavior

cf. chemical-releasing stimulus: semiochemical: pheromone: alarm pheromone; enemy specification; signal: alarm signal

allelomimetic behavior *n.*

1. Any behavior in which animals “do the same thing with some degree of mutual stimulation and consequent coordination” (Scott 1956, 215).

syn. mood induction (Scott 1946)

2. Two, or more, animals’ imitative behavior that results from mutual stimulation (Lincoln et al. 1985).

3. Mimicry of a single animal’s behavior by others in its group, *e.g.*, in Llamas that perform excretion in a localized area, lining up at the area as soon as one member urinates or defecates (Altmann 1969 in Heymer 1977, 168).

cf. effect: group effect

Comment: Immelmann and Beer (1989, 275) distinguish between “mood induction” and “social facilitation,” *q.v.* In “mood induction,” an animal switches to a new mood (*e.g.*, from fleeing to preening) due to observing its group conspecifics’ showing the behavior to which it switches.

allochthonous behavior *n.* An animal’s focal behavior that is energized by the drive built up by other activities besides the focal behavior (Kortlandt 1940 in McFarland 1985, 383).

See behavior: displacement behavior.

cf. behavior: autochthonous behavior

altruistic behavior See altruism.

amatory behavior *n.* “All the minor and less stimulating attentions, such as licking and nuzzling,” that may keep two animals together (Southern 1948, 179).

ambivalent behavior *n.*

1. An animal’s alternately showing two different reactions, or their incipient forms, because two different sign stimuli are present, each eliciting a different behavior, *e.g.*, the zig-zag dance of a male stickleback (Tinbergen 1951, 50).

2. An animal’s tending to behave in two, or more, incompatible ways at the same time (Hinde 1982, 277).

cf. emotional ambivalence

ambivalent movements and postures *n. pl.*

In animals in which two, or more, conflicting drives are weakly activated: A combination of intention movements of introductory appetitive behavior that belongs to the drives involved and in some cases, integrated movements that typically occur later in the chain from introductory appetitive to consummatory behavior (Bastock et al. 1953, 67).

cf. behavior: ambivalent behavior, compromise behavior, displacement behavior; conflict

Comments: These behaviors occur because the individual in question responds to all activated drives simultaneously. “Although ambivalent combinations of movements may visually resemble various displacement activities, they differ basically from displacement activities in that they are autochthonous” (Bastock et al. 1953, 67). An example of an ambivalent posture is found in a duck that has approached a person for bread and then cranes its neck forward

to reach the bread and simultaneously turns its body away from the person (McFarland 1985, 401).

amicable behavior *n.* In some rat species: All specific forms of behavior that involve the association together of two, or more, individuals and that do not involve conflict, including sexual behavior and care of young (Barnett 1958, 117).

animal behavior *n.*

1. "The total of movements made by the intact animal" (Tinbergen 1951, 2).
2. All observable, recordable, or measurable activities of a living animal, including muscular contractions that cause movement, organelle (*e.g.*, cilium) movement, color changes, and glandular secretion, due to the animal's interactions with, or reactions to, its environment (Collocot and Dobson 1974); "what an animal does" (Lehner 1979, 8).
3. One, or more, behaviors of one animal, species, or other grouping of animals.

See study of: behavior.

syn. behavior

cf. behavior: human behavior, organism behavior

antipredatory behavior *n.* An organism's behavior that helps to minimize its being attacked and consumed by a predator (Ylnen and Magnhagen 1992, 179).

cf. aggression: antipredator aggression

aposematic behavior, aposematism *n.* In many animal species with defenses (bites, sprays, stings, toxicity) and either warning coloration (*q.v.*) or warning structures, or both: An individual's acting as if it is dangerous to a potential predator (*e.g.*, by resting in a conspicuous place or walking slowly in the open) (Wilson 1975, 579; Matthews and Matthews 1978, 312, 323).

syn. warning (behavior)

cf. allosomatic; coloration: aposematic coloration

apotreptic behavior See behavior: threat behavior.

appeasement, appeasement behavior *n.* In many animal species: An individual's behavior that occurs in agonistic contexts and commonly signifies lack of hostility towards, or intent to attack, another conspecific animal and is often directly opposite in form from threats, *q.v.*; *e.g.*, a Wolf that is losing a fight throws up its head and turns the ventral surface of its neck toward the jaws of the winner (Darwin 1872, Verplanck 1957, Sparks 1965, Hand 1986, 216). See display: appeasement display.

syn. appeasement display (in some contexts, Wilson 1975), appeasing signal (in some contexts, Hand 1986, 216), submission (Brown 1985)

cf. submission

Comments: Appeasement functions either to halt aggression or facilitate conciliation; "appeasement" does not necessarily indicate either submission or subordination (Hand 1986, 216). "Appeasement," defined as behavior that activates behavior of another animal that is incompatible with aggression, is sometimes distinguished from "submissive behavior," defined as the cessation of aggressive signaling. "Appeasement" commonly includes the connotation of "submission" (Immellmann and Beer 1989, 18).

► **trophallactic appeasement** *n.* In Ants: A worker's use of a liquid-food offering to appease a potentially hostile worker (Hölldobler and Wilson 1990, 644).

appetitive behavior *n.*

1. "A term applied to characterize, in terms of an inferred or anticipated (by the ethologist) consummatory act, the behavior of an animal that is not at rest or 'doing nothing'" (Verplanck 1957).
2. An animal's "variable, agitated behavior that is terminated by the occurrence of a stimulus releasing a consummatory act" (W. Craig in Dewsbury 1978, 14).
3. Behavior that enables an animal to perform a specific kind of action or to attain a specific state of being; *e.g.*, satiety, stimulus reception, arrival at a suitable nesting place, or contact with particular individuals (Immellmann and Beer 1989, 18).
4. An animal's orientation and adjustment movements that are more, or less, reflexes (Immellmann and Beer 1989, 19).

cf. behavior: consummatory behavior

Comments: Appetitive behavior is usually comparatively plastic with a learned component (Immellmann and Beer 1989, 19).

[coined by Sherrington 1906 in Hailman 1984]

attachment behavior *n.*

1. A number of evolved response systems (behaviors) that maintain proximity between a human mother and her infant that is necessary for the infant's survival (Bowlby 1969, 1973 in Hinde 1974, 189).
2. The number of different types of behavior contributing to maintaining proximity, or contact, between a human parent and his young; these include proximity- and contact-seeking behavior such as approaching, following, and clinging, and signaling behaviors such as smiling, crying, and calling of infants (Ainsworth and Bell 1970, 50; Hinde 1982, 228).

Note: Attachment figures can be nonparents or even other children (Harré and Lamb 1983).

3. Any behavior that results in a person's obtaining, or retaining, proximity to some other differentiated and preferred individual, usually conceived as stronger, wiser, or both (Bowlby 1975 in Goldenson 1984).

cf. attachment

Comment: Human infant attachment behaviors include signals (*e.g.*, crying, smiling, vocalizing) and active proximity-seeking (approaching, following, and clinging) to an attachment figure, typically the infant's mother (Mann 1991, 1).

attack behavior *n.* In many animal species: "A broad response class including those behaviors of an animal that, when carried to completion, bring to bear one or more of the animal's effectors on the body surface of a second animal in such a way that injury and possibly death of the second animal will occur if the behavior continues. [In a given species more precise specification is possible in terms of biting, clawing, hitting with the wings, and the like.]" (Verplanck 1957).

autochthonous behavior, autochthonous activity *n.* A behavior caused by its proper (own) drive (Tinbergen 1952, 6).

cf. behavior: displacement behavior; drive; instinct

autonomous behavior See behavior: autonomous spontaneous behavior.

beneficent behavior *n.* An organism's behavior that raises the fitness of a conspecific regardless of its evolutionary basis (West Eberhard 1975, 7).

cf. altruism, cooperation, mutualism

bonding behavior *n.* For example, in a crustacean, some mammal, and many bird species: An individual's behavior that establishes, or maintains, a pair bond; *e.g.*, sexual behavior, duet singing, courtship feeding, and allogrooming (Immelman and Beer 1989, 34, 212).

caching, caching behavior *n.*

1. A person's concealing, or storing, something in the earth or other place (Michaelis 1963).
2. A person's hiding an object in a secret place (Michaelis 1963).
3. An animal's storing food in a particular place.
4. An individual's storing food (such as seeds and succulent fruits and leaves) for long periods (Janzen 1977 and Smith and Reichman 1984 in Reichman 1988, 1535; Balda and Kamil, 1989, 486).
5. An animal's handling food in a way that conserves it for future use (Vander Wall 1990, 1).

syn. food hoarding, food storing (Vander Wall 1990, 1)

Notes: In this definition, an animal's handling food involves its deterring other organisms from consuming the food, and one or more of the following: food concealment, placement, preparation, and transportation (Vander Wall 1990, 1–2). This definition excludes an animal's accumulation of food in its crop or other diverticula of its digestive tract as occurs in birds including finches, grouse, and hummingbirds. The time of hoarding food varies from a few minutes (*e.g.*, in *Chlorocebus sabaeus*, Green Monkeys) through 2 yr (*e.g.*, *Sciurus vulgaris*, Red Squirrels).

cf. behavior: hoarding behavior: larder hoarding, scatter hoarding; cache

v.t. cach, cached

Comments: Food-hoarding animals can control the availability of their food in space and time, which gives them a marked advantage over nonhoarders (Vander Wall 1990, 1). Caching behavior occurs in many species including *Dipodomys* spp. (Kangaroo Rats); *Garrulus glandarius* (Eurasian Jay); *Gymnorhinus cyanocephalus* (Pinyon Jay); *Melanerpes lewis* (Lewis Woodpecker); *Neotoma floridana* (Eastern Woodrat); *Nucifraga columbiana* (Clark's Nutcracker); *Sciurus carolinensis* (Eastern Gray Squirrel); *Sciurus niger* (Fox Squirrel) *Sciurus vulgaris* (Red Squirrel); some *Argiope* spider, harvester-ant, pocket-mice, and spider-wasp species; and many bee species.

care-giving behavior See behavior: epimeletic behavior.

cf. care

catasematic behavior See submission.

chemical self-marking See behavior: marking behavior: automarking.

chin raising *n.* In some duck species: An individual's raising its bill, without just previously lowering it, while its body moves lower in water, as part of courtship behavior (Lorenz 1941 in Heymer 1977, 98).

v.t. chin raise

chinning *n.* For example, in *Meriones unguiculatus* (Mongolian Gerbils), *Oryctolagus cuniculus* (European Rabbits): An individual's rubbing the lower surface of its chin against objects on the ground resulting its depositing pheromones (Wilson 1975, 280).

v.i., v.t. chin

coenotrope *n.* Behavior common to all members of a group or species (Lincoln et al. 1985).

comfort behavior *n.*

1. In many kinds of animals: Animals' body-care behaviors (*e.g.*, dustbathing, grooming, rubbing, scratching, shaking, or washing) (Heymer 1977, 100; Immelman and Beer 1989, 49).
2. An animal's behaviors that relieve tensions arising from metabolic functions (*e.g.*, defecating, stretching, urinating, or yawning) (Heymer 1977, 100; Immelman and Beer 1989, 49).

Note: Is it unclear if yawning is one of these behaviors although Heyer (1977) included it.

syn. comfort search (Kortlandt 1940 in Heymer 1977, 100), comfort movements (Baerends 1950 in Heymer 1977, 100)

cf. ²movement: comfort movement; syndrome: stretching syndrome; yawning

compromise behavior *n.* Behavior that consists of separate components of conflicting tendencies (McFarland 1985, 401).

conflict behavior *n.* An animal's tension (often leading to displacement behavior) shown when simultaneous releasers activate contradictory activities, *e.g.*, attack and flee (Heymer 1977, 101).

cf. behavior: displacement behavior; conflict; ³theory: conflict theory of display

Comment: "Conflict behavior" includes "ambivalent behavior," "displacement behavior," and "redirection" (Immelman and Beer 1989, 57).

conscious behavior, consciousness *n.* A person's behavior that involves empathy, analogical sympathy, and concordance (Crook 1983, 12).

See ³consciousness.

Comment: Similar behavior is likely to occur in other vertebrates (Crook 1983, 13).

consummatory act, consummatory behavior *n.*

1. In many organism species: The last phase of an individual's appetitive-behavior sequence that ends an elicited series of actions and leads under normal conditions to drive reduction, *e.g.*, food ingestion or copulatory behavior (Craig 1918 in Heymer 1977, 61).

Note: In a behavioral sequence, an act can simultaneously represent appetitive and consummatory behavior (Craig 1918 in Heymer 1977, 61). Some kinds of appetitive behavior can reduce an animal's likelihood of immediate repetition or of continuation of a sequence in which they occur; this blurs the distinction between appetitive and consummatory behavior (Immelman and Beer 1989, 86).

2. An organism's act that "constitutes the termination of a given instinctive behavior pattern or sequence" (Thorpe 1951, 4).

3. One of a group of an organism's acts that "complete a reaction chain and give very plain evidence of release of appetitive tension" (Thorpe 1956, 26).

4. An organism's behavior that "constitutes the terminal phase of an instinctive behavior sequence" (Lincoln et al. 1985).

syn. end act (Immelman and Beer 1989, 86)

cf. behavior: appetitive behavior, comfort behavior; pattern: fixed-action pattern

[coined by Sherrington 1906 in Hailman 1984; linking "consuming" and "consummatory" is an unintended pun. Consuming comes from Latin *consumere*, to devour or destroy; consummatory comes from Latin *summa*, a total, or sum (Immelman and Beer 1989, 86).]

contact behavior, contactual behavior *n.*

1. In some wren, swift, and penguin species: Two, or more, usually conspecific individuals' maintaining bodily contact (Scott 1956, 214); in many cases, the birds position themselves so as to have as much of their body surfaces as possible in contact with another (Immelmann and Beer 1989, 58, 136); *e.g.*, in *Aptenodytes forsteri* (Emperor Penguins), during severe storms, members of a group's gathering together, forming a sort of roof by holding their heads together; other animals move toward the group's center and inner ones are pushed outward (Prevost 1961 in Heymer 1977, 156).
- syn.* huddling, huddling behavior
cf. animals: contact animals
2. For example, in clinging young of primates: A young's holding onto its parent, usually its mother (Immelmann and Beer 1989, 58).
3. In social animals: Signal exchange (Immelmann and Beer 1989, 59).

contact-seeking behavior *n.* Contact-oriented display and movements, especially in small children (Heymer 1977, 92).

cf. baby schema, hand patting

conventional behavior *n.*

1. An animal's "voluntarily agreeing" to curtail reproduction when it realizes that its population density is rising due to its perceiving ritualized displays from a conspecific(s) (Allee et al. 1949; Kalela 1954; Wynne-Edwards 1962 in Wilson 1975, 87).
2. "Any behavior by which members of a population reveal their presence and allow others to assess the density of the population," according to Wynne-Edwards' hypothesis (Wilson 1975, 581).

syn. epideictic display (Lincoln et al. 1985)

cf. display; selection: group selection

Comment: "Conventional behavior" is a controversial concept.

copulatory behavior See copulation.

► **postcopulatory behavior** *n.* Behavior that occurs immediately after copulation, *e.g.*, the postcopulatory display of Uganda Kobs or mate guarding of Japanese Beetles (Barrows and Gordh 1978).

syn. copulatory afterplay, postcopulatory play (Immelmann and Beer 1989, 229, who do not recommend these synonyms because "postcopulatory behavior" does not appear to be "play" in its strict sense)

cf. behavior: mate guarding

► **precopulatory behavior** See courtship.

► **pseudocopulatory behavior** See copulation: pseudocopulation.

courtship behavior See courtship.

cryptic behavior *n.*

1. In many animal species: An individual's behavior that enables it to be concealed, or concealed better, in its environment including altering its coloration (flatfish), sticking pieces of its environment onto itself (caterpillars of some geometrid moth species, some spider crabs), concealing itself with feces (Tortoise Beetles, Cassidinae), and resting in its environment in a concealing way as in flatfish (Wickler 1968, 54).
cf. camouflage
2. A behavior that a species has in its repertoire, but is never shown by certain individuals (White et al. 2000, 885).

curiosity behavior See behavior: exploratory behavior.

Davian behavior *n.* For example, in *Spermophilus richardsonii* (Richardson's Ground Squirrels): A male's copulating with a conspecific dead female (Dickerman 1960 in Lehner 1988).

[named after a ribald Limerick about necrophilia]

► **avian Davian behavior** *n.* In *Anas platyrhynchos* (Mallards): A male's copulating with a dead conspecific female [coined by Lehner 1988].

Comment: Male birds also copulate with dead heterospecific females (Lehner 1988).

defensive behavior *n.*

1. In many animal species: The measures that an individual takes that reduce its chances of being eaten as prey (Immelmann and Beer 1989, 71).
2. An animal's self-protective behavior shown in agonistic encounters with conspecifics (Immelmann and Beer 1989, 71).

Comment: Examples of defensive behaviors include an animal's keeping away from a predator; rapidly retreating from an aggressive conspecific; withdrawing into a burrow, crevice, or shell; submerging into water; displaying protean behavior; displaying thanatosis; and hiding (Immelmann and Beer 1989, 90).

cf. behavior: threat

Comment: Hermann and Blum (1981, 77–197) describe many of the defensive behaviors used by social Hymenoptera, including abdominal bursting; ant-wasp symbioses; architectural defense; attack (stinging and mobbing); biting; defensive immobility; defensive smearing; mimicry; stridulation; territoriality; use of defensive alarm pheromones, allomones, mandibular-gland secretions, phragmotic heads, protective body spines and other integumental modifications, and sticky fluids; and venom spraying.

► **autotomy** *n.* In some *Camponotus*-ant species: A worker's increasing the hydrostatic pressure inside her gaster until it bursts (Maschwitz and Maschwitz 1974 in Hermann and Blum 1981, 79; 86, illustration).
cf. abdominal bursting (Hermann and Blum 1981, 79)

Comment: An ant's bursting releases a large quantity of a sticky fluid that immobilizes an ant of another species that is attacking (Hermann and Blum 1981, 79).

► **cycloalexy** *n.* For example, in some chrysomelid-beetle and tenthredinid-sawfly species and a ceratopogonid species: Larvae's resting in a "tight circle" with their heads or abdominal ends at its periphery; surrounding other larvae inside the circle; and using coordinated threatening postures, regurgitation, and biting that repel predators or parasites (Lewis 1836, Vesconcellos-Neto and Jolivet 1988, etc. in Jolivet et al. 1990, 133, 139).

cf. circular defense, circular-defense strategy (Jolivet et al. 1990, 133–134)

Comment: Similar behavior occurs in some penguin and saturniid moth species, Muskoxen, Oryx, and some other vertebrate species (Jolivet et al. 1990, 133, 139).

[Greek *kyklos*, circle; *alexo*, defend, avert, ward off]

deimatic behavior *n.*

1. For example, in large-cat species: An animal's adopting an intimidating posture that frightens another animal (Lincoln et al. 1985).
2. In animals with eyespots, *e.g.*, some mantid, moth, and butterfly species: An individual's frightening a predator by suddenly exposing an eyespot, *q.v.*

(Immelmann and Beer 1989, 71; Edmunds and Brunner 1999, 291, illustrations).

cf. display: deimatic display

► **enteric discharge** *n.* Regurgitation (*e.g.*, in some grasshoppers that produces “tobacco juice,” and in some sawfly larvae), or defecation that is used as predator repellent (Matthews and Matthews 1978, 335).

cf. elimination: egestion

► “**heat defense**” *n.* In *Apis cerana japonica* (Japanese Honey Bees): Worker’s covering a *Vespa mandarinia japonica* (Japanese Giant Hornet) and killing it by baking it with their body heat (Masato Ono in Anonymous 1996, 16, February, illustration). *Comments:* The *Apis cerana japonica* raise their temperatures through 116°F by vibrating their wing muscles (Anonymous 1996, 16, illustration). They can tolerate a temperature of up to 122°F, but the hornets perish at 114°F.

► **playing dead** *n.* An animal’s defensive behavior in which it becomes essentially motionless and, thus, acts as if it were not alive (Maier and Schneirla 135, 222; Wilson 1975, 363).

syn. self-mimesis (a kind of) (Pasteur 1982, 184); akinesis, animal hypnosis, catalepsy, trance reaction (Hermann and Blum 1981, 104); ascaphus reflex, death-feigning behavior, death feinting, death feigning, feigning death, freezing, hypnotic reflex, playing possum (Opossum, Possum), thanatosis, tonic immobility (Lincoln et al. 1985)

cf. behavior: defensive behavior; kinesis: akinesis; hypnosis; response: immobility response

Comment: Playing dead occurs in some anole-lizard, ant, bat, bee, beetle, butterfly, frog, hog-nose snake, mantid, sawfly, spider, and wasp species; the African Ground Squirrel, Domestic Chicken, Gundi (rodent), Human, Monarch Butterfly, Turkey Vulture, and Virginia Opossum (Maier and Schneirla 135, 222; Wilson 1975, 363; Burghardt and Greene 1988, 1842; Allen 1996, 639; Edmunds and Brunner 1999, 293; D. R. Smith, pers. comm.; pers. obs.).

► **primary defensive behavior** *n.* An animal’s defensive behavior it continuously shows, including living in burrows, constructed tubes, or shells; camouflaging behavior, aposematic advertisement, and acting like a Batesian model (Immelmann and Beer 1989, 71).

► **secondary defensive behavior** *n.* An animal’s defensive behavior shown when it is faced with a predator, including escaping, thanatosis, protean behavior, deimatic behavior, attack deflection, and various forms of defensive attack (*e.g.*, mobbing) (Immelmann and Beer 1989, 71).

detour behavior *n.* An animal’s immediately following an alternative route with success after its path is blocked (Immelmann and Beer 1989, 151).

developmentally fixed behavior *n.* In all animal species: An individual’s behavior that arises from interactions of its environment and genetics during its ontogeny (Dawkins 1986, 62).

Comment: “Developmentally fixed” is not synonymous with “genetic” (inherited) (Dawkins 1986, 62).

displacement behavior, displacement activity *n.*

1. For example, in some bird and stickleback fish species and Humans: Behavior that appears irrelevant to the situation in which it appears (Huxley 1914, etc. in McFarland 1985, 381).

2. Behavior that results from the activation of the specific-action potential of one instinct, or of the action pattern belonging to another instinct, and appears when a charged instinct is denied the opportunity for adequate discharge through its own consummatory acts (Kortlandt 1940 in Dawkins 1986, 79; Tinbergen 1951, 113; Lincoln et al. 1985).

3. “Behavior that is not activated by its own drive” (Verplanck 1957).

4. “Behavior that is activated as a consequence of the frustration of behavior activated by some drive other than that which most often controls it” (Verplanck 1957).

5. “A seemingly irrelevant display of behavior given in conflict situations where it has no direct functional significance;” displacement behavior “presumably does have communicatory significance” (Wittenberger 1981, 614).

6. An activity that seems irrelevant to its behavioral context to a human observer and often occurs when its performer is in a conflict situation, *e.g.*, a chaffinch’s suddenly breaking off an encounter and wiping its bill while it is engaged with a rival (Hinde 1982, 66) or a person’s fidgeting with cigarettes, or jewelry, in a tense circumstance.

syn. allochthonous behavior (Verplanck 1957), allochthonous reaction (Lorenz 1957, 296), ambivalence (Lincoln et al. 1985), displacement activity (Tinbergen and van Iersel 1947 in Tinbergen 1951, 114), irrelevant behavior, irrelevant movements (Rand 1943 in Tinbergen 1951, 114), redirected behavior (in the broad sense according to some authors), sparkling-over movement (Makkink 1936 in Tinbergen 1951, 114), substitute activity (Kirkman 1937, Tinbergen 1951, 114)

cf. autochthonous behavior; inhibition: behavioral inhibition; redirected behavior (in the strict sense)

Comments: Dawkins (1986, 79–80) indicates that because displacement behavior relates to the abandoned Lorenz’s hydraulic model of behavior, *q.v.*, this term should be abandoned. The exact cause of displacement behavior is not known; it might have more than one cause.

[coined by Armstrong 1947 and Tinbergen and van Iersel 1947 in McFarland 1985, 382 < energy displaced from two mutually antagonistic behaviors into a third behavior]

► **adjunctive behavior** *n.* In experimental psychology, apparently irrelevant rat behavior that occurs in learning situations, such as grooming, or drinking, by a hungry individual that is pressing a bar for food (Falk 1971 in Hinde 1982, 66).

► **displacement feeding** *n.* In some gallinaceous-bird species: Displacement behavior involving a bird’s pecking the ground but not feeding (Heymer 1977, 183).

► **displacement preening** *n.* For example, in some duck species: Displacement behavior involving preening (Heymer 1977, 183).

► **displacement sleeping** *n.* For example, in some limicolan species: Displacement behavior involving sleeping in place (Heymer 1977, 183).

► **grass pulling** *n.* For example, in Herring Gulls: An individual’s probable displacement behavior consisting of its pulling up tufts of grass which it does not use for nest building while it is confronting a conspecific individual (Goethe 1956, Tinbergen 1958 in Heymer 1977, 78).

► **redirected behavior, redirected activity** *n.*

1. In some bird species, Humans: Irrelevant behavior that involves an individual's directing a behavior, such as an act of aggression, away from its primary target and toward another, less appropriate object (Wilson 1975, 225, 594).
2. A behavior shown toward a seemingly less appropriate conspecific; *e.g.*, an animal in the conflict of attacking, or not attacking, another animal might attack another (less threatening) animal rather than its opponent (Dewsbury 1978, 19); redirection activity (Dewsbury 1978, 262).
cf. aggression: redirected aggression, displaced aggression

► **sham pecking** *n.* In some bird species: An individual's pecking at the ground, but not consuming food (Heinroth 1911, etc., in Heymer 1977, 154).

► **sham preening** *n.* In some bird species: A male's preening his wings during courtship, apparently not because they require cleaning (Heymer 1977, 155).
cf. preening

► **sublimation** *n.* In Freudian psychoanalysis, human behavior similar to redirected behavior (Immelman and Beer 1989, 75).

dive, diving *n.* For example, in diving ducks: An individual's quick entry followed by moving deeper into water in an arching path when feeding on submerged vegetation (Peterson 1947, 36; Welty 1966, 442).

v.i. dive

cf. dabble

► **neck-over-neck diving** *n.* In some swan species: An epigamic behavior that occurs just before mating when members of a pair, with one's neck over that of the other, dip their bills into water several times (Petzold 1964 in Heymer 1977, 53).

duration-meaningful behavior See behavior state.

eliminative behavior, elimination *n.* For example, in Mammals: An individual's behavior associated with urination and defecation (Scott 1950 in Lehner 1979, 64).

cf. behavior: comfort behavior; elimination; enurbation

egg-rolling behavior *n.* In many ground-nesting birds, including *Anser anser* (Greylag Geese) and *Dromaius novaehollandiae* (Emus): A bird's painstakingly rolling an egg back into its nest by pulling it with the underside of its bill and making sideways correction movements; classified as a fixed-action pattern, *q.v.*, with a taxis component by Lorenz and Tinbergen (1970 in Gould 1982, 36; Immelman and Beer 1989, 84).

cf. retrieving

emotional behavior *n.* For example, in *Columba livia* (Rock Doves), some rat species: "An arbitrary class of responses that is defined differently for different species and that is based on the covariation in response-strength of the behaviors as a function of certain often ill-defined independent variables (Verplanck 1957).
cf. emotion, emotionality

Comments: "Despite the rather fuzzy origins of this class, once a particular response has been placed in the class, the term emotional can be consistently applied to it; and a concept that is initially theoretical seems to acquire some empirical status" (Verplanck 1957). In rats, emotional behaviors include urination,

defecation, freezing, vocalizing, and trembling, when two or more of them occur together. In *Columba livia*, emotional behavior includes cooing and wing-beating (Verplanck 1957).

end act See behavior: consummatory behavior.

epideictic behavior See display: epideictic display.

epigamic behavior *n.* In many animal species: An individual's expressive activities that are directly related to its reproduction (Heymer 1977, 61).
cf. display: epigamic display

► **nonepigamic behavior** *n.* In many animal species: An individual's behavior that normally occurs apart from its reproduction (Heymer 1977, 61).
cf. behavior: epigamic behavior

epimeletic behavior *n.* In many animal species: An individual's giving care and attention (Scott 1950 in Lehner 1979, 64), including attentive behavior and nurturance (Scott 1956, 214), guarding, protecting, and allogrooming (Heymer 1977, 129).
syn. care-giving behavior (Heymer 1977, 129)

cf. baby schema, infantilism

► **et-epimeletic behavior** *n.* In some young and adult animal species: An animal's soliciting care and attention from another animal (Scott 1950 in Lehner 1979, 64, Scott 1956, 214).

epitreptic behavior See behavior: treptic behavior: epitropic behavior.

equilibratory behavior *n.* An animal's response to a potential, or overt, threat that occurs between attacking and fleeing (Chance 1956).

escape behavior *n.* An animal's rapid locomotion from any given location that occurs after specific stimuli are presented there (Verplanck 1957).
syn. flight, flight behavior, flight response (LaGory 1987, 20)

Comment: "The stimuli effective in producing escape behavior are almost identical with those identified as negative reinforcing stimuli or aversive stimuli in conditioning situations" (Verplanck 1957).

► **protean behavior** *n.* A pursued prey animal's escape behavior in which it switches unpredictably between (among) different fleeing or avoidance behaviors, *e.g.*, erratic flying of a moth under attack by a bat or an insect's simulating a frightening predator (Chance and Russell 1959 in Heymer 1977, 133; Immelman and Beer 1989, 236).

cf. display: protean display

[named after the minor deity Proteus, the Greek sea god, who escaped his pursuers by continually changing his form]

exploratory behavior *n.*

1. In many vertebrate (*e.g.*, rats) and invertebrate species: An animal's species-typical orientation in time and space necessary for its effective learning and resulting in remembering its nest site or surroundings (Heymer 1977, 62).

2. In many bird and mammal species, some fish and reptile species: An animal's searching for and actively investigating novel situations in the absence of a pressing physiological need (Immelmann and Beer 1989, 95).

syn. curiosity behavior, exploration

Comment: Exploratory behavior is more conspicuous in young than adults, but it persists throughout life in Parrots, Primates, raptors, and Rodents (Immelmann and Beer 1989).

fairness *n.* One animal's being impartial in its treatment of another animal; one animal's not disadvantaging another in the former's treatment of the latter (Jensen et al. 2007a, 13046).

Comment: In a laboratory ultimatum game, researchers found that Chimpanzees are rational maximizers and are not sensitive to fairness (Jensen et al. 2007b, 107).

feather ruffling *n.*

1. In some bird species: An individual's setting up (stiffening) its feathers, especially "as a sign of anger" (given as "ruffling" in the Oxford English Dictionary 1972, entries from 1643).

Note: "Anger" of birds may be an anthropomorphic concept.

2. In some bird species: An individual's erecting its feathers; feather erection (Immellmann and Beer 1989, 101)

Note: Feather erection may be related to threatening another animal (Heymer 1977, 81, who calls feather ruffling "ruffling").

syn. shuffling (Heymer 1977, 81)

cf. piloerection

► **extreme feather erection, ruffling** *n.* Feather ruffling that causes feather tips to separate from one another, which allows more air to get to a bird's skin and cool it (Immellmann and Beer 1989, 101). *syn.* ruffling (Immellmann and Beer 1989, 101)

Comment: A pet *Psittacus erithacus* (African Gray Parrot), named Lindsay Kalin McGihon, showed extreme feather erection over much of her body as I photographed her on a warm October day (fig. 16).

► **fluffing** *n.* Feather ruffling that stops short of separating feather tips from one another, which increases the thickness of a feather insulating layer and increases a bird's heat retention (Immellmann and Beer 1989, 101).

finning *n.* A whale's slapping the surface of water with its long flipper, instead of its flukes (Baker and Herman 1985, 55).

v.t. fin

cf. behavior: lobtail

fixed-reaction behavior *n.* A human infant's quiet orientation toward sound with his eyes; *e.g.*, in congenitally blind infants when they are spoken to by their mothers or in infants with normal vision, especially during nursing, probably being used in memorizing their mothers' faces (Heymer 1977, 68).

flight behavior See behavior: escape behavior.

following behavior *n.*

1. In nidifugous birds: A bird's innate disposition to approach and follow a moving object shortly after hatching (Hess 1958, 1959a, in McFarland 1985, 369; Heymer 1977, 121).

2. In species with parental care, *e.g.*, some fish, precocial-bird, ungulate, and mammal species: A young animal's attempts to stay close to one, or both, of its parents (Immellmann and Beer 1989, 109).

cf. learning: imprinting: object imprinting

foraging, foraging behavior *n.*

1. A person's searching about, or rummaging around, for something, especially food or supplies (given as a verb in Michaelis 1963).

2. A person's making a raid to find, or capture, supplies (given as a verb in Michaelis 1963).

3. A person's obtaining (food, supplies) by rummaging about (given as a verb in Michaelis 1963).

SOME CLASSIFICATIONS OF FORAGING BEHAVIOR

- I. Classification of behavior of an individual forager
 - A. handling
 - B. pursuing (*syn.* pursuit)
 - C. searching (*syn.* search)
 1. detecting (*syn.* detection)
 2. encountering (*syn.* encounter)
 - D. traveling

- II. Classification by kinds of foraging behavior

- A. central-place foraging
- B. cooperative foraging
- C. imitative foraging
- D. percussive foraging
- E. risk-sensitive foraging

4. An organism's searching for, or obtaining, or both, a resource (*e.g.*, food or water).

Comment: Some researchers divide the foraging behavior of echolocating bats, *e.g.*, into a search phase, prey-approach phase, terminal-buzz phase I, and terminal-buzz phase II (Moss and Surlykke 2001, 2209, illustration).

[French *fourrage* < Old French *feurre*, fodder < Germanic]

► **cooperative foraging** *n.* Foraging, in which animals show at least some temporary altruistic restraint, group members' behaviors are often diversified, and communication modes are typically complex (Wilson 1975, 51).

► **handling, handling behavior** *n.* A predator's behavior after it catches a prey, including its physically manipulating the prey for consumption, ingestion, and sometimes digestion (Stephens and Krebs 1986).

► **imitative foraging** *n.* An animal's simply going where its social group goes and eating what it eats (Wilson 1975, 51).

► **percussive foraging** *n.* A *Daubentonia madagascariensis* (Aye-Aye) gentle tapping on wood surfaces that enables it to locate cavities in wood that may contain prey (Erickson 1991, 793).

Comment: This primate might use echolocation, or a cutaneous sense, in its extremely narrow middle digit, to find cavities and detect insect movement in them (Erickson 1991, 793).

► **risk-sensitive foraging behavior** *n.* An organism's foraging in which it responds to risk in food rewards as well as mean food reward (Stephens and Paton 1986, 1659).

frass ejection *n.* In many lepidopteran families: a larva's ballistically ejecting individual fecal pellets (frass) great distances (Frohawk 1892, 1913 and other authors in Weiss 2003, 361).

Comments: Larvae of *Epargyreus clarus* (Silver-spotted Skipper) launch frass up to 153 cm (Weiss 2003, 361).

In this species, elimination of chemical cues used by natural enemies is likely to have been a driving force behind the evolution of frass ejection, and hygiene and crowding are less important.

grooming behavior See grooming.

guarding behavior *n.* A parent's or other older animal's watching over conspecifics other than mates (Immellmann and Beer 1989, 124).

cf. behavior: mate-guarding behavior

head flagging *n.* For example, in *Chroicocephalus ridibundus* (Black-headed Gulls) and some duck species: A bird's turning its head away from another bird, normally during aggressive interactions (Manley 1960 and Chance 1962 in Heymer 1977, 88).

syn. looking away (Heymer 1977, 88)

cf. display

head lunge *n.* For example, in Humpback Whales: A kind of aggressive behavior (Baker and Herman 1985, 55).

v.i. head lunge

head-neck dipping *n.* For example, in some pelican and swan species: An individual's dipping its head into water in a rhythmic snakelike fashion during bathing (Heymer 1977, 103).

head nodding *n.*

1. In male blenniid fishes: An individual's moving its head up and down while in a tube-like enclosure and encountering a rival (Heymer 1977, 103).
2. In many human cultures: One's moving one's head up and down in signifying agreement (Heymer 1977, 103).

cf. head shaking

head scratching *n.*

1. In many bird species: An individual's scratching its head with its claws (Heymer 1977, 103).
2. In Humans and *Pan troglodytes* (Chimpanzees): A displacement activity made during concentration or being perplexed (Heymer 1977, 103).

head shaking *n.*

1. For example, in some duck and swan species: An individual's moving its head from side to side (Heymer 1977, 103).
2. A person's moving his head from side to side, signifying disagreement (Heymer 1977, 103).

cf. head nodding

head-up-tail-up behavior *n.* In some duck species: A drake's simultaneously pulling up his head sharply, whistling, bending his chin down towards his breast, and bending his tail region up steeply (Heymer 1977, 107).

helping behavior, help, helping *n.*

1. For example, in *Aegithalos caudatus* (Long-tailed Tits) and some jay species: An individual's assisting a conspecific breeding pair (often its relatives) in raising its young, but not reproducing itself (Wilson 1975, 448, 451).
2. For example, in Gray-crowned Babblers (in usually nonbreeding helpers): An individual's showing parent-like behavior toward young that is not its offspring (Brown et al. 1982).

cf. altruism

hip thrusting *n.* A person's moving his hips forward and backward performed as part of mocking and threat behavior during dancing (Heymer 1977, 89).

cf. buttocks display

homing behavior See homing.

homosexual behavior *n.* In many animal species including Humans, *Pan paniscus* (Bonobos), and *Popillia japonica* (Japanese Beetles): Sexual behavior that is directed toward a conspecific member of the same sex, e.g., pseudocopulation (Barrows and Gordh 1978, 341; Waal 1989, 201; Waal and Lanting 1997, 23, illustration).

Comments: White et al. (2000, 892) consider "true homosexuality" to involve a male's actively seeking

another male for sexual purposes, which has not been found in Fruit Flies (Tephritidae).

cf. copulation: pseudocopulation: homosexual pseudocopulation, genital-genital rubbing, mating, homosexual mating; transvestism; sexual: homosexual

huddling behavior See behavior: contact behavior.

human behavior *n.*

1. A person's manner of conducting himself in external relations of life (Oxford English Dictionary 1971, entries from 1490).

syn. bearing, demeanor, deportment, manners

2. "Conduct, general practice, course of life; course of actions *towards* or *to* others, treatment of others" (Oxford English Dictionary 1971, entries from 1754).

3. In psychology, the form of glandular and muscular activity characteristic of an individual in relation to internal, or external, stimuli, with special reference to emotional, linguistic, and other responses (Michaelis 1963).

syn. behavior

hygienic behavior *n.* In *Apis mellifera* (Western Honey Bees): A worker's removing a diseased, or dead, immature bee from its cell and her nest (Rothenbuler 1964 in McFarland 1985, 39).

cf. behavior: nest-cleaning behavior

imitative behavior See learning: social imitative learning.

► **inborn behavior**

See innate (note).

infantile behavior, infantilism, infant-like behavior *n.* An adult animal's returning to childlike behavior especially in connection with courtship or submissive behavior, e.g., mature male mammals' imitating juvenile vocalizations during courtship or a human male's speaking in a distinctly childlike fashion using diminutives which may be accompanied by sucking breasts (Heymer 1977, 92; Immelmann and Beer 1989, 146).

cf. mouth-to-mouth feeding

ingestive behavior *n.* An animal's eating, drinking, or both (Scott 1950 in Lehner 1979, 64).

innate behavior *n.*

1. An animal's "behaviour that has not been changed by learning processes" (Tinbergen 1951, 2).
2. An animal's inherited behavior that is independent of its experience (early ethologists in McFarland 1985, 36).
3. An animal's "behavior that develops without obvious environmental influence" (McFarland 1985, 37).

cf. behavior: instinctive behavior

Comment: Some workers synonymize "innate behavior" and "instinctive behavior" in certain contexts; others distinguish between these two behaviors.

innovative behavior, innovation *n.* In some reptile, bird, and mammal species especially primates: An individual's new behavioral combination that arises neither from trial and error nor from imitation, but occurs spontaneously when the animal encounters a new situation and occurs as though the animal "anticipates" a new circumstance and produces the "correct" behavioral response for the first time (Immelmann and Beer 1989, 150); e.g., a Chimpanzee's spontaneously putting fitted sticks together and reaching food with its new long stick or an animal's following a successful alternative route

after its original path is blocked (Immelmann and Beer 1989, 150).

syn. insight learning (which is little used today because it carries a connotation of consciousness, Immelmann and Beer 1989, 150)

cf. learning; insight learning

inspection behavior *n.* In some fish species:

An individual's, or small group's, approach toward a predator and then retreating (George 1960 and Curio et al. 1983 in Magurran and Seghers 1990, 443).

cf. attack-cone avoidance

► **attack-cone avoidance** *n.* In some fish species:

Inspection behavior in which an individual selectively avoids a predatory fish's anterior portion when it approaches the predator (George 1960, etc., in Magurran and Seghers 1990, 443).

Comment: This behavior enables an inspecting fish to obtain information about a predator, e.g., its size and motivation, while avoiding the dangerous zone in front of its mouth (attack cone) (George 1960, etc., in Magurran and Seghers 1990, 443).

instinct, instinctive behavior *n.*

1. An animal's complex reflex made up of units compatible with inheritance mechanisms, and, thus, a product of natural selection that evolved with other aspects of an animal's life (Darwin 1859 in McFarland 1985, 363).

2. An animal's "purposeful action without "foresight of the ends and without previous education in the performance" (James 1890 in Immelmann and Beer 1989, 151).

3. An animal's behavior that is entirely genetically based ("innate behavior" of Lorenz 1932, 1937 in Dawkins 1986, 66).

Notes: Lorenz considered all environmental effects on behavior under the category of learning; however, some workers point out that environmental factors (apart from those that promote learning) can determine whether a behavior develops in a usual way or if it is shown in the first place. Further, Dawkins (1986, 57) discusses the problems with equating "innate" with "inherited."

4. An animal's fixed-action pattern, *q.v.* (Lorenz 1937 in McFarland 1985, 363).

5. An animal's "behavior that has been experimentally demonstrated, in both its stimulus control and topography, to be independent of and unmodified by the operation of variables encountered in conditioning and learning, such as the occurrence of reinforcing stimuli" (Verplanck 1957).

syn. inborn behavior

6. A behavioral difference between two individual animals, or two species, that is based, at least in part, on a genetic difference (Wilson 1975).

7. An organism's behavior that either is subject to relatively little modification in an individual's lifetime, or varies very little throughout the population, or (preferably) both (Wilson 1975, 26).

Note: "This definition can never be precise, and it really has informational content only when applied to the extreme cases" (Wilson 1975, 26). "Closed instinct" is considered to be an unmodified instinct, or instinct in the strict sense, and "open instinct" is considered to be a kind of learning (Alcock 1979).

cf. learning

8. An animal's behavior that is highly stereotyped, more complex than the simplest reflexes, and

usually directed at particular objects in its environment (Wilson 1975, 587).

Note: Learning may, or may not, be involved in the development of instinctive behavior; "the important point is that the behavior develops toward a narrow, predictable end product" (Wilson 1975, 587).

9. An animal's behavior that is not learned, or acquired, during ontogeny (Heymer 1977, 28).

10. An animal's behavior that is present at birth, but not necessarily functional, and may appear only in the course of ontogenetic maturation (Heymer 1977, 28).

11. An animal's "highly stereotyped, species-specific behavior that is more complex than a simple reflex and is attributable largely to genetic influences" (Wittenberger 1981, 617).

Note: Aggression, altruism, dominance, intolerance of outsiders, the need to form amicable groups, and subordination might be human instincts (Eibl-Eibesfeldt 1973 in Heymer 1977, 194).

syn. preprogrammed behavior, programmed behavior, species-specific behavior (Heinroth 1911 in Heymer 1977, 178)

cf. behavior: innate behavior, instinct, instinctive behavior pattern, learning

Comments: Dawkins (1986, chapter 5) explains why an "innate character" is not synonymous with a "developmentally-fixed, or genetic, character" and why "instinctive behavior" is not synonymous with "innate behavior;" however, based on certain subsets of criteria, some authors seem to synonymize "innate" and "instinctive behavior." McFarland (1985, 363–364) explains problems with early definitions of "instinct." McFarland (1987, 310) explains that modern research regards previously designated features of "instinct" (genetically determined parts, reflexes, and motivational aspects) as separate issues. Historically, "instinct" and "innate behavior" have been used to indicate separate concepts; these terms are sometimes used interchangeably today (Immelmann and Beer 1989, 151).

[Latin *instinctus*, past participle of *instinguere*, to impel < root -*stig-*]

► **primary instinct** *n.* Instinct that directly results from natural selection (Romanes 1882 in Gherardi 1984, 381).

► **secondary instinct** *n.* Animal habits that are unconsciously formed and directly inherited in some unknown manner (Romanes 1882 in Gherardi 1984, 381).

intention movement *n.*

1. For example, in some bird, fish, and mammal species, including Humans: The beginning of an innate behavior pattern that communicates an individual's readiness to perform a specific behavior and that indicates its "mood" (Heinroth 1911 in Tinbergen 1951, 141).

2. An animal's preparatory motions shown prior to a complete behavioral response, e.g., a crouch before a leap or a snarl before a bite (Daanje 1950, Andrew 1956 in Wilson 1975, 225, Wilson 1975, 560, 587).

cf. behavior: displacement behavior

Comments: An intention movement is not necessarily followed by the behavior that it seems to indicate. Some intention movements have been ritualized into communicative signals (Wilson 1975, 560).

"Intention" in this term does not imply subjective intent (Immelmann and Beer 1989, 155).

► **fight-intention movement** *n.* An intention movement that communicates combat readiness to a rival (Heymer 1977, 96).

cf. irrelevant behavior

► **flight-intention movement** *n.* An intention movement that communicates fleeing readiness to a rival (Heymer 1977, 96).

intentional behavior *n.*

1. A person's behavior that involves a mental representation of a goal that is instrumental in guiding his behavior; this representation is not necessarily conscious (McFarland 1985, 500).

2. A person's having a mental image, or images, of future events in which he "pictures" himself as a participant and makes a choice as to which image he will try to bring to reality (Griffin 1976 in McFarland 1985, 526).

cf. intent, intentionality

intraspecific behavior *n.* An animal's behavior directed toward a conspecific (Immelmann and Beer 1989, 158).

cf. behavior: social behavior

investigative behavior *n.* An organism's exploring its abiotic, biotic, and social environment (Scott 1950 in Lehner 1979, 64).

cf. behavior: exploratory behavior

joking behavior *n.* A person's kidding around, mocking, and teasing that might serve to divert aggression, educate, or both (Heinz 1967, Eibl-Eibesfeldt 1972 in Heymer 1977, 155).

v.i. joke

juvenile behavior *n.* Behavior shown by a juvenile, or immature, animal that is never shown during its later life; *e.g.*, food begging by juvenile swallows, alarm behavior of Herring Gull chicks, or larval behavior of Lepidoptera (McFarland 1985, 36).

killing behavior, killing *n.* An animal's causing the death of another animal, *e.g.*, a predator's killing a prey or an animal's committing infanticide or siblicide, *q.v.* (Immelmann and Beer 1989, 164).

cf. cannibalism, -cide: infanticide

Comments: Wilson (1975, 246–248, 504) uses "murder" for "killing behavior" and indicates that it is done without reference to morality of a killing act; Waal (1989, 69) suggests that "murder" implies intent to kill in Chimpanzees which cannot be proved. Many animal species kill conspecifics, including Chimpanzees, Humans, Lions, some praying-mantid species, and Western Honey Bees (Waal 1989, 6). Many animal species kill heterospecific organisms in predating, or fighting with, them over resources, *e.g.*, some ant or stingless bee species.

learned behavior See learning.

leisure behavior, luxury *n.* A behavior that completely disappears from an animal's activities when it has to ration its time (McFarland 1985, 452).

lingulation See lingulation under L in this book.

lobtail *n.* A whale's slapping its tail flukes against the surface of water (Baker and Herman 1985, 55).

v.i., v.t. lobtail

cf. fin

marking behavior, marking *n.*

1. In some bee and desert-woodlouse species, many mammal species: An individual's making, or strengthening, its scent mark (urine, feces, saliva, pheromones, or a combination of these things)

depending on the species (Immelmann and Beer 1989, 258).

syn. scent marking, scent-marking behavior (Clapperton 1989, 436)

2. An animal's making, or strengthening, any kind of a mark, *e.g.*, scent mark or acoustic, or optical, signal (Immelmann and Beer 1989, 179).

cf. scent mark

Comment: As a type of bookkeeping system, a *Vulpes vulpes* (Red Fox) scent-marks a place where food, or food odor, remains after it has eaten most to all of the food in a that particular location (Henry 1993, 90).

► **allomarking** *n.* An animal's marking a conspecific (Immelmann and Beer 1989, 259).

cf. behavior: marking behavior: automarking

► **automarking** *n.* In some primate species; many deer species; *Erinaceus europaeus* (European Hedgehogs) and *Ovibus moschatus* (Muskoxen): An individual's applying an odorous substance to its own body and using the odor in communication (Immelmann and Beer 1989, 259, 262), *e.g.*, a deer's automarking its belly and forelegs with sprayed urine resulting in almost black staining of these areas (Heymer 1977, 83).

syn. chemical self-marking (Immelmann and Beer 1989, 259), self-marking

► **marking drumming** *n.* In some hamster and mice species: An individual's marking the ground with its hind paws after rubbing them across its scent glands (Heymer 1977, 129).

► **self-marking** See behavior: marking: automarking.

► **territory marking, territory signaling** *n.* An animal's delineating its territory with markings, signals, or both (Heymer 1977, 147).

Comments: Many dragonfly and fish species mark with special conspicuous movements. Electric fish may mark with weak electric fields. Many mammal species scent mark with gland secretions, feces, urine, or a combination of these things. (Heymer 1977, 147). Many bird species and some *Alouatta* spp. (howler monkeys) mark with songs or other vocalizations (Heymer 1977, 147).

► **urine marking** *n.* In many mammal species: An individual's marking a landmark with its urine.

► **urine spraying** *n.*

1. In some mammal species, especially rodents: An animal's spraying a partner with urine (Altmann 1969 in Heymer 1977, 83).

2. In some rodent species and hares: An individual's (usually a male) forceful ejection of urine used in marking inanimate objects in its territory or conspecifics in its territory (rodents, hares) (Immelmann and Beer 1989, 322).

syn. urine marking

► **urine washing** *n.* In several species of less derived and more derived primates: An individual's moistening its palms with urine and wiping it on its foot soles with rapid swipes; this leaves an odor trail as the animal moves about (Hill 1938 and Eibl-Eibesfeldt 1953 in Heymer 1977, 83).

mashing, scamming, scrumping, shacking *n.* United States slang, a person's having sexual relations with another person (Gabriel, 1997, 22).

Comments: These are terms used by U.S. people (especially students) in the 1990s that suggest lack of emotional and romantic content (Gabriel, 1997, 22).

mate guarding, mate-guarding behavior *n.*

In many species of invertebrate and vertebrate species: An individual's staying near, on before, after copulation, or both, and stopping others from copulating with its mate (Wilson 1975, 322; Barrows and Gordh 1978, 341; Convey, 1989, 56; Immelmann and Beer 1989, 124; Dunham and Hurshman 1990, 976). *syn.* "wife watching" (Immelmann and Beer 1989) *cf.* escort

v.t. mate guard

► **postcopulatory mate guarding** *n.* For example, in some cricket, damselfly, and dragonfly species; *Popillia japonica* (Japanese Beetles); *Scathophaga stercoraria* (Dung Flies): A male's mate-guarding behavior shown after initially, or completely, copulating with his mate, depending on the species (Jacobs 1955, Parker 1970, and Mangan 1979 in Parker 1984, 17; Barrows and Gordh 1978, 341; Waage 1984, 253; Smith 1984, 636; Sakaluk 1991, 207).

Comment: In *Gryllodes sigillatus* (Decorated Crickets), mate guarding deters rivals from courting a recently mated female (Sakaluk's 1991, 207).

► **precopulatory mate guarding** *n.* For example, in some insect species; many crustacean and spider species; *Bonellia* echinoid worms, and Humans: A male's staying in close association with a female before copulation; this guarding can involve physical attachment of the pair in some species (Austad 1984, 245; Parker 1984, 19; Dunham et al., 1986, 1680).

syn. suitor phenomenon (Robinson and Robinson 1980 in Austad 1984, 245, Smith 1984, 636)

Comment: In Humans, some female guard their mates. Humans mate guard in many ways including use of societal rules and laws and male anticuckoldry techniques (Dickeman 1979, 1981 in Smith 1984).

maternal behavior See care: parental care: maternal care.

mating behavior See mating.

mimetic behavior *n.* One animal's making a species-specific response after perceiving a conspecific second animal's making the same response, under conditions where it can be demonstrated that the latter animal's response is the stimulus for the former animal and that no opportunity for discrimination and differentiation training has been given to either animal (Verplanck 1957).

cf. behavior: imitative behavior; learning: social imitative learning

momentary behavior See behavior event.

mounting, mounting behavior *n.* A male animal's adopting a position that facilitates copulation (Immelmann and Beer 1989, 194–195).

syn. sexual mounting

cf. bout: mount bout, copulation: pseudocopulation

Comment: In mammals, mounting usually consists of a male's standing on his hindlegs and grasping a female's flanks from behind (Immelmann and Beer 1989, 194–195).

necrophoric behavior *n.* For example in Ants, parents of some bird species, Elephants, mothers of some primate species, and *Apis mellifera* (Western Honey Bees): An individual's carrying a corpse of a dead conspecific (Immelmann and Beer 1989, 198).

nest-cleaning behavior *n.* In social-insect and many songbird species: An individual's removing fecal matter, debris, remains of dead animals, or

some other object from its nest (Immelmann and Beer 1989, 200).

cf. behavior: hygienic behavior

nonepigamic behavior See behavior: epigamic behavior: nonepigamic behavior.

nurturance, nurturing behavior *n.* An animal's behavior that is essential for ensuring the survival of relatively helpless offspring (Moris et al. 1995, 1697).

cf. care

Comment: There has been considerable ambiguity in researchers' use of the term nurturance; they have used broad definitions, often including any form of cooperative behavior (Morris et al. 1995, 1699). A more fine-grained definition of nurturance would be useful.

[Old French *norriture, norreture* < Late Latin *nutrire*, to nourish]

operant behavior *n.* An animal's totality of operant responses (Verplanck 1957).

organism behavior *n.*

1. Any observable action, or response, of an organism (Lincoln et al. 1985).
2. The response(s) of a single organism, group, species, or other taxon, to environmental factors (Lincoln et al. 1985).
3. An organism's "adaptive movement dependent on complex structures that facilitate the action" (Alcock 2006 28).
4. "The internally coordinated responses (actions or inactions) of whole living organisms (individuals or groups) to internal and/or external stimuli, excluding responses more easily understood as developmental changes" (Levitis et al. 2009).

Notes: In a survey of 174 members of three behavior-focused scientific societies, Levitis et al. (2009, 1) found widespread disagreement as to what is organism behavior. They formulated the above definition based largely on the survey responses. According to the definition of Levitis et al. (2009), behaviors include the movement of bacterial colonies across a sugar gradient, fissioning and fusing of a zebra herd, barking of a *Canis familiaris* (Domestic Dog), and a Dog's not barking in obeying a trainer's signal. Thinking alone is not behavior. In an informative, popular-style article, Angier (2009, D4) paraphrases and shortens the formal definition, removing some of its precision.

syn. behavior

cf. behavior: animal behavior, human behavior

pairing behavior See copulation, courtship.

parental behavior See care: parental care.

paternal behavior See care: parental care: paternal care.

phoretic behavior See symbiosis: phoresy.

play behavior See play.

playing dead, playing O'possum, playing possum See behavior: defensive behavior: playing dead.

preceptive behavior See behavior: soliciting behavior.

postcopulatory behavior See behavior: copulatory behavior.

precoital behavior, precopulatory behavior See courtship.

pouting, pouting behavior *n.* A person's hanging his head, turning his eyes away, and making

a long face, *e.g.*, in children that have just lost an argument (Heymer 1977, 157).

preprogrammed behavior See behavior: instinct.

prey-catching behavior *n.* A predator's behavior that leads to prey capture (Heymer 1977, 42).

proceptive behavior *n.*

1. A female's reactions that constitute her initiative in establishing and maintaining a sexual interaction with a male (Beach 1976 in Dewsbury 1978, 237), including genital presentation in some primate species (Immelman and Beer 1989, 233).
2. Attraction of estrous females to males (Hinde 1982, 155).

syn. proceptivity

cf. attractivity, receptivity

programmed behavior See behavior: instinct.

protean behavior See behavior: escape behavior; protean behavior.

pseudosexual behavior See behavior: sexual behavior; pseudosexual behavior.

puddling *n.* Butterflies' congregating at puddles where they imbibe salts and other nutrients that are found in the evaporating water (Anderson 1995, 88). *v.i.* puddle (Anderson 1995, 88)

Comments: Butterflies and moths also congregate at excrement, rotting fruit, urine, and other nutritious substances (Anderson 1995, 88; pers. obs.). Bees also congregate at salt sources (Barrows 1974, 189). [Middle English *podel*, diminutive of Old English *pudd*, ditch]

purposive behavior *n.* Behavior that is considered with respect to its goals (Verplanck 1957).

cf. teleology

Comment: Verplanck (1957) discusses problems with "purposive behavior" in view of the fact that the definition of "goal" varies. "... purposive behavior is not a very useful concept, for it is neither empirical fish nor theoretical fowl."

rapping behavior *n.* In Hermit Crabs: A short, rapid tapping that an initiator in shell-exchange interaction makes against a noninitiator's shell (Hazlett 1975 in Hazlett 1987, 218).

Comment: A noninitiator can obtain information about an initiator's shell size from the rapping (Hazlett 1987, 218).

recruitment behavior See recruitment.

reflex behavior See reflex.

relict behavior *n.*

1. A behavior that has become functionless (vestigial) yet persists usually in a fragmentary, or greatly reduced form, *e.g.*, performance of balancing movements with their tails which are no longer appropriate for balancing in some macaque species or egg-rolling behaviors typical of their ground-nesting ancestors shown by many pigeon species and tree-nesting rails (Immelman and Beer 1989, 252).

syn. evolutionary vestige (Immelman and Beer 1989, 252)

2. A species' behavior that remains essentially intact long after an environmental stimulus that influenced its evolution vanished (Yoon 1996, 24 December, C1).

Notes: *Spermophilus beecheyi* (California Ground Squirrels) from populations that have been free of snakes for 70,000–30,000 yr still clearly recognize rattlesnakes and exhibit stereotypic anti-rattlesnake

behavior (R. Coss et al. in Yoon 1996, 24 December, C1). Stickleback fish from a population that has long been free of sculpin (a dangerous predator of these fish) immediately engage in stereotypic antisculpin behavior when confronted with a sculpin (S. A. Foster et al. in Yoon 1996, 24 December, C6). Human females report that they are fearful about being attacked from below, and males report that they are fearful about being attacked from the side. This behavior might have evolved when female hominids spent more time in trees than males, and males spent more time on the ground than the females. A possible relict behavior is the fast running of the North American Pronghorn Antelope which can run nearly 60 mi per hr (J. Byers in Yoon 1996, 24 December, C1). This running ability might have evolved in response to now extinct predators, including Jaguars, Lions, Long-legged Hyenas, North American Cheetahs, and Short-faced Bears.

cf. organ: relict

reproductive behavior *n.* Any behavior relating to breeding, including pair formation and mating; some investigators include territoriality, nest building, brooding, and parental care in reproductive behavior (Immelman and Beer 1989, 253).

cf. copulation, mating

respectful behavior, respect of possession *n.* In *Papio hamadryas* (Hamadryas Baboons): An individual's inhibition of taking possessions of conspecific animals, *e.g.*, males' not taking over mates, or food, of others (Kummer et al. 1973 in Sigg and Falett 1985, 978).

cf. showing respect

respondent behavior *n.* An animal's totality of behavior respondents (Verplanck 1957).

risk-sensitive behavior *n.* An animal's showing different behavioral options based on variance in its reward or punishment (Brown 1987, 306).

ritualized behavior *n.*

1. An animal's behavior that appears in most members of its species, is relatively invariant in its topography, and is typically a social releaser (Verplanck 1957).

2. An animal's behavior that appears in repertoires of members of several related species and usually varies in stereotypy among species (Verplanck 1957).

syn. ritualized response

cf. emancipation; grooming: ritualized grooming; ritual; ritualization

Comments: "Ritualized responses occur in sharply restricted situations," *e.g.*, grass pulling during Herring Gull threat behavior; theoretically, they have become specialized through evolution, most often as a social releaser; and are often associated with a special marking of fur or feathers, *e.g.*, ritualized preening in the courtship of some anatid (duck) species, that reveals a usually hidden light colored patch (Verplanck 1957). "Ritualized behavior" has been traced evolutionarily to intention movement, ambivalent behavior, displacement activities, or redirection, augmented by additional secondary signal characteristics, in most cases studied (Immelman and Beer 1989, 255).

ruffling See behavior: feather ruffling

rutting behavior *n.* In deer and many species of other ruminants: Animal sexual behavior (Michaelis 1963; Immelman and Beer 1989, 257).

syn. estrus, *q.v.* (Michaelis 1963)

cf. rut

saliva spreading *n.* An animal's spreading its saliva on its body surface, often for cooling purposes (Bligh and Johnson 1973, 954).
cf. temperature regulation: behavioral temperature regulation

self-medicating behavior, self-medication

See pharmacognosy: zoopharmacognosy.

selfish behavior, selfishness *n.*

1. A person's devotion to, or concern with, his own advantage, or welfare, to the exclusion of regard for others (Oxford English Dictionary 1971, entries regarding selfish from 1640).
2. Sociobiologically, an individual organism's doing something that benefits its own genetic fitness at the expense of the genetic fitness of conspecifics (Wilson 1975, 594).
3. Sociobiologically, an individual organism's doing something that benefits itself while harming, or imperiling, others that it affects (Wittenberger 1981, 621).

Note: Benefit and harm can be measured in terms of direct fitness [to the performer] (Wittenberger 1981, 621).

cf. altruism; behavior: spiteful behavior, cooperation
 ▶ **weak selfishness** *n.* An interaction between an actor and recipient in which the actor has a fitness increase and the recipient has no fitness change (Gadagkar 1993, 233).

sentinel behavior *n.* For example, in some baboon species including *Chlorocebus pygerythrus* (Vervet Monkeys): An alert nonforaging individual's stationing itself in a prominent place while members of its group forage nearby (Horrocks and Hunte 1986, 1566).

sexual behavior *n.* An organism's courtship and copulatory behavior (Scott 1950 in Lehner 1979, 64).
cf. courtship, copulation

▶ **pseudosexual behavior** *n.* In some racerunner- and whiptail-lizard species: A reproductively active female's pursuing, mounting, and gripping another such female with her limbs and jaws (Halliday and Adler 1986, 93).

cf. copulation; pseudocopulation

Comment: This behavior might synchronize ovulation and oviposition in a female group (Halliday and Adler 1986, 93).

shell-searching behavior *n.* In Pagurid Crabs (Hermit Crabs): An individual's searching for a new shell when it outgrows its present one or when its shell is artificially removed (Heymer 1977, 151).

shelter-building behavior *n.* An animal's using parts of its environmental, body products, or both for producing a shelter for itself, other organisms, or both (inferred from Fitzgerald 1995, 30).

Comments: In Lepidoptera (Butterflies and Moths), larvae of many species make shelters from plant parts, silk, or both. Some species roll leaves; some cut and fold over leaves; some fasten leaves and twigs together with silk; and so forth (Fitzgerald 1995).

shelter-seeking behavior *n.* An organism's seeking out and coming to rest in a favorable part of its environment (Scott 1950 in Lehner 1979, 64).

showing-the-nest behavior *n.* In many bird and fish species: A male's drawing a female toward his nest, or nesting hole, that may be followed by his showing her nesting behavior (broodiness) and her occupying his nest (Heymer 1977, 122).

signaling behavior See display.

snoring *n.* A sleeping animal's breathing through its nose and open mouth with a hoarse, rough noise and rattling vibrations of its soft palate (Michaelis 1963).

v.i. snore

n. snorer

Comments: Snoring occurs in mammals including the Domestic Dog, Human, and Orangutan (Galdikas 1995, 11).

[Middle English *snoren*. Akin to Middle Low German *snorren*, to hum, drone.]

social behavior See sociality.

▶ **selfish-social behavior** *n.* Behavior of a focal organism that includes overt selfishness (promoting its direct fitness), such as aggressiveness and territoriality, and quasi-altruistic selfishness, such as cooperation and reciprocal (temporary) altruism. *q.v.* (West Eberhard 1975, 7).

soliciting behavior *n.* For example, in Primates: A female's movements and postures that invite a male to copulate with her (Immelman and Beer 1989, 281).

syn. preceptive behavior

▶ **presenting** *n.* In some species of Old World Monkeys: Soliciting behavior in which a female shows her swollen red sex skin to a male(s) (Dewsbury 1978, 87).

syn. genital presentation (Immelman and Beer 1989, 281)

v.i. present

spacing behavior *n.* In many animal species including Humans and some mockingbird and social-insect species: Behavior (including territoriality and individual-distance behavior) that maintains an appropriate distance between individual organisms or groups (Heymer 1977, 52).

cf. dispersion

species-specific behavior *n.* Behavior that is unique to one species (Brown 1975, 400).

syn. species-characteristic behavior, species-typical behavior (G. M. Burghardt, pers. comm.)

See instinct

cf. behavior; behavior: innate behavior

spinning *n.* In *Apis mellifera* (Western Honey Bees): A worker's rotating her body and moving erratically due to pesticide poisoning (Robinson and Johansen 1978, 16).

spite, spiteful behavior *n.* "Behavior that lowers the genetic fitnesses of both the perpetrator and the individual toward which the behavior is directed" (Wilson 1975, 595).

cf. altruism; behavior: selfish behavior

Comment: "Harm is measured in terms of direct fitness" (Wittenberger 1981, 622).

▶ **weak spite** *n.* An interaction between an actor and recipient in which the actor has no fitness change and the recipient has decreased fitness (Gadagkar 1993, 233).

sponge carrying *n.* In *Tursiops* sp. (bottlenose dolphins): An individual's transporting a sponge on its rostrum (Smolker et al., 1997, 454).

Comment: Available data indicate that sponge carrying is probably involved in foraging and a likely case of tool use, *q.v.* (Smolker et al., 1997, 454).

spontaneous behavior *n.*

1. Behavior that occurs in the ostensible absence of any stimuli that can be shown to elicit, release,

or set the occasion for its occurrence (Verplanck 1957).

Notes: To call a behavior “spontaneous” indicates our current ignorance of the events that control it. Spontaneous behavior is not capricious. “This term would be synonymous with operant behavior, except that operants that have come under the control of discriminative stimuli are no longer spontaneous” (Verplanck 1957).

2. Internally caused and controlled behavior that is neither released nor maintained by external, or peripheral stimulation; *e.g.*, some vocalizations of some cricket and turkey species, initiation of appetitive behavior, and some embryo movements (Immelmann and Beer 1989, 289).

syn. autonomous behavior (Immelmann and Beer 1989, 289)

cf. activity: vacuum activity

stereotype, stereotyped-motor acts, stereotypic behavior See stereotypy.

submissive behavior See submission.

superstitious behavior *n.* For example, in *Columba livia* (Rock Doves): An individual’s repeating certain behavior that it associates with a reward because it once showed the behavior by chance when a reward was given, *e.g.*, a Rock Dove’s turning quickly in a small circle or tic-like head movements (Skinner 1948 and Herrnstein 1966 in Hinde 1970, 449).

symbolic behavior *n.*

1. An animal’s intentional movement that became ritualized and is used for intraspecific communication (Lorenz 1941 in Immelmann and Beer 1989, 301).
2. An animal’s display (Immelmann and Beer 1989, 301).

syn. symbolic action, symbolic movement

3. A person’s verbal behavior (Verplanck 1957).

4. A hypothesized class of behavior that cannot necessarily be directly observed (Verplanck 1957).

5. The observed behavior from which symbolic behavior (def. 4) is inferred (Verplanck 1957).

6. Loose and colloquially thinking (Verplanck 1957). *cf.* thinking

Comment: This term was used in earlier literature, but without consistency; it is seldom used today (Immelmann and Beer 1989, 301).

territorial behavior See territoriality.

threat, threat behavior *n.*

1. An animal’s behavior that produces flight behavior of some strength in another usually conspecific animal when it occurs in its presence; threat behavior most often elicits other agonistic behavior in a threatened animal (Verplanck 1957).

syn. apotreptic behavior (Barnett 1981 in Immelmann and Beer 1989, 18)

2. In many animal species: Avoidance behavior with aggressive elements, *e.g.*, an intimidation display with aspects of threat (hair bristling, feather ruffling, raising skin folds and crests, teeth displaying, horn displaying, making sounds, etc.); threat always contains components of attacking and fleeing, and it can express an animal’s readiness to fight (Heymer 1977, 55; Immelmann and Beer 1989, 311).

3. Behavior that occurs in agonistic contexts and commonly signifies hostility toward, or intent to attack, another animal (Hand 1986).

cf. behavior: appeasement behavior, treptic behavior: epitropic behavior; display: bared-teeth display, bared-teeth-scream display, challenge display; facial expression: ear-flap threat, open-mouth threat [apotreptic behavior coined by Barnett 1981 in Immelmann and Beer 1989, 18]

► **canine-tooth threat** *n.* In several deer species: A male’s drawing back his upper lip along his entire upper jaw, exposing his rudimentary canine teeth in the corner of his mouth, making his eyes appear white to his rival due to his standing diagonal to his rival with only the side of his eyeball exposed, and erecting his neck and back hair (Bützler 1974 in Heymer 1977, 58).

Comment: This threat is associated with specific types of confrontations, *e.g.*, rank changing (Heymer 1977, 58).

► **defensive threat** *n.* An animal’s showing a threat while it withdraws from a combatant during an agonistic encounter (Eibl-Eibesfeldt 1957 in Heymer 1977, 50).

► **offensive threat** *n.* An animal’s showing a threat while it approaches a combatant during an agonistic encounter (Eibl-Eibesfeldt 1957 in Heymer 1977, 50).

► **phallic threat** See display: genital display: genital presentation.

► **protected threat** *n.* In some baboon species: A tactic used by females of a one-male group (“harem”) that involves confronting a rival only when the group’s male is nearby (Wilson 1975, 534).

► **teeth grinding** *n.* In rodents and ruminants that use their teeth as weapons: An individual’s noisily rubbing its teeth together by sideways mandibular movement (Heymer 1977, 204)

tongue-lashing behavior See lingulation.

trekking *n.*

1. In South Africa, a person’s traveling by ox wagon (Michaelis 1963).

2. Traveling, especially slowly or arduously (Michaelis 1963).

3. In South Africa, an ox’s drawing a vehicle or load (Michaelis 1963).

4. In Yanomami, an entire community’s packing up its possessions, abandoning its communal shelter, and going into the forest in one through several groups to hunt and gather wild foods (Good 1995, 57).

n. trek

v. trekked

v.i. trekking

[Dutch *trekken*, to draw, travel]

treptic behavior, treptics *n.* Animal social interactions of approach and withdrawal during interactions [coined by Barnett 1981 in Immelmann and Beer 1989, 18, who indicate that this term and apotreptic and epitropic behavior have not caught on in the literature].

cf. intimidation

► **apotreptic behavior** See behavior: threat.

► **epitropic behavior** *n.* An animal’s behavior that tends to cause a conspecific to approach [coined by Barnett 1981 in Immelmann and Beer 1989, 18].

trial-and-error behavior See kinesis: klinokinesis.

triggered behavior *n.* Behavior that continues independently of external stimulation after its first elicitation by a stimulus, *e.g.*, a fixed-action pattern (Dewsbury 1978, 15).

unlearned behavior See instinct.

cf. behavior: innate behavior; innate

vacuum behavior See activity: vacuum activity.

verbal behavior *n.*

1. A person's vocalization, writing words, response to written words, or a combination of these activities (Verplanck 1957).
2. A person's behavior (including vocalization, writing, gesturing, and other forms of communication) whose reinforcement is contingent upon stimulation of and response by another individual (Verplanck 1957).

vestigial behavior See behavior: relict.

vigilant behavior See vigilance.

wallowing *n.*

1. An animal's rolling about (Michaelis 1963).
 2. A animal's actively being immersed in mud, sand, snow, etc. (Michaelis 1963).
- Note:* This is often done with pleasure in Humans (Michaelis 1963).
3. A animal's trashing about, floundering (Michaelis 1963).
 4. A person's living self-indulgently: wallowing in sensuality (Michaelis 1963).
 5. An animal's spreading fluid (*e.g.*, mud, water, or urine) on its body surface, resulting in evaporative heat loss (Bligh and Johnson 1973, 958).

cf. temperature regulation: behavioral temperature regulation

n. wallower

v.i. wallow

[Old English *wealwian*]

warning behavior See behavior: alarm behavior.

wing fanning *n.* In *Apis mellifera* (Western Honey Bees): While in front of her nest entrance, a worker's (*sterzelnde* bee) raising her abdomen, extending her scent organ, and fanning her wings, and thereby making a pheromone plume that helps her hive mates to find their nest entrance (Frisch 1965 in Heymer 1977, 69).

See display: wing fanning.

cf. bee: fanning bee

♦ **behavior chain** See chain.

♦ **behavior-chain diagram** See -gram: behavior chain diagram.

♦ **behavior event, behavioral event** *n.* An animal's change in behavior states that approaches being an instantaneous occurrence, *e.g.*, a bird's taking flight (Altmann 1974 in Lehner 1979, 69).

syn. momentary behavior (Sackett 1978 in Lehner 1979, 69)

cf. behavior state

♦ **behavior hypothesis** See hypothesis: population-limiting hypotheses: behavior hypothesis.

♦ **behavior modification, behavioral modification** *n.* A technique that seeks to modify animal (including human) behavior, in which rewards and reinforcements, or punishments, are used to establish desired habits, or patterns of behavior (Michaelis 1963).

♦ **behavior pattern** See classification of behavior (table); pattern: behavior pattern.

♦ **behavior-sequence diagram** See behavior chain diagram.

♦ **behavior state, behavioral state** *n.* The behavior that one, or more, animals is engaged in; an ongoing behavior, *e.g.*, a bird's flying (Altmann 1974 in Lehner 1979, 69).

syn. duration-meaningful behavior (Sackett 1978 in Lehner 1979, 69)

cf. behavior event

♦ **behavior stereotype** See stereotypy.

♦ **behavior syndrome** *n.* A behavioral category composed of several smaller behavioral categories (Immelmann and Beer 1989, 303).

♦ **behavior type** *n.* One kind of behavior in Scott's (1950 in Lehner 1979, 64) classification: ingestive, investigative, shelter-seeking, eliminative, sexual, epimeletic, et-epimeletic, allelomimetic, and agonistic behavior.

♦ **behavioral act, act** *n.* Part of a behavior pattern; *e.g.*, parts of flight: taking off, flying, and landing (Lehner 1979, 65).

See classification of behavior (table).

cf. behavior pattern, behavior type, behavioral act: component part of a behavioral act, episode

component part of a behavioral act *n.* Part of a behavior act, *e.g.*, parts of the act of taking off; movements of particular body parts, and neurological activity (Lehner 1979, 65).

cf. behavioral act, behavior pattern, behavior type

♦ **behavioral biology** See study of: biology: behavioral biology.

♦ **behavioral catalog** See -gram: ethogram.

♦ **behavioral characteristic** See character: behavioral characteristic.

♦ **behavioral deficit** *n.* An animal's abnormally low production of a particular behavior (Immelmann and Beer 1989, 137).

cf. behavior: abnormal behavior; hypertrophy

♦ **behavioral dichotomy** See courtship: behavioral dichotomy.

♦ **behavioral dimorphism** See polyethism.

♦ **behavioral ecology** See study of: ecology: behavioral ecology.

♦ **behavioral embryology** See study of: embryology: behavioral embryology.

♦ **behavioral endocrinology** See study of: endocrinology: behavioral endocrinology.

♦ **behavioral event** See behavior event.

♦ **behavioral genetics** See study of: genetics: behavioral genetics.

♦ **behavioral inventory** See -gram: ethogram.

♦ **behavioral-isolating mechanism** See mechanism: isolating mechanism: sexual-isolating mechanism.

♦ **behavioral mimicry** See mimicry: behavioral mimicry.

♦ **behavioral modification** See behavior modification.

♦ **behavioral ontogenesis, behavioral ontogeny** See -genesis: ethogenesis.

♦ **behavioral phylogeny** See study of: phylogeny: behavioral phylogeny.

♦ **behavioral physiology** See study of: physiology: behavioral physiology.

♦ **behavioral polymorphism** See polyethism.

♦ **behavioral program** See program: behavioral program.

♦ **behavioral repertoire, behavioral repertoire** See -gram: ethogram.

♦ **behavioral resilience** *n.* A measure of the extent to which any of an animal's behaviors can be reduced in duration by its other behaviors (McFarland 1985, 452).

cf. behavior: leisure behavior

Comment: Low-resilience behaviors are reduced in duration, rather than high-resilience ones, when an animal faces a time constraint (McFarland 1985, 452).

♦ **behavioral scaling** *n.*

1. Variation in the magnitude, or in the qualitative state, of an animal's behavior that is correlated with stages of its life cycle, population density, or certain parameters of its environment (Wilson 1975, 20).

Note: Behavioral scaling is likely to be adaptive (Wilson 1975, 20).

2. "The range of forms and intensities of a behavior that can be expressed in an adaptive fashion by the same society or individual organism" (Wilson 1975, 579).

Note: For example, a society may be organized into individual territories at low densities but shift to a dominance system at high densities (Wilson 1975, 579).

syn. behavior scaling

♦ **behavioral sciences** See study of: behavioral sciences.

♦ **behavioral silence** See learning: behaviorally silent learning.

♦ **behavioral state** See behavior state.

♦ **behavioral system** See cycle: functional cycle.

♦ **behavioral temperature regulation** See temperature regulation: behavioral temperature regulation.

♦ **behavioral tendency** See potential: specific-action potential(ity).

♦ **behavioral unit** *n.* The kind of behavior that one measures in a study; *e.g.*, blows, fights, footsteps, journeys, or songs (Lehner 1979, 63).

Note: Lehner 1979 (64–67) lists classifications of behavioral units.

♦ **behavioral vestige** See relict.

♦ **behaviorism** *Brit. behaviourism* *n.*

1. A theory and method of psychological investigation that is based on the objective, experimental study and analysis of behavior (Oxford English Dictionary 1989, entries from Watson 1913).
2. The psychological theory that the behavior of human and nonhuman animals is determined by measurable external and internal stimuli acting independently (Michaelis 1963).
3. The view that "psychology studies behavior itself, rather than mental events" (McFarland 1985, 8), such as consciousness, emotion, imagery, mind, sensation, and will (Collocot and Dobson 1974).

syn. behaviorist school of psychology

cf. study of: behavior, behavioral biology; psychology: behaviorism

Comments: "In its strong form, behaviorism rejects all reference to inner processes in the explanation of behavior." Behaviorism was initiated by John B. Watson in 1913 (McFarland 1985, 8). Eysenck et al. (1979) describes "Watsonian behaviorism," "Tolman's purposive behaviorism," etc.

American behaviorism See study of: psychology: classical animal psychology.

♦ **descriptive behaviorism** *n.*

1. The learning theory of B. F. Skinner which explains behavior largely in terms of linguistically formulated observations and their interrelationships (Eysenck et al. 1979, 121).
2. "A collective term for the techniques of operant conditioning by which operants, or emitted responses, are examined without necessary

reference to originating rather than reinforcing stimuli" (Eysenck et al. 1979, 121).

ethical behaviorism *n.* One of several theories of human ethical behavior that proposes that "moral commitment is entirely learned, with operant conditioning's being the dominant mechanism; in other words, children simply internalize the behavioral norms of the society" (Scott 1971 in Wilson 1975, 562–563).

See ethical institutionism

Comment: This theory is opposed by the "developmental-genetic concept" (Scott 1971 in Wilson 1975, 562–563).

♦ **logical behaviorism**

n. Behaviorism that has the view that any statements about mental events are meaningless (Dawkins 1980, 12).

metaphysical behaviorism, radical behaviorism *n.* Behaviorism that denies the existence of mind; asserts that conscious, or mental processes, are beyond the realm of scientific enquiry; and emphasizes observability, operationalism, falsifiability, experimentation, and replication (Blackburn 1984, 291–292).

Comments: Skinner's "metaphysical behaviorism" is often exaggerated by his followers; Skinner makes several references to the essential study of thoughts in psychological studies (Blackburn 1984, 291–292).

methodological behaviorism *n.* Behaviorism that acknowledges that subjective experiences may exist, but it is of no concern of science to study them (Dawkins 1980, 12).

molar behaviorism, molarism See behaviorism: purposive behaviorism.

molecular behaviorism *n.* Behaviorism that seeks to explain all behavior as built from the smallest possible units (Eysenck et al. 1979, 121).

purposive behavior, purposive behaviorism *n.*

1. The concept that behavior is not a mechanical succession of causes and effects, but is a set of actions strictly linked and oriented towards an organism's "achieving a goal" (Tolman 1932 in Gherardi 1984, 371).

cf. teleology

2. The learning theory of E. C. Tolman who does not start from the smallest possible elements of behavior but instead considers the holistic, purposive units or species (Eysenck et al. 1979, 121).

syn. molar behaviorism, molarism (Eysenck et al. 1979, 121)

radical behaviorism See behaviorism: metaphysical behaviorism.

♦ **behaviorist** *n.* A proponent, or practitioner, of behaviorism, *q.v.* (McKechnie 1979; McFarland 1985, 9). *adj.* behaviorist, behavioristic

♦ **behaviorist school of psychology** See behaviorism.

♦ **behavioristic method** See method: behavioristic method.

♦ **Behrens-Fisher-*t* test** See statistical test: multiple-comparisons test: planned-multiple-comparisons procedure: Behrens-Fisher-*t* test.

♦ **bell-shaped distribution** See distribution: normal distribution.

♦ **bellowing** See ²group: bellowing.

♦ **beneficence** See symbiosis: beneficence.

- ♦ **beneficent behavior** See behavior: beneficent behavior.
- ♦ **beneficiary** *n.* A person who receives benefits or favors (Oxford English Dictionary 1971, entries from 1662).
- super-beneficiary** *n.* An organism that is a very efficient at being a recipient of help from conspecific workers, or subordinates, *e.g.*, queens of some kinds of social insects (West Eberhard 1975, 14). *cf.* super-donor
- ♦ **benefit** *n.*
1. Any consequence of a phenotypic trait that increases Darwinian fitness (Wittenberger 1981, 613). *Note:* Sometimes, benefits are operationally defined in terms of direct and indirect fitness, especially in empirical studies, or theoretical analyses, pertaining to them (Wittenberger 1981, 613).
 2. An organism's gain in viable offspring (Dawkins 1986, 31).
 3. An organism's energy intake (Dawkins 1986, 31). *cf.* cost, utility
- benefits of sex** *n. pl.* Benefits including assembly of better genotypes (Willson 1983, 47).
- expected benefit** *n.* Benefit, measured as fitness, that an individual can expect to receive at some future time by performing a particular behavior rather than some alternative behavior; "benefit multiplied by the probability of realizing the benefit" (Wittenberger 1981, 615).
- **net-expected benefit** *n.* "The average net increase in fitness that an individual receives by choosing one of several possible behavioral options in a given context;" expected benefit minus expected cost (Wittenberger 1981, 618).
- ♦ **benthic, benthal, benthonic** *adj.*
1. Referring to a sea bed, river bed, or lake floor (Lincoln et al. 1985); contrasted with pelagic.
 2. Referring to a stickleback species that always feeds on the bottom of a lake; contrasted with limnetic (Weiner 1995, 31).
- See benthos.
- erybenthic** *adj.* Referring to an organism that lives on a sea, or lake bed, and is tolerant of a wide depth range; contrasted with stenobenthic (Lincoln et al. 1985).
- holobenthic** *adj.* Referring to an organism that is confined to a benthic existence throughout its life cycle (Lincoln et al. 1985).
- nectobenthic, nektobenthic** *adj.* Referring to an organism that swims off a sea bed (Lincoln et al. 1985).
- stenobenthic** *adj.* Referring to an organism that lives on a sea, or lake, bed and is tolerant of a narrow depth range; contrasted with erybenthic (Lincoln et al. 1985).
- ♦ **benthon** See community: benthos.
- ♦ **benthopotamous** *adj.* Referring to an organism that lives on the bed of a river or stream (Lincoln et al. 1985).
- ♦ **benthos** *adj.* benthic. See ²community: benthos.
- ♦ **Bergmann's law, Bergmann's rule** See rule: Bergmann's rule.
- ♦ **Bern Convention (on the Conservation of European Wildlife and Natural Habitats 1979)** See convention: Bern Convention on the Conservation of European Wildlife and Natural Habitats 1979.
- ♦ **Bernard's dictum, Bernard's principle** See principle: Bernard's principle.
- ♦ **berried** See gravid.
- ♦ **bestiality** See sodomy.
- ♦ **best-man hypothesis** See hypothesis: hypotheses of the evolution and maintenance of sex: best-man hypothesis.
- ♦ **beta, β** *n.*
1. The second ranking animal in a dominance hierarchy. *cf.* alpha, omega
 2. In statistics, the type-II error (*q.v.*). *adj.* beta
- [β, the second letter of the Greek alphabet]
- ♦ **β-diversity** See diversity: β-diversity.
- ♦ **β-diversity index** See index: species-diversity index: β-diversity index.
- ♦ **beta karyology** See karyology (comment).
- ♦ **β'** See coefficient: selection coefficient.
- ♦ **beta taxonomy** See taxonomy: beta taxonomy.
- ♦ **beta waves** See brain waves: beta waves.
- ♦ **bevy** See ²group: bevy.
- ♦ **bew** See ²group: bew.
- ♦ **B horizon** See soil horizon: B horizon.
- ♦ **bi-, bin** *prefix* Twice; doubly; two; especially, occurring twice or having two. Also *bis-* before a c or s (Michaelis 1963). [Latin *bi-* < *bis*, twice]
- ♦ **bias** *n.* In statistics, the difference between an expectation (= estimation) of a quantity and the actual magnitude of that quantity (Efron and Tibshirani 1991, 124).
- observer bias** *n.* A data taker's unconscious interpretation of an observation that fits his expectation better than an objective observation (Martin and Betesson 1993 in Milinski 1997, 169).
- ♦ **bicentric** *adj.*
1. Referring to a taxon that has two centers of distribution or evolution (Lincoln et al. 1985).
 2. Referring to an organism's distributional range with two zones of concentration separated by an impoverished region (Lincoln et al. 1985).
- ♦ **biennial** *adj.*
1. Referring to an event that occurs every 2 yr (Michaelis 1963).
 2. A plant that produces flowers and fruit in its second year, then dies (Michaelis 1963). *Note:* Some plant species contain annual, biennial, and perennial individuals (pers. obs.)
 3. Referring to an organism that requires 2 yr to complete its life cycle (Lincoln et al. 1985). *cf.* annual, perennial
- ♦ **big bang** *n.* A virtually simultaneous radiation at the base of the eukaryotic evolutionary tree that involves the appearance of almost all extant eukaryotic phyla (Gray et al. 1991, 1980). See Cambrian explosion.
- ♦ **big-bang cosmology** See hypothesis: hypotheses of the beginning and evolution of the Universe: big-bang cosmology.
- ♦ **big-bang hypothesis** See hypothesis: hypotheses of the beginning and evolution of the Universe: big-bang hypothesis.
- ♦ **big-bang model, big-bang theory** See hypothesis: hypotheses of the beginning and evolution of the Universe: big-bang cosmology.
- ♦ **big-bang reproduction strategy** See parity: semelparity.

- A**
- ◆ **big-bang theory** See hypothesis: hypotheses of the beginning and evolution of the Universe: big-bang cosmology.
 - ◆ **Big Chill** *n.* The ending of our Universe if its present expansion continues unabated and the entire Universe dilutes itself to zero density and temperature [coined by David N. Schramm, physicist (1979 in Hitt 1992)].
cf. Big Crunch
 - ◆ **Big Crunch** *n.* The catastrophic ending of our Universe if its present expansion stops, and the whole universe collapses on itself [coined by David N. Schramm, Beatrice Tinsley, James Gunn, and Richard Gott, physicists (1973 in Hitt 1992)].
cf. Big Chill
 - ◆ **Big Science** See science: Big Science.
 - ◆ **bike** See ²group: bike.
 - ◆ **bilateral-primary-linkage principle** See principle: bilateral primary-linkage principle.
 - ◆ **billing** *n.* In birds that maintain permanent pair bonds: Two bird's mutual beak contact in which their bills are either crossed, or the bill of an arriving partner is grasped by the other; billing sometimes involves actual food transfer (Gwinner 1964, Wickler 1969 in Heymer 1977, 158).
cf. food begging, feeding; courtship feeding
Comment: Billing without food transfer may be symbolic feeding (Heymer 1977, 158).
 - ◆ **bimodal distribution** See distribution: bimodal distribution.
 - ◆ **binary digit** See bit.
 - ◆ **binary fission** *n.* In Prokaryotes: A kind of cell division in which a parent cell splits transversely into approximately equal sized daughter cells that each receives a copy of a single parental chromosome (King and Stansfield 1985; Campbell 1990, G-2).
cf. mitosis
 - ◆ **binaural hearing** See modality: mechanoreception: audition: binaural hearing.
 - ◆ **binomial distribution** See distribution: binomial distribution.
 - ◆ **bio-** *comb.f.* "Life" (Michaelis 1963).
[Greek *bios*, life]
 - ◆ **bioacoustics** See study of: acoustics.
 - ◆ **biocenose, biocoenose, biocoenosis** *n.* An organism community, or natural assemblage, excluding abiotic aspects (Lincoln et al. 1985).
syn. life assemblage
cf. biotope, ²community
 - ◆ **biocenotics** See study of: biocoenology.
 - ◆ **biochemical crypsis** *n.* A species' being olfactorily hidden from its parasite compared to another similar species which is olfactorily apparent to its parasite (inferred from Moraes and Mescher 2004, 8993).
cf. mimicry, molecule: volicitin
Comment: Biochemical crypsis is a term that compares a usual system with three species (two signaling species and one receiving one) with a system of two ecologically similar species that do not signal. Other kinds of crypsis involve only one signaling and one receiving (or nonreceiving) individual (or species). In many plant-herbivore-parasitoid systems, herbivorous insects cause plants to produce induced plant volatiles which attract the herbivore's parasitoids. In biochemical crypsis, the herbivore does not induce such volatiles, and therefore, the parasitoids cannot find the herbivores via the volatiles. Compared to the usual plant-herbivore-parasitoid system, in biochemical crypsis, the herbivore is cryptic, or hidden, from its putative parasitoid. Evidently, the only known example of biochemical crypsis involves the noctuid moth *Heliothis subflexa* (Moraes and Mescher 2004, 8993). In related noctuid species, larvae produce volicitin (*q.v.*) which causes their plants to release induced plant volatiles, and adult wasps that parasitize the larvae use the volatiles as cues for finding host larvae. Larvae of *H. subflexa* do not produce volicitin (because its required precursor, linolenic acid, is not in their food), and, therefore, do not cause their host plant, *Physalis angulata*, to produce the volatiles.
 - ◆ **biochemical pathway** *n.* A directional series of chemical reactions within a living organism (inferred from Strickberger 1996, 515).
cf. pathway
Comments: Biochemical pathways are linear or cyclical, make molecules more or less complex, and consume and produce energy. Organisms have hundreds of biochemical pathways.
 - ◆ **C₃ photosynthesis** *n.* Plant photosynthesis that fixes carbon via ribulose bisphosphate carboxylase (= rubisco, RUBP carboxylase), the Calvin-cycle enzyme that adds CO₂ to ribulose bisphosphate (RuBP); contrasted with C₄ photosynthesis (Campbell et al. 1999, 182).
cf. Plantae: C₃ plant (Appendix 1)
[C₃, after the fact that the first organic product of carbon fixation is a three-carbon compound, 3-phosphoglycerate]
 - ◆ **C₄ photosynthesis** *n.* Plant photosynthesis that prefaces its Calvin cycle with a mode of carbon fixation that forms the four-carbon compound malate as its first product; contrasted with C₃ photosynthesis (Campbell et al. 1999, 182).
cf. Plantae: C₄ plant (Appendix 1)
[C₄, after the fact this process makes the four-carbon compound malate as its first product]
 - ◆ **Calvin cycle** *n.* A cyclic biochemical pathway that incorporates CO₂ from air into sugar (as the process of carbon fixation) (Campbell 1990, 209).
Comments: The Calvin cycle occurs in the stroma of chloroplasts. In most plants, it occurs during daylight, but because it does not require light directly, this cycle is sometimes referred to as "dark reactions" (Campbell 1990, 209).
[after Melvin Calvin, chemist, who began to elucidate the steps along with his colleagues in the late 1940s]
 - ◆ **citric-acid cycle** *n.* A biochemical cycle that uses a two-carbon acetyl fragment from pyruvic acid which is combined with the four-carbon oxaloacetic acid and makes citric acid and other compounds and releases a net of 2 ATPs.
Comments: This cycle produces NADH and FADH₂ which provide electrons used in the electron transport chain, *q.v.* (Campbell 1987, 193).
syn. tricarboxylic-acid cycle, TCA cycle, Krebs cycle (Campbell 1987, 191)
[citric-acid cycle after citric acid which is formed by the condensation of acetyl-coenzyme A with the four-carbon oxaloacetic acid]
 - ◆ **fermentation** *n.* An anaerobic metabolic pathway that converts sugar into a waste product and energy (Campbell 1987, 187).
syn. anaerobic glycolysis (Strickberger 1996, 151)
cf. biochemical pathway: glycolysis
Comments: Fermentation includes "glycolysis" and the steps necessary to regenerate NAD⁺ (Campbell 1987, 187–188). Types of fermentation include "alcohol

fermentation” and “lactic-acid fermentation.” Living organisms use part through all of a fermentation pathway, depending on the taxon.

glycolysis *n.* An anaerobic metabolic pathway (= sequence of reactions) that converts one glucose molecule into two pyruvic-acid molecules and releases a net of two ATPs (Alberts et al. 1989, 12). *cf.* fermentation

Comments: Glycolysis probably occurred in early life because it occurs in cytoplasm and thus does not require membrane-bound organelles; it is widespread in living organisms, probably being in almost all living cells; and different sections of the glycolytic pathway are thought to occur in all living species (Alberts et al. 1989, 12; Strickberger 1990, 139). Glycolysis (as fermentation) is the first pathway in energy production of present-day aerobes (Campbell 1987, 187). Some organisms change amino acids, fats, or sugars into products that enter glycolysis (King and Stansfield 1985; Strickberger 1996, 151).

[Greek sugar splitting < *glukos*, sweet; *lysis*, loosening]

glycolytic pathway *n.* Glycolysis that starts with almost any organic material, e.g., amino acids, fats, or sugars (Strickberger 1990, 139).

Comments: Strickberger (1990, 139) does not clearly indicate the difference between “glycolytic pathway” and “glycolysis.” Some researchers are likely to make them synonymous.

Krebs cycle *n.* A biochemical cycle that is enzymatically controlled, uses a two-carbon acetyl fragment from pyruvic acid (from glycolysis) which is combined with the four-carbon oxaloacetic acid and makes citric acid and other compounds, and releases a net of 2 ATPs (Campbell 1990, 188).

syn. citric-acid cycle, tricarboxylic-acid cycle, TCA cycle (Campbell 1987, 191), citrate cycle (King and Stansfield 1985)

Comments: Each turn of this cycle produces 3 NADH and 1 FADH₂ which provide high-energy electrons used in the electron transport chain, *q.v.* (Campbell 1990, 189, illustration).

[Krebs cycle after British scientist Hans Krebs who was largely responsible for elucidating the pathway in the 1930s (Campbell 1987, 191)]

photosynthesis *n.* The enzymatic conversion of light energy into chemical energy resulting in the formation of carbohydrates and oxygen from carbon dioxide and water (King and Stansfield 1985).

Comments: Photosynthesis is found in anaerobic photosynthetic bacteria, Cyanobacteria, Green Plants, many protist species including algae, and sulfur bacteria (Campbell 1990, 204; Strickberger 1990, 237).

[Greek synthesis by light < *photos*, light; *syn*, together; *tithenai*, to place]

“photosystem-I photosynthesis” *n.* Photosynthesis that uses only photosystem-I and obtains protons and electrons from ammonia, hydrogen sulfide, ferrous ions, or some other chemical, but not water (Campbell 1990, 529; Strickberger 1990, 146).

Comments: Photosystem-I photosynthesis is found in anaerobic photosynthetic bacteria: the Green Sulfur Bacteria and Purple Sulfur Bacteria. The chemical used as a source of protons and electrons depends on the taxon.

“photosystem-II photosynthesis” *n.* Photosynthesis that uses both photosystem-I and photosys-

tem-II and obtains protons and electrons from water (Strickberger 1990, 146).

♦ **biochronology** See study of: biochronology.

♦ **BIOCLIM v.5.0** See model: BIOCLIM v.5.0.

♦ **bioclimatic modeling** See method: bioclimatic modeling.

♦ **bioclimatology** See study of: bioclimatology.

♦ **biocoenology** See study of: biocoenology.

♦ **bicoid** See gene: *bicoid*.

♦ **biogeochemical cycle** See cycle: biogeochemical cycle.

♦ **biodeterioration zone** See zone: biodeterioration zone.

♦ **biodiversity** *n.* The total spectrum of living variability from genes through species through higher taxa, including ecological interactions, communities, and populations (Buchmann and Nabhan 1996, 242). *cf.* place: biodiversity hotspot, ²species

Comments: Coral reefs and tropical rain forests are renowned for their very high biodiversity (Howlett et al. 2000, 207). In general, on the average, greater diversity may lead to greater productivity in plant communities, greater nutrient retention in ecosystems, and greater ecosystem stability (Tilman 2000, 208). Experimental species-rich assemblages had more biomass accumulation than species-poor assemblages that both grew with elevated levels of CO₂, nitrogen, or both (Reich et al. 2001, 809). Biodiversity is fundamentally a multi-dimensional concept that cannot be sensibly reduced to a single number (Purvis and Hector 2000, 212). Biodiversity is a major part of Humans’ life-support system (Milner-Gulland 2001, 752). Currently, Humans are causing what may become the greatest species extinction since the end of the Cretaceous Period, 65 Ma ago — the Biodiversity Crisis (Turning Point Project, A14).

♦ **biogeochemistry** See study of: chemistry: biogeochemistry.

♦ **biogeography** See geography: biogeography.

♦ **biogeosphere** See -sphere: biosphere: eubiosphere.

♦ **biogram** See -gram: biogram.

♦ **biohydrology** See study of: biohydrology.

♦ **bioinert body** See ¹system: ecosystem.

♦ **bioinvasion** *n.* The entry of one, or more, species from distant ecosystems into a focal ecosystem (Turning Point Project 1999, A14).

cf. Kingdom Plantae: invasive plant (Appendix 1), ²species: invasive species

Comments: Bioinvaders alter vegetation, compete with native species, prey upon native species, and sometimes bring in new diseases that affect native organisms, as well as Humans (Turning Point Project 1999, A14). About 50,000 bioinvaders have entered U.S. ecosystems. More than 200 plant bioinvaders occur in U.S.

eastern deciduous forests. The damage of bioinvaders to the U.S. is about \$138 billion annually. Pathogens that arrive in raw logs cause about \$2.1 billion loss in forest products each year. Bioinvaders include in Australia, Black-striped Mussels, feral Domestic Cats; Europe, Rootworms; Guam, Brown Tree Snakes; Hawai'i, a Central American tree *Miconia calvescens*, Giant African Snails, feral Domestic Goats, Lantana, feral Domestic Pigs, rats, Rosy Wolf Snails; Lake Victoria, Africa, Nile Perch; South Africa, pines, Varroa Mites; Tahiti, *Miconia calvescens*; Tierra del Fuego, South America, Beavers; the Mediterranean, *Caulerpa taxifolia*; and Mainland U.S., *Arundo donax* (Giant Cane), Asian Longhorned Beetles, Asiatic Clematis, Bottlebrush Tree, Baby's-breath (a plant), Brazilian-pepper, Brown Trout, Eurasian Cheatgrass, Eurasian Milfoil, Hydrilla, Japanese Knotweed, Kudzu Vine, Leafy Spurge, Mosquito Fish, Norway Maple, Purple Loosestrife, Russian Olive, Russian Thistle (= Tumbleweed), Tall Fescue, Tamarisk Tree, Varroa Mites, Water-hyacinths, Witchweed, Yellow Star Thistle, and Zebra Mussels (Kaiser 1999, 1839–1841; Malakoff 1999, 1841–1843; Raver 1999, 16 September, D1; Stone 1999, 1837; Turning Point Project 1999, A14). United States nurseries continue to sell many species of invasive plants.

♦ **biological adj.**

1. Referring to biology, *q.v.*
2. Colloquially, referring to the genetic relationship between relatives (Alexander 1987, 8).

♦ **biological altruism** See altruism (def. 2).

♦ **biological clock** See clock: biological clock.

♦ **biological complementariness** *n.* The phenomenon that organisms are not self-sufficient, in that they require stimuli from their environments for normal maturation (Brownlee 1981, iv).

syn. complementariness, principle of biological complementariness

cf. -genesis: epigenesis

♦ **biological efficiency** See ¹efficiency: ecological efficiency.

♦ **Biological Dynamics of Forest Fragments Project** See project: Biological Dynamics of Forest Fragments Project.

♦ **biological function** See adaptive significance.

♦ **biological-isolating mechanism** See mechanism: isolating mechanism: biological-isolating mechanism.

♦ **biological mimicry** See mimicry.

♦ **biological race** See ¹race: biological race.

♦ **biological-rank ordering** See hierarchy: dominance hierarchy: biological-rank ordering.

♦ **biological rhythm** See rhythm: biological rhythm.

♦ **biological species** See ²species: biological species.

♦ **biological theory of evolution** See evolutionary synthesis.

♦ **biology** *n.* Colloquially, genetic variations (Gould 1984 in Alexander 1987, 7).

See study of: biology.

♦ **bioluminescence** *n.* In many organism species: An organism's emission of light due to an energy-yielding chemical reaction in which luciferin undergoes oxidation, catalyzed by luciferase (Aristotle, Boyle 1672, etc. in Johnson 1966, 3; Barnes 1974, 141, 277, 531; Hastings 1989).

cf. communication: flash communication, Lampyridae (Appendix 1), phosphorescence

Comments: Bioluminescence is a kind of chemiluminescence (Hastings 1989, 545) found in many organisms including a limpet, acorn-worm, earthworm, sea-pansy, polychaete worm, and midge (fly) species; some bacterium, fungus, dinoflagellate, sponge, jellyfish, brittle-star, tunicate, ostracod crustacean, millipede, and centipede species; and many ctenophore, beetle (including some firefly, elaterid, phenotid), and fish species. Luminescent bacteria emit a continuous blue-green light (Hastings 1989, 547). A species of deep-sea octopus squirts a luminescent fluid instead of ink which would be ineffective in total darkness (Hastings 1989, 548). A marine crustacean, *Cypridina*, squirts luciferin and luciferase into water; this light in the water might divert, or confuse, predators (Hastings 1989, 547). Fireflies use their lights in attracting mates and prey, depending on the species (White 1983, 190). Firefly lights range from green through yellow-orange, depending on the species (McDermott 1948, 13). Many dusk-active fireflies have yellow lights, and many dark-active fireflies have green lights, perhaps because the colors enhance communication with regard to time of the day (Lall et al. 1980, 561). Some species of cantharoid beetles, including fireflies, may use bioluminescence as aposematic signaling (Sagegami-Oba et al. 2007, 104). Flashlight Fish appear to use their luminescence (from symbiotic luminous bacteria in the fish's eye pouches) for assisting in predation and predator escape and for intraspecific communication (Hastings 1989, 548). The Pony Fish has a diffuse glow from symbiotic bacteria over its entire ventral surface; this light might camouflage it against a light background seen when an animal looks up at it (Hastings 1989, 548). Some angler-fish species attract prey with dangling luminescent bodies that they hold in front of their mouths; a *Neosopelus* fish has a photophore on its tongue that lures prey (Hastings 1989, 548).

♦ **biomass** *n.* The weight of a set of organisms (Wilson 1975, 579).

Comment: The set is chosen for convenience; it can be, for example, a colony of insects, a population of wolves, or an entire forest (Wilson 1975, 579).

♦ **biome** *n.*

1. "A biogeographical region or formation" (Lincoln et al. 1985).
2. A major regional community characterized by distinctive life forms and principal plant (terrestrial biomes) or animal (marine biomes) species (Lincoln et al. 1985).

cf. habitat

Comment: Terrestrial biomes are chaparral, desert, mountains, northern coniferous forest, temperate deciduous forest, temperate rain forest, temperate grassland, tropical deciduous forest, tropical grassland and savannah, tropical rain forest, tropical scrub forest, and tundra.

♦ **biomechanics** See study of: biomechanics.

♦ **biometeorology** See study of: meteorology: biometeorology.

♦ **biometrician** *n.*

1. An evolutionist who is interested in population phenomena and holistic interpretations (Mayr 1982, 778–779).

Note: Biometricians opposed the "Mendelian," *q.v.*, from about 1894 to 1906 (Mayr 1982, 778–779).

2. A biostatistician.

cf. study of: biometry

- ♦ **biometrics** See study of: -metry: biometry.
- ♦ **biometry** See study of: -metry: biometry.
- ♦ **BioMOO Center, MOO** *n.* A computer-produced science facility with a simulated large, growing laboratory and an office complex that is used by hundreds of biologists in different parts of the world and different fields who are communicating, collaborating, and designing electronic tools for scientific work (Anderson 1994, 900).
adj. MOO (Anderson 1994, 900)
cf. Diversity University MOO Campuses
Comments: Gustavo Glusman founded the BioMOO Center in 1993 (Anderson 1994, 900, illustration). It is the first major effort to use a virtual environment to perform day-to-day science and scientific communication. In using the bioMOO center, a scientist can walk down a virtual hall and into a lab, strike up a conversation with one of its workers (communicating in real time — almost instantaneously), use a computer program in the lab, inspect and manipulate a research model, and participate in a journal club. The main physical part of the BioMOO is continuously growing and changing and located at the BioInformatics Unit of the Weizmann Institute of Science, Israel (telnet://bioinfo.weizmann.ac.il:8888, 2000).
[Greek *bios*, life + MOO, multiple-user dimension, object oriented. The M originally stood for multiple-user dungeon, referring to the computer version of the game Dungeons and Dragons, from which the BioMOO Center evolved (Anderson 1994, 900)]
- ♦ **bion** See biont.
- ♦ **bionomic axes, resource axes** *n. pl.* Axes that relate to resources, such as food and space, for which there may be competition with neighboring species in the context of a multidimensional hyperspace (= niche) (Lincoln et al. 1985).
cf. scenopoetic axes
- ♦ **biont, bion** *n.*
1. An elementary, difficult concept that expresses the extent to which one living thing is separate from, or independent of, other living things (Bell 1982, 508).
syn. individual (Bell 1982, 508)
 2. An individual organism (Lincoln et al. 1985).
 3. A physiological individual, *e.g.*, a *Physalia physalis* (Portuguese man-of-war); contrasted with morphont Haeckel in (Hull 1992, 184).
- See individual: biont.
adj. biontic, biotic
cf. -cole, 1-phile, -vore
Comment: “Biont” and “morphont” are problematical terms because “morphology and physiology do not provide sufficiently well articulated theoretical contexts” (Hull 1992, 184).
- chorotobiont** See -cole: graminicole.
- coprobiont** *n.* An animal (coprozoite) or a plant (coprophyte) that lives, or feeds, on dung (Lincoln et al. 1985).
- diplobiont, diphophalontic organism** *n.* An organism with a regular alternation of haploid and diploid generations during its life cycle (Lincoln et al. 1985).
- endobiont** *n.* An organism that lives within a substratum (Lincoln et al. 1985).
- eobiont** *n.* One of the early living organisms that developed from prebiotic macromolecular precursors (Lincoln et al. 1985).
- epibiont** See -cole: epicole.

- eremobiont deserticole** *n.* An organism that lives in desert regions (Lincoln et al. 1985). See -cole: deserticole.
- eurybiont** *n.* An organism that tolerates a wide range of a particular environmental factor; contrasted with stenobiont (Lincoln et al. 1985).
- eutroglobiont** See 1-phile: troglophile.
- exobiont** *n.* An organism that lives on the outer surface of another organism or on the surface of a substratum (Lincoln et al. 1985).
- halobiont, halobion** *n.*
1. A marine organism (Lincoln et al. 1985).
 2. An organism that lives in a saline habitat (Lincoln et al. 1985).
- haplobiont** *n.*
1. An organism that does not have a regular alternation of haploid and diploid generations during its life cycle (Lincoln et al. 1985).
cf. biont: diplobiont
 2. A plant that flowers once per season (Lincoln et al. 1985).
- geobiont** *n.*
1. An organism that spends its whole life in soil (Lincoln et al. 1985).
 2. A member of the permanent soil fauna (Lincoln et al. 1985).
syn. terricole
- limnobiont, limnobion** *n.* A freshwater organism (Lincoln et al. 1985).
- mycobiont** *n.* The fungal partner of an algal-fungal symbiosis of a lichen; contrasted with phycobiont (Lincoln et al. 1985).
- neobiont** *n.* A primordial life form that arises independently from nonliving matter (Lincoln et al. 1985).
- oxybiont, aerobe** *n.* An organism that grows, or occurs, only in the presence of molecular oxygen (Lincoln et al. 1985).
- patabiont, patobiont** *n.* An organism that permanently inhabits forest litter (Lincoln et al. 1985).
- petrobiont** *n.* An organism that lives on, or among, rocks or stones (Lincoln et al. 1985).
- phycobiont** *n.* The algal partner of an algal-fungal symbiosis of a lichen; contrasted with mycobiont (Lincoln et al. 1985).
- phytobiont** *n.* An organism that spends most of its active life on, or within, plants (Lincoln et al. 1985). See -cole: planticole.
- planktobiont** *n.* An organism that lives solely in plankton (Lincoln et al. 1985).
adj. holoplanktonic, planktobiotic.
- polyoxybiont** *n.* An organism that requires abundant free oxygen (Lincoln et al. 1985).
- probiont** *n.*
1. “A hypothetical prebiotic complex of proteins and nucleic acids that eventually gave rise to self-replicating, and hence living, organisms” (Wittenberger 1981, 620).
 2. A protistan.
adj. protistan
[iGreek *prōtos*, first + *bios*, life]
- psammobiont** *n.* An organism that lives interstitially between, or attached to, sand particles (Lincoln et al. 1985). See -cole: arenicole
- saprobiont, saprophage** *n.* An organism that feeds on dead, or decaying, organic matter (Lincoln et al. 1985).
adj. saprobiontic, saprophagic

- stenobiont** *n.* An organism that requires a stable uniform habitat; contrasted with eurybiont (Lincoln et al. 1985).
- trophobiont** *n.* An organism that provides food in trophobiosis, *q.v.* (Wilson 1975, 354, 597).
- xenobiont** *n.* A species that lives with its host species in xenobiosis, *q.v.* (Wilson 1975, 362).
- ♦ **biophage** See -phage: biophage.
- ♦ **biophasic processes** See ³theory: approach-withdrawal theory.
- ♦ **biophile** See ¹phile and ³phile: biophile.
- ♦ **biophilia** See -philia: biophilia.
- ♦ **biophysics** See study of: physics: biophysics.
- ♦ **biopiracy** *n.* A person's obtaining biological material from a country without reimbursing that country for it (Faiola 1999, 9 July, A21).
Comment: Tropical countries are trying to stop biopiracy (Faiola 1999, 9 July, A21).
- ♦ **biopoiesis** *n.* "The origin of life, including the abiotic synthesis of macromolecular systems and the transformation (eobiogenesis) of these systems into the first living organisms (eobionts)" (Lincoln et al. 1985).
- ♦ **biopsy dart** *n.* A needle-like dart that a researcher shoots at an animal that takes a thin plug of skin and falls to the ground as the startled animal retreats (Vogel 2001, 1414).
Comment: A researcher can use the skin as a DNA source for DNA analysis (Roca et al. 2001, 1473). Such analysis can be used to distinguish between species and populations.
- ♦ **bipolar mating system** See mating system: bipolar mating system.
- ♦ **bipolar-mimicry system** See ¹system: mimicry system: bipolar-mimicry system.
- ♦ **biorealm** *n.* "A group of similar biomes" (Lincoln et al. 1985).
- ♦ **-bios** See biota.
cf. biome, biorealm, biotope, ²community, flora, fauna
- geobios** *n.*
 1. Total life on land (Lincoln et al. 1985).
 2. The part of the Earth's surface that is occupied by terrestrial organisms (Lincoln et al. 1985).
- halibios, halobios** *n.*
 1. The total life of the sea (Lincoln et al. 1985).
 2. The part of the surface of the Earth occupied by marine organisms (Lincoln et al. 1985).
- heteroplanobios** *n.* Organisms that are passively transported by flood water (Lincoln et al. 1985).
- hydrobios** *n.*
 1. All aquatic life (Lincoln et al. 1985).
 2. The part of the Earth's surface that is occupied by aquatic organisms (Lincoln et al. 1985).
- hygropetrobios** *n.*
 1. "Hygropetric fauna and flora" (Lincoln et al. 1985).
 2. "Hygropetrical fauna" (Lincoln et al. 1985).
- limnobios** *n.*
 1. All life of fresh waters (Lincoln et al. 1985).
 2. The part of the Earth's surface occupied by freshwater organisms (Lincoln et al. 1985).
- prebios** *n.* Conditions existing before the origin of life on Earth (Lincoln et al. 1985).
adj. prebiological, prebiotic
- protobios** *n.* "All ultramicroscopic life forms" (Lincoln et al. 1985).
- saproxylobios** *n. pl.* Organisms that live in, or on, rotting wood (Lincoln et al. 1985).
- skatobios** *n.* Organisms that inhabit detritus or fecal matter (Lincoln et al. 1985).

- ♦ **bioseries** *n.* "The evolutionary sequence of changes in any heritable character" (Lincoln et al. 1985).
- ♦ **-biosis** *comb. f.* "Manner of living" (Michaelis 1963).
cf. symbiosis
[iGreek *biōsis* < *bios*, life]
- anabiosis** *n.* An organism's state of greatly reduced metabolic activity assumed during unfavorable environmental conditions (Lincoln et al. 1985).
syn. cryptobiosis (Lincoln et al. 1985)
cf. estivation; -biosis: cryptobiosis; dormancy; hibernation; suspended animation; viable lifelessness; viability
- cleptobiosis** See symbiosis: cleptobiosis.
- cryptobiosis** *n.* A dormant organism's showing no external signs of metabolic activity (Lincoln et al. 1985).
cf. -biosis: hypobiosis
- ecotrophobiosis** See trophallaxis.
- epibiosis** See symbiosis: epibiosis.
- hamabiosis** *n.* "Symbiosis without obvious advantage to either symbiont" (Lincoln et al. 1985).
- hypobiosis** *n.* A dormant organism's showing only minimal outward signs of metabolic activity (Lincoln et al. 1985).
cf. -biosis: cryptobiosis; dormancy
- kleptobiosis** See symbiosis: cleptobiosis.
- lestobiosis** See symbiosis: lestobiosis.
- metabiosis** See symbiosis: metabiosis.
- oecotrophobiosis** See trophallaxis.
- parabiosis** *n.* An organism's temporary suspension of physiological activity (Lincoln et al. 1985).
See symbiosis: mutualism.
- phylacobiosis** See -biosis: parabiosis.
- plesiobiosis** *n.*
 1. In social animals: The close association of nests of two, or more, species, accompanied by no mixing of individuals and little, or no, benefit to any of the species, *e.g.*, some ant species (Wilson 1975, 354, 591).
 2. Organisms' living close to one another (Lincoln et al. 1985).
[iGreek *pλēsίος*, near + *biōsis* < *bios* life]
- symbiosis** See symbiosis.
- synclerobiosis** See symbiosis: synclerobiosis.
- trophobiosis** See symbiosis: mutualism.
- ♦ **biospace** See niche: realized niche.
- ♦ **biospecies** See ²species: biological species.
- ♦ **biospeleology, biospeleology** See study of: biospeleology.
- ♦ **biosphere** See -sphere: biosphere.
- ♦ **Biosphere 2** *n.* An large, artificial, enclosed habitat designed to study closed, large-scale integrated ecosystems (Dempster 1997, 1247–1248; Nelson 1997, 1248–1249; Allen 1997, 1249).
- ♦ **biospherian** *n.* A person who was enclosed in Biosphere 2 for a period as part of studying large-scale, artificial ecosystems (Dempster 1997, 1247–1248).
- ♦ **biostratigraphy** See study of: paleontology: stratigraphic paleontology.
- ♦ **biostratinomy** See study of: biostratinomy.
- ♦ **biosystem** See ¹system: ecosystem.
- ♦ **biosystematics** See study of: systematics.
- ♦ **biosystematy** See study of: systematics.
- ♦ **biota** *n.*
 1. Flora and fauna of a region or geological period (Michaelis 1963); *e.g.*, forest biota or pond biota.
 2. Organisms of a region or geological period.
cf. biome, biorealm, -bios, biotope, community, flora, fauna

A CLASSIFICATION OF BIOTA BASED ON ORGANISM SIZE

- I. macrobiota (includes macroflora, megafauna)
- II. mesobiota (includes macroflora, megafauna)
- III. microbiota (includes meiofauna, microfauna, microflora)

aerophytobiota *n.* “Aerobic soil flora” (Lincoln et al. 1985).

♦ **anaerophytobiota** *n.* “Anaerobic soil flora” (Lincoln et al. 1985).

macrobiota *n.*

1. Soil organisms longer than 1 mm (Lincoln et al. 1985).
2. Larger soil organisms, or their parts, that one can readily remove with one's hands from a soil sample, including particular burrowing vertebrates (*e.g.*, moles and rabbits) and tree roots (Allaby 1994).

mesobiota *n.* Soil organisms of intermediate size, from about 40 mm long through a size just visible with the use of a hand lens (Lincoln et al. 1985).

Comments: Mesobiota includes the mesofauna (*e.g.*, annelids, arthropods, molluscs, and nematodes) and the mesoflora, *q.v.*

microbiota *n.* Soil organisms that are too small to be seen with a hand lens, including algae, bacteria, fungi, and protozoa (Lincoln et al. 1985; Allaby 1994).

mycobiota *n.* Fungi of an area or habitat (Lincoln et al. 1985).

♦ **biotaxis** See *taxis*.

♦ **biotechnology** *n.*

1. Human use of organisms to make specific industrial products (Ereky 1917 in Bugos 1993, 121).

[After *Biotechnologie* coined by Ereky (1917) as part of a campaign to revolutionize Hungarian agriculture]

2. In a very broad sense, every possible human use and manipulation of life (Bugos 1993, 121).

Comments: The concept of biotechnology has its roots in bacteriology (Bugos 1993). Zymotechnology, was the bridge between biotechnology's ancient roots and its modern association with chemical engineering. Scientists gave “biotechnology” meanings that conveyed their specific hopes for industrial uses of life. Biotechnology and genetic engineering wed in 1974.

♦ **biotelemetry** See *-metry*: biotelemetry.

♦ **bioterrorism** *n.* A person's effort to spread germs to destroy a country's crops, livestock, or both for financial gain, political purposes, or both (Miller 1999, 22 September, A1, A25).

♦ **biotic** Also see *-biosis*.

cryptobiotic *adj.* Referring to an organism that is typically hidden, or concealed, in crevices or under stones (Lincoln et al. 1985).

geobiotic *adj.* Referring to a terrestrial organism (Lincoln et al. 1985).

hemiendobiotic *adj.* Referring to an organism that is usually found inside its host (Lincoln et al. 1985).

hypobiotic *adj.* Referring to an organism that lives in a sheltered microhabitat (Lincoln et al. 1985).

macrobiotic *adj.* Referring to a long lived organism (Lincoln et al. 1985).

oxybiotic, oxybiontic See *aerobic*.

prebiotic *n.* Referring to conditions on Earth that existed before the beginning of life (Lincoln et al. 1985).

syn. prebiological

n. prebios

zoobiotic *adj.* Referring to an organism that lives as a parasite on an animal (Lincoln et al. 1985).

♦ **biotic pollination** See *pollination*: biotic pollination.

♦ **biotic potential** See *rate*: *r*.

♦ **biotic succession** See ²*succession*.

♦ **biotically-sympatric population** See ¹*population*: biotically-sympatric population.

♦ **biotope** *n.*

1. The smallest geographical unit of the biosphere, or a habitat, that can be delimited by convenient boundaries, is characterized by its biota, and labeled by its predominant vegetation type (Lincoln et al. 1985; Immelmann and Beer 1989, 33).

syn. habitat (according to some authors, *e.g.*, New 2009, 146)

Note: Organisms of a particular biotope are its ecological community (= biocenose).

2. A parasite's location within its host's body (Lincoln et al. 1985).

cf. habitat

crenon *n.* “The spring-water biotope” (Lincoln et al. 1985).

stygon *n.* “The groundwater biotope” (Lincoln et al. 1985).

thalasson *n.* “The marine biotope” (Lincoln et al. 1985).

troglon *n.* The biotope comprising subterranean water bodies in caves and subterranean passages (Lincoln et al. 1985).

♦ **biotrophic** See *-trophic*: biotrophic.

♦ **biotrophic symbiosis** See *symbiosis*: biotrophic symbiosis.

♦ **biparous** See *-parous*: biparous.

♦ **biped** *n.* For example, in many dinosaur and primate species, birds: An animal with two feet (Oxford English Dictionary 1972, entries from 1607).

adj. biped, bipedal

[Latin, *bipes, bipedis*, two-footed]

♦ **bipolar mimicry system** See ¹*system*: mimicry system: bipolar mimicry system.

♦ **bird-watching** *n.*

1. A person's observing, or identifying, wild birds in their natural habitats (Michaelis 1963).

syn. birding

2. Derogatorily, a person's observing scientific phenomena, making little, or no, relationships of these phenomena to scientific principles (Thomson 1985, 570).

v.t. bird-watch

cf. stamp-collecting

♦ **biotechnology** *n.* Human manipulation of organisms or their components to perform practical tasks, provide useful products, or both (Campbell et al. 1999, 364).

Comment: People started practicing biotechnology centuries ago when they started using microbes to make cheese and wine and practiced selective breeding of crops and livestock (Campbell et al. 1999, 364).

♦ **birth rate** See *natality*.

♦ **bisexual** See *sexual*: bisexual.

♦**bit** *n.* “The basic quantitative unit of information; specifically, the amount of information required to control, without error, which of two equiprobable alternatives is to be chosen by the receiver” (Wilson 1975, 194, 579).

[binary + digit]

♦**bite** *n.*

1. An animal's seizing, tearing, or wounding another animal with its teeth (Michaelis 1963).
2. An animal's tearing of something with its teeth (Michaelis 1963).
3. An animal's puncturing the skin of another animal with its sting or fangs (Michaelis 1963).

See ²group: bite.

v.t., v.i. bite

neck bite *n.*

1. In many bird and carnivorous-mammal species: A male's bite given on his mate's neck during copulation (Heymer 1977, 122).
syn. pairing bite (Immelmann and Beer 1989, 197)
2. A bite given by a predator on a prey's neck in contrast to shaking a prey to death (Heymer 1977, 122; Immelmann and Beer 1989, 197).
3. In felid carnivores and some rodent species: Neck grasping of a young by its parent when carrying it (Heymer 1977, 197).

cf. posture: limp posture

repeated bites *n.* In many carnivore species: A predator's biting into its prey, shaking it, relaxing its jaws, and biting again (Eibl-Eibesfeldt 1956, Leyhausen 1965 in Heymer 1977, 121).

tail-bite *n.* In crowded, Domestic Pigs: A bite given by one Pig to another's tail, followed by other Pigs doing likewise and possible death of the victim due to the biting (Colyer 1970 in Dawkins 1980, 77).

Comment: “Tail-biting” is often accompanied by “ear-biting” (Colyer 1970 in Dawkins 1980, 77).

♦**bivoltine** See voltine: bivoltine.

♦**bivouac** *n.*

1. In Army Ants: The mass of workers within which the queen and brood find refuge (Schneirla 1933–1971 in Wilson 1975, 425).
2. The site of a bivouac (def. 1) (Wilson 1975, 579).

♦**black-box view of behavior, whole-animal view of behavior** *n.* The claim that to understand behavior, one should study the behavior of whole, intact animals without examining their insides (Dawkins 1986, 84).

cf. identified-neurone chauvinist

♦**black hole** *n.* A predicted region of space where the gravitational force is so strong that not even light can escape from it (Mitton 1993).
Comments: Black holes might suck up nearby objects and material from them might reappear somewhere else in our Universe, in another universe, or both (Sawyer 1997, 14 January, A3). They may be plentiful, important players in the evolution of the Universe. In the two-star system V404Cyg in the constellation Cygnus, a dense object believed to be a black hole is sucking material from a companion star.

galactic black hole *n.* A black hole in the central area of a galaxy (Sawyer 1997, A3)

Comments: Almost all galaxies might have central black holes which may have played key roles in galaxy formation (Sawyer 1997, 14 January, A3). A galactic black hole might have the mass of three billion Suns, all squeezed into an area no larger than our Solar System (Wilford 1997, 14 January, C7). There is

evidence for a black hole in the middle of the giant galaxy M87, the Milky Way, and other galaxies based on a sharp rise in star velocities near the centers of galaxies.

stellar black hole *n.* A black hole believed to be the remnant of a supernova of a star that was 3, or more, solar masses (Mitton 1993).

Comments: Stellar black holes are about 10 km or less in diameter. We observe black holes indirectly by their gravitational effects and their X-ray emission. Their X-rays result from the energy released when matter streams into them. Scientists found strong evidence for the existence of an event horizon, the rim of a black hole (Sawyer 1997, 14 January, A3). A black-hole candidate seems to be swallowing nearly 100 times as much energy as it is radiating.

♦**blade** See tool: blade.

♦**BLAST** See algorithm: Basic Local Alignment Search Tool.

♦**blastochore** See -chore: blastochore.

♦**blastogenesis** See -genesis: blastogenesis.

♦**bleat** See animal sounds: baa.

♦**blending** *n.*

1. A gradual return to a parental type of an artificially bred line of organisms (Mayr 1982, 740).
2. An intermediate appearance of phenotypes, particularly in species crosses (Mayr 1982, 781).

Comment: “Blending” does not necessarily make any commitment with regard to the behavior of genetic material (Mayr 1982, 781).

♦**blending concept of heredity, blending inheritance** See inheritance: blending inheritance.

♦**blind sight** *n.* A brain-damaged person's not being able to name objects presented to him in certain parts of his visual field, although he might be able to point to such an object although he claims he cannot see it (Weiskrantz 1980 in McFarland 1985, 523).

♦**bloat** See ²group: bloat.

♦**block** *n.* A hypothetical state of the pathways between two centers of an instinct that stops an interaction between centers (Verplack 1957).

Comment: This state may be terminated, or reduced, by the action of an innate-releasing mechanism that has been activated by a sign stimulus. After such nullification of the state, “motivational impulses” can flow from a higher to a lower center, activating the latter and, hence, yielding a response. There is no direct physiological evidence for such a state (Verplanck 1957).

♦**blocking** *n.* The phenomenon in which stimulus A stops (“blocks”) an animal from learning that stimulus B is correlated with an unexpected, or surprising, occurrence because the animal has already experienced the occurrence in stimulus A's presence (Kamin 1969 in McFarland 1985, 352).

♦**blood theory of inheritance** See inheritance: blending inheritance.

♦**blue moon** *n.*

1. The second full moon in the same month (Mitton 1993; Anonymous 1996, 30 June, A7).

Notes: Blue moons occur every 2.7 yr and are the result of human-made calendars which do not coincide with the Moon's 29-day cycles (Anonymous 1996, 30 June, A7). Further, atmospheric effects occasionally make the Moon appear blue; possibly due to dust in the upper atmosphere from forest fires, volcanoes, or both (Mitton 1993).

2. The fourth full moon in a season (Anonymous 1999, 1 April, B4).

Notes: The Editors of Sky and Telescope say they incorrectly defined blue moon 53 yr ago and that def. 2 is correct, not def. 1 (Anonymous 1999, 1 April, B4).

[possibly from Old English *belewe*, to betray, referring to a blue moon's betraying the rule of one full moon per month]

♦ **Blue Ridge Province** See geological province: Blue Ridge Province.

♦ **BoDD** See database: Botanical Dermatology DataBase.

♦ **body** *n.*

1. The entire physical part of an organism (Michaelis 1963).
2. A colony of genes' using cells as convenient working units for their chemical industries (Dawkins 1977).

♦ **body part** *n.* Part of an organism's body.

Comments: This category contains body parts, except organs (*q.v.*) and organelles (*q.v.*). Nicols (1989) defines hundreds of arthropod body parts. A few of the thousands of animal body parts are defined below.

antler *n.*

1. A usually-branched, deciduous, boney outgrowth, or horn, on the head of a member of the Cervidae (Deer Family) (Michaelis 1963).
2. One member of a pair of elongate projections, or processes, on the head of an arthropod, that is not an antenna, eye, or mouthpart (inferred from Wilkinson and Dodson 1997, 310).

syn. horn (*q.v.*)

cf. body part: eye stalk

adj. antlered

Comments: Antlers occur in five fly families (Wilkinson and Dodson 1997, 310–311, illustrations). Adult arthropods do not naturally shed their antlers. No known fly species has adults with both antlers and eyestalks. In *Zygothrica* (Drosophilidae), each compound eye is elongated into a cone which may curl like the horn of a ram.

[Old French *antoillier*; ultimately? < Latin *ante-*, before + *oculus*, eye]

eye stalk *n.* An elongate part of an arthropod's head (= a peduncle) which bears a compound eye (Wilkinson and Dodson 1997, 310, 316, illustration).

cf. body part: antler

Comments: Eye-stalks occur in eight fly families.

horn *n.*

1. A hard, bonelike, permanent, often curved growth of epidermal tissues, that usually occurs in pairs and projects from the head of a hooved mammal, *e.g.*, a Cattle, Domestic Sheep, or oxen (Michaelis 1963).
2. Either of the two antlers of a deer, which is shed annually (Michaelis 1963).
3. Any outgrowth that projects from the head of an animal, such as the Great-horned Owl's feather tuft, an arthropod's antenna, or a snail's tentacle (Michaelis 1963).

Notes: Arthropod horns include any large, pointed head process and any body process that resembles the horn of a hooved mammal (Torre-Bueno 1978). A less frequent usage, is to refer to "horns" to mean a pair of antennae (Nichols 1989). The Cerambycids (a large beetle family) are often called the "Long-horned Beetles" in reference to their long antennae. Horns have arisen repeated in different beetle

lineages; thousands of extant species have horns (Emlen 2000, 403–404). In most horned beetle species, only the males have horns. In all beetle species, thus far studied, males use their horns in combating conspecific males over access to resources used by females. A male that obtains the access can increase his chances of inseminating a female(s) that comes to the resource.

syn. antler, *q.v.* (a nontechnical synonym)

[Old English, akin to CORN, Latin *cornu*, a horny thickening of skin]

♦ **body-brooding** See brooding: body-brooding.

♦ **bog** See habitat: bog.

♦ **bog body** *n.* A subfossil or fossil of *Homo sapiens sapiens* (from 8,000 B.C. through the early Medieval Period) that is the remains of a person who was preserved in the acidic waters of a North American or northern European bog (Archaeological Institute of America 1997, Tyson 2006).

Comments: Bog bodies show great variation in their degrees of preservation (Archaeological Institute of America 1997, Tyson 2006). Depending on the age of the fossil and amount of pressure from layers of peat above a fossil, the fossils range from a complete, well-preserved human body through skeletons with much brain matter through just patches of skin (Deem 1998). Regarding patches of skin alone, the acidic water dissolved all other parts over the centuries. There are hundreds of known bog bodies that range from isolated heads and limbs through complete bodies. Some bog bodies may have been people who accidentally fell into bogs, were purposely buried in bogs, were human sacrifices, or were punished people. Many people, preserved as bog bodies, died violent deaths. Bog bodies from Windover, Florida, are from approximately 6,280 B.C. (Tyson 2006).

♦ **bog forest** See habitat: bog forest.

♦ **bombykol** See chemical-releasing stimulus: semiochemical: pheromone: bombykol.

♦ **bonanza strategy** See strategy: bonanza strategy.

♦ **Bonnet's chain of being** *n.* Bonnet's (1769) idea that there is a gradual, unbroken transition from inanimate matter to the most perfect organic being (Mayr 1982, 350).

cf. scala naturae

♦ **bond, bonding, social attachment** *n.* A specific dependence between, or among, individual animals; *e.g.*, mated pairs, young animals and their mother or both parents, and groups, especially individualized groups (Immelmann and Beer 1989, 34).

cf. attachment; behavior: bonding behavior; harem

life-long pair bond *n.* For example, in some raptor species and *Anser anser* (Greylag Geese): A pair bond, *q.v.*, that endures during much, or all, of the lives of partners (Immelmann and Beer 1989, 176).

long-term pair bond *n.* In some mammal species and many bird species: A pair bond, *q.v.*, that transcends a species' single reproductive period (Immelmann and Beer 1989, 176).

pair bond, pair bonding *n.* For example, in some insect and mammal species and many bird species: A close association formed between a conspecific male and female and which can last until the end of a breeding season or longer (Wilson 1975, 327; Immelmann and Beer 1989, 211).

syn. pair formation (according to some authors), marriage, sexual bonding (Wilson 1975, 315)
See marriage.

cf. pair formation

Comment: In Mammals, pair bonding serves primarily for cooperative rearing of young (Wilson 1975, 327, 590).

partner bonding *n.* Individuals' of a mated pair maintaining continuous visual contact, auditory contact, or both, with one another (Heymer 1977, 128).

spatial bonding *n.* Individuals' of a mated pair maintaining close physical proximity with one another [coined as *Paarsitzten* (spatial bond) by Seibt and Wickler (1972, 128)].

♦**bonding behavior** See behavior: bonding behavior.

♦**bonding drive** See drive: bonding drive.

♦**B₁, B₂, etc.** See generation: backcross generation.

♦**Bonn Convention** See treaty: Convention on the Conservation of Migratory Species of Wild Animals.

♦**booming** See animal sounds: booming, drumming.

♦**booming field** See ²lek: booming field.

♦**Boorman-Levitt model of group selection** See ⁴model: Boorman-Levitt model of group selection.

♦**boot**

1. *n.* An often boot-shaped nesting cavity made in a *Carnegiea gigantea* (Saguaro) by a *Melanerpes uropygialis* (Gila Woodpecker), which may be used by other species of birds, *e.g.*, Screech Owls and Elf Owls, which do not make their own cavities (Scott 1974, 49; Venning 1974, 36; Shelton 1985, 67).

Note: Isolated boots can be found on the ground after surrounding Saguaro tissue disappears (pers. obs.). Pima Indians used them as jugs (Venning 1974, 36).

2. *v.t.* To start up a computer from a set of core instructions (Efron and Tibshirani 1993, 5).

syn. bootstrap (Efron and Tibshirani 1993, 5)

cf. statistical test: bootstrap

[after one's pulling oneself up by one's own bootstraps in the Adventures of Baron Munchausen]

♦**bootstrap** See boot; statistical test: bootstrap.

♦**botany** See study of: botany.

♦**Botanical Dermatology DataBase** See database: Botanical Dermatology DataBase.

♦**botrology** See study of: botrology.

♦**bottleneck** *n.* A single episode of small population size of a particular population that changes its size through time (Hartl and Clark 1997, 291).

cf. drift: genetic drift

♦**bottleneck effect, bottlenecking** See effect: bottleneck effect.

♦**bottom-up control** See ³control: bottom-up control.

♦**bounded-rationality model of human behavior** See ⁴model: bounded-rationality model of human behavior.

♦**bouquet** See ²group: bouquet.

bout *n.*

1. An animal's repetitive display of the same behavior, *e.g.*, a bout of pecking by a bird (Lehner 1979, 70).

2. An animal's relatively stereotyped sequence of behaviors that occur in a burst, *e.g.*, a courtship-display bout (Lehner 1979, 70).

Comment: Sibly et al. (1990) indicate how to divide behavior into bouts.

mount bout *n.* In some mammal species: A male's series of mountings with, or without, pelvic thrusting

and intromission, that occurs before he can ejaculate (Immelmann and Beer 1989, 194).

superbout *n.* A cluster of bouts of behavior, *q.v.*, which can be revealed by long-term records of behavior (Machlis 1977 in Lehner 1979, 73).

cf. bout

♦**bow** See ²group: bow.

♦**bow-coo display** See display: bow-coo display.

♦**bower** See territory: display territory.

♦**bp** See unit of measure: base pair, megabasepair.

♦**brace** See ²group: brace.

♦**brachial gland** See gland: brachial gland.

♦**brachiation** *n.* In some arboreal-primate species: Locomotion by swinging among tree limbs with use of "hands" and forelegs (Michaelis 1963).

[Latin *brachiatus*, having arms < *brachium*, arm]

♦**bradys** *comb.f.*

[Greek *bradys*, slow]

♦**bradyauxesis** See auxesis: heterauxesis: bradyauxesis.

♦**bradygenesis, bradytely** See ²evolution: bradygenesis.

♦**bradymetabolism** See metabolism: bradymetabolism.

♦**brain** *n.* Figuratively, intellectual power, intellect, sense, thought, imagination; often used as a plural (brains) (Oxford English Dictionary 1971, entries from 1393).

See organ: brain.

♦**brain-first hypothesis** See hypothesis: "brain-first hypothesis."

♦**brain stem** See organ: brain: brain stem.

♦**brain stimulation** See method: brain stimulation.

♦**branchicole** See -cole: branchiocole.

♦**b-rates** See ²evolution: horotely.

♦**BRCA1** See gene: *BRCA1*.

♦**breakage-fusion theory** See ³theory: breakage-fusion theory.

♦**breaking dance** See dance: bee dance: buzzing run.

♦**breast cancer** See disease: breast cancer.

♦**breathing** *n.*

1. An animal's inhaling and exhaling air (Michaelis 1963).

syn. respiring (Michaelis 1963)

cf. respiration

2. A vertebrate's inhaling and expelling air from its lungs (Michaelis 1963).

syn. respiring (Michaelis 1963)

cf. respiration

3. An organism's being alive (Michaelis 1963).

4. An animal's pausing for breath, resting (Michaelis 1963).

5. A person's murmuring; whispering (Michaelis 1963).

6. An animal's exhaling something, *e.g.*, an odor (Michaelis 1963).

v.i., v.t. breathe

[Middle English *brethen* < *breth*, breath]

air breathing *n.* For example, in 34 fish families and terrestrial animals: An individual's extracting oxygen from air; contrasted with bimodal breathing and water breathing (Kramer and Mehegan 1981, 299; Kramer 1983, 145).

syn. aerial respiration (Kramer 1983, 145)

bimodal breathing *n.* For example, in some fish species: An individual's extracting oxygen from both

air and water; contrasted with air breathing and water breathing (Kramer 1983, 145).

Comment: Fish species with bimodal breathing vary from having almost complete dependence on air breathing to complete dependence on water breathing except when dissolved oxygen is extremely limited (Kramer 1983, 145).

water breathing *n.* For example, in fish: An individual's extracting dissolved oxygen from the water in which it lives; contrasted with air breathing and bimodal breathing (Kramer 1983, 145).

syn. aquatic respiration (Kramer 1983, 145)

♦**breed** *n.*

1. "A group of organisms related by descent; an artificial mating group having a common ancestor," especially with regard to genetic studies of domesticated species (Lincoln et al. 1985).
cf. copulation

2. *v.i.* In organisms: To reproduce.

3. *v.t.* In Humans: "To propagate organisms under controlled conditions" (Lincoln et al. 1985).

♦**breeding** *n.* Reproducing (Lincoln et al. 1985).

communal breeding *n.* For example, in *Aphelocoma ultramarina* (Mexican Jays) and *Crotophaga sulcirostris* (Groove-billed Ani): A breeding system in which helpers are normally present at some, or all, nests, often resulting in three, or more, birds' attending the young of a nest (Brown 1987, 298).

syn. cooperative breeding (which Brown 1987, 298 indicates is not preferable to "communal breeding")
cf. mating system: polygynyandry

Comments: By tradition, "communal breeding" excludes "brood capture" (*q.v.*) and cases in which individuals care for young not their own as a result of deception through intraspecific, or interspecific, brood parasitism (Brown 1987, 298). "Group living" should not be synonymized with "communal breeding" (Brown 1987, 300).

cooperative breeding See breeding: communal breeding.

crossbreeding See breeding: outbreeding; crossing.

explosive breeding *n.* Simultaneous breeding in a large group of conspecific animals (Halliday and Adler 1986, 146).

inbreeding *n.*

1. Mating of kin (Wilson 1975, 586); mating, or crossing of individuals that are more closely related than average pairs in a population (Lincoln et al. 1985).

2. Sexual reproduction in which there is a greater frequency of mating between related, or relatively closely related, individuals than would occur by chance alone (random mating) (Lincoln et al. 1985).

syn. endogamy, endokaryogamy

cf. breeding: outbreeding

Comment: The degree of inbreeding is measured by the fraction of genes that are identical owing to common descent (Wilson 1975, 586).

♦**optimal inbreeding** See breeding: optimal outbreeding.

interbreeding *n.* Mating, or hybridization, between different individuals, populations, varieties, races, or species (Lincoln et al. 1985).

cf. hybrid

outbreeding *n.*

1. Sexual reproduction between individuals that are not closely related (Lincoln et al. 1985).

syn. exogamy

2. Mating, or crossing, of conspecific organisms that are either less closely related than average pairs in their population, or from different populations (Lincoln et al. 1985).

syn. outcrossing, open-pollination, crossbreeding
cf. breeding: inbreeding

►**optimal outbreeding** *n.* An individual's breeding with conspecifics of particular genetic relationships so that there will be the least possible build up of deleterious homozygous genes in offspring, due to inbreeding, and simultaneously, the least possible loss of adaptive genetic complexes, due to too much outbreeding; balancing the costs of inbreeding and outbreeding (Bateson 1978 in Keane 1990, 264; Bateson 1983, 257–277).

syn. optimal inbreeding (Shields 1982)

cf. hypothesis: optimal-outbreeding hypothesis; law: Knight-Darwin law

plural breeding *n.* In many bird species: A social system in which two, or more, monogamous, or non-monogamous conspecific females breed in the same communal social unit (Brown 1987, 21–22, 305).

cf. breeding: singular breeding

selective breeding See selection: artificial selection.

singular breeding *n.* In many bird species: A communal social system in which no more than one conspecific female breeds in each social unit (Brown 1987, 18–21, 306).

cf. breeding: plural breeding

♦**breeding colony** See colony: breeding colony.

♦**breeding system** See ¹system: breeding system.

♦**breeding value** See value: breeding value.

♦**breed true** *v.t.* To produce offspring phenotypically identical to parents (Lincoln et al. 1985).

♦**broad-sense heritability** See heritability: heritability in the broad sense.

♦**broadcast promiscuity** See mating system: polybrachygamy: broadcast promiscuity.

♦**Brock-Riffenburgh model** See ⁴model: Brock-Riffenburgh model.

♦**broken-wing display, broken-wing feign** See display: distraction display: injury-feigning-distraction display: broken-wing display.

♦**brontophobia** See -phobia: brontophobia.

♦**brood** See ²group: aerie, brood, clutch, covey, eye, eyrar, fall.

♦**brooding** *n.*

1. In many egg-laying animal species: An adult's incubating eggs (Oxford English Dictionary 1972, entries from 1440).

2. In many bird species: An adult's protecting (young) by covering with its wings (Michaelis 1963).

3. In many bird species: A parent's caring for brood, including incubating its eggs (Immelmann and Beer 1989, 36).

4. In many bird species: A parent's covering and warming, or cooling, hatched young by sitting on them, squatting over them, crouching on them, or a combination of these behaviors (Immelmann and Beer 1989, 36, 142).

syn. incubating (not a preferred synonym, Immelmann and Beer 1989, 142)

See ²group: brood.

cf. care: parental care; incubation; parity

A

n. brooder**v.t.** brood

Comments: Balon (1975, 821, etc.) classifies a major division of ecoethological guilds of fish as “bearers.” This division includes the “external bearers” (forehead brooders, gill-chamber brooders, mouth brooders, pouch brooders, skin brooders, and transfer brooders) and the “internal bearers (ovovoviparous, ovoviviparous, and viviparous fish).

body-brooding *n.* In some frog species and Giant Water Bugs: An animal’s taking care of eggs that are on its own body (Townsend et al. 1984).

egg-brooding *n.* In some stink-bug species, many social-insect and bird species, a tropical-frog species and the Gharial: An animal’s taking care of eggs by being near them and protecting them from egg predators (Townsend et al. 1984).

forehead-brooding *n.* In *Kurtus* (fish) species: An adult male’s taking care of eggs on his superoccipital hook (Balon 1975, 852, illustration, 853).

gastric-brooding See brooding: stomach brooding.

gill-brooding *n.* In four genera of North American cavefishes: A mother’s taking care of her eggs in her gill cavities (Balon 1975, 852, illustration, 853).

mouth-brooding *n.* In many fish taxa, including in some cichlid- and belontiid-fish species: A mother’s, or father’s, taking care of eggs in her, or his, mouth (buccal cavity) until they hatch (Wickler 1968, 221; Balon 1975, 852).

syn. oral brooding (Blumer 1982, 3)

cf. brooding: open-brooding, mouth breeder

Comments: The fry are typically well developed when they leave their parent’s mouths (Blumer 1982, 3). In some fish species, fry return to their parent’s mouth when they sense danger (Immelmann and Beer 1989, 195).

nest-brooding *n.* For example, in carrion beetles, social insects, many bird species, alligators: An animal’s taking of eggs, or young, that are in its nest.

open-brooding *n.* An animal’s taking care of eggs that are in its environment and not on its body or in its mouth (Wickler 1968, 221).

pouch-brooding *n.* In a group of South American catfishes; some pipefish species, including seahorses, and female marsupials: An adult’s taking care of young in its body pocket (= marsupium) (Balon 1975, 854).

Comment: In fish, either a female, or a male, pouch broods, depending on the species (Balon 1975, 854).

skin-brooding *n.* In some pipefish species, a group of South American catfishes: An adult female’s taking care of eggs attached to the ventral surface of her body before depositing them (Balon 1975, 852, illustration, 853).

cf. care: parental care: ectodermal feeding

Comments: In the some catfish, a stalked, vascularized cup envelops each egg (Balon 1975, 854). Skin-brooding also occurs in males of some fish species.

stomach-brooding, gastric-brooding *n.* An adult’s taking care of its young in its stomach, *e.g.*, in an Australian frog “that swallows its fertilized eggs, broods its tadpoles in its stomach, and gives birth to young frogs through its mouth” (Gould 1985a, 12).

transfer-brooding *n.* In some fish species: An adult female’s taking care of her eggs by carrying them in her fins for a certain time before depositing them (Balon 1975, 852, illustration, 853).

vocal-pouch-brooding *n.* An adult’s taking care of young in its vocal pouch, *e.g.*, in male *Rhinoderma darwini* (frogs) which take advanced eggs into their pouches where they hatch and from which they emerge in 52 days as froglets (Gould 1985a, 16).

♦ **brood capture** *n.* In some waterfowl species: A parent’s taking over the care of young that are not its own by forcing their real parents to abandon them (Brown 1987, 298).

cf. parent: alloparent.

♦ **brood cell** *n.* A special chamber, or pocket, that an insect builds that houses its immature stages (Wilson 1975, 579).

♦ **brood parasitism** See parasitism: brood parasitism.

♦ **brood patch** *n.* For example, in Gulls and Songbirds: An area, or areas, of an individual’s ventral skin that becomes defeathered, vascularized, and edematous during egg laying and stays in this condition during incubation (Immelmann and Beer 1989, 36).

♦ **brood provisioning** See provisioning: brood provisioning.

♦ **brood raiding** See parasitism: social parasitism: slavery.

♦ **Brook’s law** See law: Dyar’s law.

♦ **brotherhood** *n.* For example, in *Meleagris gallopavo* (Turkeys): A pair of brothers that assist each other in fierce competition for mates (Watts and Stokes 1971 in Wilson 1975, 125).

♦ **broticole** See -cole: broticole.

♦ **Browerian mimicry** See mimicry: Browerian mimicry.

♦ **brownfield site** See place: brownfield site.

♦ **browse** *n.*

1. “The edible plant material within the reach of browsing animals” (Lincoln et al. 1985).

2. *v.t.* In many vertebrate species: “To feed on parts of plants” (Lincoln et al. 1985).

♦ **browse line** *n.* The height of a plant to which grazing animals can reach and eat plant parts, *e.g.*, acacia trees fed on by Giraffes (Lincoln et al. 1985).

♦ **Bruce effect** See effect: Bruce effect.

♦ **bryocole** See -cole: bryocole.

♦ **bryology** See study of: bryology.

♦ **bryophile** See ¹-phile: bryophile.

♦ **b selection** See selection: b selection.

♦ **bulbling** *n.* In *Megaptera novaeangliae* (Humpback Whales): An individual’s releasing air underwater during male-male competitions (Baker and Herman 1985, 54). *v.i.* bubble

♦ **bubble nest** See nest: bubble nest.

♦ **bubble net** *n.* In some whale species: A perimeter of bubbles that an individual produces around its prey that might confuse them and improve the whale’s feeding efficiency (Baker and Herman 1985, 55).

♦ **budding** *n.*

1. For example, in Hydras: Reproduction by the direct growth of a new individual from the body of an old one (Barnes 1974, 94; Wilson 1975, 390, 580).

2. In *Aphelocoma coerulescens* (Florida Scrub Jays): A means of forming a new social unit (mated pair with helpers) (Wilson 1975, 455).

See swarming: budding.

♦ **budget** *n.* A person’s, group’s, institution’s, or country’s summary of probable income and expenditures for a given period; also its plan for adjusting expenditures to income (Oxford English Dictionary 1972, entries from 1733; Michaelis 1963).

resource budget *n.* The total amount of resources, *e.g.*, time and energy, that an organism has at a particular time (Wilson 1983, 6).

time budget *n.* The total amount of time that an organism has for a particular activity.

♦**buffer species** See ²species: buffer species.

♦**buffered populations** See ¹population: buffered populations.

♦**buffering** *n.*

1. Stabilization of population size fluctuation (Kluijver and Tinbergen 1953 in Wilson 1975, 274).
2. An animal's using another animal as part of its social communication with a third animal.

agonistic buffering *n.*

1. For example, in some baboon species and multimale groups of *Macaca sylvanus* (Barbary Macaques): One male's using an infant in a way that inhibits aggression by another conspecific male animal (Deag and Crook 1971, 195–196; Wilson 1975, 352, 578; Immelmann and Beer 1989, 10).
2. For example, in Australian Aborigines, Waika Indians: A person's use of a child to signal friendly intention (Immelmann and Beer 1989, 10).

cf. buffering: social buffering; care

[coined by Deag and Crook 1971, 195–196]

social buffering *n.* For example, in *Macaca sylvanus* (Barbary Macaques): An individual's using another conspecific "individual to regulate, in whatever context, its relations with a third party" [coined by Deag and Crook 1971, 196].

cf. care

Comment: "Agonistic buffering," *q.v.*, may be a category of "social buffering."

♦**buffering gene** See gene: buffering gene.

♦**bufotenin** See toxin: bufotenin.

♦**bufotoxin** See toxin: bufotoxin.

♦**bug perceiver** *n.* The convex-edge detector in a frog's retina which facilitates its seeing flying insects (Dewsbury 1978, 181).

♦**building** See ²group: building.

♦**bull** See animal names (table).

♦**bunch** See ²group: bunch.

♦**bunt order** See hierarchy: dominance hierarchy: bunt order.

♦**bursa copulatrix** See organ: copulatory organ: bursa copulatrix.

♦**bury** See ²group: bury.

♦**bush** See habitat: bush; Plantae: bush, shrub (Appendix 1).

♦**busyness** See ²group: busyness.

♦**Butler's aphorism** *n.* The chicken is only an egg's way of making another egg (Samuel Butler in Wilson 1975, 3).

♦**buzzing run** See dance: bee dance: buzzing run.

♦**buzz pollination** See pollination: buzz pollination.

♦**Bwindi National Park** See place: Bwindi National Park.

♦**byproduct mutualism** See symbiosis: mutualism: byproduct mutualism.

C

♦ **Cache** *n.*

1. A place where a person stores equipment, provisions, or other things (Michaelis 1963).
2. A place where an animal stores food (Vander Wall 1990, 3; Clarke and Kramer 1994, 299).

cf. behavior: hoarding behavior; larder
[French < *cacher*, to hide]

♦ **caching, caching behavior** See behavior: caching.

♦ **cacogenesis** See -genesis: cacogenesis.

♦ **cadavericole** See -cole: cadavericole.

♦ **caecotroph** See food: caecotroph; -troph-: caecotroph.

♦ **caenogenesis, caenogenetic** See -genetic: caenogenetic.

♦ **caenomorphic, caenomorphism** See -morphism: caenomorphism.

♦ **caespiticole** See -cole: caespiticole.

♦ **cage effect** See effect: cage effect.

♦ **Cainism** See -cide: fratricide.

♦ **Cairnsian mutation** See mutation: Cairnsian mutation.

♦ **calcicole** See -cole: calcicole.

♦ **calcifuge** See -phobe: calciphobe.

♦ **calciphile** See ¹-phile: calciphile.

♦ **calciphobe** See -phobe: calciphobe.

♦ **calcosaxicole** See -cole: calcosaxicole.

♦ **calf** See animal names: calf.

♦ **caliology** See study of: caliology.

♦ **call** See animal sounds: call.

♦ **calling** *n.* An animal's making a call, *q.v.*

♦ **female calling, calling** *n.* For example, in some ant and moth species: A female's releasing sex pheromone and standing in one place; thereby, "calling" males to her with her pheromone (Hölldobler and Wilson 1990, 638).

♦ **tandem calling** *n.* In some ant species: A leader's pheromone release that recruits a nest mate for tandem running (Hölldobler and Wilson 1990, 644).

♦ **callus** *n., pl. calli* A plant's protruding mass of hardened tissue that is often formed after an injury, but is sometimes a regular feature of the plant (*e.g.*, the calluses on labella of some orchid species and on the spikelet axes of some grass species (McCusker 2003). *cf.* cell: callus cell
adj. callose

♦ **callus cell** See cell: callus cell.

♦ **callow** *adj.*

1. Referring to an unfledged bird, without feathers (Oxford English Dictionary 1972, entries from 1603).

2. Referring to an inexperienced person; immature person; a callow youth (person) (Michaelis 1963).
3. Referring to an individual arthropod that is newly emerged from its last larval skin, chrysalis, or pupa (Torre-Bueno 1978).

syn. teneral (Torre-Bueno 1978)
[Old English *calu* bare, bald]

♦ **callow worker** See caste: worker: callow worker.

♦ **calobiosis** See symbiosis: calobiosis.

♦ **Calvin cycle** See biochemical pathway: Calvin cycle.

♦ **Cambrian explosion** *n.* The rapid diversification of marine invertebrates during the Cambrian Period, resulting in the many now extinct taxa and extant animal phyla and classes (Bowring et al. 1993, 1293; Strickberger 1996, 308).

syn. big bang (Kerr 1993, 1274; Yoon 1993, C1)

Comments: Researchers date the Cambrian explosion from *ca.* 570–530 Ma ago (Kerr 1993, 1274), 530–520 Ma ago (Bowring et al. 1993, 1297), and 530–525 Ma ago (Erwin et al. 1997, 132). The first known fossils of Annelida, Arthropoda, Brachiopoda, Chaetognatha, Echinodermata, Hemichordata, Mollusca, Onycophora, Pogonophora, Porifera, and Priapulida are from the Cambrian Period (Erwin et al. 1997, 132). Sites for these fossils include the Burgess Shale and Chengjiang. Multicellular organisms first appeared about 570 Ma ago (Graham Logan in Oliwenstein 1996, January, 43). Jeffrey Levinton, Gregory Wray, and Leo Shapiro compared seven genes from annelids, arthropods, chordates, echinoderms, and molluscs (Zimmer 1996, December, 52). Their data suggest that chordates and echinoderms diverged from the other phyla about 1.2 Ga ago and that chordates and echinoderms diverged about 1 Ga ago, long before the Cambrian explosion.

♦ **camnium** See ²succession: camnium.

♦ **camouflage** *n.*

1. Human military measures, or material, used to conceal, or misrepresent, the identity of; *e.g.*, installations, ships, or persons (Michaelis 1963).

Note: Game hunters also use camouflage.

2. In many animal species, including *Aeshna* dragonfly larvae, the Ermines, ptarmigans, and Snow-shoe Hares: An individual's resembling its environmental background coloration (Bruns 1958 in Heymer 1977, 186).

3. An individual organism's imitation of "certain environmental background features," involving "at least shape, color, and color pattern, and sometimes scent and sound;" *e.g.*, a swallowtail butterfly caterpillar's looking like a bird dropping or a

- katydid's resembling a leaf (Matthews and Matthews 1978, 310).
syn. crypsis (Immelmann and Beer 1989, 39)
v.i., v.t. camouflage
cf. coloration, mimicry, mimesis
[French *camoufler*, to disguise]
- background imitation** *n.* An organism's resembling its background.
- **countershading** *n.* For example, in caterpillars of some moth species, some fish species, many mammal species: An individual's coloration that decreases, or eliminates, its three-dimensional appearance when it is in a certain position with regard to light direction; *e.g.*, a caterpillar's having coloration that becomes lighter from its dorsum to its venter, and when it rests so that the greater amount of light strikes its dorsum, it tends to look two, rather than three, dimensional from its side (Matthews and Matthews 1978, 315).
syn. obliterative coloration, obliterative shading (Lincoln et al. 1985)
cf. hypothesis: Thayer's countershading hypothesis
- **disruptive coloration** *n.* In some arthropod, fish, and mammal species: An individual's coloration that breaks up its outline "so that parts of it appear to fade separately into its background" (Matthews and Matthews 1978, 314).
- **dorsoventral flattening** *n.* In some arthropod species: An animal's body morphology that involves its body's being flattened from its venter to its dorsum; dorsoventral flattening may be accompanied by lateral flaps, various irregular body protuberances, or both, which bridge the gap between its body and its substrate (Matthews and Matthews 1978, 314).
- **hunting camouflage** *n.* For example, in *Chroicocephalus ridibundus* (Black-headed Gulls): Coloration, *e.g.*, white underparts, that make an individual inconspicuous to its aquatic prey when it views it against a bright sky (Gtmark 1987, 1786).
- **mimesis** See mimesis, mimicry.
- **transparency** *n.* For example, in some butterfly, crustacean, and fish species: An individual's having a mostly clear, or partially clear, body that allows its background to show through (Immelmann and Beer 1989, 39).
- eye camouflage** *n.* In several coral-fish species: Obscuring of eyes by black bars (Heymer 1977, 35).
- ♦ **canalization** *n.* The buffering of an organism's developmental pathways that tends to produce a standard phenotype despite environmental fluctuations and underlying genetic variability (Lincoln et al. 1985).
See canalization: genetic canalization.
syn. developmental homeostasis (Lincoln et al. 1985), allometry (sometimes), developmental canalization, developmental flexibility, phenotypic flexibility
- environmental canalization** *n.* An organism's having the same phenotype despite changes in its environment (Stearns 1989, 436).
syn. autonomous development (Schmalhausen 1949 in Stearns 1989, 436)
cf. auxesis: heterauxesis, plasticity: phenotypic plasticity, reaction norm
- genetic canalization** *n.* An organism's having the same phenotype despite changes in its genotypes (due to mutation or recombination) (Stearns 1989, 436).
syn. canalization (Waddington 1942 in Stearns 1989, 436)
- ♦ **Canavan disease** See disease: Canavan disease.
- ♦ **cancer** See disease: cancer.
- ♦ **cancer phobia, cancer phobia** See -phobia: carcinomaphobia.
- ♦ **canine-tooth threat** See behavior: threat behavior: canine-tooth threat.
- ♦ **cannibal** *n.*
1. A person, especially a savage, that eats human flesh; a man eater; an anthropophagite (Oxford English Dictionary 1971, entries from 1153).
 2. In over 1300 animal species including some Humans; *Hyaena* sp. (hyenas); *Meriones unguiculatus* (Mongolian Gerbils); *Pan troglodytes* (Chimpanzees); *Panthera leo* (Lions); *Poecilia reticulata* (Guppies); many termite species; some ant, bird, langur, praying-mantid, salamander, spider species: An animal that eats members of its own species (Oxford English Dictionary 1971, entries from 1796; Ehrlich and Raven 1964, 598; Wilson 1975, 84–85, 246; Jones 1982 in Picman and Belles-Isles 1987, 236; Goodall in Gould 1989, 29; Immelmann and Beer 1989, 39).
Comments: An individual that eats its own mother is a "gerontophag," *q.v.* Cannibalism might have been widespread in *Homo neanderthalensis* (T. White in Gugliotta 1999, 1 October, A3). [Spanish *Canibales*, var. of *Caribes*, Caribs, a fierce nation of the West Indies reported to eat human flesh]
- ♦ **cannibalism** *n.* An animal's being a cannibal, *q.v.*
syn. metasitism (Lincoln et al. 1985)
cf. -cide
- conism** *n.* For example, in some duck, eagle, gull, hawk, jay, owl, shrike, stork, and tern species: A parent's actual, or attempted, swallowing of its dead, or sickly, young (Welty 1975, 349; Schz 1957 in Campbell and Lack, 1985).
syn. *Kronismus* (German)
cf. cannibal; -cide: infanticide
Comments: Immelmann and Beer (1989, 145) do not indicate that cronism involves dead, or sickly, young. Captive fish (*e.g.*, Cichlids, Labyrinth Fish, and Live-bearing Tooth Carps) commonly eat their young (Gilbert 1976, 145). Laboratory Gerbils also eat their own young, especially when their young are sick or when a person disturbs the gerbils too often (pers. obs.). Under disturbed conditions, mother Tree Shrews cannibalize their young (Immelmann 1977, 567). [term proposed by Schüz (1957) in Campbell and Lack (1985) after the Greek mythological Cronus, the son of Uranus (Heaven) and Gaea (Earth), who swallowed his sons, except for Zeus, as they were born (Duckworth and Rose 1989)]
- egg cannibalism** *n.*
1. For example, in the ant *Leptothorax acervorum*: A queen's consuming eggs of other queens and workers in her nest (Bourke 1991, 295).
Note: This egg cannibalism appears to be part of reproductive conflict among queens and workers in this ant (Bourke 1991, 295).
 2. For example, in some stickleback-fish species: Intraspecific egg consumption by groups composed of females, nonnesting males, and occasionally nesting males (Woriskey 1991, 989).
syn. oophagy
- filial cannibalism** *n.* In some frog species: Cannibalism in which parents eat their own eggs (Rohwer 1978 in Townsend et al. 1984, 422).
syn. filial ovicide (Picman and Belles-Isles 1987, 35)
- gerontophagy** See -phage: gerontophage.
- heterocannibalism** *n.* In some frog species: Cannibalism in which animals eat conspecific eggs

which are not their own (Rohwer 1978 in Townsend et al. 1984, 422).

♦**oophagy** See cannibalism: egg cannibalism; -phagy: oophagy.

♦**sexual cannibalism** *n.* In some arachnid and mantid species: A female's eating her potential mate before copulation or her mate during, or after, copulation (Barrows 1982, 16; Elgar and Nash 1988, 1511; Birkhead et al. 1988).

Comment: Sexual cannibalism appears to be the exception, rather than the rule, in mantids (Barrows 1982, 16; Brown 1986, 421).

♦**canonical correlation** See statistical test: correlation: canonical correlation.

♦**canopy** *n.*

1. Part of forest community that is formed by trees (Allaby 1994, 66).

Note: Some forests have more than one canopy layer. A complex tropical rain forest can have an upper emergent zone, middle zone, and lower zone (Allaby 1994, 66).

2. The upper layer of scrub, or shrub communities, or any terrestrial plant community in which a distinctive habitat is formed in the upper, denser regions of its taller plants (Allaby 1994, 66).

[Middle English *canape* < Medieval Latin *canapeum*, mosquito net < Latin *conopeum* < Greek *kōnōpion* < *Kanōpos*, *Canopus*, a city of ancient Egypt]

♦**cantharidin** See toxin: cantharidin.

♦**cantharophile** See ²-phile: cantharophile.

♦**capacity** *n.* The metaphorical highest limit in the magnitude of a focal character that an organism can show when it lives in an excellent environment (Lewontin 2000, 26).

Comments: This is the empty-bucket metaphor (Lewontin 2000, 26). An organism's genes determine the size of its character bucket," and its environment determines that "fullness of the bucket." In considering the capacity of human I.Q., Jensen (in Lewontin 2000, 28) erroneously suggested that one human genotype will always produce a higher I.Q. in all environments compared to another genotype.

♦**capacity laws** See law: capacity laws.

♦**Cape Floral Kingdom** See ²community: fynbos.

♦**caprification** See pollination: caprification.

♦**captive rearing** See rearing: captive rearing.

♦**captivity degeneration** *n.* All of an animal's disturbances in mental and physical performance that result from captivity (Fox 1968 in Heymer 1977, 95).

cf. behavior: abnormal behavior; stereotypy

♦**capture hypothesis** See hypothesis: Moon-origin hypotheses: capture hypothesis.

♦**carbon** See element: carbon.

♦**"carbon-dioxide hypothesis"** See hypothesis: hypotheses regarding the Permian mass extinction: "carbon-dioxide hypothesis."

♦**carbonaceous chondrite** See meteorite: carbonaceous chondrite.

♦**carbonicole** See -cole: carbonicole.

♦**carbonyl group** See group: functional group: carbonyl group.

♦**carboxyl group** See group: functional group: carboxyl group.

♦**carboxylic acid** See molecule: carboxylic acid.

♦**carboxyphile** See ¹-phile: carboxyphile.

♦**carcinology** See study of: carcinology.

♦**care** *n.*

1. A person's charge; oversight with a view to protection, preservation, or guidance (Oxford English Dictionary 1972, entries from *ca.* 1400).

2. In many animal species: Interactions between, or among, individual (immature, adult, or both) that, depending on the species, may involve behaviors such as protection from dangerous situations caused by the physical environment and conspecific and heterospecific animals, grooming, and holding (or preening) (Deag and Crook 1971, 195).

v.i., v.t. care

cf. behavior: care-giving behavior; buffering: agonistic buffering, social buffering

♦**alloparental care** *n.* A nonparent's assisting in care offspring which may be shown either by females (allomaternal care) or by males (allopaternal care) (Wilson 1975, 349, 578).

cf. parent: alloparent

♦**female care** *n.* For example, in *Macaca sylvanus* (Barbary Macaques): Care given to baby monkeys by females other than their mothers [coined by Deag and Crook 1971, 196].

cf. aunt; care: maternal care

♦**male care** *n.* In some primate species, including marmosets and *Macaca sylvanus* (Barbary Macaques): Care given to baby monkeys by males of unknown relationship to the young [coined by Deag and Crook 1971, 195].

cf. care: female care, maternal care, paternal care; uncle

Comment: Because it is difficult to distinguish clearly between a male's "paternal care" and other kinds of behavior, "male care" is sometimes extended to mean the totality of behaviors between mature males and conspecific young (Immelmann and Beer 1989, 179, 214).

♦**parental care** *n.* In some myriapod species and many amphibian, bird, cephalopod, crustacean, insect, fish, leech, mammal, and spider species: All forms of assistance (*e.g.*, protecting, nourishing, and nurturing young) provided by parents to their progeny following their birth and prior to their independence or maturity; all parental investments other than a parent's investment in its gametes (Wilson 1975, Chapter 16; Wittenberger 1981, 619; Kutschera and Wirtz 1986, 941; Nafus and Schreiner 1988, 1425; Immelmann and Beer 1989, 214).

syn. parental behavior

cf. brooding; ²facilitation: parental facilitation; -parity; provisioning: brood provisioning

Comments: Most amphibian, arthropod, fish, and reptile species have no parental care; most bird species have parental care by both parents; and most mammal species have only maternal care (Maynard Smith 1978b in McFarland 1985, 131; Halliday and Adler 1986). About 89 of the approximately 422 families of bony fishes exhibit parent care (Blumer 1982, 1–2). Forms of parental care in fishes include "brood-pouch egg carrying" (pouch brooding), "cleaning," "coiling," "ectodermal feeding" (skin brooding), "egg burying," "external-egg carrying," "fanning," "internal gestation," "guarding," "moving," "nest building and maintenance," "removal," "splashing," and "substrate cleaning." Major categories of "parental care" in frogs are "egg attendance," "tadpole attendance," "egg transport," and "tadpole transport" (Townsend et al. 1984, 421). McFarland (1985, 132) classifies parental care as a kind of altruism; his classification is controversial.

♦**brood-pouch egg carrying** See brooding: pouch-brooding.

- **cleaning** *n.* A fish's taking an egg into its mouth, manipulating it inside its buccal cavity, and returning it to its original site (Blumer 1982, 3).
- **coiling** *n.* A parent fish's coiling its body around its egg mass while guarding it (Blumer 1982, 3). *Comment:* This guarding posture reduces the eggs' exposure to air at low tide, in intertidal oviposition sites (Blumer 1982, 3).
- **ectodermal feeding** *n.* A parent fish's feeding its young fry with a specialized mucous produced on the parent's body surface (Blumer 1982, 3).
- **egg burying** *n.* A fish's depositing eggs beneath a substrate surface, or covering its eggs with substrate material (Blumer 1982, 3).
- **external egg carrying** *n.* A fish's carrying an egg(s) outside of its body until the egg hatches (Blumer 1982, 3).
- **fanning** *n.* A fish's moving its anal, caudal, pectoral, pelvic, or a combination of these fins over its eggs mass or fry (Blumer 1982, 3). *Comments:* This behavior aerates the young and removes sediment from their area. Some fish perform these acts by forcing water through their gill cavities or mouths that flows over their young (Blumer 1982, 3).
- **internal gestation** *n.* A mother fish's retaining her egg(s) inside her oviducts, or ovaries, while it develops (Blumer 1982, 3). *cf.* -parity: ovoviviparity, oviparity, ovoviparity, viviparity
- **guarding** *n.* A fish's actively chasing, displaying toward, or both, a conspecific, or heterospecific, individual that approaches its eggs, fry, or the site where they reside (Blumer 1982, 2).
- **maternal care** *n.* For example, in a sawfly species; some burying-beetle, crustacean, frog, reptile (including alligators), and spider species; many bee, bird, mammal, and wasp species; burying beetles; and scorpions: Care given by a mother to her young (Deag and Crook 1971, 196; Fink 1986, 34; Immelmann and Beer 1989, 178; Polis 1989; Scott and Traniello 1989; D. R. Smith, pers. comm.). *Comment:* Mother *Macaca fuscata* (Japanese Macaques) take care of their offspring for months as occurs in Jigokudani Monkey Park, Japan (fig. 4). *syn.* female-parental care, maternal behavior (Fink 1986, 34) *cf.* care: female care, male care
- **moving** *n.* A fish's taking eggs, or fry, by its mouth from one location to another, often from one nest to another (Blumer 1982, 3).
- **nest building and maintenance** *n.* A fish's making a structure that holds its eggs, fry, or both (Blumer 1982, 2). *Comment:* Depending on the species, this parental care includes one or more of the following behaviors: assembling a cup, or tube, with pieces of vegetation; blowing mucus-covered bubbles that form a floating mass; digging a burrow, or tube, into a substrate; and making an elevated mound with substrate materials (Blumer 1982, 2).
- **oral brooding** See brooding: mouth brooding.
- **paternal care** *n.* In some insect, seahorse, and other-fish species; many bird, frog, and mammal species: Care given by a father to his young (Townsend et al. 1984; Bisazza and Marconato 1988, 1352; Immelmann and Beer 1989, 178; Scott and Traniello 1989).

syn. male-parental care, paternal care, paternal behavior
cf. care: male care

- **removal** *n.* A fish's removing dead, or diseased, eggs from its egg mass with its mouth (Blumer 1982, 3).

- **retrieval** *n.* A fish's taking an egg, or fry, that falls, or strays, from its nest, or school, into its mouth and returning it to its nest or school (Blumer 1982, 3). *cf.* retrieving

- **splashing** *n.* A fish's splashing water upon its eggs that are deposited out of water, or upon eggs exposed to air during low tide (Blumer 1982, 3).

- **substrate cleaning** *n.* A fish's removing an alga, animal, detritus, or a combination of these items from a site where she will deposit her eggs (Blumer 1982, 2).

♦ **care-giving behavior** See behavior: epimeletic behavior.

♦ **carnival** *n.*

1. In Humans: "A season or course of feasting, riotous revelry, or indulgence" (Oxford English Dictionary 1972, entries from 1598); any gay festival, wild revel, or merrymaking (Michaelis 1963).
2. In Chimpanzees: A display produced by troop members that involves unleashing of "a deafening outburst of noise — drumming trunks and buttresses of trees with their hands, shaking branches, and shouting at maximum volume, all the while running rapidly over the ground or brachiating from branch to branch" (Savage 1844, Sugiyama 1972, Reynolds and Reynolds 1965 in Wilson 1975, 222, 542).

[Italian *carnevale* < Medieval Latin *carnelevarium* < Latin *caro*, *carnis*, flesh + *levare*, to remove]

♦ **Carolina bay** See habitat: bay.

♦ **Carolinian Canada** See region: Carolinian Canada.

♦ **Carolinian zone** See region: Carolinian zone.

♦ **carotenoid** See molecule: carotinoid.

♦ **Carpogenous** See -genous: carpogenous.

♦ **carpophage** See -phage: carpopophage.

♦ **carrying capacity (K)** *n.*

1. The number of Reindeer stock that a range can support without injury to the range (Hadwen and Palmer 1922, who evidently first introduced this term, according to Pulliam and Haddad 1994, 141).
2. The number of animals that a particular range can support (Leopold 1933, 50–51, in Pulliam and Haddad 1994, 141).

Notes: The carrying capacity of a particular animal species is habitat dependent (Pulliam and Haddad 1994, 141–144). "Carrying capacity is a useful concept only when used in the original sense of a limit set to population size by the availability of resources; carrying capacity can vary in the same location from year to year.

3. A "threshold of security" that is reached when all available cover is saturated and mortality increases rapidly because "surplus animals" become especially vulnerable to predation (Errington 1934 in Pulliam and Haddad 1994, 141).

4. Parameter *K* of the logistic growth equation; the "upper bound beyond which no major increase in an animal's population size can occur (assuming no major environmental changes) (Odum 1953, 122, in Pulliam and Haddad 1994, 142).

Note: Odum assumed that carrying capacity and saturation point are the same concept (Pulliam and Haddad 1994, 142).

5. "A measure of the amount of renewable resources in the environment in units of the number of organisms these resources can support" (Roughgarden 1979 in Pulliam and Haddad 1994, 142).
6. The largest number of individuals of a particular species that can be maintained indefinitely in a given part of their environment (Wilson 1975, 81, 580).
7. The numbers of individuals of different species that can live in an area without harming its resource base (Odum et al. 1988, 25).

cf. saturation point

Comment: Dhont (1988 in Pulliam and Haddad 1994, 141) reviewed the concept of carrying capacity. Textbooks frequently use Odum's (1953) definition of carrying capacity.

human carrying capacity *n.*

1. The maximum number of persons that can be supported in perpetuity in an area with a given technology and set of consumptive habits and without causing environmental degradation (Allan 1965 in Pulliam and Haddad 1994, 150).

Note: Pulliam and Haddad (1994, 150) chose to omit "without causing environmental degradation" in defining Human carrying capacity.

2. The maximum number of Humans that an environment can sustain without reference to the quality of life of the people (Hardin 1986 Pulliam and Haddad 1994, 154).

Comments: Human carrying capacity is more complicated than that of other organisms because it includes, in addition to bio-physical components, social and cultural components (Daily and Ehrlich 1992 in Pulliam and Haddad 1994, 150). Human carrying capacity changes through time due to human innovation and technology. The number of people, their consumptive habits, and their damage to ecosystems determine human carrying capacity. A human population that leads to irreparable degradation of its life-support mechanisms is, by definition, above human carrying capacity (Pulliam and Haddad 1994, 154).

♦ **carrying in** *n.* In some carnivore and rodents species: An individual's transporting objects (*e.g.*, nest material or winter provender) or young to its nest, den, or burrow (Immelman and Beer 1989, 40).

cf. transport of young

♦ **carsinomaphobia, carsinomatophobia, cars-inophobia** See -phobia: carsinomaphobia.

♦ **Cartesian** *adj.* Referring to the philosophy of René Descartes (1596–1650) (Swartz 2001, 398).

♦ **carton** *n.* "The chewed vegetable fibers used by many kinds of ants, wasps, and other insects to construct nests" (Wilson 1975, 580).

♦ **-caryo** See -karyo.

♦ **caryotype** See -type, type: karyotype.

♦ **caryogamy** See -gamy: karyogamy.

♦ **caryotype** See -type: karyotype.

♦ **cascade** See trophic cascade.

♦ **cast** See fossil: cast.

♦ **cast downness** See abasement.

♦ **caste** *n.*

1. "A hereditary group, endogamously breeding, occupied by persons belonging to the same rank, economic position, or occupation, and defined by mores that differ from those of other castes" (Oxford English Dictionary 1971, entries from 1613; Wilson 1975, 299).
2. In eusocial bees and wasps: A functional group of females, either workers or queens (Michener 1974, 371).

Note: A caste may be differentiated by behavior and physiology alone; it may also be morphologically distinct (Michener 1974, 371).

3. In Ants: The workers, soldiers, ergatogynes, dichthadiiform ergatogynes, or queen(s) in a colony (Wilson 1971, 136).

Note: The three castes, queens, soldiers, and workers, are found in only a minority of ant species; males comprise a caste only in the very loosest sense (Wilson 1971, 136).

4. In Termites: The larvae (apterous nymphs), nymphs (brachypterous nymphs), workers, primary reproductives (first-form reproductives, imagos), pseudergates, soldiers, supplementary reproductives, replacement reproductives, neotenic reproductives, adultoid reproductives, nymphoid reproductives (second-form reproductives, secondary reproductives, brachypterous neotenic), and ergatoid reproductives (third-form reproductives, tertiary reproductives, apterous neotenic) (Wilson 1971, 184).

Note: The castes present depend on species of termite and colony development.

5. In the Naked Mole Rat and social insects: Any set of individuals of a particular morphological type, age group, or both, that performs specialized labor within its colony (Wilson 1975, 299; Jarvis 1981, 571).

6. In social insects: "Any set of individuals in a given colony that are both morphologically distinct from other individuals and specialized in behavior" (Wilson 1975, 299, 580).

7. In coelenterates, ectoprocts, sponges, and tunicates: A set of cells that has a particular role in social cell groups (Wilson 1975, 315).

See ²group: brace; imago.

cf. auxiliary, division of labor, king, role

Comment: Castes can be classified by type of polyethism (physiological and temporal) and by kind of individual (worker, soldier, and reproductive).

[Portuguese *casta*, unmixed breed < Latin *castus*, pure] **dichthadiigyne** *n.* In some ant species: A large female with a huge gaster (Wilson 1971, 70, 136).

syn. dichthadiiform ergatogynne (Wilson 1971, 136)

ergatandromorph *n.* In some ant species: A form that is morphologically intermediate between a worker and male, having normal male genitalia and a worker-like body (Wilson 1971, 138).

syn. eratomorphic male, ergatoid male

adj. ergatandromorphic

cf. male

ergatogynne *n.* In some social-insect species: Any form that is morphologically intermediate between a worker and a queen (Wilson 1971, 138; 1975, 371, 583).

syn. queen-worker intercaste

adj. ergatogynous

gyne *n.*

1. In Ants: A sexual female that is not socially a functional reproductive (Brian 1957 in Wilson 1971, 138).

2. In some bee species: A potential, or actual, queen (Michener 1974, 372).

3. In Ants: A female reproductive-caste member that may, or may not, be functioning as a reproductive at a particular time; broadly, a queen (Hölldobler and Wilson 1990, 638).

syn. queen (Wheeler 1907 in Wilson 1971, 138)

cf. queen

gynergate *n.* In Ants: A female with patches of both queen and worker tissue (Hölldobler and Wilson 1990, 638).

king *n.* In Termites: The male that accompanies a queen (egg-laying female) and inseminates her from time to time (Wilson 1975, 435, 587).

larva See caste: reproductive: nymph.

microgynne *n.* In an ant species with two sizes of queens: A queen of the smaller form (Hölldobler and Wilson 1990, 640).

cf. female: macrogynne

neoteinic *n.* A supplementary reproductive termite (Wilson 1975, 589).

syn. neotene, neoteinic (Lincoln et al. 1985).

nymph, nympha See caste: reproductive: nymph.

pseudergate *n.* In less derived termites: A caste comprising individuals that either have regressed from nymphal stages by molts that reduced, or eliminated, their wing buds, or else were derived from larvae by undergoing nondifferentiating molts (Wilson 1975, 435, 593).

Comment: Pseudergates serve as the principal elements of the worker caste, but remain capable of developing into other castes, *e.g.*, secondary neoteinic, *q.v.*, by further molting (Wilson 1975, 435, 593).

pseudocaste *n.* A group of social symbionts in its host species' colony (Wilson 1975, 353).

pupa See caste: reproductive: nymph.

queen *n.*

1. In Ants, Termites, and some species of bees and wasps: "A perfect female" (Oxford English Dictionary 1972, entries from 1609); a female member of a reproductive caste (Wilson 1975, 435, 593).

2. In the Naked Mole Rat: A reproductive female (Jarvis 1981).

v.i., v.t. queen

syn. gyne (Wheeler 1907 in Wilson 1971, 138).

cf. caste: gyne; female

Comments: In social animals, the existence of a queen presupposes the existence of a worker caste at some stage of a colony's life cycle. Queens may, or may not, be morphologically different from workers (Wilson 1975, 435, 593).

► **foundress queen** *n.* In social halictine bees: A principal egg layer that never functioned as a worker (Eickwort and Kukuk 1987 in Michener 1988a, 77).

► **macrogynne** *n.* In an ant species with two sizes of queens: A queen of the larger form (Hölldobler and Wilson 1990, 640).

► **microgynne** *n.* In an ant species with two sizes of queens: A queen of the smaller form (Hölldobler and Wilson 1990, 640).

► **replacement queen** *n.*

1. In highly eusocial bees: A queen that a colony produces that will replace a queen that has died or became lost (Michener 1974, 374).

2. In social halictine bees: A principal egg layer that is a daughter, with a high probability of originally being a worker, of a disappeared queen (Eickwort and Kukuk 1987 in Michener 1988a, 77).

► **supersedure queen** *n.* In highly eusocial bees: A queen that a colony produces while an aging queen is still present and that will replace her (Michener 1974, 374).

reproductive *n.* An individual that has offspring. See imago.

► **primary reproductive** *n.* In Termites: A colony-founding type of queen, or male, derived from a winged adult (Wilson 1975, 592).

► **neoteinic** *n.* In Termites: A supplementary reproductive (Wilson 1975, 589).

► **nymph** *n.* In Termites: An immature individual that possesses external wing buds and enlarged gonads and is capable of developing into a functional reproductive by further molting (Wilson 1975, 590). *syn.* larva (confusing synonym), nympha, pupa (uncommon synonym, Oxford English Dictionary 1972).

► **secondary neoteinic** *n.* In some termite species: A male, or female, that replaces a king or queen, respectively, which is lost; a secondary neoteinic transforms in one molt from a worker-like pseudergate (Wilson 1975, 435).

nasute soldier *n.* A termite soldier with a nasus (Wilson 1975, 589).

scout *n.* In Ants: A worker that searches outside her nest for food, or in a slave-making species, a worker that searches for a host colony suitable for raiding (Hölldobler and Wilson 1990, 642).

cf. caste: worker

soldier *n.*

1. A nonreproductive worker ant, or termite, that is specialized for colony defense (Wilson 1975, 595).

2. A morphologically distinct, second-instar aphid that defends its area against other insects (Aoki et al. 1977 in Aoki et al. 1991).

Note: Soldier aphids do not molt into third instar, and they do not reproduce (Aoki et al. 1991).

worker *n.*

1. A "neuter or undeveloped female" of certain social Hymenoptera, *e.g.*, bees and ants, that "supplies food and provides other services for the community" (Oxford English Dictionary 1972, entries from 1747; Darwin 1859, 259–262).

2. In most ant species: An ordinarily nonreproductive (sterile) female that has reduced ovarioles and a greatly simplified thorax with nota that are typically represented by no more than one sclerite each (Tulloch 1935 in Wilson 1971, 138).

Note: In ants, workers are minors (minima), medias, majors (maxima, soldiers).

syn. ergate (Torre-Bueno 1978)

[Greek *ergatēs*, workman]

3. In semisocial and eusocial insect species and the Naked Mole Rat: A member of the nonreproductive, laboring caste (Wilson 1975, 598, Jarvis 1981).

4. In many termite species, usually termitid species: A male, or female, individual that undertakes usual colony chores; *e.g.*, constructing a nest, cleaning, nursing, and foraging (Wilson 1971, 184).

Note: In Termitid Termites: A worker that lacks wings; has a reduced pterothorax; has reduced, or no, eyes; and has a rudimentary genital apparatus (Wilson 1971, 184; 1975, 598).

5. In Bumble Bees, Honey Bees, Stingless Bees, and other kinds of social bees: A female that lays no eggs, or few eggs relative to a queen, and performs tasks in her nest (Michener 1974, 374).

See worker.

cf. scout

Comments: The existence of a worker caste presupposes the existence of royal (reproductive) caste in a species.

► **callow worker** *n.* In social insects: A teneral adult worker; a newly emerged adult worker, whose exoskeleton is still relatively soft and lightly pigmented (Wilson 1975, 426, 580).

► **frequent worker** *n.* In *Heterocephalus glaber* (Naked Mole Rats): An animal that frequently

- performs tasks associated with nest building and foraging (Jarvis 1981, 571); contrasted with infrequent worker.
- **gamergate** *n.* In Ants: "A mated, egg-laying worker" (Hölldobler and Wilson 1990, 638).
- **infrequent worker** *n.* In *Heterocephalus glaber* (Naked Mole Rats): An animal that shows role overlap with frequent workers, but performs tasks in its colony at less than half the rate of frequent workers (Jarvis 1981, 571); contrasted with frequent worker.
- **major worker** *n.* In some ant and termite species. "A member of the largest-worker subcaste, especially in ants" (Wilson 1975, 588).
cf. caste: worker: media worker, minor worker
Comment: In Ants, this subcaste is usually specialized for defense, and an adult belonging to it is often also referred to as a soldier (Wilson 1975, 588).
- **media worker** *n.* In polymorphic ant series involving three, or more, worker subcastes: An individual belonging to the medium-sized subcaste(s) (Wilson 1975, 588).
cf. caste: worker: minor worker, major worker
- **minima** See caste: worker: minor worker.
- **minor worker** *n.*
 1. In eusocial insects, especially in some ant species: "A member of the smallest worker subcaste" (Wilson 1975, 589).
 2. In eusocial insects: A sterile but not necessarily nonreproductive caste that performs most energy acquisition, colony maintenance, and brood care functions (Wittenberger 1981, 618).*syn.* minima (*sing.*, Wilson 1971, 589)
cf. caste: worker: major worker
Comment: Minor workers may be differentiated into several functionally different castes on the basis of age, ontogeny, or both (Wittenberger 1981, 618).
- **nanitic worker** *n.* In some ant species: A dwarf worker that is produced from either the first, or late, ant brood of a colony and is small due to her being starved (Hölldobler and Wilson 1990, 640).
- **nonworker** *n.* In *Heterocephalus glaber* (Naked Mole Rats): A larger male, or female, that cares for young and very rarely digs or transports materials (Jarvis 1981, 571).
cf. A male nonworker is likely to mate with the sole reproductive female of his colony (Jarvis 1981, 571).
- **replete** *n.* For example, in *Camponotus* sp. (honeypot ants) and *Prenolepis imparis* (False Honey Ants): A worker whose crop is greatly distended with liquid food, to the extent that her abdominal segments are pulled apart and her intersegmental membranes are stretched tight (Talbot 1943, 32; Wilson 1975, 594).
Comment: Repletes usually serve as living reservoirs that regurgitate food on demand to their nest mates (Wilson 1975, 594).
- **temperature messenger** *n.* In some ant species: A worker that runs along her nest surface in winter and tests external temperature; the warmer it becomes, the longer the messenger remains near the surface and the more heat she transfers to her nest mates when she returns (Wilson 1971, 1973 in Heymer 1977, 173).
- ♦ **caste polyethism** See polyethism.
- ♦ **casting** *n.* An object that has been cast off, or voided, by an organism, *e.g.*, a fecal pellet or worm casting (Lincoln et al. 1985).
cf. exuviae

- ♦ **Castle's law** See law: Hardy-Weinberg law.
- ♦ **Castle's theory** See ³theory: Castle's theory.
- ♦ **castration** *n.*
 1. A person's removal of, or interference with the function of, testes (gelding, emasculation) or ovaries (spaying) of another animal, including a Human (Oxford English Dictionary 1972, entries from 1420; Lincoln et al. 1985).
 2. In *Macaca mulatta* (Rhesus Macaques), *Pan paniscus* (Bonobos), and *Pan troglodytes* (Chimpanzees): One individual's removing the testicles of another (Waal 1989, 73–74, 221).*syn.* gonadectomy
[Latin *castratus*, past participle of *castrare*, to castrate, prune, expurgate, deprive of vigor]
- emasculation** *n.* A person's removal of male reproductive organs, or inhibition of male reproductive capacity, of another animal (Lincoln et al. 1985).
syn. castration, orchidectomy, orchectomy (Immelman and Beer 1989, 120)
- ovariectomy** *n.* A person's removal of another animal's ovaries (Immelman and Beer 1989, 120).
- parasitic castration** *n.* A host's reproductive death due to a parasitic infection (Lincoln et al. 1985).
- psychological castration** *n.* In some primate species: The phenomenon that the mere presence of higher-ranking rivals suppresses the breeding capability of subordinate males (Immelman and Beer 1989, 120).
- ♦ **casual society, casual group** See ²society: casual society.
- ♦ **cata-, kata-** *prefix*
 1. Down; against; upon (Michaelis 1963).
 2. Back; over (Michaelis 1963).
Before vowels, cat-
[Greek *kata-* < *kata* down, against, back]
- ♦ **catabolism** See metabolism: catabolism.
- ♦ **cataclysmic evolution** See ²evolution: cataclysmic evolution.
- ♦ **cataudromous** See -dromous: cataudromous.
- ♦ **catagenesis** See -genesis: catogenesis.
- ♦ **catalepsy** See playing dead.
- ♦ **catalog** See -gram: ethogram.
- ♦ **cataplasia** See -plasia: cataplasia.
- ♦ **catastrophe system** See ¹system: catastrophe system.
- ♦ **catastrophe theory** See ²theory: catastrophe.
- ♦ **catastrophic selection** See selection: catastrophic selection.
- ♦ **catastrophism** See hypothesis: catastrophism.
- ♦ **catastrophist** See directionist.
- ♦ **catch-mark-recatch method** See Lincoln index.
- ♦ **catecholamine** See hormone: catecholamine.
- ♦ **category** *n.* The rank, or level, in a hierarchic classification; *e.g.*, *Canis familiaris* (Domestic Dog) and *Musca domestica* (House Fly) are in the species category (Mayr 1982, 207).
cf. name: scientific name; taxon
- ♦ **cause, causation** *n.* An agent, or force, that produces an effect; *e.g.*, a person, occasion, or condition, that gives rise to a result or action (Michaelis 1963). See etiology.
- configurational causes** *n. pl.* Factors in different constellations that can have drastically different results [coined by Simpson 1970 in Mayr 1982, 377].
- proximate cause, proximate causation** *n.*

1. "The immediate cause underlying expression of a phenotypic trait" (Spencer, Romanes, Baker 1938 in Mayr 1982, 68; Wittenberger 1981, 620).

2. A factor, *e.g.*, external stimuli or an animal's motivational state, that governs the immediate causation of the animal's physiological process or behavior; *e.g.*, in many birds, the tactile stimuli from sitting on eggs leads to cessation of egg laying (Immelmann and Beer 1989, 236).

syn. proximate factor

cf. causation: ultimate causation; function: proximate function of behavior

► **proximate causation of behavior** *n.* A condition(s) in an organism's external or internal environment (physiology, development) that triggers the organism's response (Wilson 1975, 593), *e.g.* increase in day length that triggers the beginning of a bird's breeding cycle (Immelmann and Beer 1989, 321); contrasted with ultimate causation of behavior. *syn.* proximal causation, proximate cause *cf.* cause: ultimate causation: ultimate causation of behavior

ultimate causation *n.*

1. All environmental conditions that lead to an animal's longer life expectancy and greater reproductive success (Immelmann and Beer 1989, 321).
2. The evolutionary cause(s) of a biological phenomenon (Mayr 1997, 66).

► **ultimate causation of behavior** *n.*

1. Past environmental forces (*e.g.*, food supply) that influenced the evolution of behavioral adaptations (Wilson 1975, 23, 593); *e.g.*, environmental factors that affect bird breeding time over evolutionary time (Immelmann and Beer 1989, 320); contrasted with proximate causation of behavior.
2. Both evolutionary and ecological reasons why an organism exhibits particular behavior (Alcock 1975 in Dewsbury 1978, 6).
3. Adaptive consequences of behavior presumed to have had selective significance during the history of a species; why a behavior evolved (Baker 1938 in Mayr 1982, 68, Daly and Wilson 1983).
4. In experimental psychology, function of behavior that is not necessarily the result of natural selection (Daly and Wilson 1983).
5. In physiology, an utterly proximate stimulus for behavior (Daly and Wilson 1983).

syn. ultimate factor, ultimate function, selective factor (Immelmann and Beer 1989, 320) *cf.* cause: proximate cause: proximate causation of behavior

♦ **cavalry** See ²group: cavalry.

♦ **cavernicole** See -cole: cavernicole.

♦ **cavernarius** *adj.* Living in caves.

syn. cavernicolous

♦ **CC** See coefficient: coefficient of community.

♦ **CCD** See disease: colony-collapse disorder.

♦ **ced genes** See death: apoptosis (comment).

♦ **Ced proteins** See death: apoptosis (comment).

♦ **cDNA** See nucleic acid: deoxyribonucleic acid: copy DNA.

♦ **cDNA library** See library: cDNA library.

♦ **celestial-body taxis** See taxis: celestial-body taxis.

♦ **cell** *n.*

1. "A minute portion of protoplasm, enclosed usually in a membranous investment" (Oxford English Dictionary 1971, entries from 1672).

Note: This definition is misleading because all living cells are thought to have peripheral limiting membranes (G. B. Chapman, pers. comm.).

2. The structural unit of organisms that is surrounded by a membrane and composed of cytoplasm, one or more nuclei, and other structures (Curtis 1983, 1090).
3. The smallest, membrane-bound protoplasmic body that is capable of independent reproduction (King and Stansfield 1985).
4. A mass of protoplasm limited in space by a plasma membrane (= cell membrane, cytoplasmic membrane) and containing one, or more, nuclei (or nucleoids) and various organelles and inclusions (G. B. Chapman, pers. comm.).

See nest: wasp nest: cell.

cf. -cyte; organized structure: quasi-cell

Comments: In most bacteria, fungi, and plants, a cell wall surrounds a cell's membrane (Curtis 1983, 1090). "Cell" is also used to refer to a dead cell, such as a wood cell, which may have lost its contents after death. Only a few of the hundreds of kinds of cells are defined below.

[Latin *cella*, chamber]

► **callus cell** *n.* A plant cell that can develop into an entire plant in a laboratory culture in some species (Homeyer 2003, SP12; North Carolina Biotechnology Center 2003).

► **echo detector** *n.* In some bat species: one of a class of neurons that responds to a faint, bat-like echo preceded by a loud, bat-like sound (Feng et al. 1978 in Dawkins 1986, 89).

germ cell *n.*

1. A gamete, or cell, that gives rise to a gamete(s) (Mayr 1982, 658).
2. An ancestral (primitive) male or female element (Mayr 1982, 658).

syn. agamete, gamete, germinal cell

cf. gamete

Comment: The concept of "germ cell" arose in the second half of the 18th century (Mayr 1982, 658).

► **glial cell, supporting cell** *n.* A cell in a vertebrate's brain and spinal cord (Campbell et al. 1999, 964).

cf. Glial cells give nervous systems structural integrity and aid in normal neuron functioning (Campbell 1999, 964). The brain of a human baby contains about 1 trillion glial cells at birth which form a network that protects and nourishes neurons (Nash 1997, 3 February, 50).

[Greek *glia*, glue]

► **neuroendocrine cell** *n.* A cell that delivers its neurohormone(s) into an animal's bloodstream (Immelmann and Beer 1989, 202).

► **neuron** *n.* A nerve cell (Immelmann and Beer 1989, 202). *cf.* echo detector

Comment: The brain of a human baby, at birth, contains about 100 billion neurons (Nash 1997, 3 February, 50).

► **afferent neuron** *n.* A neuron that transmits an impulse from an animal's receptor to its central nervous system (Michaelis 1963).

► **efferent neuron** *n.* A neuron that transmits an impulse from an animal's central nervous system to another part of its body (*e.g.*, a muscle) (Michaelis 1963).

► **interneuron** *n.* A neuron that intervenes between an afferent and efferent neuron in a reflex chain

of three neurons (= disynaptic reflex) (Immelmann and Beer 1989, 248).

syn. intercalated association, intercalated association neuron, intercalated commissural neuron, intercalated neuron, internuncial neuron (G. B. Chapman, pers. comm.)

protocell *n.* A hypothetical structure that is composed of proteins and other kinds of organic compounds, interacts as a unit with its environment, and reproduces (Strickberger 1990, 120–121).

Comments: One kind of protocell might have had ancestral heredity (without nucleic acids) that enabled it to pass on some of its metabolic and enzymatic properties to its offspring. This kind of protocell possibly evolved into the first cell (= the first organism, progenote) which had heredity based on nucleic acids (Strickberger 1990, 120–123). Inorganic selection (= chemical selection) evolved into organic selection (= biological selection) with the appearance of the first cell. Protocells might have evolved from organized structures (*q.v.*).

quasi-cell See organized structure: quasicell.

sense cell See ²receptor.

♦ **cell assembly** *n.* The basic unit of storage in brains which is a group of neurons connected in a ring or “closed circuit” (Hebb 1949 in Immelmann and Beer 1989, 41).

cf. engram

♦ **cell biology** See study of: biology: cell biology.

♦ **cell signaling** See signaling: cell signaling.

♦ **cell theory (of multicellularity)** See ³theory: cell theory (of multicellularity).

♦ **cell-to-cell recognition** See signaling: cell signaling: cell-to-cell recognition.

♦ **cenancestor** See ancestor: cenancestor.

♦ **cenobiology** See study of: biocoenology.

♦ **cenogenesis** See -genesis: cenogenesis.

♦ **cenogenous** See -genous: coenogenous.

♦ **cenophobia** See -phobia: agoraphobia.

♦ **cenospecies** See ²species: ceanospecies.

♦ **cenothermy** See -thermy: cenothermy.

♦ **cenozoology** See study of: zoology: cenozoology.

♦ **centeener** See ²group: centeener.

♦ **center** *n.*

1. A locus in an animal's nervous system characterized by the presence of a number of cell bodies and synapses, whose excitation by appropriately specified electrical stimulation may yield discrete motor, or autonomic, behavior patterns, and whose experimental destruction is followed by the disappearance, or gross modification, of the same, or similar, discrete motor or autonomic behavior patterns (Verplanck 1957).

2. A functionally coordinated, but not necessarily localized, group of neural structures that have the properties of a center (def. 1) (Verplanck 1957).

3. A hypothetical neural structure, place, or set of places in an animal's central nervous system, of unspecified anatomical properties, presumed to act as a unit upon excitation by another such place, or other such places, by sending nerve impulses that govern the occurrence of some innate response (Verplanck 1957).

syn. Erbkordinationen

Comments: A center is the theoretical neural correlate of a species-specific response. Theory endows this correlate with all the properties of a physiologist's center. These centers may become empirical concepts, with specified anatomical loci and properties (Verplanck 1957).

♦ **center of creation** *n.* A place where a species is thought to originate according to a creationist; a center of creation varies from a single pair of organisms in one particular location to groups of organisms all over its present range, depending on the theorist (Mayr 1982, 440).

♦ **centimorgan (cM)** See genetic map (comments).

♦ **central dogma, central dogma of genetics** *n.*

1. During protein production within a cell or virus, amino acids and proteins are translated from nucleic acids and not the other way around (Mayr 1982, 574).

Note: “This discovery supplied the last and most conclusive proof for the impossibility of an inheritance of acquired characters” (Mayr 1982, 574). “Acquired characters” refers to those that theoretically could be induced in a cell nucleus by environmental protein. However, newly acquired cytoplasmic DNA and nuclear DNA that are incorporated by a cell may be transmitted to offspring in some bacteria.

2. “The dogma that genes exert an influence over the form of a body, but the form of a body is never translated back into genetic code; acquired characteristics are not inherited” (Dawkins 1982, 285).

3. In molecular biology, “The dogma that nucleic acids act as templates for the synthesis of proteins, but never the reverse” (Dawkins 1982, 285).

syn. central dogma of molecular biology (Lewontin 2000, 115)

4. Acquired characters are not inherited and only changes in germ plasm are transmitted from generation to generation (Lincoln et al. 1985).

syn. Weismannism (Lincoln et al. 1985)

cf. Lamarckism, transposable element

Comment: Pigliucci (2007, 2744) comments that the use of the word “dogma” in the scientific term “central dogma of genetics” is an odd use of “dogma.”

♦ **central dogma of developmental genetics** *n.*

The development of an organism's shape can be understood by knowing the complete set of signaling pathways among its relevant genes, *i.e.*, which genes “turn on” which other genes (Lewontin 2000, 115).

♦ **central dogma of evolutionary theory** See ³theory: central dogma of evolutionary theory.

♦ **central-excitatory mechanism** See mechanism: central-excitatory mechanism.

♦ **central-excitatory state** See state: central-excitatory state.

♦ **central executive** See working memory (comments).

♦ **central grouping tendency** *n.* The array of the median numbers in each sex-age category calculated from a sample of societies (Wilson 1975, 518).

♦ **central hierarchy** See hierarchy: central hierarchy.

♦ **central-place system** See ¹system: central-place system.

♦ **central-motive state** See state: central-excitatory state.

♦ **central nervous system** See ²system: nervous system: central nervous system.

♦ **centrifugal selection** See selection: disruptive selection.

♦ **centripetal selection** See selection: stabilizing selection.

♦ **centripetal society** See ²society: centripetal society.

♦ **cenobiology** See study of: biocoenology.

♦ **cephalization** (SEF ah leh ZAYE shun) *n.* Evolutionary concentration and localization of functions, powers, parts, or a combination of these things in, or

toward, an animal's head: The cephalization of a vertebrate nervous system (Michaelis 1963).

[French *cephalique*, ultimately from Greek *kephalios* < *kephalē*, head]

♦ **cerebellum** See organ: brain: cerebellum.

♦ **ceremony** *n.*

1. A person's formal act, or observance, expressive of difference, or respect, to superiors in rank, or established by custom in social intercourse; a usage of courtesy, politeness, or civility (Oxford English Dictionary 1972, entries from *ca.* 1386).
2. In many animal species: "A highly evolved and complex display used to conciliate others and to establish and maintain social bonds" (Wilson 1975, 224, 491, 560, 580).
3. A complex social behavior sequence that is distinguished by a high degree of form constancy (Immelmann and Beer 1989, 42).

cf. display

Comment: "Ceremony" is more commonly used in earlier, rather than later, ethological literature (Immelmann and Beer 1989).

[Old French *cerymone* < Latin *caerimonia*, awe, veneration]

♦ **courtship feeding** See feeding: courtship feeding.

♦ **defecation ceremony** *n.* In Dikdiks: Sequential defecation by a pair of animals, often involving more than one defecation bout of each partner (Pilters 1956, Altmann 1969, and Hendrichs 1971 in Heymer 1977, 105).

♦ **feeding ceremony** *n.* For example, in some species of empidid flies and terns: A ceremony involving one individual's giving food to another (Heymer 1977, 73).

cf. feeding: courtship feeding

♦ **greeting ceremony** *n.* Behavior displayed when conspecific animals meet (Wilson 1975, 193, 227, 495, 509).

Comments: When *Canis lupus* (Gray Wolves) and *Lycaon pictus* (African Wild Dogs) have a greeting ceremony, subordinate individuals approach higher-ranked pack members in a groveling posture and "enthusiastically" nip and lick the latter's mouth areas; Elephants show a similar greeting ceremony (Wilson 1975, 193, 227, 495, 509).

♦ **relief ceremony** *n.* Special behaviors that an animal shows just prior to nest relief, *q.v.* (Immelmann and Beer 1989, 201).

♦ **triumph ceremony** *n.* In *Anser anser* (Greylag Geese): A ceremony in which a male makes a sham attack toward objects that are normally avoided (including a rival male), returns to his intended, or actual, mate, gives a "triumph" call, and threat displays toward a point near her (Lorenz 1943 in Heymer 1977, 180; Immelmann and Beer 1989, 319).

Comment: Similar ceremonies occur in other goose species (Immelmann and Beer 1989, 319).

♦ **urination ceremony** *n.* For example, in some rodent species, Hottentots: Urination on one animal by another (Heymer 1977, 84).

cf. enurbation; odor; group odor

Comment: In Hottentots, a circumciser may urinate upon a newly circumcised youth; a marriage official may urinate upon a bride, bridegroom, and bystanders; or a man may urinate upon a successful hunter (Eibl-Eibesfeldt 1970 in Heymer 1977, 84).

♦ **cerophage** See -phage: cerophage.

♦ **Certified Wildlife Habitat** See place: Certified Wildlife Habitat™.

♦ **cespiticole** See -cole: cespiticole.

♦ **Cetacean Behavior and Conservation Award** See Award: Cetacean Behavior and Conservation Award.

♦ **cete** See ²group: cete.

♦ **cetology** See study of: cetology.

♦ **CFC** See molecule: chlorofluorocarbon.

♦ **CFIRMS** See instrument: C/N-continuous-flow-isotope-ratio mass spectrometer, CFIRMS.

♦ **C₄ photosynthesis** See biochemical pathway: C₄ photosynthesis.

♦ **CGH** See congenital generalized hypertrichosis.

♦ **chain** *n.* "Any connected series; a succession: a chain of events" (Michaelis 1963).

action chain *n.*

1. A preprogrammed response sequence often shown by animals in social interactions; *e.g.*, in courtship, copulation, ritualized fights, food searching, and prey catching (Szymanski 1913, Meisenheimer 1921, etc. in Heymer 1977, 142).

2. Two animals' stereotyped sequence in which one's response is the stimulus for the other's next act, which, in turn, stimulates the next act of the first animal, etc. (Immelmann and Beer 1989, 2).

syn. reaction chain (Immelmann and Beer 1989, 2)

cf. graph: behavior-chain diagram; reflex: chain reflex

behavior chain *n.* A sequence of stimuli and an animal's responses that can be observed repeatedly with only minor variations in the ordinal position of each stimulus and response (Verplanck 1957).

cf. pattern: behavior pattern

Comment: In many chaining cases, one cannot identify all of the stimuli of a chain, but only the responses as they occur in order. In other cases, an animal's response may move it in such a way that it is confronted with a new set of stimuli that release, or elicit, the next response, and so on (Verplanck 1957).

courtship chain *n.* An action chain of a pair of courting animals.

electron-transport chain *n.* A system of electron carriers embedded in the inner membrane of a mitochondrion that produces a net of 32 ATPs from the electrons obtained from one glucose molecule that is involved in glycolysis and the Krebs cycle (Campbell 1987, 194).

Comment: The electrons are carried by NADH and FADH₂.

food chain *n.*

1. Part of a food web, *q.v.*, that is most frequently a simple sequence of prey species and the predators that consume them (Wilson 1975, 584).

2. The energy transfer from primary producers through a series of organisms that eat and are eaten, assuming that each organism feeds on only one other type of organism (*e.g.*, caterpillar → sparrow → Sparrow Hawk) (Allaby 1994, 159).

Comments: Much energy is lost at each stage, a fact that usually limits the number of steps (trophic levels) in the chain to four or five (Allaby 1994, 159).

The two basic food-chain types are grazing and detrital pathways. They often interact, giving a complex food web.

See chain: food chain.

Markoff chain *n.* A series of items in which the different-from-chance transition probability between two focal items is independent from one through all

preceding items in the sequence (Immelmann and Beer 1989, 295).

syn. Markov chain (Hartl and Clark 1997, 275)

► **first-order Markoff chain** *n.* A Markoff chain in which the different-from-chance transition probability between two focal items is independent of all preceding items in the sequence (Immelmann and Beer 1989, 295).

► **second-order Markoff chain** *n.* A Markoff chain in which the different-from-chance transition probability between two focal items is independent of one preceding item in the sequence (Immelmann and Beer 1989, 295).

reaction chain See chain: action chain.

♦ **chaining** *n.* An animal's linking together its responses in a learning test; each response gives rise to a new stimulus that the animal associates with its next response in a series (Storz 1973, 41).

♦ **chain of being** See *scala naturae*.

♦ **chain reaction** See reaction: chain reaction.

♦ **chain reflex** See reflex: chain reflex.

♦ **chain-reflex theory** See ³theory: chain-reflex theory.

♦ **chain transport** See transport: chain transport. See behavior chain.

♦ **chalcone synthase** See enzyme: chalcone synthase.

♦ **challenge display** See display: challenge display.

♦ **challenge ritual** See ritual: challenge ritual.

♦ **change in motivation** See emancipation.

♦ **change of function** *n.* Evolution of a new function by an organ or behavior, *e.g.*, the food calls of certain phasianid birds becoming mate-attracting calls (Schenkel 1956, 1958 in Heymer 1977, 72; Immelmann and Beer 1989, 42).

cf. ritualization

♦ **change of mood** *n.* A change from one motivational state, or mood, to another (von Holst and von St. Paul 1960 in Heymer 1977, 185).

♦ **channel** *n.* A pathway through which a signal travels in communication (Dewsbury 1978, 99).

See ¹system: communication system.

♦ **chaos system** See ¹system: chaos system.

♦ **chaos theory** See ²theory: chaos theory.

♦ **character** *n.*

1. A distinguishing feature of a species or genus (Chambers 1727 in Oxford English Dictionary 1972).
2. A taxonomic trait (Wilson 1975, 580); an organism's reliably recognizable attribute, or distinguishing mark (Wickler and Seibt 1977 in Immelmann and Beer 1989, 28).

Notes: Mendel referred to traits (Merkmale) in his genetic work and characters (Charaktere) as essentially phenotypic traits (Mendel 1865 in Mayr 1982, 735). A character can also be (1) an organism's correlated set of observable features caused by a single developmental, or ecological, process, *e.g.*, a group of features that are due to paedogenesis, or (2) a historic event in the evolution of a feature, *e.g.*, an unobservable ancestral character that gave rise to observable characters (Fristrup 1992, 45–16). In systematic studies, a character is a feature that is thought to vary independently of other features of an organism and to be homologous among the taxa of interest (Futuyma 1978, 93).

3. A property (of a structure or behavior) of an organism, or population, chosen for study (Hinde 1982, 277; Darden 1992, 41).

4. Any feature, or trait, transmitted from parent to offspring (Lincoln et al. 1985).

5. Part of an individual: the *cat's blue eyes* (Colless 1985 in Fristrup 1992, 46).

syn. character part (Colless 1985 in Fristrup 1992, 46) *Note:* Use of this kind of character is problematic (Fristrup 1992, 46).

6. A basis of comparison between taxa: the *cat's eye color* is blue (Colless 1985 in Fristrup 1992, 46).

syn. character-variable, *fundamentum divisionis* (Colless 1985 in Fristrup 1992, 46), variable (Sokal and Rohlf 1981; etc. in Fristrup 1992, 47)

7. An attribute of an individual: the cat is *blue-eyed* (Colless 1985 in Fristrup 1992, 46).

syn. character-attribute (Colless 1985 in Fristrup 1992, 46)

8. An organism's feature that can be evaluated as a variable with two, or more, mutually exclusive and ordered states (Pimentel and Riggins, 1987, 201, in Fristrup 1992, 45).

syn. characteristic (according to some authors), trait (many authors), variable (statistics)

See variable.

cf. characteristic

Comments: Many authors use "character," "characteristic," and "trait" interchangeably; I have not listed synonyms which differ only by these words in this book. Character is "not an unproblematic, easily operationalized concept" (Darden 1992, 41). Fristrup (1992) also discusses "aggregate character," "conditional character," "emergent character," and "extra-individual character," and sources of confusion regarding the concept of character.

acquired character *n.* A character resulting from direct environmental influences (Lincoln et al. 1985). See inheritance: inheritance of acquired characteristics; Lamarckism.

adaptation, adaptive character See ³adaptation: ²evolutionary adaptation (def. 2).

advanced character See character: derived character.

aggregate character See character (comments).

all-or-none character See character: binary character.

allesthetic character *n.* An animal's character that evolves via its effects on a potential mate's emotions, perceptions, and senses (Huxley 1914 in Gherardi 1984, 388).

cf. selection: mutual sexual selection

ancestral character *n.*

1. A character that appeared first in evolution and gave rise to other, more derived characters (Wilson 1975, 593).

2. A character that is similar to an ancestral character (Wilson 1975, 424).

syn. nonderived character, plesiomorph (*q.v.*), primitive character

cf. ancestral; character: plesiomorph, specialized character; Darwin's admonition

Comment: Ancestral characters are often, but not always, less complex than derived ones (Wilson 1975, 593).

antepisematic character See character: episematic character: antepisematic character.

apomorph *n.* A character that is unique and derived [coined by Hennig in Mayr 1982, 227].

syn. advanced character, apomorph character, apomorphic character, apomorphy, apotypic character,

apotypy, derived character, modern character, specialized character (Wiley 1981, 122)

cf. character: derived character, plesiomorph [Greek *apo*, after + *morp*, form]

► **autapomorph** *n.* An apomorph that has evolved in only one of two sister groups (Hennig in Mayr 1982, 230, 869).

► **nonhomologous apomorph** *n.* An apomorph that is similar to another one with which it is compared because of convergent evolution (Mayr 1982, 228).

syn. pseudoapomorph

► **synapomorph** *n.* An apomorph that is shared in both sister groups.

cf. -typy: synapotypy.

homologous synapomorph *n.* An apomorph that is actually, or inferred to be, derived from the nearest common ancestor of two taxa (Wiley 1981, 9–10; Mayr 1982, 228).

syn. genuine synapomorph

cf. character: apomorph, nonhomologous apomorph, pseudoapomorph; homolog

attached earlobe *n.* A human phenotypic character that is an earlobe that joins the side of a person's face without making a totally free earlobe; contrasted with free earlobe (Campbell et al. 1999, 253, illustration).

Comments: Homozygous dominant and heterozygous people have free earlobes; homozygous recessive people have attached earlobes (Campbell et al. 1999, 252). Some people have earlobes that are intermediate between attached and free.

auxiliary character *n.* A character that is used to confirm a taxon's identification (Lincoln et al. 1985).

syn. confirmatory character

cf. character: diagnostic character

behavioral character *n.*

1. An aspect of an animal's behavior that can be reliably measured, and is reasonably stable over an animal's life, and can, thus, be studied as a single phenomenon in relation to, *e.g.*, its heredity (Collocot and Dobson 1974).

2. Any character connected with behavior; *e.g.*, a movement pattern, scent signal, sensitive period, response to a sign stimulus, or vocalization (Immelman and Beer 1989, 28).

binary character *n.* A character that has only two states (Lincoln et al. 1985).

syn. all-or-none character, two-state character

cf. character: multistate character

character-attribute See character.

character part See character.

character-variable See character.

complex character *n.* A phenotypic character that is determined by more than one gene and, consequently, is not transmitted to offspring as a simple unit (Lincoln et al. 1985).

conditional character See character (comments).

confirmatory character See character: auxiliary character.

continuous character *n.* A character for which there is a continuum of possible phenotypes, *e.g.*, growth rate, height, milk yield, and weight; contrasted with meristic character (Hartl 1987, 216).

See character: continuous character.

demonstrative character *n.* An anatomical character, or behavioral character (locomotory pattern, distraction display), that an animal presents during a demonstrative movement, *q.v.* (Heymer 1977, 50).

dependent character *n.* A character that is applicable to an organism only if another character is already present in a particular state; *e.g.*, hairy legs occur only in an organism with legs (Lincoln et al. 1985).

derived character *n.* A character that is more recently evolved than one with which it is compared, *e.g.*, feathers of birds which have evolved from scales of reptiles (Lincoln et al. 1985).

syn. apomorph character, advanced character, modern character

cf. character: apomorph, ancestral character, plesiomorph, stasimorphic character; Darwin's admonition

diagnostic character *n.*

1. A character that is particularly important in a group of organisms evolving in a new direction; *e.g.*, feathers were a key character in evolution of birds from reptiles (given as "key character" in Mayr 1982, 613–614).

2. A character, or character state, that unambiguously differentiates one taxon from others (Lincoln et al. 1985).

syn. key character, peculiar character (Lincoln et al. 1985)

dichotomous character *n.* A character that exists in two states only (Lincoln et al. 1985).

dimorphism *n.* A character with two alternative states (Lincoln et al. 1985).

discrete character *n.* A character that is either present, or absent, in any one individual of a taxon (Hartl and Clark 1997, 399).

See character: qualitative character.

domestication character *n.* A character that distinguishes a domestic strain of a species from its wild ancestral type(s) (Immelman and Beer 1989, 78, 262).

Comment: Domestication characters include increase (hypertrophy) in sexual behavior; decrease (hypotrophy) in aggressiveness, brain weight, and parental care; and changes in body size, color (albinism, piebalding), hair (Angora hair), feathers (curling feathers), and shape (Immelman and Beer 1989, 78, 262).

emergent character See character (comments).

epigamic character *n.* An organism's trait (other than one that is essential or copulation behavior) that attracts, or stimulates, individuals of the opposite sex during courtship (Lincoln et al. 1985).

episematic character *n.* A character (episeme), *e.g.*, some color markings, that aids in one animal's recognizing another (Lincoln et al. 1985).

► **antepisematic character** *n.* An episematic character that implies a threat (Lincoln et al. 1985).

► **proepisematic character** *n.* An episematic character that aids social recognition (Lincoln et al. 1985).

► **pseudepisematic character** *n.* A character that aids an animal in recognition of another animal but involves deception (Lincoln et al. 1985).

syn. pseudoepisematic character, pseudosemantic character

cf. cheat

extra-individual character See character (comments).

extrinsic character *n.* A trait that exists, or has its origins, outside an individual organism, group, or system (Lincoln et al. 1985).

syn. extraneous character

cf. character: intrinsic character

free earlobe See character: attached earlobe.

- fundamentum divisionis** See character.
- heterogynistic character** *n.* A character this is more strongly marked in females than males (Lincoln et al. 1985).
syn. heterogynism
- holandric character** *n.*
1. A character that occurs only in males (Lincoln et al. 1985).
 2. A character carried on the Y-chromosome in the heterogametic male (Lincoln et al. 1985).
- syn.* holandry
cf. character: hologynic character
- hologynic character** *n.*
1. A character found only in females (Lincoln et al. 1985).
 2. A sex-linked character in a species with heterogametic females (Lincoln et al. 1985).
- syn.* hologenous character, hologyny
cf. character: holandric character
- homolog, homologue, homology** See homolog.
- homologous synapomorph** See character: apomorph: synapomorph: homologous synapomorph.
- ideal character** *n.* An organism's character that has the best features for the organism's present environment (Wilson 1975, 23).
- independent character** *n.* A character that is not linked to a second character of the same individual organism because it is part of a different ontogenetic pathway and is free to respond to evolution differently than the second one (Wiley 1981, 117).
Comments: Independent characters of the same organism are not absolutely independent of one another because they are both of this same organism. Examples of independent characters are a gar's number of teeth that border its snout and its number of caudal-fin rays (Wiley 1981, 117).
- intrinsic character** *n.* A character that originates, or occurs, within an individual, group, or system (Lincoln et al. 1985).
cf. character: extrinsic character
- juvenile characteristic** *n.* One of a set of characters that distinguishes a young animal from a conspecific infant or adult, *e.g.*, juvenile plumage of birds or juvenile behavior, including vocalization (Immelman and Beer 1989, 161–162).
cf. coloration: baby coloration, dress: juvenile dress
- key character** See character: diagnostic character.
- lethal character** *n.* Any inherited character that causes an organism's death before it can reproduce (Lincoln et al. 1985).
- linked character** See character: dependent character.
- Mendelian character** *n.* Any character that is inherited in accordance with Mendel's law of independent assortment, *q.v.* (Lincoln et al. 1985).
- meristic character** *n.* A character for which the phenotype is expressed in discrete, integral classes, *e.g.*, bristle number on a fruit fly, ear number on a *Zea mays* (Corn) plant, litter size, and petal number; contrasted with continuous character (Hartl 1987, 216–217).
See character: quantitative character.
- modern character** See character: apomorph, derived character.
- morphological character** *n.* A character of an organism's anatomy or form (*e.g.*, ear shape, ear size, height, leaf shape, petal color, symmetry) (inferred from Futuyma 1998, 519).

- multifactorial character** *n.* A phenotypic character that is influenced by many factors, both environmental and genetic (Campbell et al. 1999, 251). [multifactorial, referring to the fact that multiple genetic and environmental factors affect many polygenic characters (Hartl 1987, 215)]
- multistate character** *n.* A character that has three, or more, different states (Lincoln et al. 1985).
cf. character: binary character
- nonadaptive character** *n.* An "abnormal character that reduces the fitness of individuals that consistently manifest it under environmental circumstances that are usual for their species" (Wilson 1975, 21).
- numerical character** See character: polygenic character.
- optimum-permissible character** *n.* An organism's character that has the best possible features given the genetic and environmental constraints upon it and that is less than its ideal conceivable condition (Wilson 1975, 24).
- paratelic character** *n.* One of two, or more, superficially similar characters that result from convergent evolution (Lincoln et al. 1985).
- patristic character** *n.* A character that is inherited by all members of a group from their most recent common ancestor (Lincoln et al. 1985).
- peculiar character** See character: diagnostic character.
- phene** *n.* A phenotypic character that is genetically determined (Lincoln et al. 1985).
- plesiomorph** *n.* An ancestral character or character state (Lincoln et al. 1985).
syn. ancestral character, generalized character, plesiomorph character, plesiomorphous character, plesiomorphy, plesiotypic character, plesiotypy, primitive character (Wiley 1981, 122)
cf. character: apomorph
[Greek *plesios*, near + *morph*, form]
- **symplesiomorph** *n.* A plesiomorph shared by two, or more, taxa (Lincoln et al. 1985).
cf. -typy: symplesiotypy
- polygenic character** *n.* A character that is controlled by the integrated action of multiple independent genes (Lincoln et al. 1985; Hartl 1987, 215); contrasted with digenic character, monogenic character, oligogenic character, and trigenic character.
syn. polyergistic character, polyfactorial character, polygenetic character, multifactorial trait, multigenic character (Lincoln et al. 1985); quantitative trait (Hartl 1987, 215).
Comment: An organism's external environmental influences polygenic characters to varying degrees (Hartl 1987, 215).
[polygenic, referring to the fact that multiple genetic factors affect many polygenic characters (Hartl 1987, 215) quantitative, referring to the fact that combined effects of many quantities (environmental and genetic) affect many polygenic characters (Hartl 1987, 216)].
- polymorphic character** *n.* A character with two, or more, alternative states (suggested by Campbell 1990, 446); contrasted with dimorphism (under character).
cf. -morphism: dimorphism, polymorphism
- primitive character** See character: ancestral character, plesiomorph.
- pseudepisematic character, pseudoepisematic character, pseudosematic character**

See character: episematic character: pseud episematic character.

qualitative character *n.* A character that has discrete states that are not numerical or morphometric (Lincoln et al. 1985).

See character: discrete character.

syn. discrete character

► **qualitative-multistate character** *n.* A qualitative character that exhibits several states that cannot be arranged linearly along a single axis (Lincoln et al. 1985); contrasted with quantitative-multistate character.

quantitative character *n.*

1. A character based on counts, measurements, ratios, or other numerical values (Lincoln et al. 1985).

syn. meristic character, *q.v.* (Hartl and Clark 1997, 398), numerical character (Lincoln et al. 1985)

See character: polygenic character.

2. A character with continuous variation and controlled by several interacting genes (Lincoln et al. 1985; Hartl and Clark 1997, 398).

syn. continuous character (Hartl and Clark 1997, 398)

cf. gene locus: quantitative-trait locus; study of: quantitative genetics

A CLASSIFICATION OF QUANTITATIVE CHARACTERS

- I. continuous character (*syn.* quantitative character)
- II. discrete character
- III. meristic character (*syn.* numerical character, quantitative character)
- IV. polygenic character (*syn.* polygenetic character, polyergistic character, polyfactorial character, multigenic-character multifactorial trait, quantitative trait)
- V. quantitative-multistate character

► **quantitative-multistate character** *n.* A quantitative character that exhibits several states that can be arranged linearly along a single axis (Lincoln et al. 1985); contrasted with qualitative-multistate character.

redundant character *n.* Any character that does not contribute useful information to an analysis" (Lincoln et al. 1985).

regressive character *n.* A character that shows a gradual loss of differentiation due to aging or evolution (Lincoln et al. 1985).

rudimentary character *n.*

1. An imperfectly developed character (Lincoln et al. 1985).

2. A character that is arrested at an early stage of its development or evolution (Lincoln et al. 1985).

cf. character: stasimorphic character

Comment: "Rudimentary character" is sometimes incorrectly synonymized with "vestigial character" (Lincoln et al. 1985).

semantid *n.* "Any biochemical character" (Lincoln et al. 1985).

sex-limited character *n.* "A character expressed in only one sex" (Lincoln et al. 1985).

sexual character *n.* In sexually-dimorphic organisms: A character in which sexes differ (Immelmann and Beer 1989, 266).

► **primary-sexual character** *n.*

1. "Any character that is directly involved in reproduction or parental care" (Wittenberger 1981, 620).

2. A difference between the sexes of a species that is related to reproductive organs and gametes (Lincoln et al. 1985).

► **secondary-sexual character** *n.* A character that differs between the sexes of a species and that is related to characters other than gametes and reproductive organs (Lincoln et al. 1985).

cf. character: epigamic character

somatic character *n.* A character that results from an organism's bodily change during its lifetime due to practice or environmental impact (Bateson 1979, 245).

specialized character *n.*

1. A character that is highly modified from its ancestral condition and can no longer carry out its ancestral function (Lincoln et al. 1985).

2. A character that is adapted to perform a particular function (Lincoln et al. 1985).

species character *n.* A character that does not vary within a species, but does vary among species (Mayr 1963, 1969 in Fistrup 1992, 48).

syn. taxonomic character

species-specific character *n.*

1. A character that is specific only to a particular species or part of a species, *e.g.*, innate-movement patterns or learning dispositions (Immelmann and Beer 1989, 287).

Note: Some workers use "species-characteristic" and "species-typical" for characters that are found in more than one species and to distinguish these characters from "species-specific characters" (def. 1) (Immelmann and Beer 1989, 287).

2. A character that is specific to a group of species (Immelmann and Beer 1989, 287).

cf. character: specific character

specific character *n.* A character that is diagnostic of a species (Lincoln et al. 1985).

cf. character: species-specific character

stasimorphic character *n.* A character that retains an ancestral condition (Lincoln et al. 1985).

syn. stasimorph, stasimorphy

synapomorph See character: apomorph: synapomorph.

taxonomic character See character: species character.

threshold character *n.*

1. A character that is either present, or absent, in any one individual of a population (Hartl 1987, 217).

Note: Hartl and Clark (1997, 399) call this kind of trait a "discrete trait," *q.v.*

2. A character that an individual expresses when its liability value is greater than a particular threshold, or triggering, level; *e.g.*, human diabetes and schizophrenia.

two-state character See character: binary character.

vestigial, vestige *n.* A character, or function, that has become diminished, or reduced, through regressive evolution or ontogeny (Lincoln et al. 1985).

cf. relict

Comment: "Vestigial character" is not synonymous with "rudimentary character" (Lincoln et al. 1985).

widow's peak *n.* A human phenotypic character that is a pointed contour of one's hairline on one's forehead (Campbell et al. 1999, 252, illustration).

Comment: Homozygous dominant and heterozygous people have widow's peaks; homozygous recessive people lack widow's peaks (Campbell et al. 1999, 252).

♦ **character-attribute** See character.

♦ **character convergence** *n.* Two newly evolved species' interacting in such a way that one, or both, converges in one, or more, characters toward the other; contrasted with character displacement (Moynihan 1968, Cody 1969 in Wilson 1975, 277, 580).

syn. theory of character convergence

♦ **character-data methods** See method: character-data methods.

♦ **character displacement** *n.* For example, in some frog and Darwin's Finch species: The phenomenon in which the ranges of closely related species with similar ecological niches come to overlap, and the differences in some traits of these species evolve and become more different compared to areas where the species do not overlap; contrasted with character convergence (Murray 1971 in Wilson 1975, 277, 580; Immelmann and Beer 1989, 43; D. M. Lambert, pers. comm.).

syn. character divergence (Darwin 1859 in Price 1996, 78); theory of character displacement

Comment: Since the 1950s, some researchers broadened "character displacement" to include character divergence, convergence, and parallel characteristic shifts in zones of sympatry (Taper and Case 1992 in Price 1996, 79).

[Brown and Wilson (1956) introduced this term according to Futuyma and Slatkin (1983, 4). The idea of character displacement can be traced to Lack (1947 in Wilson 1992, 367).]

♦ **reproductive character displacement** *n.*

Character displacement (*q.v.*) that involves sexual aspects of a species, *e.g.*, the pitch of the mating call of the cicada *Magicicada neotredecim* (Marshall and Cooley 2000, 1315).

Comment: Waage (1979 in Marshall and Cooley 2000, 1313) discussed four criteria that must be met to make a convincing case for reproductive character displacement.

♦ **character enhancement** *n.* A character's further differentiation caused by selection on sympatric animals (Heymer 1977, 102).

Comment: Characters involved include firefly flashing and grasshopper vocalizations (Heymer 1977, 102).

♦ **character gradient** See cline.

♦ **character part** See character.

♦ **character release** *n.* An increase in the variation of certain phenotypic characters associated with ecological release of a species (Lincoln et al. 1985).

♦ **character space** *n.* "The hypothetical space occupied by a taxon, having as many dimensions as characters used to define the taxon" (Lincoln et al. 1985).

♦ **character state** *n.*

1. A particular character possessed by one individual and not another, or by one species and not another (Wilson 1975, 580).

2. "Any of the range of values, conditions, or expressions of a particular taxonomic character" (Lincoln et al. 1985).

Comments: Examples of character states include "present" or "absent" of the character "thumb" in Primates and particular position of nucleotides A, C, G, and T in a DNA sequence (Futuyma 1998, 93).

♦ **character-variable** See character.

♦ **characteristic** *n.* A distinguishing feature, often used loosely as a synonym of character although, more precisely, it refers to the distinctive state, or expression, of that character (Lincoln et al. 1985).

♦ **Charaktere** See character.

♦ **characteristic species** See ²species: characteristic species.

♦ **charge-strike** *n.*

1. A kind of aggressive behavior, *e.g.*, in Humpback Whales (Baker and Herman 1985, 55).

2. *v.t.* To show a charge-strike.

cf. head lunge

♦ **Charles Darwin Research Station** See research station: Charles Darwin Research Station.

♦ **charm** *n.*

1. Any fascinating, or alluring, human quality, or feature, that excites admiration, love, or both (Oxford English Dictionary 1972, entries from 1598).

2. In lekking birds: A male's attribute that attracts females as mates and is expected to be correlated with genetic quality of the male (Darwin in Zuk 1984).

See ²group: charm.

[French *charme* < *carmen*, song, incantation]

♦ **chasmogamy** See -gamy: chasmogamy.

♦ **chasmophile** See ¹-phile: chasmophile.

♦ **Chauvet Grotto** See place: Chauvet Grotto.

♦ **cheater, cheat** *n.*

1. A person who deals fraudulently; deceives; swindles (Oxford English Dictionary 1972, entries from 1607).

2. In organisms: An individual that does not reciprocate, or reciprocate fully, in a reciprocal-altruism interaction with another organism (West Eberhard 1975, 21; Axelrod and Hamilton 1981).

cf. robber, thief

3. An individual organism that deceives a conspecific organism in a way that is likely to increase the cheater's fitness (Trivers 1976, 139).

v.i. cheat.

cf. deceit; signaler: deceitful signaler

♦ **gross cheater** *n.*

1. A cheater that does not reciprocate in an interaction with an altruist (Trivers 1971, 46).

2. A cheater that reciprocates so little, if at all, that the altruist receives less benefit from the gross cheater than the cost of the altruist's acts of altruism to the cheater [coined by Trivers (1971, 46)].

♦ **subtle cheater** *n.* A cheater that reciprocates, but always attempts to give less than it was given, "or more precisely, to give less than the partner would give if the situation were reversed" [coined by Trivers (1971, 46)].

♦ **cheekpadder** See animal names: cheekpadder.

♦ **cheiropterophile** See ¹-phile: cheiropterophile.

♦ **chemical communication** See communication: chemical communication.

♦ **chemical-degradation method** See method: chemical-degradation method.

♦ **chemical dialect** See dialect: chemical dialect.

♦ **chemical ecology** See study of: ecology: chemical ecology.

♦ **chemical evolution** See ¹evolution: chemical evolution.

♦ **chemical legacy** *n.* The phenomenon that a connection between larval and adult behavior can develop if an eclosing adult is exposed to an odor carried over from its larval environment; contrasted with associative learning with regard to odor (Corbet 1985 in Blackiston et al. 2008, 1736e).

♦ **chemical releaser** See chemical-releasing stimulus; semiochemical; pheromone.

♦ **chemical-releasing stimulus (CRS)** *n.* A chemical that an organism makes, bears, or both, that may, or actually, influence the behavior of one, or more, other organisms (Weldon 1980).

cf. odor

Comment: The same chemical may function in more than one different type of organism interaction (Nordlund and Lewis 1976, 212).

A CLASSIFICATION OF CHEMICAL-RELEASING STIMULI

- I. apneumone
- II. arrestant
- III. attractant
- IV. deterrent
- V. semiochemical (*syn.* chemosignal, semiochemic)
 - A. allelochemic (*syn.* “allelochemical,” xenomone)
 - 1. allomone (*syn.* false pheromone)
 - a. allelopathic substance
 - b. defense allomone
 - (1) plant-derived allomone
 - (2) plant-produced allomone
 - (3) predator-released allomone
 - (4) chemiocryptic allomone (*syn.* mimetic allomone)
 - (5) herbivore-released allomone
 - (6) plant-manipulation allomone
 - (7) prey-disruption allomone
 - (8) prey-attraction allomone
 - (9) prey-subduction allomone
 - (10) predator-defense allomone
 - c. exocrine substance (*syn.* ectocrine substance, environmental hormone)
 - d. propaganda substance
 - 2. antimone
 - 3. kairomone
 - a. herbivore-released kairomone
 - b. predator-released kairomone
 - c. trail kairomone
 - 4. synomone
 - a. plant-produced synomones
 - (1) extrafloral-nectar synomone
 - (2) floral-scent synomone
 - (3) food-body synomone
 - (4) guardian synomone
 - b. herbivore-released synomone
 - c. predator-released synomone
 - d. vegetative synomone
 - B. pheromone (*syn.* ectohormone, social hormone, etc.)
 - 1. acrasin
 - 2. aggregation pheromone
 - 3. aggregation-attachment pheromone
 - 4. alarm pheromone
 - 5. androstenone
 - 6. antiaphrodisiac
 - 7. aphrodisiac
 - 8. bombykol
 - 9. copulin
 - 10. dispersant pheromone
 - 11. death pheromone (*syn.* funeral pheromone)
 - 12. epideictic pheromone
 - 13. human-female pheromone
 - 14. human-male pheromone

- 15. incitin
- 16. individual pheromone
- 17. inhibitory pheromone
- 18. matrone
- 19. mating pheromone
- 20. primer pheromone
- 21. propaganda pheromone
- 22. queen pheromone
- 23. recognition pheromone
- 24. recruitment pheromone
- 25. releaser pheromone
- 26. reproductive pheromone
- 27. sex pheromone
- 28. superpheromone
- 29. surface pheromone
- 30. synchronization pheromone
- 31. territory pheromone
- 32. trail pheromone (*syn.* trail-marking pheromone, trail-following pheromone)

VI. stimulant

- A. feeding stimulant (*syn.* phagostimulant)
- B. locomotory stimulant
- C. mating stimulant
- D. ovipositional stimulant

apneumone *n.* A chemical that is emitted by non-living material and evokes a behavioral, or physiological, reaction that is adaptively favorable to a receiving organism, but detrimental to a hetero-specific organism that may be found in, or on, the nonliving material, *e.g.*, the odor of a host's food (oatmeal) that attracts an ichneumonid parasitoid to this food [coined by Nordlund and Lewis 1976, 216, from Greek *ἀ-pneum*, breathless or lifeless]

arrestant *n.* A chemical that causes organisms to aggregate in contact with it, the mechanism of aggregation being kinetic or having a kinetic component (Dethier et al. 1960 in Nordlund et al. 1981, 22).

Comment: An arrestant may slow the linear progression of organisms by reducing their actual speed of locomotion, or by increasing their turning rate (Dethier et al. 1960 in Nordlund et al. 1981, 22). Arrestants, attractants, deterrents, and stimulants might be nonsemiochemicals, or semiochemicals, depending on their origins.

attractant *n.* “A chemical that causes an organism to make oriented movements toward its source” (Dethier et al. 1960 in Nordlund et al. 1981, 22).

deterrent *n.* “A chemical that inhibits feeding, mating, or oviposition when in a place where an organism would, in its absence, feed, mate, or oviposit” (Dethier et al. 1960 in Nordlund et al. 1981, 22).

semiochemical, semiochemic *n.* A chemical that mediates interactions between (among) organisms [coined by Law and Regnier 1971, from Greek *semeion*, a mark or signal + chemical].

syn. chemosignal (Houck and Reagan 1990, 729)

Comment: A substance produced by a species can have different simultaneous functions; *e.g.*, a pine terpenoid can act as an allomone, kairomone, and synomone (Whitman 1988, 13).

► **allelochemic** *n.*

- 1. A chemical that mediates interspecific interactions and is significant to organisms of a species different from its source for reasons other than indicating food (Whittaker 1970a, b in Nordlund and Lewis 1976, 213).

2. A secondary substance produced by an organism that modifies the behavior, growth, or population dynamics of other species, often having an inhibitory or regulatory effect (Lincoln et al. 1985).
syn. allelochemical (Weldon 1985, pers. comm., suggests this word should not be used as a noun), xenomone (Chernin 1970 in Nordlund and Lewis 1976, 213)
cf. chemical-releasing stimulus: semiochemical: allelochemic: allomone substance [coined by Whittaker (1970a in Nordlund and Lewis 1976, 213)]
3. *adj.* Referring to the general phenomena of chemical interactions between and among species (Whittaker and Feeny 1971).

SOME ALLELOCHEMICS AND THEIR CHARACTERISTICS

	BENEFIT TO:		EXAMPLE OF ALLELOCHEMIC/ RECEIVER
	SENDER	RECEIVER	
allomone	yes	no	venom of a snake, person
antimone	no	no	chemicals of a pathogen, host
kairomone	no	yes	Western Honey Bee wax, Greater Wax Moth
synomone	yes	yes	floral scent, pollinator

allomone *n.* A chemical substance, produced, or acquired, by an emitter organism, that contacts a heterospecific receiver organism in nature and evokes the receiver's behavioral, or physiological, response that is adaptively favorable to the emitter but not the receiver; *e.g.*, chemicals used as repellents, plant defense chemicals used against herbivores and that reduce competition from other plants, and venoms used in defense (Brown 1968 in Nordlund and Lewis 1976, 214; Nordlund et al. 1981, 17).

syn. false pheromone (Immelmann and Beer 1989, 156); heterotelergone (Kirschenblatt 1958 in Maschwitz 1964, 268); pseudopheromone
cf. chemical-releasing stimulus: semiochemical: allelochemic: kairomone, -cide: siblicide

Comment: Whitman (1988) describes "chemiocryptic (= mimetic) allomone," "defense allomone," "herbivore-released allomone," "plant-derived allomone," "plant-manipulation allomone," "plant-produced allomone," "predator-defense allomone," "predator-released allomone," "prey-atraction allomone," "prey-disruption allomone," and "prey-subduction allomone." The rare parasitoid *Ichneumon eumerus* enters *Myrmica* ants nests, sprays an allomone (comprising several chemicals) that causes the ants to attack one another instead of the parasitoid, and parasitizes larvae of the lycaenid butterfly *Maculinea alcon* which live in ant nests (Thomas et al. 2002, 505).

[derived from alloiohormone (coined by Beth 1932 in Nordlund and Lewis 1976, 214)]

■ **allelopathic substance** *n.* A waste product, excretory product, or metabolite produced by

one organism that inhibits, or regulates, other organisms (Lincoln et al. 1985).

cf. chemical-releasing stimulus: semiochemical: allelochemic

■ **exocrine substance** *n.* An organism's externally secreted substance that excites, or inhibits, a biological system or process (Lincoln et al. 1985).

syn. ectocrine substance, environmental hormone

■ **propaganda substance** *n.* In slave-making ants: An odor deposited during a raid that disperses defenders which are the slave ants [coined by Regnier and Wilson 1971, 267].

cf. chemical-releasing substance: semiochemical: pheromone: propaganda pheromone, gland: Dufour's gland

antimone *n.* A chemical substance, produced or acquired by an emitter organism, that contacts a heterospecific receiver organism in nature and evokes the receiver's behavioral, or physiological, response that is maladaptive to both emitter and receiver; *e.g.*, a substance released by a pathogenic microorganism that can cause abnormal behavior, or premature death, of its host [coined by Whitman 1988, 13, 18].

false pheromone See chemical-releasing stimulus: semiochemical: allelochemic: allomone.

kairomone *n.* A chemical substance, produced, or acquired, by an emitter organism, that contacts a heterospecific receiver organism in nature and evokes the receiver's behavioral, or physiological response, that is adaptively favorable to the receiver, not the emitter (Brown et al. 1970 in Nordlund and Lewis 1976, 214; Nordlund et al. 1981, 18–19), *e.g.*, a host's odors that a parasite uses in host finding (Conte et al. 1989).

Comments: Some workers contend that "allomone" should be used in a broader sense and the term "kairomone" should be dropped, but Weldon (1980) defends its use. Kairomones include "oviposition stimulants," "phagostimulants," and "plant-produced attractants" of arthropods and "herbivore-released kairomones," and "predator-released kairomones" (Whitman 1988). Blum (1974 in Nordlund and Lewis 1976, 214) suggests that the so-called kairomones appear to be pheromones and allomones' that have "evolutionarily backfired" and thus "do not represent a class of chemical signals different from allomones and pheromones." Instead of "kairomone," Blum uses the term "kairomonal effect." Establishing whether a sender, or receiver, benefits from a kairomone is difficult and occasionally impossible.

[Greek *kairos*, opportunistic, coined by Brown et al. 1970 in Nordlund and Lewis 1976, 214].

■ **trail kairomone** *n.* A trail pheromone that is deposited by one species that is responded to by another species, *e.g.*, an ant trail odor used by inquiline cockroaches (Moser 1964).

pseudopheromone See chemical-releasing stimulus: semiochemical: allelochemic: allomone.

synomone *n.* A chemical substance produced, or acquired by, an emitter organism that contacts a heterospecific receiver organism in nature and evokes the receiver's behavioral, or physiological, response that is adaptively favorable to both emitter and receiver [coined by Nordlund and

Lewis 1976, 215; Nordlund et al. 1981, 20, from Greek *syn*, with jointly + *borman*, to excite or stimulate].

Comments: "Synomones" have been regarded as "allomones," as either "allomones" or "kairomones," or as "allomone-kairomones," e.g., the molting hormone (= ecdisone) of a wood-eating cockroach that induces the sexual cycle of some of its symbiotic protozoa or pheromones produced by two species of *Ips* beetles that also serve as substances that reduce competition between the two species (Brown et al. 1970 and Whittaker and Feeny 1971 in Nordlund and Lewis 1976, 215). Whitman (1988) describes many kinds of plant-produced synomones, including "extrafloral-nectar synomone," "floral-scent synomone," "food-body synomone," "guardian synomone," "herbivore-released synomone," "predator-released synomone," and "vegetative synomone."

► **pheromone** *n.*

1. "A substance secreted by an animal to the outside that causes a specific reaction" by one, or more, conspecifics (Nordlund and Lewis 1976, 213).
2. A substance, usually glandular, secreted by an organism outside its body that causes a specific reaction in a conspecific receiving organism that smells, or tastes, it (Wilson 1975, 414, 591).
3. A chemical used for communication among conspecific animals (Nordlund et al. 1981, 15).

syn. chemical releaser, ectohormone (Karlson and Butenandt 1959, 39); ectoincretion (Karlson and Butenandt 1959, 39); homotelergone (Kirschenblatt 1958 in Maschwitz 1964, 268); social hormone, sociohormone

cf. odor: colony odor; organ: Jacobson's organ

Comments: "Pheromone" has essentially replaced all of its synonyms. "Ectohormone" is a self contradictory term (Wilson 1965, 1064). A pheromone usually comprises more than one type of chemical substance (Nordlund et al. 1981, 15–16). The same pheromone may elicit different behavior in different contexts in the same species. A pheromone may be autostimulatory, that is directly affect the behavior of its producer (Bradshaw et al. 1986, 234). Some, of the many kinds of pheromones, are defined below. [Greek *phereum*, to carry, *borman*, to excite or stimulate, coined by Karlson and Butenandt 1959, 39; Karlson and Luscher 1959 in Nordlund and Lewis 1976, 213]

acrasin *n.* In slime molds: An aggregation pheromone which is cyclic AMP in *Dictyostelium discoideum* (Konijn et al. 1967 in Wilson 1975, 235, 391).

aggregation pheromone *n.* A pheromone that brings two, or more, members of a group together, e.g., for feeding in scolytid beetles (Pitman et al. 1968; Pitman and Vit 1968; Borden 1984, 123).

syn. attractant, population-aggregating pheromone

aggregation-attachment pheromone *n.* In a tick species: A male-produced pheromone that causes unfed adult ticks to aggregate and attach themselves to a particular Domestic Cow individual (Norval et al. 1989, 364).

alarm pheromone *n.* For example, in some ant, aphid, fish, termite, and wasp species and *Apis mellifera* (Western Honey Bees): A pheromone that induces a state of alertness, or alarm, due to

a common threat (Butler 1609; Frisch 1942; Buren 1958, 121; Moore, 1968, 33; Moser et al. 1968, 529; Crewe and Blum 1970, 141; Regnier and Wilson 1971; Wilson 1975, 578).

syn. alarm releaser (Wilson 1958 in Ghent and Gary 1962, 1), alarm substance, sting pheromone (Wilson 1971, 234); *Schreckstoff* (*sing.*, Frisch 1942); warning substance (Karlson and Butenandt 1959, 40)

cf. behavior: alarm behavior

Comments: The same substance can be an alarm pheromone as well as serve other functions, most alarm substances are not species specific, and many known and probable alarm substances have been chemically identified (Wilson 1971, Chapter 12). Some frog and snail species have chemical-alarm systems (Maschwitz 1964, 267).

androstenone *n.* In *Sus scrofa domestica* (Domestic Pigs): A presumed pheromone that induces lordosis in sows (Forsyth 1985, 30).

cf. chemical-releasing stimulus: semiochemical: pheromone: human-male pheromone

Comments: This compound is in hog saliva and given off by truffles. Androstenone is used in Boar Mate® (Forsyth 1985, 30).

antiaphrodisiac *n.*

1. For example, in a heliconiine-butterfly and sweat-bee species, and the beetle *Tenebrio molitor*. A pheromone that is produced by a male, placed on a conspecific female by him, counteracts an aphrodisiac, and, thus, tends to stop other males from mating with the female (Gilbert, 1976; Kukuk 1983).
2. A repellent pheromone that a male puts on his mate that decreases the chances that other males will try to mate with her (Thornhill and Alcock 1983, 336).

aphrodisiac *n.*

1. For example, in a sweat-bee species: A female pheromone that releases copulatory behavior (Barrows 1975b).
2. In a plethodontid-salamander species: A pheromone produced by a male and secreted during courtship that increases a female's receptivity (Houck and Reagan 1990, 729).

See aphrodisiac under the As.

syn. courtship pheromone (Houck and Reagan 1990, 729)

cf. chemical-releasing stimulus: semiochemical: pheromone: antiaphrodisiac

[Greek *apbrodisiakos*, *Aphrodítē*, goddess of love]

bombykol *n.* A sex attractant, *trans-10-cis-12-hexadecadienol*, produced by female *Bombyx mori* (Silk Moth).

caste pheromone *n.* In the termite *Kalotermes flavicollis*: One of several pheromones that control reproductive caste formation (Lüscher 1961 in Wilson 1965, 1067).

Comments: In *Kalotermes flavicollis*, a king and queen produce pheromones that inhibit the development of pseudergates into their own royal castes, a king produces a pheromone that stimulates female pseudergates to become reproductives, a king produces a pheromone by which other reproductive males recognize him, and a queen produces a pheromone by which other reproductive females recognize her (Lüscher 1961 in Wilson 1965, 1067).

copulin *n.* A possible pheromone comprising fatty acids in human vaginal secretions (Forsyth 1985, 30).

cf. odor: human-vaginal odor

death pheromone *n.* In some ant, bee, and wasp species: A pheromone that causes insects to drag their dead from their nests and abandon them (Matthews and Matthews 1978, 212).

syn. funeral pheromone

epideictic pheromone *n.*

1. A pheromone that indicates a receiver's population density and serves in its population-size regulation (Corbet 1971).

2. A pheromone that elicits organism dispersal from presently, or potentially, scarce, or over-crowded, resources; *e.g.*, food, space, and refugia, and thereby acts to partition intraspecific foraging activities (Prokopy 1980 in Nordlund 1981, 496).

false pheromone See chemical-releasing substance: semiochemical: allelochemic: allomone.

funeral pheromone See chemical-releasing substance: semiochemical: pheromone: death pheromone.

group pheromone See odor: clan-specific odor.

human-female "pheromone" *n.*

1. A possible pheromone produced by women that synchronizes their menstrual cycles (McClintock 1971).

Notes: Underarm secretions, from women in their early (= follicular) phase of their menstrual cycles can shorten the menstrual cycles of women exposed to the secretions (McClintock and Stern 1998 in Angier 1998, 12 March, A22). Such secretions, from women in their midcycles (= times of ovulation) can lengthen the menstrual cycles of exposed women. In theory, ancestral women might have benefitted from synchronized menstrual cycling, group mothering, and the ability to wet-nurse one another's offspring. Also competent ovulators might have helped their female kin to become more regular cyclers and ovulators by pheromonal communication.

2. A possible pheromone that is a "fishy" primary odor in menstrual blood and sweat and might serve as an indicator of estrus and menstruation (Hirth et al. 1986, 4).

cf. chemical-releasing stimulus: semiochemical: pheromone: human-female pheromone; odor: human vaginal odor

human-male "pheromone" *n.*

1. A possible pheromone, 5-alpha-androst-16-en-3-alpha-ol and 5-alpha-androst-16-en-3-one, in men's sweat (secreted by apocrine glands), smegma, and urine which may increase feelings of submissiveness, but not sexual feelings, of women in the middle of their menstrual cycles (Benton 1982 in Benton and Wastell 1986, 141).

2. A possible pheromone in men's pubic sweat and semen that may be an aphrodisiac, mating marker, response substance, and territorial marker (Hirth et al. 1986, 4).

cf. chemical-releasing substance: semiochemical: pheromone: androstenone

Comments: MHC genes, *q.v.*, code for individual odors of Humans (Claus Wedekind in Richardson 1996, 26 February). Women find the perspiration odors of individual men to vary from pleasant

through unpleasant, and they prefer the odors from men whose MHC genes are dissimilar to theirs. Pregnant women prefer the odors of relatives compared to nonrelatives. Humans who have MHC-dissimilar mates might have increased fertility, hardier offspring, and less risk of genetic disease. Androstadienone is a human-male steroid and estratetraene is a human-male steroid that subliminally alter mood (M. K. McClintock and S. Jacob in Holden 1999, 17 September, 1845). These steroids make women feel more happy and energized, and men, tired and less elated.

individual pheromone *n.* For example, in some ant and halictid-bee species and many mammal species: A pheromone that is unique to one individual of a group and that is used by other members of its group to recognize it as unique (Bowers and Alexander 1967; Müller-Schwarze 1974, 319; Halpin 1974 in Newman and Halpin 1988, 1779; Jessen and Maschiwitz 1985, 1987, etc. in Hölldobler and Wilson 1990, 277; Hefetz et al. 1986, 197).

Comment: "Individual odor," rather than "individual pheromone" is used when an investigator does not know if the odor meets the criteria of being a pheromone.

inhibitory pheromone *n.* In some species of insects and mammals: A pheromone that stops something, such as aggression, movement, or the production of reproductives within a colony (Wilson 1975, 413).

mating pheromone *n.*

1. For example, in many insect species: a pheromone that attracts members of the opposite sex prior to mating.

2. In *Saccharomyces cerevisiae* (Baker's Yeast): a pheromone that promotes mating by arresting growth which would stop Yeast cells from mating (Grishin et al. 1994, 1081; Telford et al. 1997, 228).

cf. chemical-releasing substance: semiochemical: pheromone: sex pheromone

matron *n.* In *Aedes* mosquitoes: A postulated pheromone secreted by a male's accessory glands that reduces female receptiveness to other males (Craig 1967 in Wilson 1975, 321).

cf. chemical-releasing substance: semiochemical: pheromone: antiaphrodisiac

plethodontid receptivity factor (PRF) *n.* A 22-kilodalton, cytokine protein from the submandibular (mental) gland of male *Plethodon jordani* (salamander), that increases female receptivity during courtship (Rollmann et al. 1999, 1907).

primer pheromone *n.* A pheromone that physiologically alters an animal's endocrine and reproductive system, reprogramming it for an altered response pattern (Matthews and Matthews 1978, 189), *e.g.*, a pheromone that causes desert locusts to mature more quickly (Richards and Mangoury 1968).

cf. chemical-releasing substance: semiochemical: pheromone: releaser pheromone

propaganda pheromone *n.* A pheromone that is part of the propaganda substance, *q.v.*, of some ant species that attracts slave-making ants to slave ants (Regnier and Wilson 1971, 267; Hölldobler and Wilson 1990, 394).

pseudopheromone See chemical-releasing substance: semiochemical: allelochemic: allomone.

queen pheromone *n.*

1. For example, in *Apis mellifera* and termites: A pheromone produced by a queen of a colony that mediates worker behavior (Morse 1963; Gary 1974).

syn. queen substance

2. For example, in *Apis mellifera*: A pheromone produced by a queen that attracts males (Morse et al. 1962).

syn. queen-mating attractant, queen substance

3. In *Apis mellifera*: A pheromone produced by a queen that prevents the development of other queens in her colony (Heymer 1977, 129).

syn. royal substance

recognition pheromone, discriminator *n.* A pheromone (genetically determined chemical cue) that enables an animal to classify conspecifics as kin or nonkin (Wilson 1987, 10).

recruitment pheromone *n.* In some ant species: A pheromone that elicits tandem running in a recipient (Heymer 1977, 145).

releaser pheromone *n.* A pheromone that stimulates an immediate behavioral response mediated wholly by an animal's nervous system (Matthews and Matthews 1987, 189).

cf. chemical-releasing stimulus: semiochemical: pheromone: primer pheromone

reproductive pheromone *n.* In many animal species: A pheromone that can alter a receiver's reproductive behavior or physiology (Houck and Reagan 1990, 729).

sex pheromone *n.* In many kinds of organisms including some alga, ciliate, fungus, mammal, nematode, and snake species; many insect species; and *Streptococcus faecalis*: A pheromone used in communication between members of the opposite sex in a mating context (Barnes 1974, 221; Dunny et al. 1978 and Ensign 1978, etc., in Clewell 1985, 13; Harborne 1982, 182-192; Mason et al. 1989).

cf. chemical-releasing substance: semiochemical: pheromone: mating pheromone

Comments: Some species, e.g., *Drosophila melanogaster*, have both male and female sex pheromones (Scott et al. 1988, 1164). Sex pheromones include sex attractants and aphrodisiacs produced by either sex and "antiaphrodisiacs" and "incitins" (Wilson 1975, 235; Immelmann and Beer 1989, 266).

sodefri *n.* In *Cynops pyrrhogaster* (Red-bellied Newt): A sex attractant released by a male from his cloacal gland (Kikuyama et al. 1995 in Sawyer, 1995, May).

Comment: This is the first pheromone identified from an amphibian (Wabnitz et al. 1999, 444).

[Japanese *sodefuri*, soliciting (Sawyer 1995, May)]

splendiferin *n.* In *Litoria splendida* (Magnificent Tree Frog): A male sex pheromone (Wabnitz et al. 1999, 444).

Comments: This is the first sex pheromone reported in an anuran (Wabnitz et al. 1999, 444). This chemical comprises 24 amino-acid residues, is water borne, and produced by males' parotoid and rostral glands.

[coined by Wabnitz et al. 1999, 444]

superpheromone *n.* A pheromone that is strong and long lasting, e.g., alarm pheromones in slave-making ants [coined by Regnier and Wilson 1971, 269].

surface pheromone *n.* A pheromone whose active space is restricted so close to the body of

a sending organism that direct contact, or something approaching it, must be made with the sender's body in order for the receiver to perceive the pheromone, e.g., colony odors of many species of social insects (Wilson 1975, 596).

territory pheromone *n.* For example, in some ant species: A pheromone that an individual deposits on, or around, her nest; is colony, or species, specific; and aids in excluding alien colonies (Nordlund and Lewis 1976, 213, Hölldobler and Wilson 1990, 644).

syn. territorial-demarcation substance (Karlson and Butenandt 1959, 40)

trail pheromone *n.* For example, in many ant and termite species: A pheromone deposited by an individual that is followed by and oriented to by others, (Wilson 1959; Moser and Blum 1963, 1228; and Bossert and Wilson 1963 in Farkas and Shorey 1974, 82).

syn. footprint pheromone, trail odor, trail-following pheromone (Nordlund and Lewis 1976, 212), trail-marking pheromone or substance, trail substance (Hölldobler and Wilson 1990, 644)

cf. odor trail, ²recruitment

Comment: Trail pheromones are deposited on substrates or in the air.

stimulant *n.* A chemical that increases the probability that an organism will show a particular behavior (Dethier et al. 1960 in Nordlund et al. 1981, 22).

► **feeding stimulant** *n.* A chemical that elicits an organism's feeding (Dethier et al. 1960 in Nordlund et al. 1981, 22).

syn. phagostimulant

[coined by Thorsteinson 1953, 1955 in Nordlund et al. 1981].

► **locomotory stimulant** *n.* A chemical that elicits locomotion in an organism (Dethier et al. 1960 in Nordlund et al. 1981, 22).

► **mating stimulant** *n.* A chemical that elicits mating in an organism (Dethier et al. 1960 in Nordlund et al. 1981, 22).

► **ovipositional stimulant** *n.* A chemical that elicits egg laying in an arthropod (Dethier et al. 1960 in Nordlund et al. 1981, 22).

► **phagostimulant** See chemical-releasing stimulus: stimulant: feeding stimulant.

♦ **chemical self-marking** See behavior: marking behavior: automarking.

♦ **chemical signaling** See signaling: cell signaling.

♦ **chemical temperature regulation** See temperature regulation: chemical temperature regulation.

♦ **chemiotaxis** See taxis: chemotaxis.

♦ **chemistry** See study of: chemistry.

♦ **chemoautotroph** See -troph-: autotroph: chemoautotroph.

♦ **chemoheterotroph, chemoheterotrophic** See -troph-: heterotroph, chemoheterotroph.

♦ **chemokinesis** See kinesis: chemokinesis.

♦ **chemolithotroph** See -troph-: chemolithotroph.

♦ **chemoorganotroph** See -troph-: chemoorganotroph.

♦ **chemoreception** See modality: chemoreception.

♦ **chemoreceptor** See receptor: chemoreceptor.

♦ **chemosignal** See chemical-releasing stimulus: semiochemical.

♦ **chemotaxis** See taxis: chemotaxis.

♦ **chemotaxonomy** See study of: taxonomy: chemo-taxonomy.

- ◆ **chemotroph** See -troph-: chemoautotroph.
- ◆ **cheradium** See ²community: cheradium.
- ◆ **cheradophile** See ¹-phile: cheradophile.
- ◆ **chersium** See ²community: chersium.
- ◆ **chersophile** See ¹-phile: chersophile.
- ◆ **chianophile** See ¹-phile: chianophile.
- ◆ **chianophobe** See -phobe: chianophobe.
- ◆ **chiasma** *n., pl. chiasmata* The place where, during the later stages of prophase-1 of meiosis, two homologous chromosomes establish close contact usually where an exchange of homologous parts between non-sister chromatids (crossing over) takes place (Mayr 1982, 766, 957).
cf. Janssens correctly postulated crossing over at chiasmata in 1901 (Mayr 1982, 766)
- ◆ **chico** See gene: *chico*.
- ◆ **Chicxulub Crater** See place: Chicxulub Crater.
- ◆ **child companion** See companion: child companion.
- ◆ **child labor** *n.* In Kalotermitid and Rhinotermitid Termites: Immature stages' performing a substantial amount of work in their nest (Wilson 1975, 345, 413).
- ◆ **child schema** *n.* An animal's combination of bodily and facial features that arouses a person's sentiments that he typically experiences toward young children; this schema includes large roundish eyes, a proportionately large head, small nose and chin, and rounded, chubby cheeks (Immelman and Beer 1989, 44).
Comment: Some animals, e.g., Pekinese Dogs, elicit child-schema sentiments from persons.
- ◆ **chimera, Brit. chimaera** (*keye-MERE-ah, Kih-MERE-ah*) *n.*
 1. A novel, or unusual, organism that has tissue characteristic of two, or more types; especially, a hybrid of mixed characteristics produced by grafting (Michaelis 1963).
 2. A DNA molecule that is formed from DNA fragments from different sources that are spliced together (Curtis 1983, 321).
 3. An organism that comprises tissues of two, or more, genetic types (Lincoln et al. 1985).

Comments: Artificial and natural chimeric animals include *Bos primigenius* (Domestic Cattle), *Callithrix kublii* (Wied's Black Tufted-ear Marmosets), *Felis catus* (Domestic Cats), *Gallus gallus* (Domestic Chickens), Humans, *Mus musculus* (House Mice), and *Sus scrofa domestica* (Domestic Pigs). Researchers made chimeras in the laboratory including *G. gallus* with quail brain cells in their brains, *S. s. domestica* with both individual human and pig blood cells and merged human-pig blood cells, an *M. musculus* with an almost complete human immune system, and *M. musculus* whose brains contain about 1% human brain cells. The chicken-quail chimeras showed head bobs and produced vocal trills characteristic of quail. Most human mothers carry cells from each of their children in their blood (Weiss 2004, A2, A8). Most human twins carry a few cells of their siblings. An individual *C. kublii* can be chimeric for many somatic tissue types and its germ line. For example, a mother *C. kublii* can give birth to nephews and nieces because her sire fertilized her with chimeric sperm that originated from a cell of her sire's fraternal twin (Ross et al. 2007, 6278; Zimmer 2007, D4).
- 4. A plant that comprises two, or more, genotypes, in cell layers that make up its shoot apex (Geneve 1991, 33).
syn. mosaic (Lincoln et al. 1985)

- cf.* -morph: gynandromorph
n. chimerism
adj. chimeric
- Comments:* According to Geneve (1991), Winkler selected "chimera" in 1907 as a name for a "plant mosaic." He dropped the "a" from "chimaera" to reduce the confusion of a mosaic with the fish genus *Chimaera*.
[Latin *chimaera* < Greek *chimaira*, she-goat; a mythological fire-breathing monster with a Lion's head, goat's body, and dragon's tail]
- ◆ **genetic mosaic** *n.* A fusion of more than one conspecific individual that results in a new "individual" with parts that are genetically different, e.g., probably certain species of strangler-fig trees found to be composed of multiple genotypes (Thomson et al. 1991, 1214).
syn. allofusion (Putz and Holbrook 1986 in Thomson et al. 1991, 1215)
- ◆ **graft chimera, graft hybrid** *n.* A mosaic plant composed of cells from two species and that results from artificial grafting (Geneve 1991, 33–34).
Comments: +*Laburnocytisus adamii* is a graft chimera of *Cytisus purpureus* and *Laburnum anagyroides*. The plus sign and combining the two parent-plant genus names is the designation for a graft chimera outlined by the International Code of Botanical Nomenclature (Geneve 1991, 34).
[coined by Winkler (1907 in Geneve 1991, 34)]
- ◆ **periclinal chimera** *n.* A plant with a thin outer layer of cells that differ genetically from its inner cells, e.g., +*Laburnocytisus adamii*
[coined by Bauer 1909 in Geneve 1991, 34].
cf. chimera: variegated-leaf chimera
Comment: Periclinal chimeras include those with variegated leaves and flower petals, changed fruit-skin color and fuzziness, and loss of stem thorniness (Geneve 1991).
- ◆ **sectorial chimera** *n.* A plant chimera with one-third through one-half of all three layers of its entire shoot apex comprising only mutant cells, resulting in a stem that is part white, or yellow, and part green, e.g., in *Kerria japonica* 'Kin Kan' (Bauer 1909 in Geneve 1991, 35).
- ◆ **variegated-leaf chimera** *n.* A plant that is a periclinal chimera and has white, yellow, or other color, markings on its green leaves, or entire leaf-color change, due to different leaf-cell layers' being white or green (Geneve 1991, 35–36).
Comment: For example, a variegated *Hosta* has light leaf areas due to an outer layer of white cells and an inner layer of green cells (Geneve 1991, 35). Bracts of pink *Poinsettias* have inner and middle red cells and outer white cells, compared to red *Poinsettias* that are not chimeras and have all three layers comprising red cells.
- ◆ **chimonophile** See ¹-phile: chimonophile.
 - ◆ **chin raising** See behavior: chin raising.
 - ◆ **chinning** See behavior: chinning.
 - ◆ **chinophobia** See -phobia: chinophobia.
 - ◆ **chionium** See ²community: chionium.
 - ◆ **chionophile** See ¹-phile: chionophile.
 - ◆ **chionophobe** See -phobe: chionophobe.
 - ◆ **chirm** See ²group: chirm.
 - ◆ **chiropterophile** See ²-phile: chiropterophile.
 - ◆ **chitin** See molecule: chitin.
 - ◆ **Chitty hypothesis** See hypothesis: population-limiting hypotheses: Chitty hypothesis.

- ♦ **chledium** See ²community: chledium.
- ♦ **chledophile** See ¹-phile: chledophile.
- ♦ **chlorofluorocarbon** See molecule: chlorofluorocarbon.
- ♦ **chlorophyll** See molecule: accessory pigment: chlorophyll.
- ♦ **chlorophyll a** See molecule: accessory pigment: chlorophyll *a*.
- ♦ **chlorophyll b** See molecule: accessory pigment: chlorophyll *b*.
- ♦ **chloroplast** See organelle: chloroplast.
- ♦ **chloroplast DNA** See nucleic acid: deoxyribonucleic acid: chloroplast DNA.
- ♦ **choice point** *n.* The position in a T-, or other kind of, maze, or on a discrimination apparatus, from which it is possible for an animal to give only one of two, or more, alternative responses, *e.g.*, move down only one of two, or more, runways, or jump to one of two, or more, doors.
Comment: In a T-maze, a choice point is the place at which the base of the T touches its cross-arm (Verplanck 1957).
- ♦ **choice test** See test: choice test.
- ♦ **choking** *n.* For example, in *Larus argentatus* (Herring Gulls): A disturbed bird's emitting a deep *huob-huob-huob-huob* sound while moving its breast in a conspicuous manner (Heymer 1977, 115).
syn. threat choking (Tinbergen 1958 in Heymer 1977, 115)
- ♦ **cholinergic synapse** See synapse: cholinergic synapse.
- ♦ **-chore** *neutral suffix* Spread, used to mean region or agent of dispersal (Lincoln et al. 1985).
adj. -chorous, -choric
n. -chory. The act of being spread by a particular region or agent.
- aerochore, anemochore, aerophile** *n.* An organism that is disseminated by wind (Lincoln et al. 1985).
adj. aerochorous, anemochorous, aerophilous
cf. ¹-phile: anemophile
- androchore** *n.* An organism that is dispersed by Humans (Lincoln et al. 1985).
- anemochore** See -chore: aerochore.
- anthropochore** *n.* An organism whose propagules are dispersed by Humans (Lincoln et al. 1985).
- ♦ **autochore**
n. A plant that disperses its own propagules (Lincoln et al. 1985).
- barachore** *n.* An organism that has propagules dispersed by their own weight (Lincoln et al. 1985).
- blastochore** *n.* A plant that is dispersed by off-shoots (Lincoln et al. 1985).
- bolochore** *n.* An organism whose propagules are dispersed by propulsive mechanisms (Lincoln et al. 1985).
- brotichore** *n.* An organism that lives in close proximity to Humans, *e.g.*, in houses or other buildings (Lincoln et al. 1985).
- clitochore** *n.* An organism that is dispersed by gravity (Lincoln et al. 1985).
- crystallochore** *n.* An organism that is dispersed by glaciers (Lincoln et al. 1985).
- endozoochore** *n.* An organism that is dispersed by animals after passing through their guts (Lincoln et al. 1985).
cf. -chore: epizoochore

- ♦ **entomochore** *n.* An organism that is dispersed by insects (Lincoln et al. 1985).
- ♦ **epizoochore** *n.* An organism that is dispersed by attaching to the surfaces of animals (Lincoln et al. 1985).
cf. -chore: endozoochore
- eurychore** *n.* A widely dispersed species (Lincoln et al. 1985).
adj. eurychoric, eurychorous
- gynochore** *n.* An organism that is dispersed by motile females (Lincoln et al. 1985).
- hydrochore** *n.* An organism that is dispersed by water (Lincoln et al. 1985).
- ♦ **myrmecochore** *n.* An organism that is dispersed by ants (Lincoln et al. 1985).
- saurochore, saurophile** *n.* An organism that is dispersed by lizards or snakes (Lincoln et al. 1985).
- stenochore** *n.* An organism that has a narrow range of distribution (Lincoln et al. 1985).
adj. stenochoric, stenochorous
- synzoochore, zoochore** *n.* An organism that is dispersed by animals (Lincoln et al. 1985).
adj. synzoochorous, zoochoric, zoochorous
- zoochore** See -chore: synzoochore.
- ♦ **-choric** See -chore.
- ♦ **C horizon** See soil horizon: C horizon.
- ♦ **chorology** See study of: geography.
- ♦ **chorotobiont** See -cole: graminicole.
- ♦ **-chorous** *comb. f.* Dispersed by the agency of. See -chore.
- ♦ **chortle** See animal sounds: grunt: baby-grunt.
- ♦ **chorus** See animal sounds: song: chorus; group: chorus.
- ♦ **-chory** See -chore.
- ♦ **chrom-** See chromo-.
- ♦ **chromatid** *n.* One of two longitudinal units of a chromosome resulting from a split in early prophase, becoming a daughter chromosome later in mitosis (Mayr 1982, 957).
- ♦ **chromatin** *n.*
 1. Threadlike parts of a cell nucleus, at a particular stage in the cell's mitosis, that stain heavily and are now known to be genetic material (Mayr 1982, 674).
 2. A DNA-protein complex found in both eukaryotic and prokaryotic cells (Campbell et al. 1999, 344).
cf. nucleosome
Comment: Histones are the proteins that bind with DNA (Campbell et al. 1999, 346). [Flemming (1879) first called the threadlike parts chromatin" (Mayr 1982, 674)]
- ♦ **chromesthesia** See -thesia: chromesthesia.
- ♦ **chromo-, chrom-** *comb. f.* Color; in, or with, color (Michaelis 1963).
[Greek *chrōma*, color]
- ♦ **chromoplast** See organelle: chromoplast.
- ♦ **chromosomal dimorphism** See -morphism: dimorphism: chromosomal dimorphism.
- ♦ **chromosomal inversion** *n.* The 180° rotation of a middle piece of a chromosome that occurs during chiasmata formation (Mayr 1982, 769).
syn. chromosome inversion (Mayr 1982, 769)
- ♦ **chromosomal mutation** See ⁴mutation: chromosomal mutation.
- ♦ **chromosomal polymorphism** See -morphism: polymorphism: chromosomal polymorphism.
- ♦ **chromosome** *n.*

1. One of an eukaryote cell's complex, often rodlike structures in its nucleus, that consists of chromatin and carries genetic information (genes) arranged in linear sequences (King and Stansfield 1985).
2. A prokaryote cell's circular DNA molecule that contains all genetic instructions essential for the cell's life (King and Stansfield 1985).

syn. karyomite (King and Stansfield 1985)

Comments: In general within a species, individuals all have the same chromosome number. An exception is the Raccoon Dog, whose individuals have from 38 through 56 chromosomes, with the number even varying among cells of the same individual (Doris Wurster-Hill in Anonymous, 1986, A12). Different numbers of B chromosomes account for this phenomenon.

[Waldeyer proposed this term in 1888 (Mayr 1982, 674).]

A-chromosome *n.* A normal chromosome of a eukaryotic organism; contrasts with allosome (Lincoln et al. 1985).

cf. chromosome: supernumerary chromosome

accessory chromosome *n.* In *Pyrrhocoris* (Hemiptera): The 12th chromosome, in the set of 12 chromosomes, which is a sex chromosome determining a bug's sex (Stevens 1905; Wilson 1905 in Mayr 1982, 751).

cf. chromosome: B chromosome, sex chromosome

acrocentric chromosome *n.* A chromosome, or chromosome fragment, with a nearly terminal centromere (Mayr 1982, 769; King and Stansfield 1985).

cf. chromosome: metacentric chromosome, telocentric chromosome

allosome, heterochromosome *n.* A chromosome, or chromosome fragment, that is not an A chromosome, *q.v.* (Lincoln et al. 1985).

artificial chromosome See vector: artificial chromosome.

♦ **autosome**

n. A chromosome other than a sex chromosome (Dawkins 1982, 284; Mayr 1982, 751).

B-chromosome See chromosome: supernumerary chromosome.

Barr body *n.* An inactive X chromosome that is condensed into a compact object which lies along the inside of a nuclear envelope (Campbell et al. 1999, 270).

Comments: A few of the genes in a Barr body remain active (Campbell et al. 1999, 270). A Barr body reactivates in an ovary cell that gives rise to an ovum. Which X-chromosome of a pair of X-chromosomes that becomes a Barr body is a random event, and as a consequence, a female is a mosaic of two cell types. Cells with active X-chromosomes from her father, and those from her mother. Examples of this mosaicism are calico Domestic Cats with patches of black and patches of orange fur and human females with patches of normal skin and patches of skin without sweat glands.

driving-X-chromosome *n.* An X chromosome, that when present in a male, increases the number of X-bearing sperm that he produces and thus increases his number of potential daughters and reduces his number of potential sons (Wilkinson et al. 1998, 278). *cf.* allele: meiotic-drive locus, segregation-distorter allele, t allele; ²drive: meiotic drive

Comments: A driving-X-chromosome occurs in the stalk-eyed fly *Cyrtodiopsis dalmanni* (Wilkinson et al. 1998, 278).

driving-Y-chromosome *n.* In some *Drosophila* species: A mutant Y-chromosome that causes males to make only Y-bearing sperm (Hamilton 1967 in Thornhill and Alcock 1983, 7).

heterochromosome See chromosome: allosome.

homeologous chromosome *n.* A chromosome that is only partially homologous to another one, with which it exhibits reduced synaptic attraction and which is apparently derived from the same ancestral chromosome (Lincoln et al. 1985).

homologous chromosome, homologue, homolog *n.* A chromosome that is structurally similar (has identical genetic loci in the same sequence) to another chromosome with which it pairs during nuclear division within a cell (Lincoln et al. 1985).

idiochromosome See chromosome: sex chromosome.

metacentric chromosome *n.* A chromosome with its centromere at its center (King and Stansfield 1985).

cf. chromosome: acrocentric chromosome, telocentric chromosome

parasitic chromosome *n.* A chromosome that does not confer a selective advantage to its bearer (Ostergren 1945 in Nur et al. 1988) (*e.g.*, the psr chromosome) (Nur et al. 1988).

polytene chromosome *n.* In some angiosperm, ciliate, and dipteran species: A giant cable-like chromosome that consists of many identical chromatids lying in parallel and in register (King and Stansfield 1985; Jasny 1991).

Comment: Because the chromatids are in register, there is a pattern of bands oriented perpendicularly to the long axis of a chromosome.

sex chromosome, idiochromosome *n.* In eukaryotic organisms: A chromosome, or group of chromosomes, represented differently in the sexes, responsible for the genetic determination of sex (Lincoln et al. 1985).

supernumerary chromosome *n.* In some animal and plant species: A chromosome, or chromosome fragment, that is devoid of structural genes and differs from normal A-chromosomes in structure, genetic effectiveness, and pairing behavior, and never pairs with an A chromosome (Lincoln et al. 1985; King and Stansfield 1985).

syn. accessory chromosome (King and Stansfield 1985), B-chromosome (Lincoln et al. 1985)

cf. nucleic acid: deoxyribonucleic acid: selfish DNA

Comment: A supernumerary chromosome may be a parasitic chromosome (Nur et al. 1988).

synthetic lethal *n.* A lethal chromosome formed as a result of crossing over between normally viable chromosomes (King and Stansfield 1985).

See gene: synthetic lethal.

Comment: A synthetic lethal can convey superior fitness in some combinations but is lethal in combination with other combinations of chromosomes (Mayr 1982, 580).

telocentric chromosome *n.* A chromosome with its centromere at one end (King and Stansfield 1985).

cf. chromosome: acrocentric chromosome, metacentric chromosome

W-chromosome *n.* In species with female heterogamety, *e.g.*, Lepidoptera: The sex chromosome that is present in females only (*i.e.*, females are WZ) (King and Stansfield 1985).

- X-chromosome** *n.* In species with male heterogamety (e.g., *Drosophila*, mammals): The sex chromosome that is present in both sexes (*i.e.*, females are XX, and males are XY) (King and Stansfield 1985).
- Y-chromosome** *n.* In species with male heterogamety (e.g., *Drosophila*, mammals): The sex chromosome that is present in males only (*i.e.*, males are XY) (King and Stansfield 1985).
- yeast-artificial chromosome (YAC)** See vector: yeast-artificial chromosome.
- Z-chromosome** *n.* In species with female heterogamety (e.g., Lepidoptera): The sex chromosome that is present in both sexes (*i.e.*, males are ZZ and females are WZ) (Lincoln et al. 1985).
- ◆ **chromosome band** *n.* Alternating light, or dark, staining sections along a chromosome that are visible by light microscopy after staining (Jasny 1991).
- ◆ **chromosome map** See map: genetic map.
- ◆ **chromosome ring** *n.* In a species of *Oenothera* (evening primrose): A group of fused chromosomes (Mayr 1982, 731).
- ◆ **chromosome set** *n.* The number of chromosomes characteristic of a somatic cell of a diploid species (King and Stansfield 1985); *e.g.*, 4 in *Drosophila*, 23 in *Homo sapiens sapiens*.
syn. basic number, chromosome number (Lincoln et al. 1985)
- ◆ **chromosome theory** See ³theory: Sutton-Boveri chromosome theory.
- ◆ **chromosome walking** See method: chromosome walking.
- ◆ **-chronic** *comb. f.* Referring to time (Michaelis 1963).
- allochronic** *adj.* Referring to populations, or species, that live, grow, or reproduce during different seasons (Lincoln et al. 1985).
- monochronic** *adj.* Referring to a phenomenon that happens only once (Lincoln et al. 1985).
- synchronous, contemporaneous, synchronous** *adj.* Referring to a phenomenon that occurs, or exists, at the same time as another one, or ones (Lincoln et al. 1985).
- ◆ **chronic-fatigue syndrome** See syndrome: chronic-fatigue syndrome.
- ◆ **chronistics** See study of: chronistics.
- ◆ **chronocline** See cline: chronocline.
- ◆ **chronological prediction** See prediction: temporal prediction.
- ◆ **chronometry** See -metry: chronometry.
- ◆ **chronospecies** See ²species: chronospecies.
- ◆ **chronostratigraphy** See study of: chronostratigraphy.
- ◆ **chrymosyophile** See ¹-phile: chrymosyophile.
- ◆ **CHS** See enzyme: chalcone synthase.
- ◆ **-cial** *comb. form*
- altricial** *adj.*
1. In some animals: Referring to a young that is born in a very underdeveloped state and requires significant parental care for a substantial period following its birth (Reingold 1963, 123; Wilson 1975, 578; Eisenberg 1981, 505); often used especially for birds, sometimes Humans.
 2. In many kinds of birds, including Passerines: Referring to young that hatch with closed eyes and usually no feathers, and cannot walk and find their own food (Immelman and Beer 1989, 12).
 3. In mammals including Cats, Dogs, *Mesocricetus auratus* (Golden Hamster), Mice, Rabbits, and Rats: Referring to young that are born with closed eyes

and ears, inability to walk, maintain their body temperatures, and eliminate wastes by themselves (McFarland 1987, 363).

cf. -cial: precocial; neoteny; nestling: nidicolous nestling, nidifugous nestling

[New Latin *altricialis* < Latin *altrix*, -*icis*, a nurse]

precocial, Brit. praecocial *adj.*

1. In some bird, fish, and mammal species: Referring to young that are able to engage in a wide range of behavior patterns, including locomotion, soon after hatching or birth (Dewsbury 1978, 135).
2. In mammals including *Cavia porcellus* (Guinea-pigs), *Lepus europaeus* (European Hares), and all herd ungulates (e.g., Deer, Domestic Cattle, Goats, Horses, and Sheep): Referring to young that are born with open eyes and ears and ability to walk, maintain their body temperatures, and eliminate wastes by themselves (McFarland 1987).
3. For example, in many anseriform- and galliform-bird species: Referring to young that hatch with open eyes, and ability to walk, swim, or both, and ability or inability to find their own food in foraging areas (Immelman & Beer 1989, 230).
4. For example, in Army Ants: Referring to a species whose workers participate in colony treks and raids very soon after become adults (Immelman & Beer 1989, 230).

n. *praecoces*

cf. -cial: altricial; nestling: nidicolous nestling, nidifugous; precocious

► **semiprecocial** *adj.* In some bird species, including gulls: Referring to a young bird that hatches with open eyes, down feathering, and enough motor control to stand and walk, but depends on its parent(s) for food and warmth (Immelman and Beer 1989, 203, 230).

◆ **cicada principle** See principle: cicada principle.

◆ **-cide** *comb. f.*

1. Killer or destroyer of (Michaelis 1963).

2. Murder, or killing, of (Michaelis 1963).

cf. behavior: killing behavior; pesticide

[Latin *-cida*, killer < *caedere*, to kill]

filial oicide See cannibalism.

fratricide See -cide: siblicide.

infanticide *n.*

1. In over 1300 animal species, including some lizard, falconiform-bird, and social-insect species; many rodent species; the Hanuman Langur, House Sparrow, Human, Lion, Long-billed Marsh Wren, and White Stork: An individual's killing conspecific young which may, or may not, be its own (Wilson 1975, 84; Fox 1975 and other reviews in Jenssen et al. 1989, 1054; Veiga 1990, 496).

Note: Some bumble-bee species practice infanticide by oophagy and ejection of living larvae from their brood combs (Free et al. 1969 and Pomeroy 1979 in Fisher and Pomeroy 1990, 801).

2. An animal's behavior that makes a direct and significant contribution to the immediate death of an embryo, or newly hatched, or born, conspecific individual (Hausfater and Hrdy 1984 in Wasser 1986, 624; Mock 1984 in Immelman and Beer 1989, 145).

syn. infant killing

cf. cannibalism: cronism; effect: Bruce effect

Comments: Infanticide has been considered pathological, but in the last decade, biologists have found it to be adaptive in many animal species (Jenssen et al.

1989, 1054). Infanticide may also include any deaths resulting from fetal resorption and abortion as well as from nutritional neglect, desertion, or abuse of immature offspring that may be already weaned. The latter end of this continuum is “deferred infanticide” and is especially prevalent in *Homo sapiens*. Some authors refer to young-killing without their consumption as “infanticide” as distinguished from “cannibalism,” (*q.v.*) (Immelmann and Beer 1989, 65). Infanticide by males is known only in a few bird, several mammal, and one spider species (Schneider and Lubin 1997, 305–306).

ovicide *n.* For example., in *Corcorax melanorhamphos* (White-winged Choughs): A bird's tossing an egg from the nest of another bird (Heinsohn 1991, 1097).

pesticide *n.* A chemical or other substance that a person uses to kill an unwanted organism, *e.g.*, *Alliaria petiolata* (Garlic-mustard) a major alien, invasive plant in the U.S. (after Michaelis 1963).

cf. Acaracides are mite and tick pesticides; algacides, algal pesticides; fungicides, fungal pesticides; herbicides, plant pesticides; insecticides, insect pesticides; molluscicides, mollusc (slug and snail) pesticides; and rodenticides, rodent pesticides.

Comments: Many conservation and other groups urge that people use alternatives to pesticides for pest control, and that if people do use pesticides that they use them as carefully as possible because of their possible and actual damage to environments and the health of Humans and other organisms (Sierra Club of Canada 1998). Researchers have found many links of pesticides to human diseases including brain cancer and leukemia in children (home and garden pesticides), breast cancer (DDT), and non-Hodgkins lymphomas and soft-tissue sarcomas (phenoxy herbicides). I define a few of the hundreds of kinds of pesticides below.

► **cypermethrin** *n.* A pyrethroid pesticide used against termites and other arthropods (Kim 2000, A-34).

syn. 3-(2,2-Dichloroethenyl)-2,2-dimethyl-cyclopropanecarboxylic acid, cyano(3-phenoxyphenyl) methyl ester, Prevail, and many other synonyms (Environmental Protection Agency 2001).

cf. Cypermethrin is highly toxic to fish and other aquatic organisms, and may have deleterious effects on Beagle Dogs and other mammals (Environmental Protection Agency 2001).

► **fungicide** *n.* A substance that kills a fungus (Michaelis 1963).

cf. Fungus-growing ants (Attini) secrete fungicides that control weed molds in their fungus cultures (Mueller et al. 1998, 2034).

► **Imidacloprid** *n.* A widely used, systemic neonicotinoid, neurotoxic pesticide that acts on the nicotinic acetylcholine receptors of earthworms, a few fish species, insects, and zooplankton (Extension Toxicology Network 2009, Kegley et al. 2009, Sierra Club Canada National Office 2009).

syn. N-[1-[(6-Chloro-3-pyridyl)methyl]-4,5-dihydro-imidazol-2-yl]nitramide (IUPAC name), 1-[(6-chloro-3-pyridinyl)methyl]-N-nitro-2-imidazolidinimine (C.A. name), and many trade names

Comments: People use Imidacloprid to kill many species of insect plant pests and fleas on Domestic Cats and Dogs. Imidacloprid causes paralysis and death of susceptible organisms. This compound fits into receptors that normally receive acetylcholine, which carries nerve impulses from one nerve

cell to another, and blocks acetylcholine receptors and causes an excess accumulation of acetylcholine which in turn causes paralysis and eventual death. Imidacloprid might have deleterious effects on Western Honey Bees (*Apis mellifera*) managed by beekeepers.

siblicide, sibicide *n.* In many animal species and probably many plant species: A developmentally immature individual's killing its sibling (Bragg 1954 and Hamilton 1979 in Mock et al. 1990, 438), Immelmann and Beer 1989, 113).

syn. Cainism [after the Biblical Cain who slew his brother Abel], fratricide (Immelmann and Beer 1989, 113)

Comments: Siblicide is found in some ant, fish, lacewing, and praying-mantid species; the Black Eagle, Blue-footed Boobie, Cattle Egret, *Dalbergia* sp. (tree) Domestic Pig, Great Egret, Human, Kittiwake (bird), Pronghorn Antelope, and Spadefoot Toad (Bragg 1954 and Hamilton 1979 in Mock et al. 1990, 438; Immelmann and Beer 1989, 113; Yoon 1996, 6 August, C4). In some species, siblicide may lead to cannibalism (Mock et al. 1990, 438). Siblicide is a form of sibling rivalry in many animals (Yoon 1996, 6 August, C1, C4). For example, in *Bubulcus ibis* (Cattle Egrets), a mother often lays three eggs and puts much more testosterone and other androgens into the first two eggs compared to the third one. After they hatch, their parents feed them preferentially compared to the young that hatches from the third egg. The two older young cow the youngest one which is a runt, that survives when food is plentiful. In Pronghorns, embryos literally grow through their siblings in the womb. In sharks, embryos swim about and devour others in utero. *Dalbergia* trees produce seeds in pods which settle to the ground. The seed in a pod that first sprouts makes an exocrine substance that annihilates other seeds (its siblings) in its pod. In Humans, many pregnancies that initiate with twin embryos end with only one baby, and siblings often fight after they are born.

► **facultative siblicide** *n.* For example, in some booby, eagle, and pelican species: Species-specific siblicide in which one chick usually kills another chick (Kepler 1969, etc. in Mock et al. 1990, 441).

► **obligate siblicide** *n.* For example, in some egret species, *Pandion haliaetus* (Osprey), *Sula nebouxii* (Blue-footed Boobies): Species-specific siblicide in which one chick often does not kill another chick although it fights with it (Mock 1985, etc. in Mock et al. 1990, 441).

suicide *n.*

1. A person's intentionally killing himself (Michaelis 1963).
2. In *Acyrthosiphon pisum* (Pea Aphids): An individual's displaying behavior that increases its chance of death (McAllister et al. 1990, 167).

♦ **cin4** See transposable element: cin4.

♦ **circadian mimicry** See mimicry: adjustable mimicry: circadian mimicry.

♦ **circadian rhythm** See rhythm: circadian rhythm.

♦ **circalunidian rhythm** See rhythm: circalunidian rhythm.

♦ **circamonthly rhythm** See rhythm: circamonthly rhythm.

♦ **circannual rhythm** See rhythm: circannual rhythm.

♦ **circasemiannual rhythm** See rhythm: circasemiannual rhythm.

- ♦ **circular-networks hypothesis** See hypothesis: hypotheses of species richness: circular-networks hypothesis.
- ♦ **circular statistics** See study of: statistics: circular statistics.
- ♦ **circumcision** *n.*
 1. A person's cutting off all, or part, of a prepuce either as a religious rite or as a prophylactic operation; the result of this procedure (Michaelis 1963).
 2. A person's cutting off a person's clitoris; the result of this procedure (Michaelis 1963).
 - syn.* female genital cutting (Dugger 1996, 1)
 3. spiritual purification (Michaelis 1963).

cf. infibulation

Comments: In parts of Africa, it is an ancient religious custom to circumcise a girl and stitch her genital lips together (= infibulation) to preserve her virginity (Dugger 1996, 28 December, 1, 9). This practice became a Federal crime in the U.S. in 1996. For Sierra Leoneans, genital cutting is part of an elaborate, highly secret initiation rite.

[from Old French *circonciser* < Latin *circumcisus*, past participle of *circumcidere*, *circum*, round + *caedere*, to cut]

- ♦ **circumneutrophile** See ¹-phile: circumneutrophile.
- ♦ **cis-9,10-octadecenoamide** See molecule: *cis*-9,10-octadecenoamide.
- ♦ **citric-acid cycle** See biochemical pathway: citric-acid cycle.
- ♦ **cistron** See gene.
- ♦ **citadel** See ²group: citadel.
- ♦ **CJD** See disease: Creutzfeldt-Jakob disease.
- ♦ **clade** *n.*
 1. A delimitable monophyletic unit [coined by Huxley 1957, 455].
 2. A separate evolving line of organisms (Wilson 1975, 26).
 3. A species, or species set, that represents a distinct branch in a phylogenetic tree, or cladogram (Wilson 1975, 580).
 4. A monophyletic group of taxa that share a closer common ancestry with one another than with members of any other clade (Lincoln et al. 1985).

cf. grade (evolutionary); -gram: cladogram

- ♦ **crown group** *n.* An derived clade, with relatively derived characters, which evolved from a stem group, *q.v.* (Futuyma 1998, 95).

Comment: Researchers use "crown group" and "stem group" especially in discussing taxa with a fossil record (Futuyma 1998, 95).

- ♦ **stem group** *n.* An ancestral clade, with relatively ancestral characters, from which a crown group with relatively derived characters has evolved (Futuyma 1998, 95).
- ♦ **cladism** See study of: systematics: cladistic systematics.
- ♦ **cladist** *n.* A follower of the Hennigian tradition of cladistic systematics (Futuyma 1998, 95).
- ♦ **cladistic** *adj.* Referring to a clade or holophyletic group (Lincoln et al. 1985).
- ♦ **stratocladistic** *adj.* Referring to phylogenetic relationships inferred from weighted derived similarities between fossil taxa and selected stratigraphic data not contradicted by morphological analysis (Lincoln et al. 1985).
- ♦ **cladistic affinity** See affinity: cladistic affinity.
- ♦ **cladistic method** See study of: systematics: cladistic systematics.
- ♦ **cladistics** *n.* Willi Hennig's (1) proposed method for inferring the true branching pattern of evolutionary history of organisms, and (2) his opinion on criteria for classification of organisms (Futuyma 1998, 95).

See study of: systematics: cladistic systematics.

- ♦ **clado-, klado** *prefix* Branch, offshoot, stem, twig (Brown 1956; Lincoln et al. 1985).
- ♦ **cladogenesis** See -genesis: cladogenesis.
- ♦ **cladogram** See -gram: cladogram.
- ♦ **clamping reflex** See reflex: grasp reflex.
- ♦ **clan** See ²group: ^{1,2}clan.
- ♦ **clan-specific odor** See odor: clan-specific odor.
- ♦ **clandestine** *adj.*
 1. Referring to evolutionary changes not evident in an organism's adult stage (Lincoln et al. 1985).
 2. Referring to adult characters of a descendant species derived from embryonic characters of an ancestral species (Lincoln et al. 1985).
- ♦ **clasp reflex** See reflex: grasp reflex.
- ♦ **clasping hold** See amplexus.
- ♦ **class A through class E levels of social organization** See social organization.
- ♦ **classic scientist** See scientist: classic scientist.
- ♦ **classical animal psychology** See study of: psychology: behaviorism.
- ♦ **classical Batesian mimicry** See mimicry: Batesian mimicry: classical Batesian mimicry.
- ♦ **classical conditioning** See learning: conditioning.
- ♦ **classical ethology** See study of: ³ethology: classical ethology.
- ♦ **classical fitness** See fitness (def. 2, 4); fitness: genetic fitness.
- ♦ **classical gene-chromosome theory** See ³theory: classical gene-chromosome theory.
- ♦ **classical genetics** See study of: genetics: Mendelian genetics.
- ♦ **classical imprinting** See learning: imprinting: classical imprinting.
- ♦ **classical individual fitness** See fitness (def. 2).
- ♦ **classical lek** See ²lek: classical lek.
- ♦ **classical model of human rationality** See ⁴model: classical model of human rationality.
- ♦ **classical-molecular evolution** See study of: evolution: classical-molecular evolution.
- ♦ **classical-personal fitness** See fitness (def. 4).
- ♦ **classical-population genetics** See study of: genetics: classical population genetics.
- ♦ **classical theory** See ³theory: neutral theory.
- ♦ **classification** *n.*
 1. The process used by systematists for assembling populations and taxa into groups, and these, in turn into even larger groups, using a large number of characters (Mayr 1982, 147).
 - syn.* taxonomy, systematics (Michaelis 1963)
 2. The taxonomic scheme that results from classification (def. 1).

cf. ¹identification
- ♦ **classification of behavior** *n.* A hierarchical determination of kinds of behavior, *e.g.*, Scott's (1950) classification and Delgado and Delgado's (1962) classification.

Comment: See other areas of this book for definitions of kinds of behaviors, especially under "behavior."

A

DELGADO AND DELGADO's (1962) BEHAVIOR CLASSIFICATION^a

- I. simple behavior units
 - A. individual
 - 1. static or postural units
 - 2. dynamic or gestural units
 - a. localized
 - b. generalized
 - B. social
 - 1. static
 - 2. dynamic
- II. complex behavioral units
 - A. simultaneous
 - B. sequential
 - C. syntactic
 - D. roles
 - 1. active
 - 2. passive

^a Lehner (1979, 64–66).

LEHNER'S BEHAVIOR CLASSIFICATION^a

- behavior type
- behavior pattern of a type
- behavioral act(s), or act(s), in a pattern
- component parts of an act

^a Lehner (1979, 65–66).

- ♦ **claustrophobia** See -phobia: claustrophobia.
- ♦ **castral colony founding** *n.* In queens of ants and other social hymenopterans, royal pairs in termites: A individual's sealing itself off in a cell and rearing the first generation of workers on nutrients obtained mostly or entirely from its own storage tissues, including fat bodies and histolyzed wing muscles (Wilson 1975, 422, 580).
- ♦ **claw-waving mode** See display: claw-waving mode.
- ♦ **"clay aggregation"** See organized structure: "clay aggregation."
- ♦ **cleaner** *n.* An animal, often a mutualist, that removes particular things from bodies of hosts; *e.g.*, over 40 decapod-crustacean species; about 40 fish species that remove and eat bacteria, ectoparasites, diseased and damaged tissue, or excess food particles from fish and other marine animals (Wickler 1968, 157; Immelmann and Beer 1989, 46); many bird species that pick parasites off skin of large mammals or reptiles (crocodiles, tortoises, iguanas); a mite that cleans a beetle species; and a rotifer that cleans a water flea (Immelmann and Beer 1989, 46).
- ♦ **cleaner-fish dance** See dance: cleaner-fish dance.
- ♦ **cleaner mimicry** See mimicry: cleaner mimicry.
- ♦ **cleaning appetite swimming** See dance: cleaner-fish dance.
- ♦ **cleaning customer** *n.* An animal cleaned by a cleaner, *q.v.* (Wickler, 157).
- ♦ **cleaning drive** See drive: cleaning drive.
- ♦ **cleaning-invitation posture** See posture: cleaning-invitation posture.
- ♦ **cleaning station** *n.* The home base of a cleaner fish (Heymer 1977, 136).
- ♦ **cleaning symbiosis** See symbiosis: cleaning symbiosis.
- ♦ **cleaver** See tool: cleaver.

- ♦ **cleistogamy** See -gamy: cleistogamy.
- ♦ **cleithrophobia** See -phobia: claustrophobia.
- ♦ **clesiophobia** See -phobia: claustrophobia.
- ♦ **clenched-teeth yawning** See yawning: clenched-teeth yawning.
- ♦ **cleptobiosis** See -biosis: cleptobiosis; parasitism: cleptoparasitism.
- ♦ **cleptoparasitism, kleptoparasitism** See parasitism: cleptoparasitism.
- ♦ **cliff, clift** See habitat: cliff.
- ♦ **climate envelope** See ²range: climate envelope.
- ♦ **climate experiment** See experiment: climate experiment.
- ♦ **climatic climax** See ²community: climax: climatic climax.
- ♦ **climatic hypothesis of human emergence** See hypothesis: climatic hypothesis of human emergence.
- ♦ **climatic race** See ¹race: climatic race.
- ♦ **climatic rule** See rule: ecogeographical rule.
- ♦ **climatic selection** See selection (table).
- ♦ **climatology** See study of: climatology.
- ♦ **climax species** See ²species: climax species.
- ♦ **CLIMEX** See program: CLIMEX.
- ♦ **cline** *n.*
 1. A gradient of gene frequency change, phenotypic frequency change, or both in a population from one part of its geographic range to another; *e.g.*, many mammal species show clines of increasing size toward the colder portions of their ranges (Wilson 1975, 580; King and Stansfield 1985).
 2. "Continuous variation on the expression of a character through a series of contiguous populations" (Lincoln et al. 1985).
 - syn.* geographic-character gradient
 - adj.* clinal
 - [Greek *klinein*, to slope, bend]
- ♦ **chronocline** *n.* A cline through an extended geological period (Lincoln et al. 1985).
- ♦ **coenocline** *n.* A sequence of communities distributed along an environmental gradient (Lincoln et al. 1985).
- ♦ **ecocline** *n.*
 1. A more, or less, continuous trait variation in a sequence of populations distributed along an ecological gradient, with each population's exhibiting local adaptation to its particular part of the gradient; a gradient of ecotypes (Lincoln et al. 1985).
 2. Community-structure differences resulting from changes in slope aspect around a mountain or ridge (Lincoln et al. 1985).
- ♦ **ethocline** *n.* A graded series in the expression of a particular behavioral trait within a group of related species (Lincoln et al. 1985), "interpreted to represent stages in an evolutionary trend" (Wilson 1975, 347, 584), *e.g.*, in *Peromyscus*-mouse nesting behavior and possibly in garter-snake feeding preferences to chemical cues (Brown 1975, 18).
- ♦ **geocline** *n.*
 1. A graded sequence of morphological variation through a series of populations, resulting from spatial, or topographical, separation (Lincoln et al. 1985).
 2. A cline resulting from hybridization between adjacent, but genetically distinct, populations (Lincoln et al. 1985).
- ♦ **halocline** *n.*
 1. A discontinuity in salinity (Lincoln et al. 1985).
 2. A zone with a marked salinity gradient (Lincoln et al. 1985).

hybrid cline See cline; nothocline.

morphocline, morphological transformation series *n.* “A graded series of character states of a homologous character” (Lincoln et al. 1985).

nothocline *n.* A graded series of characters, or forms, produced by hybridization.

syn. hybrid cline

ontocline *n.* An organism’s gradation of phenotypic characters during its ontogenetic development (Lincoln et al. 1985).

phenocline *n.* A graded series of phenotype frequencies within a species’ geographical range (Lincoln et al. 1985).

ratio cline *n.* In polymorphic species: A cline in which successive populations show progressive change in relative frequency of morphs (Lincoln et al. 1985).

sociocline *n.* A graded series of social organization among related species that is interpreted to represent stages in an evolutionary trend (Lincoln et al. 1985).

topocline *n.* A graded series of forms that occur through the geographical range of a taxon, “but not necessarily correlated with an ecological gradient” (Lincoln et al. 1985).

◆ **clinging young** *n.* For example, in Bats, *Phascolarctos cinereus* (Koalas), Primates, and Sloths: An offspring that holds firmly to its mother during its first days through weeks postpartum; this offspring is comparable to precocial young in its sensory capacities and to altricial young in its motility (Immelman and Beer 1989, 47).

cf. reflex: grasp reflex; transport of young

◆ **clinical psychology** See study of: psychology; clinical psychology.

◆ **clinodeme** See deme: clinodeme.

◆ **clinology** See study of: clinology.

◆ **clinotaxis** See taxis: clinotaxis.

◆ **clique** *n.* “A set of species with the property that every pair in the set has some food source in common” (Yodzis 1982 in Hawkins and MacMahon 1989, 434).

cf. guild

◆ **clisere** See succession: clisere.

◆ **clistogamy** See -gamy: cleistogamy.

◆ **clithrohobia** See -phobia: claustrophobia.

◆ **clitochore** See -chore: clitochore.

◆ **cloaca, cloacal gland** See gland: cloacal gland.

◆ **cloacal kiss** See kiss: cloacal kiss.

◆ **clock** *n.* An instrument used for measuring and indicating time (Michaelis 1963).

biological clock *n.* In many animal species: An animal’s internal physiological mechanism that measures time or maintains endogenous rhythms (Lincoln et al. 1985; Kolata 1985, 929; Immelman and Beer 1989, 155).

syn. endogenous clock, escapement clock, internal chronometer, internal clock, physiological clock, rhythm, time sense (McFarland 1985, 290; Immelman and Beer 1989, 155)

cf. rhythm

Comments: Animals have different means of regulating their master biological clocks (Blakeslee 1998: A1–A2). *Drosophila* have time-keeping genes that are active in their bristles, legs, and wings. Horseshoe Crabs have clock sensors on their tails, and Swallows have them just inside their skulls. The suprachiasmatic nucleus of a human brain might possess a master clock. Humans have light-sensitive cells on their legs, and possibly elsewhere in their skin, that affect

their biological rhythms. Hemoglobin in these cells might transmit day-length information to a person’s brain by carrying nitric oxide, a neurotransmitter. Hemoglobin in human eyes, not particular light-sensitive cells, might function in setting biological clocks. Chlorophyll regulates plant circadian rhythms.

molecular clock, molecular-clock model of evolution, molecular evolutionary clock

See hypothesis: molecular clock.

◆ **clone, clon** *n.*

1. “A population of individuals all derived asexually from the same single parent” (Wilson 1975, 581).
2. “A set of organisms all of whose cells are members of the same clone,” *e.g.*, a pair of identical twins are members of the same clone (Dawkins 1982, 285).
3. In cell biology, “A set of genetically identical cells, all derived from the same ancestral cell,” *e.g.*, a human body is a gigantic clone of some 10^{15} cells (Dawkins 1982, 285).
4. A group of bionts that are identical by descent for every allele at every locus (Bell 1982, 504).

cf. genet, ortet, ramet

Comments: Hans Spemann proposed vertebrate cloning in 1938; John Gurdon cloned frogs that lived to the tadpole stage in 1970; Steen Willadsen cloned a Domestic Sheep from immature sheep embryo cells in 1984; Neal First cloned calves from embryos that had at least 120 cells; and Ian Wilmut produced the first mammal clone, a Domestic Sheep, from an adult mammal cell in 1996 (Kolata 1997, 23 February, 1; Specter and Kolata 1997, A1, A20–A23). This Sheep grew from a Sheep egg whose DNA he removed and replaced with DNA from a Sheep mammary cell. Many plant species, including *Rhus typhina* (Staghorn Sumac) form clones such as this one in Vermont, U.S. (fig. 5). The taller shoots are bearing fruit.

[Greek *klōn*, sprout, twig]

euclone *n.* A group of conspecific organisms that comprises genotypically identical modular units (ramets), each of which can follow an independent existence if separated from its parental organism (given as *adj.* euclonal in Lincoln et al. 1985).

hemiclone *n.* “A lineage of hybridogenetic animals with a common maternal haploid genome” (Bell 1982, 507).

paraclone *n.* A group of conspecific organisms that comprises genotypically identical modular units, each of which cannot follow an independent existence if separated from its parental organism (given as *adj.* paraclonal in Lincoln et al. 1985).

pseudoclone *n.* A group of conspecific organisms that comprises nongenotypically identical modular units that are so closely related and coordinated that they can be regarded as ecologically and functionally equivalent to a clone (given as *adj.* pseudoclonal in Lincoln et al. 1985).

◆ **cloning** *n.*

1. An organism’s reproducing by producing a clone, *q.v.*
2. A person’s reproducing an organism or its gene(s) by causing the organism to clone or the gene to multiply.

gene cloning *n.* A person’s multiplying a gene(s) with the use of DNA technology (Campbell et al. 1999, 365).

molecular cloning See technology: recombinant-DNA technology.

◆ **cloning vector** See vector: cloning vector.

◆ **clonodeme** See deme: clonodeme.

- ♦ **closed-behavioral program** See program: behavioral program: closed-behavioral program.
- ♦ **closed community** See ²community: closed community.
- ♦ **closed-genetic program** See program: genetic program: closed-genetic program.
- ♦ **closed group** See ²society: closed society.
- ♦ **closed population** See ¹population: closed population.
- ♦ **closed society** See ²society: closed society.
- ♦ **cloud** See ²group: cloud.
- ♦ **clowder** See ²group: clowder.
- ♦ **clump** See ²group: clump.
- ♦ **clumped distribution** See distribution: clumped distribution.
- ♦ **clusium** See ²community: clusium.
- ♦ **CLUSTAL W** See program: CRUSTAL W.
- ♦ **cluster** See ²group: cluster.
- ♦ **clutch** See ²group: clutch.
- ♦ **clutter** See ²group: clutter.
- ♦ **cM** See genetic map (comments), unit of measure: centimorgan.
- ♦ **CMS** See treaty: Convention on the Conservation of Migratory Species of Wild Animals.
- ♦ **C/N-continuous-flow-isotope-ratio mass spectrometer** See instrument: C/N-continuous-flow-isotope-ratio mass spectrometer.
- ♦ **co-accretion hypothesis** See hypothesis: Moon-origin hypotheses: co-accretion hypothesis.
- ♦ **coacervate** See organized structure: coacervate.
- ♦ **coaction-effected social facilitation** See ²facilitation: social facilitation: coaction-effected social facilitation.
- ♦ **coadaptation, coadaption** See ³adaptation: ¹evolutionary adaptation: coadaptation.
- ♦ **coarse-grained environment** See environment: coarse-grained environment.
- ♦ **coarse-grained resource** See resource: coarse-grained resource.
- ♦ **coarse-grained species** See ²species: coarse-grained species.
- ♦ **coarse-grained variation** See variation: coarse-grained variation.
- ♦ **coarse-particulate-organic matter** See particulate-organic matter: coarse-particulate-organic matter.
- ♦ **coast** See habitat: coast.
- ♦ **Coastal Plain Province** See geological province: Coastal Plain Province.
- ♦ **coacervate** See organized structure: coacervate.
- ♦ **cob** See animal names: cob.
- ♦ **COBE** See satellite: Cosmic Background Explorer.
- ♦ **Cochran's-approximate-t test** See statistical test: multiple-comparisons test: planned-multiple-comparisons procedure: Cochran's-approximate-t test.
- ♦ **cocoon** *n.*
1. For example, in Ants, nymphal reproductive termites, and some braconid (fig. 35), moth, skipper-butterfly, and sphecid wasp species: The encasement, often of silk, made by a larva in which it pupates (Oxford English Dictionary 1972, entries from 1699; Wilson 1975, 139).
 2. The protective envelope for an animal's eggs, larvae, or pupae (Oxford English Dictionary 1972, entries from 1699; Immelmann and Beer 1989, 47). *Note:* Animals including Bagworm Moths, Earthworms, and Spiders lay their eggs in cocoons (Barnes 1974, 298).
3. In Mudfish: A clay cell made by an individual fish (Wood 1883 in Oxford English Dictionary 1972). [French *cocon* < *coque*, shell]
- ♦ **code** *n.* The complete set of possible signals and contexts in a communicatory situation (Dewsbury 1978, 99). *cf.* system: communication system
- ♦ **codemic** *adj.* Referring to organisms that belong to the same deme (Lincoln et al. 1985).
- ♦ **codominance** See dominance: codominance.
- ♦ **codon** *n.* A sequence of three nucleotides (= a triplet) of DNA, or RNA, that specifies either a particular amino-acid sequence or the end of a functional unit (*i.e.*, allele) (Wittenberger 1981, 613; Dawkins 1982, 285).
- ♦ **codon bias** *n.* The nonuniform distribution of codon usages, *e.g.*, the phenomenon that an organism frequently uses a particular codon, rather than its alternative, to specify a given amino acid (Air et al. 1976 in Rieger et al. 1991).
- ♦ **coefficient** *n.*
1. Statistically, a constant (Lincoln et al. 1985).
 2. Statistically, a dimensionless description of a distribution or data set (Lincoln et al. 1985).
- ♦ **coefficient of community (CC)** *n.* A coefficient that indicates the degree of similarity of two communities based on the number of species that they have in common (Mueller-Dombois and Ellenberg 1974 in Dubey 1995, 33; Krebs 1985, 447–448); $CC = 2c/(a + b)$; with a = the number of taxa in community 1; b = the number of taxa in community 2; and c = the number of taxa both communities have in common. *syn.* index of similarity (Krebs 1985, 447–448) *Comments:* The coefficient of community ranges from 0 through 1.0, indicating no similarity to complete similarity (Krebs 1985, 448).
- ♦ **coefficient of consanguinity** See coefficient: coefficient of relatedness.
- ♦ **coefficient of genetic determination** See heritability.
- ♦ **coefficient of inbreeding (*f, F*)** *n.* "The probability that both alleles on one locus in a given individual are identical by virtue of identical descent" (Wright 1948 in Wilson 1975, 730). *syn.* inbreeding coefficient *Comment:* "Any value of *f* above zero implies that the individual is inbred to some degree, in the sense that both of its parents share an ancestor in the relatively recent past" (Wright 1948 in Wilson 1975, 73).
- ♦ **coefficient of kinship** See coefficient: coefficient of consanguinity.
- ♦ **coefficient of relatedness (*r*)** *n.*
1. The probability that two individuals share an allele that is identical due to common descent (Wright 1922 in Keane 1990, 265).
 2. "The fraction of genes in two individuals that are identical by descent, averaged over all loci" (Wright 1948; Hamilton 1963, 1964, 9; Wilson 1975, 74, 581).
 3. The conditional probability that a second individual has a given gene if a related individual is known to have the gene (Trivers and Hare 1976).
 4. coefficient of consanguinity, f_{ij} , F_{ij} : "The probability that a pair of alleles drawn at random from the same locus in two individuals will be autozygous;" *I* and *J* refer to the individuals that are being compared (Wilson 1975, 73, 581).

syn. coefficient of kinship, coefficient of parentage, degree of relationship, panmictic index, Wright's inbreeding coefficient

cf. *r*

correlation coefficient (r, R) *n.* In linear regression, the measure of the linear association between two variables (*x* and *y*) that have been measured on interval or ratio scales, such as the relationship between Horse height in centimeters and weight in kilograms (Kleinbaum and Kupper, 1978, 75; Quinn and Keough 2007, 91–92).

syn. Pearson's correlation coefficient and product-moment correlation coefficient (Upton and Cook 2006, 102), Pearson's product-moment-correlation coefficient (Easter and McColl, 1997)

Comments: The correlation coefficient (*r*) is a measurement of how close data points are to a best-fitting line in a regression plot of *y* versus *x*; *r* varies from -1 through 1. When the points are distributed randomly with regard to the line, *r* = 0; when all of the points fall on the line, *r* = 1. The correlation coefficient squared (*r*² also written as *R*²) is a commonly used measure that indicates the amount of variation of *y* that is accounted for by *x*. For example, if *r*² = 0.49, *x* accounts for 49% of the variation of *y*. The correlation coefficient squared (*r*²) is not a measure of the magnitude of the slope of a regression line, and *r*² is not a measure of the appropriateness of a straight-line regression model (Kleinbaum and Kupper, 1978, 76–77). The correlation coefficient (*r*) is different than the regression coefficient (*r*), *q.v.*, which is the slope of a regression line.

panmictic index See coefficient: Coefficient of Relatedness.

regression coefficient (r) *n.* In statistics, the rate of change of a dependent random variable with regard to one, or more, independent variables; *e.g.*, the rate *b* which is the slope of the line in the regression equation $y = a + bx$ is the regression coefficient of this equation (Sokal and Rohlf 1969, 408).

Comment: The regression coefficient (*r*) is different from the correlation coefficient (*r*), *q.v.*

relative-crowding coefficient (RCC) *n.* A measure of the aggression of one plant species towards another, derived from the results of a replacement-series experiment (Lincoln et al. 1985).

selection coefficient (s) *n.* A measure of the intensity of natural selection against a less fit genotype in a population (Futuyma 1978, 368).

syn. coefficient of selection

cf. selective advantage

Comments: The selection coefficient is calculated as the proportional reduction in gametic contribution of one genotype compared with that of a standard genotype; $0 < s < 1$ (Futuyma 1986, 152).

Wright's inbreeding coefficient See coefficient: coefficient of relatedness.

♦ **coelom** *n.* (SEE *lim*) An animal's body cavity that is between its body wall and viscera and lined with mesoderm; contrasted with pseudocoelom (Michaelis 1963).

syn. celom, coelome (SEE *lome*)

Comment: Coelomate phyla include Arthropoda, Chordata, and Echinodermata.

[Greek *koilōma*, cavity < *koilos*, hollow]

pseudocoelom (sue doe See *lim*) *n.* An animal's body cavity that is between its body wall and viscera and partly lined with mesoderm; contrasted with coelom.

syn. pseudocelom, pseudocoelome

Comment: Aschelminthes and related phyla are pseudocoelomates.

♦ **coeno-, ceno-, koino-** *comb. f.* Sharing, in common (Lincoln et al. 1985).

cf. ¹community: phytocoenosis
[Greek *koinos*, common]

♦ **coenobiology** See study of: biocoenology.

♦ **coenocline** See cline: coenocline.

♦ **coenogamodeme** See deme: coenogamodeme.

♦ **coenogenesis** See -genesis: coenogenesis.

♦ **coenogenous** See -genous: coenogenous.

♦ **coenomonoecism** See -oecism: coenomonoecism.

♦ **-coenosis** *cf.* ²group

necrocoenosis, liptocoenosis *n.* "An assemblage of dead organisms" (Lincoln et al. 1985).

phytocoenosis *n.* "The total plant life of a given habitat or community" (Lincoln et al. 1985).

cf. ¹community: phytocoenosis; flora.

psephonecrocoenosis *n.* A necrocoenosis of dwarf individuals (Lincoln et al. 1985).

♦ **coenosium** See ²community: coenosium.

♦ **coenospecies** See ²species: coenospecies.

♦ **coenocline** See cline: coenocline.

♦ **coenotrope** See behavior: coenotrope.

♦ **coenzyme 2** See enzyme: nicotinamide adenine dinucleotide phosphate.

♦ **coercive copulation** See copulation: forced copulation.

♦ **coevolution** See ²evolution: coevolution.

♦ **cognition** *n.*

1. A person's action, or faculty, of knowing taken in its broad sense, including sensation, perception, conception, etc.; distinguished from feeling and volition; more specifically one's recognizing an object in perception proper (Oxford English Dictionary 1972, entries from 1651).

2. A hypothetical stimulus-stimulus association, or perceptual organization, postulated to account for expectancies (Verplanck 1957).

Note: Cognition is not yet possible to define in other than intuitive terminology, except for trivial cases (Verplanck 1957).

3. "All of the various modes and aspects of knowing, including perceiving, recognizing, remembering, imagining, conceptualizing, judging, and reasoning," potentially including "all inner mediating systems whereby an organism processes stimulus information and construes, represents, organizes, interprets, and responds to ongoing events" (Storz 1973, 49).

Note: In Humans, this includes thought processes involving imagery, language, and symbols (Storz 1973, 49).

4. In Humans: A state that modulates the expression of emotions (Hinde 1985, 987).

Note: It is often useful to consider a continuing cognitive-emotion interaction when studying cognition and emotion (Hinde 1985, 987).

5. Animal mental processes that cannot be observed directly but for which there is scientific evidence (McFarland 1985, 345).

Note: Cognition may involve an animal's having a mental image of a "goal" to be achieved (McFarland 1985, 356).

6. Animal "brain processes through which an organism acquires information about its environment" (Zayan and Duncan 1987 in Dawkins 1988, 316).

7. A general psychological term for a person's mental functioning including memory, perception, and thinking; a person's knowledge of awareness of self, judgment, learning, local geography, and use of language (Immelman and Beer 1989, 48).
cf. awareness, cognitive map
[Latin *cognitio*, -*onis*, knowledge < *cognoscere*, to know < *co-* together + (*g*)*noscere*, to know]
- visuospatial-construction cognition** *n.* A person's ability to take a whole apart mentally and to reconstruct it from its parts (Blakeslee 1996, 23 July, C3).
cf. syndrome: Williams syndrome
Comment: This process appears to take place in the parietal lobes of the back of a person's brain (Blakeslee 1996, 23 July, C3).
- ♦ **cognitive** *adj.* Referring to imparting objective information unrelated to emotion (Sebeok 1962 in Wilson 1975, 217).
Comment: This is one of Sebeok's six basic functions of communication. The other basic functions are conative, emotive, metacommunicative, phatic, and poetic (Sebeok 1962 in Wilson 1975, 217).
- ♦ **cognitive-developmental concept** See developmental-genetic conception of ethical behavior.
- ♦ **cognitive ethology** See study of: ³ethology: cognitive ethology.
- ♦ **cognitive map** *n.*
1. An elaboration of a cognition (Verplanck 1957).
 2. In more-derived vertebrates, possibly in *Apis mellifera* (Western Honey Bees): An ordered mental "map" that tells an animal how to interpret cues that occur in a particular sequence (Gould 1982, 263; Gould and Gould 1988, 108–109).
 3. An animal's internal representation of the layout of an area in its environment (Immelman and Beer 1989, 48).
syn. landmark-based mental map (Gould 1986 in Dyer 1991, 239), mental map (Dyer 1991, 239)
Comment: Dyer's (1991) study does not support the existence of cognitive maps in *Apis mellifera* reported by Gould and Towne (1987).
- ♦ **cognitive psychology** See study of: psychology: cognitive psychology.
- ♦ **cohesion speciesconcept** See ²species (def. 32).
- ♦ **coition, coitus** See copulation.
- ♦ **coitus interruptus** *n.* An individual act of onanism, *q.v.*, with regard to intercourse (Storz 1973, 183).
- ♦ **cold blooded animal** See -therm: poikilotherm.
- ♦ **-cole** *comb. f.* Inhabitant of, in, or on (Lincoln et al. 1985).
adj. -colous
cf. ¹-phile, -zoite
- agaricole** *n.* An organism that lives on mushrooms and toadstools, *e.g.*, some springtails (arthropods) (Lincoln et al. 1985).
- aigicole** *n.* An organism that lives on beaches, *e.g.*, a tiger-beetle species (Lincoln et al. 1985).
- algicole** *n.* An organism that lives on algae, *e.g.*, a periwinkle snail (Lincoln et al. 1985).
- alsocole** *n.* An organism that lives in woody groves, *e.g.*, the Piliated Woodpecker (Lincoln et al. 1985).
cf. -cole: arboricole, hylacole, nemoricole, silvicole; ¹-phile: acrodendrophile, aiphylophilie, dendrophile, halorgadophile, hydrolophile, orgadophile
- amanthicole** *n.* An organism that lives on sandy plains, *e.g.*, the Pronghorn (Lincoln et al. 1985).

- cf.* -cole: aigicole, ammocole, amnicole, arenicole, thinicole; ¹-phile: aigialophile, amathophile, ammochtophile, ammophile, anemophile, cheradophile, enaulophile, psamatophile, psammophile, syrtidophile, thinophile
- ammocole** *n.* An organism that lives on, or in sand, *e.g.*, *Pinus elliottii* (Slash Pine) (Lincoln et al. 1985).
cf. -cole: aigicole, amanthicole, amnicole, arenicole, thinicole; ¹-phile: aigialophile, amathophile, ammochtophile, ammophile, anemophile, cheradophile, enaulophile, psamatophile, psammophile, syrtidophile, thinophile
- amnicole** *n.* An organism that lives on sandy river banks, *e.g.*, a digger-wasp species (Lincoln et al. 1985).
cf. psammon
- ancocole** *n.* An organism that lives in canyons, *e.g.*, a hummingbird species (Lincoln et al. 1985).
cf. ¹-phile: ancophile
- aphidicole** *n.* An organism that lives among aphid aggregations, *e.g.*, a larva of a syrphid-fly species (Lincoln et al. 1985).
- aquaticole** *n.* An organism that lives in water or aquatic vegetation, *e.g.*, the Sunfish (Lincoln et al. 1985).
- arboricole, dendricole, dendrophile** *n.* An organism that lives in trees or large woody shrubs, *e.g.*, *Pongo borneo* (Orangutan) (Lincoln et al. 1985).
cf. -cole: alsocole, arboricole, arbusticole, fruticole, hylacole, nemoricole, silvicole, thamnocoole; ¹-phile: acrodendrophile, aiphylophilie, dendrophile, halorgadophile, hydrolophile, orgadophile
- arbusticole** *n.* An organism that lives on scattered shrubs and shrub-like perennial herbs, *e.g.*, a grasshopper species (Lincoln et al. 1985).
cf. -cole: arboricole, fruticole, hylacole, thamnocoole
- arenicole, psammobiont, sabulicole** *n.* An organism that lives in sand, *e.g.*, a coquina-clam sp., the grass *Elymus arenicola*, and the wasp *Sphex sabulosus* (Lincoln et al. 1985).
cf. -cole: aigicole, amanthicole, ammocole, amnicole, thinicole; ¹-phile: aigialophile, amathophile, ammochtophile, ammophile, anemophile, cheradophile, enaulophile, psamatophile, psammophile, syrtidophile, thinophile
- argillicole** *n.* An organism that lives on, or in, clay, *e.g.*, the evening primrose *Oenothera argillicola* (Lincoln et al. 1985).
cf. ¹-phile: argillophilie, pelophile, phellophilie, spiladophile
- branchicole** *n.* An organism that lives on gills of fish or other aquatic animals, *e.g.*, a parasitic-crustacean species (Lincoln et al. 1985).
- broticole** *n.* An organism that lives in close proximity to Humans, in houses or other buildings, *e.g.*, the American Cockroach (Lincoln et al. 1985).
- bryocole** *n.* An organism that lives on, or in, moss, *e.g.*, a tardigrade species (Lincoln et al. 1985).
cf. -cole: muscicole, sphagnicole; ¹-phile: bryophile, sphagnophile
- cadavericole** *n.* An organism that feeds on dead bodies or carrion, *e.g.*, the beetle *Dermestes cadavérinus* (Lincoln et al. 1985).
cf. saprobe
- caespiticole** *n.* An organism that lives in grassy turf or pastures, *e.g.*, the Broadleaf Plantain (Lincoln et al. 1985).
cf. -cole: nomocole; ¹-phile: nomophile

calcicole, calcipete, calciphyte, gypsophyte *n.* A plant that grows in soils rich in calcium salts (Lincoln et al. 1985).

cf. calcifuge; -cole: gelicole, geocole, halicole, humicole, pergelicole, perhalicole, silicole, terricole; ¹-phile: agrophile, geophile, gypsophile, nitrophile

calcosaxicole *n.* An organism that lives in rocky limestone areas, *e.g.*, a fern species (Lincoln et al. 1985).

cf. -cole: petrimadicole, petrocole, rupicole; ¹-phile: actophile, calicophile, chasmophile, lithophile, petrochthophile, petrodophile, petrophile, phellophile

carbonicole *n.* An organism that lives on burnt, or scorched, substrates, *e.g.*, Fireweed (Lincoln et al. 1985).

caulicole *n.* An organism that lives on plant stems, *e.g.*, some aphid species (Lincoln et al. 1985).

cf. -cole: culmicole, folicaulicole

cavernicole *n.* An organism that lives in subterranean caves or passages, *e.g.*, a salamander species (Lincoln et al. 1985).

cf. -cole: stygobie; ¹-phile: troglophile

cespiticole See -cole: caespiticole.

corticole *n.* An organism that lives on bark, *e.g.*, a lichen species (Lincoln et al. 1985).

crenicole *n.* An organism that lives in springs or in brook water fed from a spring, *e.g.*, a dragonfly species (Lincoln et al. 1985).

culmicole *n.* An organism that lives on grass stems, *e.g.*, a planthopper species (Lincoln et al. 1985).

cf. -cole: caulicole, folicaulicole

dendricole See -cole: arboricole.

deserticole *n.* An organism that lives on open ground in an arid, or desert, region, *e.g.*, a cactus species (Lincoln et al. 1985).

cf. -cole: siccocole, xerocole; ¹-phile: chersophile, hydrophile, hylodophile, lochnodophile, subxerophile, syrtidophile, xerohyophile, xerophile

domicole *n.* An organism that lives in a tube, nest, or other domicile, *e.g.*, a polychaete-worm species (Lincoln et al. 1985).

cf. cole: tubicole

epicole, epibiont *n.* An organism that lives attached to the surface of its organism "host" without benefit, or detriment, to its host, *e.g.*, a bromeliad species (Lincoln et al. 1985).

fimbricole *n.* An organism that grows in, or on, dung, *e.g.*, a dung-beetle species (Lincoln et al. 1985).

fimicole, meridicole *n.* An organism that lives in, or on, dung, *e.g.*, the Dung Fly (Lincoln et al. 1985).

cf. -zoite: coprozoite

folicaulicole *n.* An organism that lives attached to leaves and stems, *e.g.*, a scale-insect species (Lincoln et al. 1985).

cf. -cole: folicole, forbicole

folicole *n.* An organism that lives on leaves, *e.g.*, the Poison Ivy Sawfly (Lincoln et al. 1985).

cf. -cole: folicaulicole, forbicole; hypophyllus

forbicole, herbicole *n.* An organism that lives on broad leaved plants, *e.g.*, the Eastern Tent Caterpillar (Lincoln et al. 1985).

cf. -cole: folicaulicole, folicole

fructicole *n.* An organism that lives on, or in, fruits, *e.g.*, the Mediterranean Fruit Fly (Lincoln et al. 1985).

cf. -cole: arboricole, arbusticole, hylacole, thamnocoole

fruticole *n.* An organism that lives on, or growing, on, shrubs, *e.g.*, a mistletoe species (Lincoln et al. 1985).

fungicole *n.* An organism that lives in, or on, fungi, *e.g.*, the Handsome Fungus Beetle (Lincoln et al. 1985).

gallicole *n.* An organism that lives in galls, *e.g.*, a mite species (Lincoln et al. 1985).

geicole *n.* An organism that lives in geloid soils having a crystalloid content between 0.2 and 0.5 parts per thousand (Lincoln et al. 1985).

cf. calcifuge; -cole: calcicole, geocole, halicole, humicole, pergelicole, perhalicole, silicole, terricole; ¹-phile: agrophile, geophile, gypsophile, nitrophile

geocole *n.* An organism that lives in soil for part of its life cycle, *e.g.*, a 17-yr Cicada (Lincoln et al. 1985).

cf. calcifuge; -cole: calcicole, gelicole, halicole, humicole, pergelicole, perhalicole, silicole, terricole; ¹-phile: agrophile, geophile, gypsophile, nitrophile

graminicole *n.*

1. An animal that spends most of its life in a grassy habitat (Lincoln et al. 1985).

2. An organism that grows on grasses, *e.g.*, a grasshopper or dodder (parasitic plant) (Lincoln et al. 1985).

syn. chorotobiont

halicole *n.*

1. An organism that lives in haloid soils having a crystalloid content from 0.5 through 2 parts per thousand (Lincoln et al. 1985).

2. An organism that lives in a habitat with a high salt content, *e.g.*, *Aster halophilus* or *Rhizophora mangle* (Red Mangrove) (Lincoln et al. 1985).

cf. calcifuge; -cole: calcicole, gelicole, geocole, halicole, pergelicole, perhalicole, silicole, terricole; ¹-phile: agrophile, geophile, gypsophile, nitrophile

herbicole See -cole: forbicole.

humicole *n.* An organism that lives on, or in, soil, *e.g.*, *Arabis humifusa* (Arctic Rockcress) (Lincoln et al. 1985).

cf. calcifuge; -cole: calcicole, gelicole, geocole, halicole, pergelicole, perhalicole, silicole, terricole; ¹-phile: agrophile, geophile, gypsophile, nitrophile

hydrocole *n.* An organism that lives in an aquatic habitat, *e.g.*, *Castor canadensis* (North American Beaver) (Lincoln et al. 1985).

hygrocole *n.* An organism that lives in moist, or damp, habitat, *e.g.*, a slime-mold species (Lincoln et al. 1985).

hylacole, hylocole *n.* An organism that lives among trees or in woodland understory shrubs or forest; *e.g.*, *Hylobates agilis* (Gibbon) or *Hylocichla fuscescens* (Veery, a bird) (Lincoln et al. 1985).

cf. -cole: alsocole, arboricole, arbusticole, fruticole, hylacole, nemoricole, silicole, thamnocoole; ¹-phile: acrodendrophile, aiphyllophile, dendrophile, haloragadophile, hylodophile, orgadophile

lapidocole, saxicole, saxatile *n.* An organism that lives under, or among, stones, *e.g.*, *Parmelia saxatilis* (a lichen) or the Pavement Ant (Lincoln et al. 1985).

cf. hypolitic; ¹-phile: petrochthophile

latebricole *n.* An organism that lives in holes, *e.g.*, the Gopher Tortoise (Lincoln et al. 1985).

leimocole, leimicole *n.* An organism that lives in moist grassland or meadowland, *e.g.*, False Hellebore (Lincoln et al. 1985).

cf. -cole: poocole, pratinicole; ¹-phile: coryphile, helolochmophile, poophile, telmatophile

lichenicole *n.* An organism that lives in, or on, a lichen, e.g., a bagworm species (Lincoln et al. 1985).
cf. ¹-phile: lichenophile

lignicole *n.* An organism that lives on, or in, wood, e.g., *Selenops lignicolus* (a spider) (Lincoln et al. 1985).
cf. ¹-phile: lignophile, proxylophile, xylophile

limicole *n.* An organism that lives in mud shores, e.g., *Limosella aquatica* (Mudwort) (Lincoln et al. 1985).
cf. -cole: liticole; ¹-phile: argillophile, pelochthophile

limnicole, limniicole *n.* An organism that lives in a lake, e.g., *Gammarus limnaeus* (amphipod) (Lincoln et al. 1985).
cf. ¹-phile: limnophile

lochmocole *n.* An organism that lives in thickets, e.g., *Rubus occidentalis* (Black Raspberry) (Lincoln et al. 1985).

lucicole *n.* An organism that lives in open habitats with ample light, e.g., *Quercus alba* (White Oak) (Lincoln et al. 1985).
cf. -cole: umbriticole

luticole *n.* An organism that lives in mud, e.g., *Nuphar lutea* (Spatterdock, waterlily) (Lincoln et al. 1985).
cf. -cole: limicole; ¹-phile: argillophile, pelochthophile

merdicole See -cole: fimbicole.
adj. merdicolous, stercoraceous

monticole *n.* An organism that lives in mountain habitats, e.g., the plant *Paronychia montana* (Lincoln et al. 1985).

muscicole *n.* An organism that lives on, or in, mosses or moss-rich communities, e.g., a millipede species (Lincoln et al. 1985).
cf. -cole: bryocole, sphagnicole; ¹-phile: bryophile, sphagnophile

myrmecocole *n.* An organism that lives in ant, or termite, nests, e.g., a butterfly species (Lincoln et al. 1985).

nemoricole, orgadocole *n.* An organism that lives in open woodlands, e.g., *Solidago nemoralis* (Gray Goldenrod) (Lincoln et al. 1985).
adj. nemoricolous, nemeral, nemorose
cf. -cole: alsocole, arboricole, hylacole, silvicole; ¹-phile: acrodendrophile, aiphyllophile, dendrophile, halorgadophile, hylodophile, orgadophile

nervicole *n.* An organism that lives on, or in, leaf veins, e.g., a scale-insect species (Lincoln et al. 1985).

nidicole *n.* An organism that lives in a nest, e.g., stingless bees and *Sciurus carolinensis* (Eastern Gray Squirrel) (Lincoln et al. 1985).

nivicole *n.* An organism that lives in snow, or snow-covered habitats, e.g., *Lepus americanus* (Snowshoe Hare) (Lincoln et al. 1985).

nomocole *n.* An organism that lives in a pasture, e.g., *Cirsium vulgare* (Bull Thistle) (Lincoln et al. 1985).
cf. -cole: ceaspitcole; ¹-phile: nomophile

omnicole *n.* An organism that lives on many kinds of substrates, e.g., a bacterium species (Lincoln et al. 1985).

orgadocole See -cole: nemoricole.

ovariicole *n.* An organism that lives in ovaries (Lincoln et al. 1985).

paludicole *n.* An organism that lives in marshy habitats, e.g., *Althaea officinalis* (Marshmallow) (Lincoln et al. 1985).
cf. -cole: pontohalicole, telmicole; ¹-phile: helophile, limnodophile

patacole *n.* An organism that lives in forest litter part of its life cycle, e.g., *Epilachna varivestis* (Mexican Bean Beetle) (Lincoln et al. 1985).

pergelicole *n.* An organism that lives in haloid soils having a crystalloid content below 0.2 parts per thousand (Lincoln et al. 1985).
cf. calcifuge; -cole: calcicole, gelicole, geocole, halicole, humicole, perhalicole, silicole, terricole; ¹-phile: agrophile, geophile, gypsophile, nitrophile

perhalicole *n.* An organism that lives in haloid soils having a crystalloid content above 0.2 parts per thousand (Lincoln et al. 1985).
cf. calcifuge; -cole: calcicole, gelicole, geocole, halicole, humicole, pergelicole, silicole, terricole; ¹-phile: agrophile, geophile, gypsophile, nitrophile

petrimadicole *n.* An organism that lives in the surface film of water on rocks, e.g., an alga species (Lincoln et al. 1985).
cf. -cole: calcosaxicole, petrocole, rupicole; ¹-phile: actophile, calicophile, chasmophile, lithophile, petrochthophile, petrodophile, petrophile, phellophile
adj. hygopetric, petrimadicolous

petrocole *n.* An organism that lives in a rocky habitat, e.g., a scorpion species (Lincoln et al. 1985).
cf. -cole: calcosaxicole, petrimadicole, rupicole; ¹-phile: actophile, calicophile, chasmophile, lithophile, petrochthophile, petrodophile, petrophile, phellophile

phreatocole *n.* An organism that lives in groundwater habitats, e.g., a crustacean species (Lincoln et al. 1985).
adj. phreatobie, phreatocolous

piscicole *n.* An organism that lives on, or within, fish, e.g., a lamprey (Lincoln et al. 1985).
cf. -zoite: histozoite

planticole, phytobiont, phytophile *n.* An organism that spends most of its active life, on, or within, plants, e.g., *Apbis nerii* (Oleander Aphid, fig. 6) (Lincoln et al. 1985).
cf. -zoite: histozoite

pontohalicole *n.* An organism that lives in a salt marsh, e.g., the Salt-marsh Skipper (butterfly) (Lincoln et al. 1985).
cf. -cole: paludicole, telmicole; ¹-phile: helophile, limnodophile

poocole *n.* An organism that lives in a meadow (e.g., the Meadow Fritillary, a butterfly) (Lincoln et al. 1985).
cf. -cole: leimocole, pratinicole; ¹-phile: coryphile, helolochmophile, poophile, telmatophile

potamincole *n.* An organism that lives in a river, e.g., the Hippopotamus (Lincoln et al. 1985).

pratinicole *n.* An organism that lives in a grassland or meadowland, e.g., the spider *Pardosa prativaga* and *Pleum pratense* (Timothy Grass) (Lincoln et al. 1985).
cf. -cole: leimocole, poocole, pratinicole, psicole; ¹-phile: coryphile, helolochmophile, poophile, psilophile, telmatophile

psicole *n.* An organism that lives in a savannah or prairie, e.g., *Echinacea purpurea* (Purple Coneflower) (Lincoln et al. 1985).
cf. -cole: pratinicole; ¹-phile: psilophile

radicicole *n.* An organism that lives on, or in, roots, *e.g.*, the Carrot Wireworm (beetle) (Lincoln et al. 1985).

ramicole *n.* An organism that lives on twigs and branches, *e.g.*, a leafhopper species (Lincoln et al. 1985).

ripicole *n.* An organism that lives on banks of rivers and streams, *e.g.*, Otters (Lincoln et al. 1985).

rubicole *n.* An organism that lives on brambles, *e.g.*, a sawfly species (Lincoln et al. 1985).

rupicole *n.* An organism that lives on walls or rocks, *e.g.*, a bristletail (insect) species (Lincoln et al. 1985).

adj. mural, rupestral, rupestrine, rupicolous
cf. -cole: calcosaxicole, petrimadicole, petrocole; 1-phile: actophile, calicophile, chasmophile, lithophile, petrochthophile, petrodophile, petrophile, phellophile

sabulicole See -cole: arenicole.

sanguicole *n.* An organism that lives in blood, *e.g.*, a malaria *Plasmodium* (Lincoln et al. 1985).

saxicole, saxatile See -cole: lapidicole.

sepicole *n.* An organism that lives in hedge rows, *e.g.*, *Alliaria petiolata* (Garlic-mustard, Jack-by-the-hedge) (Lincoln et al. 1985).

siccocole, siccicole, siccole *n.* An organism that lives in arid habitats, *e.g.*, the Creosote Bush (Lincoln et al. 1985).
cf. -cole: deserticole, xerocole; 1-phile: chersophile, hydrophile, hylodophile, lochnodophile, subxerophile, syrtidophile, xeroxylophile, xerophile

silicole *n.* An organism that lives in soil rich in silica or silicates or on flints, *e.g.*, a cactus species (Lincoln et al. 1985).
cf. calcifuge; -cole: calcicole, gelicole, geocole, halicole, humicole, pergelicole, perhalicole, terricole; 1-phile: agrophile, geophile, gypsophile, nitrophile

silvicole, sylvicole *n.* An organism that lives in woodlands, *e.g.*, the Oven Bird (Lincoln et al. 1985).
adj. silvicolous, sylvstral, sylvicolous
cf. -cole: alsocole, arboricole, hylacole, nemoricole; 1-phile: acrodendrophile, aiphyllophile, dendrophile, halorgadophile, hylodophile, orgadophile

spaghnicole *n.* An organism that lives in peat moss, *e.g.*, the Rose-pogonia Orchid (Lincoln et al. 1985).
cf. -cole: bryocole, muscicole; 1-phile: bryophile, sphagnophile

spongicole *n.* An organism that lives on, or in, sponges, *e.g.*, a starfish species (Lincoln et al. 1985).

stagnicole *n.* An organism that lives in stagnant water, *e.g.*, *Lymnaea stagnalis* (Pond Snail) (Lincoln et al. 1985).

stygobie, troglobie *n.* "An obligate cavernicole" (Lincoln et al. 1985).
cf. -cole: cavernicole; 1-phile: trogophile

subgeocole *n.* An organism that lives underground, *e.g.*, a mole cricket (Lincoln et al. 1985).

sylvicole See -cole: silvicole.

tegulicole *n.* An organism that lives on tiles, *e.g.*, a lichen species (Lincoln et al. 1985).

telmicole *n.* An organism that lives in fresh-water marshes, *e.g.*, *Telmatodytes griseus* (Marsh Wren) (Lincoln et al. 1985).
cf. -cole: paludicole, pontohalicole; 1-phile: helophile, limnodophile

termitocole *n.* An organism that lives in termite nests, *e.g.*, a silverfish species (Lincoln et al. 1985).

terricole *n.* An organism that lives on, or in, soil, and spends most of its life there, *e.g.*, *Heterocephalus glaber* (Naked Mole Rat) (Lincoln et al. 1985).
cf. calcifuge; -cole: calcicole, gelicole, geocole, halicole, humicole, pergelicole, perhalicole, silicole; 1-phile: agrophile, geophile, gypsophile, nitrophile

thamnocoile *n.* An organism that lives on, or in, bushes or shrubs, *e.g.*, *Dendroica petechia* (Yellow Warbler) (Lincoln et al. 1985).
cf. -cole: arboricole, arbusticole, fruticole, hylacole, thamnocoile

thinicole *n.* An organism that lives on sand dunes, *e.g.*, a grass species (Lincoln et al. 1985).
cf. -cole: aigicole, amanthicole, ammocole, amniacole, arenicole; 1-phile: aigialophile, amathophile, ammochthophile, ammophile, anemophile, cheradophile, enaulophile, psamatophile, psammophile, syrtidophile, thinophile

tiphicole *n.* An organism that lives in ponds, *e.g.*, a bladderwort species (Lincoln et al. 1985).

torrenticole *n.* An organism that lives in river torrents, *e.g.*, a fly *Charadromyia torrenticola* (Lincoln et al. 1985).

tubicole *n.* An organism that lives in tubes, *e.g.*, a worm *Tubifex multisetus* or a mud-dauber *Sceliphron tubifex* (Lincoln et al. 1985).
cf. -cole: domicile

umbraticole, skiophile *n.* An organism that lives in shaded habitats, *e.g.*, a fern *Pteris umbrosa* (Lincoln et al. 1985).
cf. -cole: lucicole, umbraticole; 1-phile: anhelophile, heliophile, helioxerophile, lygophile, phenophile, skotophile, sciophile

vaginicole *n.* An organism that lives a secreted sheath or case, *e.g.*, a bagworm-moth larva (Lincoln et al. 1985).

viticole *n.* An organism that lives on vines, *e.g.*, *Battus philenor* (Pipevine Swallowtail, a butterfly) (Lincoln et al. 1985).

xerocole *n.* An organism that lives in dry conditions, *e.g.*, *Philoxyerus vermicularis* (an amaranth) or *Xerus rutilus* (African Ground Squirrel) (Lincoln et al. 1985).
cf. -cole: deserticole, siccocole; 1-phile: chersophile, hydrophile, hylodophile, lochnodophile, subxerophile, syrtidophile, xeroxylophile, xerophile

♦ **Cole's Paradox, Cole's Result** *n.* A semelparous parthenogenetic female should produce only one more offspring, or a semelparous sexually reproducing female should produce only two more offspring, than an "immortal" iteroparous female in order to match her fitness, even with the extreme and unrealistic condition that the iteroparous female is reproducing at no cost whatever to her reproductive potential (Cole 1954 in Brown 1975, 191; Daly and Wilson 1983, 182).
Comments: Cole's Paradox is unrealistic because juveniles are commonly more susceptible to mortality than are adults and other realistic complications are not included.

♦ **collaplanckton** See plankton: kollaplanckton.

♦ **collateral kin** See kin.

♦ **collecting** *n.* A person's accumulating objects as a hobby or for study (Morris 1982).

insect collecting *n.* A person's making a temporary or permanent collection of insects for personal or professional reasons (inferred from New 2009, 129).

Comment: Insect collecting might not be a cause, or major cause, for population declines of most rare insect species (New 2009, 130). Further, insect collectors can be providers of information about insects that is useful for conserving them, and the collectors can, themselves, be avid conservationists. New (2009, 132–134) presents a code for insect collecting.

stamp collecting, stamp-collecting *n.* A taxonomist's allegedly simply placing taxa in unambiguous, easily determined places in a process similar to affixing stamps in preassigned places in a stamp book (Gould 1987).

n. stamp collector

v.t. stamp collect

cf. bird-watching, inductivism

Comments: This is a derogatory term that suggests taxonomy is not "real science" but Gould (1987) discusses why this term is inappropriate.

♦ **collective group** See ²species aggregate.

♦ **collective mimicry** See mimicry: collective mimicry.

♦ **collective species** See ²species: superspecies.

♦ **collector-gatherer** See ²group: functional feeding group: gathering collector.

♦ **colonist** *n.* An organism, typically r-selected, that invades and colonizes a new habitat or territory (Lincoln et al. 1985).

♦ **colonial** *adj.*

cf. colony

multicolonial *adj.* Referring to a social-insect population that is divided into colonies that recognize nest boundaries (Hölldobler and Wilson 1990, 640).

cf. colonial: unicolonial

unicolonial *adj.* Referring to a social-insect population in which there are no behavioral colony boundaries (Hölldobler and Wilson 1990, 644).

cf. colonial: multicolonial

♦ **colonial mating system** See mating system: colonial mating system.

♦ **colony** See ²group: colony; ²society: modular society: continuous-modular society.

♦ **Colony-Collapse Disorder** See disease: Colony-Collapse Disorder.

♦ **colony fission** See swarming: fission.

♦ **colony odor** See odor: colony odor.

♦ **color change** *n.* An animal's alteration of its body color that can involve color change of its whole body surface or of specific parts or structures (Immelmann and Beer 1989, 49).

Comment: Depending on the species, an individual's color change can include only one, or a few, color changes during its development, seasonal color changes, irregularly timed color changes, and color change that lasts from only seconds through months (Immelmann and Beer 1989, 49).

cf. metachrosis

♦ **coloration** *n.* Arrangement of colors of an organism's body (Michaelis 1963).

cf. courtship colors; discolored; metachrosis; molecule: cartenoid

apapetic coloration *n.* In many kinds of animals with camouflage: Misleading coloration, e.g., coloration resembling physical features of an organism's habitat (Lincoln et al. 1985).

cf. bioluminescence, camouflage, crypsis, mimicry

aposematic coloration, aposematism *n.* In some amphibian, fish, insect, mammal, and reptile species: Conspicuous coloration with bold patterns

(often orange, red, white, or yellow; or a combination of these colors, on a black background) that advertises the identity of an animal that is dangerous (ferocious, foul-tasting, venomous); this coloration is likely to have a protective function (Matthews and Matthews 1978, 312, 323).

Comments: *Aphis nerii* (Oleander Aphid, fig. 6) has black and yellow-orange, and *Oncopeltus fasciatus* (Large Milkweed Bug, fig. 7) has black-and-orange aposematic coloration. Both species sequester toxins from their host plants (Scudder et al. 1986, 1171; McAuslane 2008). The aposematically colored *Photinus pyralis* (Big Dipper Firefly, fig. 8) is toxic to some of its predators, and bumble bees such as female *Bombus ternarius* (Tricolored Bumble Bee, fig. 9) have potent stings.

syn. proaposematic coloration, warning coloration (Matthews and Matthews 1978, 312, 323)

cf. mimicry: Batesian mimicry

► **pseudaposematic coloration** *n.* In some Batesian mimics: Aposematism that involves misleading potential enemies (Lincoln et al. 1985).

syn. pseudoaposematic coloration, pseudaposematism

► **synaposematic coloration** *n.* In some Müllerian mimicry complexes: Aposematic coloration whose warning signal is shared by more than one species (Lincoln et al. 1985).

baby coloration *n.* In many primate species: Coloration of a young that is markedly different from adult coloration, e.g., infant Black Colobus Monkeys are almost completely white while adults are predominantly black (Immelmann and Beer 1989, 162).

cf. dress: juvenile dress

cryptic coloration *n.* In camouflaged animals: Coloration that resembles an animal's substratum, or surroundings, and aids in concealment (Lincoln et al. 1985).

cf. coloration: phaneric coloration; mimicry

directive coloration *n.* A prey's surface markings that divert its predator's attention, attack, or both to nonvital parts of its body (Lincoln et al. 1985).

fighting coloration *n.* For example, in some blennioid-fish, cephalopod, chamaeleonid-lizard, and cichlid-fish species: Coloration taken on by dominant individual animals during and after fights (Heymer 1977, 95).

cf. coloration: submissive coloration

flash coloration *n.* For example, in some Australian katydid and underwing-moth species: Usually hidden coloration that an animal suddenly exposures when threatened (Matthews and Matthews 1978, 336).

gynochromatypic coloration *n.* For example, in some butterfly and dragonfly species: Coloration of a mature adult female with usual color patterns of mature, adult, conspecific females [gynochromatypic coined by Hilton, 1987, 222].

syn. heterochromatic coloration, heterochrome coloration, heteromorphic coloration (Johnson 1964 in Hilton 1987, 221), heteromorphous coloration

cf. mimicry: androchromatypic mimicry

heterochromatic coloration, heterochrome coloration, heteromorphic coloration, heteromorphous coloration See coloration: gynochromatypic coloration.

juvenile coloration See dress: juvenile dress.

nuptial coloration See dress: advertising dress.

- obliterative coloration** See camouflage: countershading.
- phaneric coloration** *n.* Conspicuous coloration (Lincoln et al. 1985).
cf. coloration: cryptic coloration.
- poster coloration** *n.* In some coral fishes: Bright spotted and banded coloration that is used as an assembling signal (Franzisket 1960 in Wilson 1975, 212).
- proaposematic coloration** See coloration: aposematic coloration.
- protective coloration** See coloration: cryptic coloration.
- pseudaposematic coloration** See coloration: aposematic coloration.
- submissive coloration** *n.* In some blennioid-fish, cephalopod, chamaeleonid-lizard, and cichlid-fish species: A coloration, after color change, in subordinate individuals (Ohm 1958 in Heymer 1977, 92).
cf. coloration: fighting coloration
- synaposematic coloration** See coloration: aposematic coloration.
- warning coloration** See coloration: aposematic coloration.
- ♦ **-colous** See -cole.
- ♦ **column raid** *n.* In Army Ants: A raid conducted in branching columns whose termini are each headed by a relatively small group of workers that lay down chemical trails and capture prey (Hölldobler and Wilson 1990, 636).
- ♦ **comb** *n.*
 - In nests of many species of bees and wasps: A layer of brood cells, or cocoons, clustered together in a regular arrangement (Wilson 1975, 581).
Note: *Apis mellifera* (Western Honey Bees) make combs of wax; some vespid-wasp species make combs of paper.
 - In nests of some termite species: A spongy, dark, reddish-brown material made by workers from excreta that is used for making fungus beds (Torre-Bueno 1978).
See nest: wasp nest: comb.
- ♦ **combat dance** See dance: combat dance.
- ♦ **combined-switch-alternative phenotype** See -type, type: phenotype: combined-switch-alternative phenotype.
- ♦ **comfort behavior** See behavior: comfort behavior.
- ♦ **comfort movement** See ²movement: comfort movement.
- ♦ **comfort sucking** *n.* A child's sucking a breast, or rubber nipple, to pacify itself, not because it is hungry (Eibl-Eibesfeldt 1972, Heymer 1974 in Heymer 1977, 40).
cf. behavior: comfort behavior
- ♦ **commensal of civilization** *n.* An animal species that changes its niche by using resources resulting from human activities, *e.g.*, swallows and swifts that originally nested in cliffs and now nest in houses and other buildings (Heymer 1977, 106).
- ♦ **commensalism** See symbiosis: commensalism.
- ♦ **commensalist mimicry** See mimicry: commensalist mimicry.
- ♦ **common** See frequency (table).
- ♦ **common ancestor** See ancestor: common ancestor.
- ♦ **common descent** *n.* Part of Darwin's theory of evolution, proposing that all species evolved from a single, or few, common ancestors, originally stated as, "There is a grandeur in this view of life, with its several powers, having been originally breathed into a

few forms or into one; and that ... from so simple a beginning endless forms most beautiful and most wonderful have been, and are being, evolved" (Darwin, 1859, last text of book).

- ♦ **commonality, principle of** See principle: principle of commonality.
- ♦ **common name** See name: nonscientific name.
- ♦ **commons** *n.* A resource, or habitat, whose depletion, or deterioration, affects all individuals using it to an similar extent regardless of imbalances in the rate that particular individuals deplete or harm it (Wittenberger 1981, 613).
- ♦ **communal breeding** See breeding: communal breeding.
- ♦ **communal courtship** See courtship: communal courtship.
- ♦ **communal sexual display** See display: communal sexual display.
- ♦ **communal sociality** See sociality: communal sociality.
- ♦ **communal song** See animal sounds: song: communal song.
- ♦ **communal territory** See territory: group territory.
- ♦ **commune** *n.* A society, or group, of conspecific organisms that have a social structure and consist of repeated members, or modular units, with a high level of coordination, integration, and genotypic relatedness (Lincoln et al. 1985).
- ♦ **communication** *n.*
 - A person's imparting, conveying, or exchanging ideas, knowledge, or information (Oxford English Dictionary 1972, entries from 1690).
 - Any sort of an animal's anticipatory movement that may signal an activity to another individual, or vocalizations, or gestures, that clearly direct or predicate (Crawford 1939).
Note: "Communication" lacks definition in its application to animal behavior, for it may be stretched to include too much (Crawford 1939).
 - "All procedures by which one [human] mind may affect another" (Shannon and Weaver 1949, 3 in Burghardt 1970, 7).
 - "The discriminatory response of an organism to a stimulus" (Stevens 1950 in Burghardt 1970, 6–7).
 - "The establishment of a social unit from individuals by the use of language or signs" (Cherry 1957 in Marler 1961).
 - Information transfer between, or among, conspecific organisms (Frings and Frings 1964, Diebold 1968 in Burghardt 1970, 8).
 - The "transformation of information from one carrier to another" (Batteau 1968 in Burghardt 1970, 7).
 - One individual organism's using a specialized stimulus-producing mechanism that emits a chemical, or other physical signal, that influences the behavior of a receiving organism which has specialized receptors and responds in a specific manner; communication involves signal, symbolic, and language levels (Tavolga 1968 in Sebeok 1968, 271–275).
 - "Any stimulus arising from one animal and eliciting a response in another" (Scott 1968 in Burghardt 1970, 8).
 - A process in which information is exchanged between individual animals to the mutual adaptive advantage of both (Klopfer and Hatch 1968 in Lewis and Gower 1980, 1).
 - One individual organism's producing a "signal that, when responded to by another organism, confers

some advantage (or the statistical probability of it) to the signaller or his group" (Burghardt 1970, 16).

12. "Action on the part of one organism (or cell) that alters the probability pattern of behavior in another organism (or cell) in an adaptive fashion" (Wilson 1975, 10, 176, 581).

Note: This definition has been criticized because it would define such interspecific interactions, such as those of predators and prey, as communicative (Lewis and Gower 1980, 1).

13. Animal "signal transmission and information exchange as a prerequisite of social behaviour" (Heymer 1977, 192).

syn. understanding

14. "The transmission of a signal or signals between two or more organisms where selection has favoured both the production and reception of the signal(s)" (Lewis and Gower 1980, 2).

Note: "It is impossible to achieve a definition, at once comprehensive and specific, of a term so widely used (and misused)" (Lewis and Gower 1980, 2).

15. "The imparting of information from one organism to another in a way that evokes a detectable response from the recipient at least some of the time" (Wittenberger 1981, 613).

16. Information exchange in which both a signal and response are adaptive (Scott-Phillips 2008 in Barbero et al. 2009, 784).

Note: This is a strict adaptationist definition of biological communication (Barbero et al. 2009, 784).

syn. animal communication, biocommunication (Immelmann and Beer 1989, 51), true communication
cf. animal sounds, kinopsis, ²movement

Comments: Burghardt (1970) discusses problems with many definitions of "communication." McGregor (1997, 754) remarks that it is difficult to find two authors who use the same definition of communication.

chemical communication *n.* In many animal and some plant species: Communication by means of chemical substances, e.g., pheromones, *q.v.*

dance language, dance-language communication *n.* In *Apis mellifera* (Western Honey Bee): A individual's communication of distance and direction of an object, e.g., food or a nesting site (Heymer 1977, 171) with use of signs (Immelmann and Beer 1989, 170).

cf. dance; bee dance; language

Comment: Many behaviorists do not consider this communication to be a language (Immelmann and Beer 1989, 170).

electrical communication, electrocommunication *n.* In Eels, Electric Fish, some catfish species; Rays, and Sharks: Communication using low-frequency, feeble voltage gradients (Möhres 1957; Valone 1970; Black-Cleworth 1970; Kalmijn 1971; Bullock 1973 in Wilson 1975, 239–240; Immelmann and Beer 1989, 85).

flash communication *n.* Communication with light by fireflies and other animals (White 1983, 190).
cf. bioluminescence, Lampyridae (Appendix 1)

instrumental communication See animal sounds: stridulation.

interspecific communication *n.* Communication between, or among, heterospecific animals, e.g., mutualists and songbirds (Immelmann and Beer 1989, 51).

mass communication *n.* Transfer among groups of individuals of information of a kind that cannot be

transmitted from a single individual to another, e.g., spatial organization of army-ant raids, the regulation of numbers of worker ants on odor trails, and certain aspects of thermoregulation of a nest (Wilson 1962a, 1971a, 1975, 193, 588).

mechanical communication *n.* Intraspecific communication among woodpeckers using different pecking patterns as signals (Blume 1967 in Heymer 1977, 93).

cf. animal sounds: drumming

metacommunication *n.*

1. Communication about how further communication should be interpreted, e.g., some primates' emitting a set of social messages that affect the way in which other social messages are interpreted (Ruesch and Bateson 1951 and Ruesch 1953 in Bateson 1955), or the word "advertisement" on an advertisement page in a magazine (C. K. Starr, pers. comm.).
2. An animal's provision of information about the frame of reference within which a subsequent message should be viewed (Lewis and Gower 1980, 5).

modulatory communication *n.* In Ants: Communication that influences a receiver's behavior by not forcing her into a narrowly defined behavioral channel, but by slightly shifting her probability of performing another behavioral act (Hölldobler and Wilson 1990, 640).

nonverbal communication *n.*

1. Human communication without using vocal words (McFarland 1985, 486).
2. In Humans of nonlinguistic means: blushing, crying, crooning, eyebrow flashing, facial expression, gesture, laughing, movement, posture, shouting, smiling, and touching that communicate without words (Immelmann and Beer 1989, 204).

cf. study of: kinesics

Comment: True nonverbal communication does not include systems such as gestural sign languages or whistling languages (Immelmann and Beer 1989, 204).

► **adaptor** *n.* An act of nonverbal communication that also has noncommunication function, e.g., grooming and intention movements (Ekman and Friesen 1969 in McFarland 1985, 486).

► **affect gestures** *n.* Body movements that communicate emotion (McFarland 1985, 486).

► **emblem** *n.* An act of nonverbal communication with a verbal counterpart; e.g., long-distance signaling movements, obscene gestures, and sign language (Ekman and Friesen 1969 in McFarland 1985, 486).

► **illustrator** *n.* An act of nonverbal communication that illustrates points that are also being made verbally (Ekman and Friesen 1969 in McFarland 1985, 486).

► **regulator** *n.* A gesture that controls the flow of conversation between two persons, e.g., head nodding, eye-contact movements, and various body-posture shifts (Ekman and Friesen 1969 in McFarland 1985, 486).

quorum sensing *n.* In many bacterial species: Communication involving secretion and uptake of small signal molecules (Chin and Yeston 2009, 19).

sematectonic communication, stigmergic communication *n.* Communication by means of constructed objects, e.g., sand pyramids of male Ghost Crabs and various portions of the nest structures of social insects (Wilson 1975, 186, 594).

syn. stigmergy, "incited to work," stigmergic communication (Grassé in Wilson 1975, 186)

cf. ³theory: stigmergy theory

[coined by Wilson 1975, according to Downing and Jeanne 1988, 1729, < Greek *sema*, sign, token + *tekton*, craftsman, builder]

trail communication *n.* Communication with a trail pheromone, *e.g.*, in ants (Wilson 1975, 55) and some species of stingless bees (Lindauer and Kerr 1958, 1960; Nedel 1960).

vibrational communication *n.* Communication by substrate vibration, *e.g.*, in larvae of many butterfly species that are symbiotic with ants (DeVries 1990, 1104).

◆ **communication channel** *n.* A means of transmitting information (Wilson 1975, 231–241).

A CLASSIFICATION OF COMMUNICATION CHANNELS

- I. sound
- II. chemical
 - A. taste
 - B. smell
 - C. toxin
 - D. vomeronasal
- III. electricity
- IV. surface wave
- V. touch
- VI. sight
 - A. movement
 - B. posture
 - C. color (UV through red)
 - D. poster

◆ **communication system** See ¹system: communication system.

◆ **communication triad** *n.* Communication that includes a signal and a female's and male's response toward it [coined by Morris and Ryan 1996, 1017].

Comments: After studying communication triads in *Xiphophorus* sp. (swordtail fish), Morris and Ryan (1996) suggest that male response to a male signal (= vertical body bars) coevolved more closely than female response to this signal.

◆ **¹community** *n.*

1. "A body of men living in the same locality" (Oxford English Dictionary 1972, entries from 1600).
2. "The people of a country (or district) as a whole; the general body to which all alike belong, the public" (Oxford English Dictionary 1972, entries from 1789).

◆ **²community** *n.*

1. "An assemblage of populations living in a prescribed area" (Krebs 1985, 458); heterospecific populations that co-inhabit that same site, *e.g.*, a dung pat, forest leaf litter, or a pond (Taylor 1992, 52).

Note: Some ecologists claim that a community has one, or more, of these attributes: species co-occurrence, conspecific-group reoccurrence, and homeostasis or self-regulation (Krebs 1985, 458).

2. Any group of heterospecific organisms that co-occur in the same habitat, or area, and interact through trophic and spatial relationships; typically characterized by reference to one, or more, dominant species (Lincoln et al. 1985).

3. A group of species that are frequently found together in a geological stratum (Lincoln et al. 1985).

4. A collection of species that occur in the same place at the same time (Fauth et al. 1996, 283).

syn. biological community, biotic community (Lincoln et al. 1985)

cf. biocenose; biome; biorealm; -bios; biota; biotope; -coenosis; -cole; ditch; flora; fauna; group: assemblage, ensemble; group: kingdom; guild; habitat; ¹-phile; ²succession; vegetation; waste ground

Comments: Odum (1969, 245) indicates that "community" is and should remain a broad term that may be used to designate natural assemblages of different sizes from the biota of a log through that of a vast forest. The concept of "community" is one of the more important ones in ecology (Odum 1969, 246). Communities are named and classified according to their (1) major structural features such as dominant species, life forms, or indicators, (2) physical habitats, or (3) functional attributes such as the type of community metabolism (Odum 1969, 253). Functional attributes, rather than structural features, offer a better basis for comparison of all communities according to Odum (1969). Fauth et al. (1996, 285) demonstrate that authors of some more current ecology textbooks define communities by space, time, organism interactions, and taxa; including the first 2, 3, or all 4 subjects in their definitions.

With regard to classification of plant communities, for example, Kuchler (1964) divides the vegetation of the conterminous U.S. into 116 named kinds; Brush et al. (1976) divide the vegetation of Maryland into tidal marsh and 15 associations; and Olson (1979) classifies the vegetation of New-Jersey pine barrens into six major vegetational types each with 1 through 4 divisions.

The organismic school holds that communities are integrated units with discrete boundaries, and the opposing individualistic school holds that communities are not integrated units but collections of heterospecific populations that require the same environmental conditions (Krebs 1985, 458). Data generally support the individualistic interpretation more than the organismic interpretation; however, allelopathic effects of plants within some communities may cause them to evolve as a functionally organized units (Callaway and Aschehoug 2000, 521). Communities grade continuously in space and time, and species groups are not consistent from place to place. Community classification is for convenience and is not a description of the fundamental structure of nature.

Plant ecology now tends to use "community" descriptively; explanations, especially evolutionary ones, are now advanced in terms of populations or population variants (Taylor 1992, 54). Plant communities in South Africa are grassland, forest, fynbos, nama karoo, savanna, succulent karoo, and thicket (Becker 1997: 10). The Michigan Natural Features Inventory delineates 76 natural communities in Michigan (Michigan.gov., 2009). Many of the large number of kinds of communities that have been named are defined below.

acrophyta, acrophyta *n. pl.* "Plant communities of alpine regions" (Lincoln et al. 1985).

cf. ²community: acrophyta, coryphium, krummholtz, orohylile community, orophytum, orothamnic community

actium *n.* A rocky-shore community (Lincoln et al. 1985).

cf. ²community: actium, petrochthium, phellium, promunturium, psamathium

- aestidurilignosa** See ²community: mixed forest.
- aestilignosa** *n.* Broadleaf-deciduous bush and woodland vegetation of temperate regions that experiences alternating periods of mild, damp and cold, dry climate (Lincoln et al. 1985).
cf. ²community: forest
- aestatiruticeta** *n.* A deciduous-bush community of an aestilignosa (Lincoln et al. 1985).
- aestatisilvae** *n.* A deciduous-woodland community of the aestilignosa (Lincoln et al. 1985).
cf. ²community: forest
- agium, aigialium** *n.* "A beach community" (Lincoln et al. 1985).
- agrion** *n.* A community on cultivated land or land subject to human activities (Lincoln et al. 1985).
syn. culture community (Lincoln et al. 1985)
- aithallium** *n.* An evergreen-thicket community (Lincoln et al. 1985).
cf. ²community: thicket
- alsium** *n.*
 1. A grove community (Lincoln et al. 1985).
 2. An area with trees and grasses (Lincoln et al. 1985).*cf.* ²community: forest
- amanthium, amathium** *n.* A sandhill, or plain, community (Lincoln et al. 1985).
cf. ²community: drimium, Jack Pine plain; habitat: prairie
- ammochthium** *n.* "A sandbank community" (Lincoln et al. 1985).
- ancium** *n.* A canyon-forest community (Lincoln et al. 1985).
cf. ²community: forest
- anemodium, anemium** *n.* A blowout community (Lincoln et al. 1985).
- aquiherbosa** *n. pl.* The herbaceous communities of ponds and swamps, subdivided into emer-siherbosa, sphagniherbosa, and submersiherbosa (Lincoln et al. 1985).
- ardium** *n.* A succession that follows irrigation (Lincoln et al. 1985).
- aufwuchs** See ²community: periphyton.

SOME CLASSIFICATIONS OF BENTHOS

- I. Classification by size
 - A. macrobenthos
 - B. meiobenthos
 - C. microbenthos
- II. Classification by habitat
 - A. endobenthos
 - B. epibenthos
 - C. haptobenthos
 - D. herpobenthos
 - E. hyperbenthos (*syn.* suprabenthos)

benthos *n. pl.*

1. The organisms that live on the sea bottom; distinguished from plankton, *q.v.* (Lincoln et al. 1985).
2. Organisms attached to, or living on, in, or near a sea bed, river bed, or lake floor (Lincoln et al. 1985).

syn. benthon (Lincoln et al. 1985)

adj. -benthic, benthonic

Comment: Ali and Lord (1980) refer to "benthic invertebrates" which they collected from fresh-water ponds. [Greek *benthos*, depth of the sea]

- **endobenthos** *n.* Organisms living within the sediment on a sea bed or lake floor; contrasted with epibenthos, haptobenthos, herpobenthos, and hyperbenthos (Lincoln et al. 1985).
syn. infauna (Lincoln et al. 1985)

Comments: Endobenthos are more common in subtidal and deeper zones in marine habitats; some endobenthos make burrows or tubes (Allaby 1994).

- **epibenthos** *n.* Organisms living on the substratum surface of a sea bed or lake floor; contrasted with endobenthos, haptobenthos, herpobenthos, and hyperbenthos (Lincoln et al. 1985).

- **geobenthos** *n.* All terrestrial life (Lincoln et al. 1985).

cf. ²community: benthos: phytobenthos; habitat: geobenthos

- **haptobenthos** *n.* Benthos that live closely applied to, or growing on, submerged surfaces; contrasted with endobenthos, epibenthos, herpobenthos, and hyperbenthos (Lincoln et al. 1985).

- **herpobenthos** *n.* Benthos growing, or moving, through muddy sediments; contrasted with endobenthos, epibenthos, haptobenthos, and hyperbenthos (Lincoln et al. 1985).

- **hyperbenthos, suprabenthos** *n.* Benthos that live above, but close to a substratum; contrasted with endobenthos, epibenthos, haptobenthos, and herpobenthos (Lincoln et al. 1985).

- **macrobenthos** *n.* The larger benthos that are over 1 mm long; contrasted with meiobenthos and microbenthos (Lincoln et al. 1985).

- **meiobenthos** *n.* Benthos that pass through a 1-mm mesh sieve but are retained by a 0.1-mm mesh; contrasted with macrobenthos and microbenthos (Lincoln et al. 1985).

- **microbenthos** *n.* Microscopic benthos which are less than 0.1 mm long; contrasted with macrobenthos and meiobenthos (Lincoln et al. 1985).

- **nectobenthos, nektobenthos** *n.* Organisms typically associated with benthos that swim actively in a water column at certain periods (Lincoln et al. 1985).

- **phytobenthos** *n.* "A bottom-living plant community" (Lincoln et al. 1985).

cf. habitat: phytobenthos

syn. phytobenthon (Lincoln et al. 1985)

- **rhizobenthos** *n.* The organisms that are rooted in a substratum (Lincoln et al. 1985).

biome See biome under B in this book.

biotic community See ²community.

biotic succession See ²succession.

carpolochmum See ²community: lochmum.

chalicum, chalicodium *n.* A plant community of gravel-slide habitats (Lincoln et al. 1985).

chaparral *n.* Fire-adapted trees, including, some oak (*Quercus*) and pine (*Pinus*) spp. and shrubs, including *Arctostaphylos* spp. (Manzanitas), *Ceanothus* spp., and *Cytisus scoparius* (Common Broom), usually growing in dense thickets in California and southwest and northern Mexico (Kricher and Morrison 1993, 336–344).

syn. little oak (Spurr and Barnes 1980, 593)

Comment: Fires frequently burn chaparral areas (Walker 1990, 250).

[Mexican Spanish (more specifically Basque) *chapara*, evergreen scrub oak (Walker 1990, 250)]

- cheradium** *n.* “A sandbar community” (Lincoln et al. 1985).
- chersium** *n.* A dry-wasteland plant community (Lincoln et al. 1985).
- chionium** *n.* A plant community that is associated with snow (Lincoln et al. 1985).
- ♦ **chledum**
n. “A plant community on waste ground or rubbish heaps” (Lincoln et al. 1985).
- climax** *n.* A more, or less, stable biotic community that is in equilibrium with existing environmental conditions and represents the terminal stage of an ecological succession (Lincoln et al. 1985).
syn. formation (sometimes) (Lincoln *n.* et al. 1985)
- **biotic climax** *n.* A plant community that is maintained at climax by a biotic factor, *e.g.*, grazing (Lincoln et al. 1985).
- **climatic climax, regional climax** *n.* A more, or less, stable community in which the major factors affecting vegetation are climatic, typical of zonal soils (Lincoln et al. 1985).
- **consociation** *n.* A small climax community, or vegetative unit, dominated by one particular species (the physiognomic dominant) that has the life form characteristic of its association (Lincoln et al. 1985).
- **disclimax** *n.*
 1. “A disturbed climax” (Lincoln et al. 1985).
 2. A succession that is maintained below climax by rapid expansion of introduced species, climatic instability, fire, grazing, human activities, or a combination of these things (Lincoln et al. 1985).
- **edaphic climax, soil climax** *n.* A more, or less, stable community whose structure and composition are determined largely by soil, or substratum, properties (Lincoln et al. 1985).
- **panclimax, panformation** *n.* Two, or more, related climaxes having similar dominants, life forms, and climatic factors (Lincoln et al. 1985).
- **paraclimax** See ²community: climax: proclimax, subclimax.
- **plagioclimax** *n.* A climax formed following the deflection of an ecological succession by human activity or influence (Lincoln et al. 1985).
- **physiographic climax** *n.* A climax that is determined largely by topographic and edaphic factors (Lincoln et al. 1985).
- **polyclimax** *n.* A compound climax that occurs within a particular climatic region and comprises a number of local edaphic climaxes (Lincoln et al. 1985).
- **postclimax** *n.* A climax that ordinarily occurs in more mesic conditions than present ones and considered to be a remnant of an earlier climatic climax (Lincoln et al. 1985).
cf. ²community: climax: preclimax
- **preclimax** *n.* A climax occurring in more xeric conditions than present ones and often considered to be a seral stage preceding attainment of a climatic climax (Lincoln et al. 1985).
cf. ²community: climax: postclimax
- **proclimax, paraclimax, subclimax** *n.*
 1. A stage in an ecological succession that replaces a typical climatic climax (Lincoln et al. 1985).
 2. A stable plant community that reflects favorable local variations in edaphic, or biotic, factors (Lincoln et al. 1985).
 See ²community: climax: subclimax.

- **prochosium** *n.* An ecological succession that occurs on an alluvial soil (Lincoln et al. 1985).
- **regional climax** See ²community: climax: climatic climax.
- **serclimax** *n.* A stable plant community that persists at a stage before a subclimax (Lincoln et al. 1985).
- **socies** *n.* A sere with at least one dominant species (Lincoln et al. 1985).
- **soil climax** See ²community: climax: edaphic climax.
- **stasium** *n.* “A stagnant-water community” (Lincoln et al. 1985).
- **subclimax, paraclimax** *n.* A state in a succession that precedes a final, or climax, community and is prevented from attaining its full development by one, or more, edaphic, or biotic, factors (arresting factors) (Lincoln et al. 1985).
 See ²community: climax: proclimax.
- **zootic climax** *n.* A stable climax whose structure and composition depend upon continued grazing or other stress from animal use (Lincoln et al. 1985).
- closed community, closed association** *n.* A plant community that covers the entire ground area of a habitat and effectively prevents establishment of other species (Lincoln et al. 1985).
- clusium, clysum** *n.* A succession on flooded soil (Lincoln et al. 1985).
- coenosium** *n.* “A plant community” (Lincoln et al. 1985).
- coniferous forest** *n.* A forest dominated by coniferous trees (Voss 1972, 18).
syn. conophorium (Lincoln et al. 1985).
cf. ²community: forest
- conifruticeta** *n.* “A forest dominated by coniferous shrubs” (Lincoln et al. 1985).
cf. ²community: forest
- conilignosa** *n.* “A forest dominated by trees and shrubs with needle-like foliage” (Lincoln et al. 1985).
cf. ²community: forest
- conodrymium** *n.* An evergreen-plant community (Lincoln et al. 1985).
- conophorium** See ²community: coniferous forest.
- conisilva** See ²community: coniferous forest.
- consocies** *n.*
 1. A successional stage (Lincoln et al. 1985).
 2. Part of an association that lacks one, or more, of its dominant species (Lincoln et al. 1985).
 3. “A group of mores” (Lincoln et al. 1985).
cf. sere
- coryphium** *n.* An alpine-meadow community (Lincoln et al. 1985).
cf. ²community: acrophytia, meadow
- crennium, cremnon** *n.* A plant community that is associated with cliffs (Lincoln et al. 1985).
- crenium** *n.* A plant community that is associated with spring water (Lincoln et al. 1985).
- crymadium, crymophilum** *n.* A plant community of a polar region (Lincoln et al. 1985).
- culture community** See ²community: agrium.
- dendrium** *n.* “An orchard community” (Lincoln et al. 1985).
cf. ²community: orchard
- deciduous forest, hardwoods, hemlock-hardwoods** *n.* A Michigan forest dominated by *Acer saccharum* (Sugar Maple), *Fagus grandifolia* (American Beech), and associated trees and with

some coniferous trees, especially *Tsuga canadensis* (Eastern Hemlock) (Voss 1972, 18).

cf. ²community: forest, ptenophyllum

dendrium See ²community: orchard.

drimium *n.* An alkaline-plain, or salt-basin, plant community (Lincoln et al. 1985).

cf. ²community: amanthium

driodium See ²community: lochmum: carplochmum.

drymium *n.* "A woody plant community" (Lincoln et al. 1985).

dyticon *n.* "An ooze-inhabiting community" (Lincoln et al. 1985).

ecological succession See ²succession.

elfin forest *n.* A forest of higher elevations in warm moist regions that has stunted trees with abundant epiphytes (Lincoln et al. 1985).

See ²community: krummholz.

cf. ²community: forest

eluvium *n.* A sand-dune community (Lincoln et al. 1985).

eremium *n.* "A desert community" (Lincoln et al. 1985).

forest *n.* A large group of trees and associated organisms (pers. obs.).

syn. hylium, hylon, wood, woods (Michaelis 1963; Voss 1972, 18)

See habitat: forest, grove.

adj. forest, sylvan

cf. ²community: aestilignosa, aestatisilvae, alsium,

ancium, bog forest, coniferous forest, conifruiticeta,

conilignosa, deciduous forest, elfin forest, helodium,

helohylium, hylodium, Jack-Pine plain, jungle, krum-

mholz, mangrove, mixed forest, northern evergreen

forest, northern hardwoods, orchard, orgadium,

orohylile community, pleurilignosa, ptenophyl-

lium, rain forest, shale barren: shale-barren wood-

land, swamp, therodrymium, thicket, tropodrymium,

woodland, wood, xerohylium; fossil: petrified forest

Comments: Forest researchers have devised many classifications of forest types, but no universally adopted classification (Spurr and Barnes 1980, 573). Forest names derive from things including dominant-tree species, historic names, latitude, moisture availability, percentage of kind of trees (broadleaf and conifers), physiognomy (tree density), specific geographic location, structure (evergreen, deciduous, thorn), and combinations of these characters. Physiognomic-structural classifications are useful for analysis at different levels. There is and can be no compartmentalized classification scheme of vegetation types that can set up mutually exclusive divisions because each geographical area has its own peculiar history and each species and genus has its own particular distribution.

Some phytogeographers divide Earth's forests into four kingdoms subdivided into provinces, sectors, and districts (Spurr and Barnes 1980, 574).

Hammond, Inc. (1978) divides world forests into two types and 6 subtypes. Spurr and Barnes (1980, 579) divide world forests into two types, six subtypes, and 20 subsubtypes. Kricher and Morrison (1988, 1993) divide U.S. forests into nine main types and about 50 subtypes. Strausbaugh and Core (1978) divide West Virginia forests into three main types and six subtypes. Brown and Brown (1972) divide Maryland forests into three main types, three subtypes, and two subsubtypes.

NatureServe (<http://www.natureserve.org/>) lists many kinds of forests and other communities in its searchable database. The Council of Europe Commission of the European Communities (1987) describes many kinds of European forests.

[Old French < Medieval Latin (*silva*) *foresta*, an unenclosed (wood) < Latin *foris*, outside]

Huarango Forest *n.* A forest of Peru's southern coast that is dominated by the long-lived tree *Prosopis pallida* (Huarango) (Kew Gardens 2009, Romero 2009).

Comment: This is a highly threatened ecosystem due to human felling of *P. pallida* for charcoal and firewood (Kew Gardens 2009). This forest helps to prevent desertification and is a principal refuge for biodiversity within a large area of hyper-arid desert.

fynbos *n.* A plant community in South Africa (Becker 1997, 10–11).

syn. Cape Floral Kingdom (Becker 1997, 10; Boroughs 1999, 17)

Comments: The fynbos is about 3 Ma old and comprises about 17,000 mi² of the Southern and Southwestern Cape in the southernmost tip of Africa (Becker 1997, 10–11). It occurs on dry, poor soil, and has frequent fires. The fynbos is a world biodiversity hotspot with its 7,000 plant species and the highest known concentration of plant species per unit area with about 1,300 per 4,000 mi². The south American rain forest is the runner up to this record with 400 plant species per 4,000 mi². The alien, invasive Argentine Ant is changing the community structure of the fynbos (Christian 2001, 635).

[Dutch *fynbos*, fine bush, fine-leaved plants]

geobenthos See ²community: benthos: geobenthos.

geosere *n.* A series of climax formations in a particular area through geological time (Lincoln et al. 1985).

cf. succession: geosere

halodrymium See ²community: mangrove.

heath barren *n.* A more, or less, dense growth of ericaceous shrubs and other low growing plants on a mountain top in West Virginia (Strausbaugh and Core 1978, x).

cf. ²community: Jack-Pine plain, orothamnic community, xeropoium; habitat: shale barren

heliophytum *n.* A plant community that thrives in full sunlight (Lincoln et al. 1985).

helium *n.* "A marsh community" (Lincoln et al. 1985).

cf. habitat: marsh

helodium, helorgadium *n.* An open-swampy-woodland community (Lincoln et al. 1985).

helodrium *n.* A swamp-thicket community (Lincoln et al. 1985).

helohylium *n.* A swamp-forest community (Lincoln et al. 1985).

cf. ²community: forest

helolochmium *n.* A meadow-thicket community (Lincoln et al. 1985).

cf. ²community: meadow, thicket

helorgadium See ²community: helodium.

herbosa *n. pl.* "Communities of grasses and herbs" (Lincoln et al. 1985).

syn. herbaceous vegetation (Lincoln et al. 1985)

hydrophtyhum *n.* A bog, or swamp, plant community (Lincoln et al. 1985).

cf. habitat: bog

hydrocarbon-seep community *n.* An oceanic community characterized by dense assemblages of clams, crabs, eels, fish, shrimp, snails, vestimentiferan worms (= tube worms), and other organisms that live in areas rich in gas and oil seepage (Kennicutt et al. 1985, 351).

cf. ²community: thalassium

Comments: The organisms if this community are similar to those of hydrothermal-vent communities, *q.v.* (Kennicutt et al. 1985, 351). Hydrocarbon-seep communities occur on the Louisiana continental slope, U.S.

hydrothermal-vent community *n.* An oceanic community characterized by dense assemblages of large clams, mussels, and vestimentiferan worms (= tube worms) that live in hydrothermal-vent areas and thrive on chemosynthetic microbial production (Grassle 1985).

cf. ²community: thalassium; ¹-phile: hyperthermophile
Comments: The first hydrothermal-vent community was discovered in 1977 off the Galápagos Islands (Broad 1993, 2 November, C1, C12). Other such communities are found at the base of the Florida Escarpment and the Guaymas Basin (Kennicutt et al. 1985, 351). The vents are fissures where the oceanic tectonic plates are moving apart. Other members of this community include several species of corals, galatheid crustaceans, hyperthermophiles, palm worms, sea anemones, and spider crabs.

hygrodrymium See ²community: rain forest.

hygrophorbium *n.* A moist-pasture, fenland, or low-moorland community (Lincoln et al. 1985).

hygrospaghnum *n.* A high-moor community (Lincoln et al. 1985).

hylium, hylion See ²community: forest.

hylodium *n.* A dry-open-woodland community (Lincoln et al. 1985).

cf. ²community: forest

infauna See ²community: benthos; endobenthos.

isocoenoses *n. pl.* Communities of plants and animals that have similar life forms (Lincoln et al. 1985).

isocommunity *n.* "A community that shows a close structural and ecology resemblance to another natural community" (Lincoln et al. 1985).

Jack Pine plain, Jack Pine barren *n.* A Michigan forest dominated by sparse through sometimes dense stands of *Pinus banksiana* (Jack Pine) and sometimes *Populus tremuloides* (Trembling Aspen) (Voss 1972, 19).

cf. ²community: amanthium, forest, heath barren

Comment: Sites of Jack Pine plains were once forested by *Pinus resinosa* (Red Pine), *Pinus strobus* (White Pine), or both (Voss 1972, 19).

jungle *n.*

1. A dense tropical thicket of high grass, reeds, vines, brush, trees, or a combination of these plants, "choked with undergrowth, and usually inhabited by wild animals" (Michaelis 1963).
2. "Any similar tangled growth" (Michaelis 1963).
3. Dense seral vegetation especially characteristic of tropics with high precipitation (Lincoln et al. 1985).

cf. ²community: forest, thicket

[Hindustani *jangal*, desert, forest < Sanskrit *jangala*, dry, desert]

krummholz *n.* A discontinuous belt of stunted forest, or scrub, typical of windswept alpine regions close to tree lines (Lincoln et al. 1985).

cf. ²community: acrophytia, forest

Comments: Krummholz (*syn.* finwood) can also mean an individual dwarfed tree (Walker 1990, 137). Cold, hail, ice, lightning, snow, and wind cause krummholz trees. Electrical discharges strike trees causing them to exhibit odd shapes.

[German *Krummbolz*, *krumm*, stunted; *holz*, wood; dwarf mountain pine, knee timber, scrub]

limnium *n.* "A lake community" (Lincoln et al. 1985).

lochmrium *n.* "A thicket community" (Lincoln et al. 1985).

cf. thicket

► **carpolochmium, driodium, lochmodium, xerodrymium** *n.* A dry-thicket community (Lincoln et al. 1985).

cf. ²community: thicket

lochmodium See ²community: lochmrium: carpolochmrium.

lophium *n.* "A hill-top community" (Lincoln et al. 1985).

major community *n.* A community that is of sufficient size and completeness of organization that it is relatively independent of adjoining communities and requires only sun energy from the outside; contrasted with minor community (Odum 1969, 245).

mangrove, mangle, halodrymium *n.* A tidal-salt-marsh community dominated by trees and shrubs, especially *Rhizophora* spp., many of which produce adventitious aerial roots (Lincoln et al. 1985).

Comment: *Rhizophora mangle* (Red Mangrove, fig. 25) is common in a swamp forests in Everglades National Park, Florida, U.S., and other locations.

cf. ²community: forest

maquis *n.* Shrubby, mostly evergreen plants in the Mediterranean region, known as cover for bandits and game (Michaelis 1963).

See habitat: maquis

syn. *macchia* (Michaelis 1963); matorral (Council of Europe Commission of the European Communities 1987, 57)

[French < Italian *macchia*, thicket, originally spot < Latin *macula*, spot]

Metasequoia Flora *n.* The rich flora associated with living *Metasequoia glyptostroboides* (Dawn Redwood) in a 800-km² area of southern China (Hu 1980, 41).

Comments: There are at least 550 species of vascular plants (including *Ginkgo biloba*) in 301 genera of 127 families in this flora (Hu 1980, 47–51, 64). It is a well-preserved ancient flora; all of its gymnosperm genera have fossil records in the Tertiary Era and some in the Mesozoic Era. Many of the Flora's angiosperm lineages trace back to the Tertiary. A main region of the Flora (Shui-sa-pa = *Metasequoia* Area) is at an elevation of 1,050 m, in a flat-floored valley in a mountainous plateau. Most of the precipitation of the area occurs in June through August. Its temperature and total precipitation is comparable to that of the coastal plain of Georgia, U.S.

mictium *n.* A heterogenous assemblage of species that often occurs in a transition zone between different vegetation stands and often results from the inter-spersion of two, or more, seres, and has the dominant species of each equally represented (Lincoln et al. 1985).

minor community *n.* A community that is more, or less, dependent on neighboring communities for

energy; contrasted with major community (Odum 1969, 245).

mixed forest, mixed woods *n.* A forest with substantial proportions of both coniferous and non-coniferous trees (Voss 1972, 18).

syn. *aestidurilignosa*

cf. ²community: forest

orchard *n.* A growth of dwarf trees that are twisted, gnarled, or both, and merges into northern hardwoods and grassy balds in West Virginia, U.S. (Strausbaugh and Core 1978, x).

cf. ²community: dendrium; habitat: orchard

namatium *n.* A brook community; a stream community (Lincoln et al. 1985).

northern-evergreen forest *n.* A high-elevation Appalachian forest, that is dominated by *Abies balsamea* (Balsam Fir) and *Picea rubra* (Red Spruce) and is generally at an elevation above 3,000 ft in West Virginia, U.S. (Strausbaugh and Core 1978, viii).

cf. ²community: forest

northern hardwoods *n.* A forest dominated by *Acer saccharum* (Sugar Maple), *Betula lenta* (Yellow Birch), and *Fagus grandifolia* (American Beech) present in a zone from about 2,500 through 3,000 ft of elevation in West Virginia, U.S. (Strausbaugh and Core 1978, ix).

cf. ²community: forest

ochthium *n.* "A bank community" (Lincoln et al. 1985).

olisthium, olisthion *n.* "A landslip community" (Lincoln et al. 1985).

open community *n.* "A community that is open to invasion by immigrant species" (Lincoln et al. 1985).

opium *n.* "A parasite community" (Lincoln et al. 1985).

orgadium *n.* An open-woodland community (Lincoln et al. 1985).

cf. ²community: forest

orohylile community *n.* An alpine-, or subalpine-, forest community or habitat (Lincoln et al. 1985).

cf. ²community: acrophytia, forest

orophytum *n.* A subalpine-plant community (Lincoln et al. 1985).

cf. ²community: acrophytia

orothamnic community *n.* An alpine-heath community (Lincoln et al. 1985).

cf. ²community: acrophytia, heath barren

oryctocoenosis, oryctocoenose *n.*

1. An outcrop community or assemblage of fossils (Lincoln et al. 1985).

2. The part of a thanatocoenosis preserved as fossils (Lincoln et al. 1985).

oxodium, oxodic community, oxodion, oxylium *n.*

1. A humus-marsh community (Lincoln et al. 1985).

2. A peat-bog community (Lincoln et al. 1985).

cf. habitat: bog, marsh

paleobiocoenosis, palaeobiocoenosis, paleocoenosis, paleocoenesis *n.* A fossil-organism assemblage that once existed as an integrated community (Lincoln et al. 1985).

paleocommunity, palaeocommunity *n.* "All preservable taxa comprising a fossil community" (Lincoln et al. 1985).

paleothanatocoenosis, palaeothanatocoenosis *n.* A group of organisms buried together in the geological past (Lincoln et al. 1985).

panclimax See ²community: climax.

panformation See ²community: climax: panclimax.

paraclimax See ²community: climax: subclimax.

pelagium *n.* "A sea-surface community" (Lincoln et al. 1985).

cf. ²community: pontium

pelochthium *n.* "A mud-bank community" (Lincoln et al. 1985).

periphyton, aufwuchs *n. pl.* **periphyta** A community of organisms and associated detritus adhering to and forming a surface coating on stones, plants, and other submerged objects (Lincoln et al. 1985).

Comment: Algae are often common in periphyta, and these algae may have different physognomies (Wellnitz and Ward 2000).

[German *Aufwuchs*, growth]

petrochthium *n.* "A rock-bank community" (Lincoln et al. 1985).

cf. ²community: actium

petridium *n.* A boulder-field, or ravine, community (Lincoln et al. 1985).

cf. ²community: actium

phellium *n.* "A rock-field community" (Lincoln et al. 1985).

cf. ²community: actium

phretium *n.* A water-tank community (Lincoln et al. 1985).

physically controlled community *n.* A community formed under high physiological stress and controlled largely by physical fluctuations and unfavorable physical conditions (Lincoln et al. 1985).

cf. hypothesis: stability-time hypothesis

phytobenthos, phytobenthon See ²community: benthos: phytobenthos.

phytocoenosis *n.*

1. A plant community (phytocenose in Kühler 1964, 1).

2. All plants of a given habitat or community (Lincoln et al. 1985).

3. In plant communities, a syntaxon composed of one, or more, synusiae (Lincoln et al. 1985).

Comments: Kühler (1964) identified 113 plant communities in the conterminous U.S.

[Greek *phyton*, plant + *koinos*, common]

phytoedaphon *n.* "Soil flora" (Lincoln et al. 1985).

phytoma, phytome *n. pl.* **phytomata** *n.* A plant community (Lincoln et al. 1985).

pioneer *n.* The first community to colonize, or recolonize, a barren, or disturbed, area, and which thereby starts a new succession (Lincoln et al. 1985).

cf. ²species: pioneer

plagioclimax See ²community: climax: plagioclimax.

pleuriilignosa, pluviilignosa *n.* A rain forest or rainbush community (Lincoln et al. 1985).

cf. ²community: forest, rain forest

pluviilignosa See ²community: pleuriilignosa.

pnoium *n.* "A ecological succession on an aeolian soil" (Lincoln et al. 1985).

poium *n.* "A meadow community" (Lincoln et al. 1985).

cf. ²community: coryphium, helolochmium, pratum, telmatium

polyclimax See ²community: climax: polyclimax.

pontium *n.* A deep-sea community (Lincoln et al. 1985).

cf. community: pelagium

postclimax See ²community: climax: postclimax.

potamium *n.* “A river community” (Lincoln et al. 1985).

pratum *n.* A meadow, or grassy-field, community (Lincoln et al. 1985).

cf. ²community: poium; habitat: field, meadow

preclimax See ²community: climax: preclimax.

proclimax See ²community: climax: proclimax.

promunturium *n.* A rocky-seashore community (Lincoln et al. 1985).

cf. ²community: actium

psamathium *n.* “A strandline community of a sandy seashore” (Lincoln et al. 1985).

cf. ²community: actium

psilium *n.* A prairie, or savanna, community (Lincoln et al. 1985).

cf. habitat: prairie, savanna

ptenophyllum *n.* A deciduous-forest community (Lincoln et al. 1985).

ptenothalium *n.* A deciduous-thicket community (Lincoln et al. 1985).

cf. ²community: thicket

pyrium *n.* “An ecological succession following fire or burn-off” (Lincoln et al. 1985).

rain forest, rainforest *n.* A forest with luxuriant tree growth and very high annual precipitation.

► **temperate rain forest** *n.* A rain forest in a temperate region; contrasted with tropical rain forest (Smith 1996, 265).

Comments: Rainfall in a temperate rain forest can exceed 600 cm per yr (Smith 1996, 265). Coniferous trees dominate temperate rain forests. They include forests along the Pacific Coast from Southern Alaska and Canada (Tongass National Forest, *q.v.*) through Washington State (The Olympic National Forest) and Redwood forests in California.

► **tropical rain forest** *n.* A rain forest in a tropical region; contrasted with temperate-rain forest, tropical dry forest, and tropical-season forest (Smith 1996, 281).

syn. *hygromyrtum* (Lincoln et al. 1985), rainforest (Golden Turtle Press 1997), rain forest (Morris 1982). *cf.* ²community: forest, pleuriilignosa

Comments: Tropical rain forests have at least 245 cm of rain per yr (Lincoln et al. 1985), come in about 40 different types, cover less than 2% of Earth's surface, may have up to 50% of Earth's species (as many as 30 million species), and are disappearing at about 150 acres per min due to human activities (Smith 1996, 281; Golden Turtle Press 1997, 2). The Amazon rain forest is the largest one. Types of tropical rain forests include equatorially-lowland tropical rain forest, evergreen-mountain forest, evergreen-savanna forest, monsoon forest, and tropical-evergreen-alluvial forest (Smith 1996, 281). Tropical rain forests are biologically characterized by being evergreen, containing many tree species that grow up to 30 m tall, having very high species numbers, numerous epiphytic plant species, and thick-stemmed woody vines (lianas) (Allaby 1994). These forests commonly have four intergrading plant strata.

[coined by A. F. W. Schimper, German botanist, in 1898 as *tropische Regenwald* (Allaby 1994; Smith 1996, 281).

repium, rhepium *n.* An ecological succession on soil that is subject to subsidence (Lincoln et al. 1985).

rhepium See ²community: repium.

rhioium *n.* “A creek community” (Lincoln et al. 1985).

rhyacium *n.* “A torrent community” (Lincoln et al. 1985).

rhygium, rhysion *n.* “An ecological succession following volcanic activity” (Lincoln et al. 1985).

saprium *n.* “A saprophyte community” (Lincoln et al. 1985).

sciophytium *n.* “A shade community” (Lincoln et al. 1985).

seminatural community *n.* A community that is modified by human activities (Lincoln et al. 1985).

serclimax See ²community: climax: serclimax.

soil climax See ²community: climax: edaphic climax.

soil climax See ²community: climax: edaphic climax.

sphagniherbosa *n.* A plant community dominated by *Sphagnum* growing on peat (Lincoln et al. 1985).

cf. community: aquiherbosa

steganochamaephytum *n.* A community of dwarf shrubs under trees (Lincoln et al. 1985).

sterrium *n.* A moorland community (Lincoln et al. 1985).

subclimax See ²community: climax: subclimax.

suprapelos *n.* Aquatic organisms that swim above soft mud that are dependent upon this substratum as a food source (Lincoln et al. 1985).

suprapsammon *n.* Aquatic organisms that swim above sand and are dependent upon this substratum as a food source (Lincoln et al. 1985).

synusia *n. pl.* **synusiae** A community of species with a similar life form and ecological requirements (Lincoln et al. 1985).

See habitat: synusia.

syrtidium *n.* “A dry sand-bar community” (Lincoln et al. 1985).

taphrium *n.* “A ditch community” (Lincoln et al. 1985).

telmatium, telmatherium *n.* A wet-meadow, or marsh, community (Lincoln et al. 1985).

cf. habitat: meadow

thalassium *n.* “A marine-plant community” (Lincoln et al. 1985).

cf. ²community: hydrothermal-vent community, habitat: sandy beach

thermum *n.* A hot-spring community (Lincoln et al. 1985).

therodrymium *n.* “A leafy-forest community” (Lincoln et al. 1985).

cf. ²community: forest

thicket *n.* A dense growth of shrubs, underwood, and small trees; a place where low trees, or bushes, grow thickly together (Oxford English Dictionary 1972, entries from *ca.* 1000).

syn. brake (Oxford English Dictionary 1972), coppice (Michaelis 1963)

See habitat: thicket.

cf. ²community: aithallium, forest, helolochmum, jungle, lochmum, ptenothalium

tiphium *n.* A pond, or pool, community (Lincoln et al. 1985).

tropodrymium *n.* A savanna-forest community (Lincoln et al. 1985).

cf. ²community: forest

varzea *n.* An area of rain forest that is partially submerged for much of the year, e.g., along the Amazon River (Alexander 1994, 606).

Comments: The varzea between the Japurá and Solimões Rivers in Brazil is inundated up to 10 m, or more, for 7 mo (Alexander 1994). Seed- and fruit-eating fish invade the varzea during the wet season.

wood *n.* A collection of trees growing more, or less, thickly together (especially naturally as distinguished from a plantation), of considerable extent, usually larger than a grove or copse (but including them), and smaller than a forest; a piece of ground covered with trees with or without undergrowth (Oxford English Dictionary 1972, entries from 825).

syn. grove, woods (Michaelis 1963)

See ²community: forest, wood.

cf. ²community: forest

[Old English *wudu, widu*]

xerodrymium See ²community: lochmum: carpolochmum.

xerohylium *n.* "A dry-forest community" (Lincoln et al. 1985).

cf. ²community: forest

xeropoium *n.* "A heathland community" (Lincoln et al. 1985).

cf. ²community: heath barren

xerothamnium *n.* "A spiny-shrub community" (Lincoln et al. 1985).

xylium *n.* "A woodland community" (Lincoln et al. 1985).

♦ **community evolution** See ¹evolution: community evolution.

♦ **community module** See group: community module.

♦ **community psychology** See study of: psychology: community psychology.

♦ **community structure** *n.* The physical and biological structures (combinations of related parts) of a community; the physical structure includes abiotic and physical manifestations of the biotic parts of a community (e.g., leaves, logs, rocks, shrub and herb thickets, soil, tree trunks, and water); the biological structure includes species composition and abundance, temporal changes in these factors, and interspecific relationships (Krebs 1985, 462).

♦ **companion** *n.*

1. An organism, or object, in an animal's environment that has specific significance in some, or all, functional systems to the animal (Lorenz 1935 in Heymer 1977, 107).
2. A social partner in a behavior nexus (a term used in earlier ethological literature, Immelmann and Beer 1989, 52).

cf. animal: companion animal

child companion See ²companion: parent companion.

flight companion *n.* A Human that an animal, e.g., *Corvus cornix* (Hooded Crow), flies near when the Human moves from place to place (Lorenz 1935 in Heymer 1977, 107).

sexual companion *n.* A Human upon whom a nonhuman animal, e.g., *Corvus monedula* (Jackdaw), is imprinted as a sexual partner (Lorenz 1935 in Heymer 1977, 107).

sibling companion *n.* A young animal that is raised with young of another species (Lorenz 1935 in Heymer 1977, 107).

social companion *n.* A Human with whom a nonhuman animal, e.g., *Corvus cornix* (Hooded Crow), interacts (Lorenz 1935 in Heymer 1977, 107).

♦ **companion species** See ²species: companion species.

♦ **company** See ²group: company.

♦ **comparative ethology** See study of: ³ethology: comparative ethology.

♦ **comparative experiment** See experiment: manipulative experiment.

♦ **comparative method** See method: comparative method.

♦ **comparative psychology** See study of: psychology: comparative psychology.

♦ **compartmentalization** *n.* "The extent to which the subgroups of a society operate as discrete units" (Wilson 1975, 17, 581).

♦ **compass orientation** See taxis: menotaxis.

♦ **compensatory mechanism** See mechanism: compensatory mechanism.

♦ **compensatory mitigation** *n.* A person's attempt to restore, or create, an ecosystem(s) so that a natural one can be ceded to development; contrasted with ecological restoration (Roberts 1993a, 1891).

Comment: Many ecologists do not favor this practice because it usually does not work (Roberts 1993a, 1890; 1993b, 1891).

♦ **compensatory-mortality hypothesis** See hypothesis: hypotheses of species richness: compensatory-mortality hypothesis.

♦ **competition** *n.*

1. "The relation between plants occupying the same area and dependent upon the same supply of physical factors" (Clements 1905, 317, in McIntosh 1992, 62).

Note: This might be the earliest published, formal definition of competition in the biological sense (McIntosh 1992, 62). Clements added elements to this definition in the first extended survey of competition: "when the immediate supply of a single necessary factor falls below the combined demand" of the competitors (Clements et al. 1929, 317 in McIntosh 1992, 62). For example, the alien, invasive Asian vine *Ampelopsis brevipedunculata* (Porcelainberry) stunts and kills other plant species by forming thick growths over them, and this vine is so competitive that it can stop forest regeneration and restoration as occurs in Dyke Marsh Wildlife Preserve, U.S. (fig. 10).

2. "A more or less active demand in excess of the immediate supply of material or condition on the part of two or more organisms" (Clements and Shelford 1939, 139 in McIntosh 1992, 63).

3. "The demand, typically at the same time, of more than one organism for the same resources of the environment in excess of immediate supply" (Crombie 1947 in McIntosh 1992, 63).

4. An organism's interfering with a heterospecific organism whether, or not, both use the same resources (Birch 1957, 16).

5. Predation within the context of one organism's interfering with another (Birch 1957, 16).

6. Utilization of common resources that are short in supply by conspecific, or heterospecific animals, or if resources are not in short supply, harming of one animal by another while seeking resources (Birch 1957 in McIntosh 1992, 64).

Note: In evolutionary and ecological literature, definitions of competition are converging on the ideas in this definition (McIntosh 1992, 67).

7. "The endeavour of two (or more) animals to gain the same particular thing, or to gain the measure each wants from the supply of a thing when that supply is not sufficient for both (or all)" (Milne 1961, 60 in McIntosh 1992, 65).
8. An interaction between two species in which an increase in population size in either one harms the other, *e.g.*, species A and B fight, A reduces B's food supply, or A, by its own losses, increases B's predators (MacArthur (1972, 256, who wrote that no precise definition of competition can be related and that current precise definitions are premature, in McIntosh 1992, 65).
9. The active demand by two, or more, individual conspecific, or heterospecific, organisms at the same trophic level for a common resource, or requirement, that is actually, or potentially, limiting (Wilson 1975, 243).
Notes: Competition may harm some contestants (Birch 1957, 16; Wilson 1975, 243); resources can include mating partners or rank positions (Immelmann and Beer 1989, 54).
10. Organisms' vying for the same resource(s), which may, or may not, involve direct confrontation (Wilson 1975, 581).

Comments: "Competition" has been described at the individual, population, and species levels. McIntosh (1992) describes C. R. Darwin's conception of competition although he did not explicitly define it. Birch (1957) reviewed the biological meanings of "competition" and concluded that it had lost its usefulness as a scientific term due to misunderstanding and confusion regarding it (McIntosh 1992, 64). Andrewartha (1961, 174 in McIntosh 1992, 65) proposed that "competition" be added to "a list of abandoned carcasses." McIntosh (1992, 65–66) explains that it is difficult to define "competition because" it is applied to diverse categories. He includes more definitions of competition. He also writes, "Although considerable agreement on the definition of competition has been achieved, dispute about its mechanisms and significance for ecological and evolutionary dynamics of population continues." Keller (1992, 71–73) explains that confusion about "competition" occurs for two main reasons: (1) "competition" is a colloquial as well as a technical word, and as the latter it carries colloquial connotations in the minds of some biologists, and (2) as a technical term, "competition" can denote an operation of comparison between organisms, or species, but only in a biologist's mind. Further, "competition" is sometimes extended to mean "natural selection" although these are separate concepts.

active competition See competition: contest competition.

apparent competition *n.* Competition that occurs when two prey species are limited in numbers by a common predator; if one prey species increases in numbers, the predator increases in numbers, and this leads in turn to an increase in the mortality rate of the other prey species (Holt 1977 in McIntosh 1992, 67).

contest competition *n.*

1. Competition for a resource in which the winner physically deters another organism from obtaining part, or all, of a fought over resource (referred to as

SOME CLASSIFICATIONS OF COMPETITION

- I. Classification with regard to species and lower levels
 - A. interspecific competition
 - B. intraspecific
 1. organismal competition
 2. sexual competition (*syn.* mate competition)
 3. sperm competition
- II. Classification with regard to behavior
 - A. contest competition (*syn.* active competition, interference competition)
 - B. diffuse competition (*syn.* consumptive competition, exploitation, exploitative competition, passive competition, scramble competition)
- III. Classification with regard to resource type
 - A. mate competition (*syn.* sexual competition)
 - B. resource competition
 - C. territory competition (which can include III.A and III.B)
- IV. Classification with regard to mechanism^a
 - A. apparent competition
 - B. chemical competition
 - C. consumptive competition
 - D. encounter competition
 - E. overgrowth competition
 - F. preemptive competition
 - G. territorial competition

^a Schoener (1983 in Feller 1987, 1466).

"interference" by Crombie 1947 in McIntosh 1992, 63; Nicholson 1954 in Wilson 1975, 85, 268).

2. Competition for a resource that is not limited (Lincoln et al. 1985).

syn. active competition (McIntosh 1992, 67), encounter competition (Feller 1987, 1466), interference competition (Park 1954, 178–181 in McIntosh 1992, 64; Feller 1987, 1466)

cf. competition: diffuse competition

diffuse competition *n.*

1. Competition for a resource in which the winner uses all of the resource that it requires without specific behavioral responses to other competitors that may be in the same area (Nicholson 1954 in Wilson 1975, 85).

2. Competition "in which individuals compete by exploiting a resource faster or more efficiently than their competitors without resort to aggression" (Wittenberger 1981, 621).

3. Competition for a resource that is equally partitioned between competitors so that some, or all, of them obtain an insufficient amount of the resource for survival or reproduction (Lincoln et al. 1985).

4. Competition for an actually, or potentially, limited resource (Lincoln et al. 1985).

5. Simultaneous interspecific competition among numerous species each with a small degree of niche overlap with other species (Lincoln et al. 1985).

syn. consumptive competition, exploitation (Park 1954, 178–181 in McIntosh 1992, 64), exploitative competition (Feller 1987, 1466), passive competition (McIntosh 1992, 67), scramble competition (Nicholson 1954 in McIntosh 1992, 62)

cf. competition: contest competition

direct competition *n.* One individual's, or species', exclusion of another individual, or species, from

a resource by direct aggressive behavior, toxins, or both (Lincoln et al. 1985).

cf. competition: contest competition, indirect competition

exploitation, exploitative competition See competition: diffuse competition.

indirect competition *n.* Competition for a resource in which one individual's, or species', exploitation reduces its availability to other individuals or species (Lincoln et al. 1985).

cf. competition: direct competition

intense competition *n.* Simultaneous interspecific competition between a few species each with considerable niche overlap with one another (Lincoln et al. 1985).

cf. competition: diffuse competition

interference competition See competition: contest competition.

interspecific competition *n.* "Competition between members of different species for a limited resource."

cf. competition: intraspecific competition (Wittenberger 1981, 617)

intraspecific competition *n.* Competition between, or among, individuals of the same species.

local-mate competition (LMC) *n.* The relative amount of intrasexual competition for mates in a localized area; *e.g.*, in some chalcidoid wasps, individual hosts are isolated (or localized) and new males, which emerge before females, compete for particular groups of females (Hamilton 1967).

mate competition *n.* In many organism species: "Competition among members of one sex for sexual access to members of the opposite sex" (Wittenberger 1981, 618).

syn. sexual competition

motivational competition *n.* Operationally, a behavioral changeover due to competition, "recognized when a change in the level of causal factors for a second-in-priority activity results in an alternation in the temporal position of the occurrence of this activity" (McFarland 1969 in McFarland 1985, 389).

resource competition *n.*

1. Competition for commodities besides mates (Wilson 1975, 243).
2. Competition of two, or more, populations, or species, for a limited resource (Lincoln et al. 1985).

cf. competition: sexual competition

scramble competition See competition: diffuse competition.

sexual competition See competition: mate competition.

sperm competition *n.* For example, in some mammal and spider-mite species; *Popillia japonica* (Japanese Beetles), *Scathophaga stercoraria* (Dung Flies): Competition among the sperm of more than one male to fertilize a female's eggs which may occur in an external medium following gamete release or within a female's reproductive tract (Wittenberger 1981, 621–622; Schwagmeyer and Foltz 1990, 156).

cf. sperm displacement, sperm precedence

status competition *n.* For example, in young male Humans: Competition for a position in a dominance hierarchy (Wilson and Daly 1985, 59).

♦ **competitive exclusion, competitive-exclusion principle** See principle: Gause's principle.

♦ **competitive release** *n.* An organism's expansion of its habitat range and food preferences due to

a reduction in intensity of interspecific competition (Lincoln et al. 1985).

♦ **competitive selection** See selection (table).

♦ **competitive species** See ²species: c-selected species.

compilospecies See ²species: compilospecies.

♦ **complemental male** See male: parasitic male.

♦ **complementariness** See biological complementariness.

♦ **complementary gene, complementary factor** See gene: complementary gene.

♦ **complementarity** *n.* The distinctness, or dissimilarity, of biota in more than one location (Colwell and Coddington 1994, 103).

Comments: Complementarity covers distinctness of species composition over a broad spectrum of environmental scales, from small-scale ecological differences (*e.g.*, differences between mite faunas on trunks versus leaves of the same tree species) through climatically distinct sites in different biomes (Colwell and Coddington 1994, 103). There are scores of published indices that can be used to measure complementarity. A simple one is C_{jk} (Marczewski-Steinhaus distance, M-S distance) which varies from 0 through 1, or 0 through 100%. Colwell and Coddington (1994, 103, 104) use complementarity," instead of the statistical equivalents of dissimilarity, distance, or distinctness, to capture the sense that complementary biotas form parts of a whole, a sense that distinctness, or its equivalent, does not convey. They prefer a single, broad term to a series of more specific, scale- or gradient-dependent concepts.

♦ **complementation** *n.*

1. Genetic masking of deleterious recessive mutations resulting from recombination of homologous alleles in sexual reproduction involving outcrossing (Bernstein et al. 1985, 1278–1279).
2. Cooperative interaction of mutant genes in double mutants, giving a phenotype closer to the wild type than any one of the mutant genes could produce alone (Lincoln et al. 1985).
3. A mutant chromosome's restoring normal function to a cell because it combined with its mutant homologous chromosome when a hybrid, or heterokaryon, formed (Lackie and Dow 1999).

Note: Complementation that involves more than one gene can occur because a mutation(s) on one homologous chromosome is in a different cistron(s) than the mutation(s) of the other homologous chromosome; therefore, a complete set of normal information is present in the two chromosomes (Lackie and Dow 1999).

Comment: Complementation is the acid test for whether two putative genes are actually alleles of a single gene, rather than being entirely different genes (Tanksley 1993, 220).

intracistronic complementation *n.* Complementation (def. 2) of a pair of mutant alleles within the same functional unit of a chromosome (cistron) (Lincoln et al. 1985).

intercistronic complementation *n.* Complementation (def. 2) of a pair of mutant alleles belonging to different functional units of a chromosome (cistrons) (Lincoln et al. 1985).

♦ **complete record** See sampling technique: all-occurrences sampling.

♦ **completely randomized block** See experimental design: completely-randomized block.

- ♦ **complex character** See character: complex character.
- ♦ **complex digital organism** See program: digital organism: complex digital organism.
- ♦ **complex system** See ¹system: complex system.
- ♦ **"complexity-level hypothesis"** See hypothesis: hypotheses regarding the origin of the Cambrian explosion: "complexity-level hypothesis."
- ♦ **complexity system** See ¹system: complexity system.
- ♦ **complexity theory** See ²theory: complexity theory.
- ♦ **component part of a behavioral act** See behavior, classification of.
- ♦ **components of fitness** *n.* An organism's "devices of adaptation, together with genetic stability in constant environments" and an organism's ability to generate new genotypes that cope with fluctuating environments (Thoday 1953 in Wilson 1975, 67).
- ♦ **composite signal** See signal: composite signal.
- ♦ **composite species** See ²species: composite species.
- ♦ **composition, principle of** See principle: principle of composition.
- ♦ **compositional method** See emergence.
- ♦ **compound** *n.*
 1. A substance that results from the combination of specific elements, or radicals, in fixed proportions, *e.g.*, table salt (= sodium chloride, NaCl); distinguished from a mixture (Michaelis 1963).
 2. A molecule composed of more than one chemical element, *e.g.*, a carbon compound (Campbell et al. 1999, 48).

cf. molecule
- ♦ **inorganic compound** *n.* A compound that does not contain carbon; distinguished from organic compound (*q.v.*) (Campbell et al. 1999, 48).
- ♦ **organic compound** *n.* A compound composed of carbon and one, or more, other elements (Campbell et al. 1999, 48).

cf. molecule: carbon

Comments: Organic compounds range from simple ones such as methane (CH₄) through proteins with thousands of atoms and molecular weights of over 100,000 daltons (Campbell et al. 1999, 48). Scientists originally erroneously thought that only organisms made organic compounds; *i.e.*, an abiotic environment did not produce organic compounds.

- ♦ **secondary compound** *n.* A compound produced by many land-plant species that may be an alkaloid, phenolic (such as a flavonoid), tannin, terpene, or other compound (Campbell and Reece 2005, 575).

syn. secondary metabolic substance (Ehrlich and Raven 1964, 587), secondary metabolite

Comments: Some alkaloids, tannins, and terpenes have bitter tastes, strong odors, toxic effects, or a combination of these characters that help defend plants against herbivores and parasites (Campbell and Reece 2005, 575). Flavonoids absorb harmful UV radiation and may act as signals in symbiotic relations of plants with beneficial soil microbes. Some phenolics inhibit pathogenic microbes' attacking plants. [A "secondary compound" is so named because it is a product of a secondary metabolic pathway, a side branch of a primary metabolic pathway that produces amino acids, carbohydrates, lipids, and other compounds common to all organisms (Campbell and Reece 2005, 575).]
- ♦ **urushiol** *n.* A compound (classified as a phenolic lipid, a group of phenolic lipids, or an oil depending

on the reference) found in some plant species in Anacardaceae, including Cashew, Lacquertree, Mango, Poison-ivy, Poison-oak, and Poison Sumac, and in seeds of *Ginkgo biloba* (Ginkgoaceae) (Leray, 2008).

Comment: Urushiol can cause severe allergic responses such as urushiol-induced contact dermatitis in some people (*pers. obs.*).

[Japanese *urushi*, lacquer + ol, after the Lacquertree (*urushi*, *Toxicodendron vernicifluum*) which has a toxic sap used as a highly durable lacquer]

- ♦ **compound nest** See nest: compound nest.

- ♦ **compression hypothesis of interspecific competition** See hypothesis: compression hypothesis of interspecific competition.

- ♦ **compromise behavior** See behavior: compromise behavior.

- ♦ **compromise of evolution** *n.* The concept that the phenotype of an individual organism is a combination of traits that vary in the amount of fine tuning that has been acquired through evolution (Endler 1978 in Mayr 1982, 589).

syn. optimization process of evolution (Mayr 1982, 589)

Comment: Compromise of evolution occurs because its genotype "is a compromise between various selection pressures, some of which may be opposed to each other, as for instance, sexual selection and crypsis" (Endler 1978 in Mayr 1982, 589).

- ♦ **computational error** See error: observer error.

- ♦ **computer-compatible data logger** *n.* A machine that transfers behavioral records to a computer which can store and analyze the data (Lehner 1979, 162-169).

- ♦ **computer program** See program.

- ♦ **computer vision** See study of: computer vision.

- ♦ **¹conceive** *v.t.* In Mammals: To become pregnant (*with*) (Michaelis 1963).

- ♦ **²conceive** *v.t.* In Humans:

1. To form a concept in one's mind; develop mentally; think of; imagine (Oxford English Dictionary 1972, entries from 1340; Michaelis 1963).
2. "To understand; grasp" (Oxford English Dictionary 1972, entries from 1362; Michaelis 1963).
3. "To believe or suppose; think" (Michaelis 1963).
4. *v.i.* "To form a mental image; think: with of" (Michaelis 1963).

adj. conceivable

adv. conceivably

n. conceivability, conceivableness, conceiver

cf. idea

Comment: We do not know if any nonhuman animals conceive as we do.

[Old French *conceveir* < Latin *concipere* < *com-*, thoroughly + *capere*, to grasp, take]

- ♦ **concept** *n.*

1. A person's "mental image; especially, a generalized idea formed by combining the elements of a class into the notion of one object;" a thought; an opinion (Oxford English Dictionary 1972, entries from 1556; Michaelis 1963).

2. A response, verbal or motor, that is under discriminative control of a broad class of environmental objects or events (Verplanck 1957).

Note: The members of a class may differ from one another in all respects other than a single quantifiable property. Most concepts are statements that refer to a common property, *e.g.*, beauty, blue, length, square, and velocity (Verplanck 1957).

3. An area of knowledge (inferred from Mayr 1997, 63).
Note: For example, evolutionary biologists include the following as important concepts: altruism, biopopulation, competition, gene flow, mate choice, natural selection, neutral evolution, and territoriality.

syn. law (in the physical sciences, a loose synonym) (Mayr 1997, 63)

cf. conceive, idea, law, principle, rule

♦ **concept formation** *n.* An animal's ability to form a concept, *q.v.*, e.g., a Civet Cat's and Rhesus Macaque's concept of same and different or a Chimpanzee's and Rhesus Macaque's correlating different kinds of tokens with different amounts of foods (Immelman and Beer 1989, 54–55).

cf. counting, language

Comment: Concept formation is the highest intellectual achievement of animals (Immelman and Beer 1989, 54–55).

♦ **concept learning** See learning: concept learning.

♦ **conceptive** *adj.* "Capable of being fertilized" (Lincoln et al. 1985).

♦ **concerted evolution** See ²evolution: concerted evolution.

♦ **conchology** See study of: conchology.

♦ **conchometry** See study of: conchometry.

♦ **concolorous** *adj.* Referring to an object that has uniform coloration (Lincoln et al. 1985).

cf. coloration

♦ **concomitant mortality** See mortality: concomitant mortality.

♦ **Concorde Effect, Concorde Fallacy, Concorde Strategy** See effect: Concorde Effect.

♦ **concrete homotypy** See homotypy: concrete homotypy.

♦ **condensation** *n.* In chemistry, two molecule's joining and forming one larger molecule and simultaneously producing one molecule of water (Curtis 1983, 1092).

Comment: Many kinds of monomers condense when they form polymers.

♦ **condition-sensitive phenotype** See -type, type: phenotype: conditional phenotype.

♦ **conditional character** See character (comments).

♦ **conditional phenotype** See -type, type: phenotype: conditional phenotype.

♦ **conditional response, conditioned response (CR)** See response: conditional response.

♦ **conditional stimulus, conditioned stimulus (CS)** See ²stimulus: conditional stimulus.

♦ **conditional strategy** See strategy: conditional strategy.

♦ **conditioned-emotional response** See response: conditioned-emotional response.

♦ **conditioned learning** See learning: conditioned learning.

♦ **conditioned-suppression technique** See method: conditioned-suppression technique.

♦ **conditioning** See learning: conditioning.

♦ **confabulation** *n.*

1. In psychology, a person's compensating for memory loss, or impairment, by fabrication of details (Michaelis 1963).

2. A person's finding a reason, or purpose, for his own behavior or external events, *e.g.*, in split-brain patients who justify why they make incorrect choices in experimental situations (Gould 1982, 492–498).

syn. justification (Gould 1982, 492–498)

♦ **confidence interval** *n.* A quantitative range between and including an upper and lower confidence limit that has a particular probability of containing the mean (whose value is fixed) in question (Sokal and Rohlf 1969, 139).

cf. confidence limit

Comment: For example, a confidence interval that has a 0.95 probability of containing the mean in question is bounded by 95% confidence limits (Sokal and Rohlf 1969, 139). The upper limit is $\bar{x} + 1.96 \sigma_{\bar{x}}$, and the lower limit is $\bar{x} - 1.96 \sigma_{\bar{x}}$; with $\sigma_{\bar{x}} = 1$ standard deviation of the mean.

♦ **confidence-interval statistics** See study of: statistics: confidence-interval statistics.

♦ **confidence limit** *n.* A value that is larger or smaller than a mean and that is the border value of a confidence interval, *q.v.* (Sokal and Rohlf 1969, 139).

cf. confidence interval

♦ **configurational causes** See cause: configurational causes.

♦ **configurational stimulus** See ²stimulus: configurational stimulus.

♦ **confirmatory characters** See character: confirmatory characters.

♦ **¹conflict** *n.*

1. An armed human encounter; a fight, battle; fighting, battling (Oxford English Dictionary 1972, entries from *ca.* 1440).

2. In many animal species: Individuals' clashing over particular resources (Immelman and Beer 1989, 57).

syn. squabble [used by Mock and Forbes (1992, 409) to avoid the ambiguity of "conflict"]

v.i. conflict

cf. war

♦ **social conflict** *n.*

1. In many animal species: Tension generated between, or among, socially interacting animals when they attempt to carry out mutually incompatible goal-directed behavior (Hand 1986, 204–205).

2. Operationally, "when the behaviors of two (or more) individuals indicate that their motivation priorities are incompatible; they seek the same thing, or different things, and both cannot be satisfied," *e.g.*, when two pair-bonded birds each try to incubate their eggs simultaneously (Tinbergen 1960, 135, in Hand 1986, 201–204).

[coined by Hand 1986, 203]

♦ **²conflict** *n.*

1. Two tendencies' (each of an incompatible behavior type) being simultaneously aroused in an animal, *e.g.*, a bird's simultaneous tendency to continue its feeding or follow its flock when its flock is leaving (Hinde 1970, 361).

Note: "Conflict" is used to refer to incompatible response probabilities, not to a hypothetical, or physiological, state (Hinde 1970, 361).

2. An animal's state when two of its incompatible behaviors are aroused equally, *e.g.*, attacking and fleeing at an animal's own territory boundary (Immelman and Beer 1989, 57).

syn. motivational conflict (Hinde 1970, 361)

cf. behavior: conflict behavior; motivation: mixed motivation

♦ **approach-approach conflict** *n.* An animal's simultaneous behavioral tendencies to move toward two different objects that are some distance apart (Hinde 1970, 361–362), *e.g.*, a positively phototactic

insect's moving toward, but between, two equally bright lights.

approach-avoidance conflict *n.* An animal's simultaneous behavioral tendencies of moving toward and away from an object, *e.g.*, a male three-spined stickleback's moving both toward and away from a rival male near its territorial boundary (Hinde 1970, 362; McFarland 1985, 399).

cf. behavior: ambivalent movements and postures, compromise behavior

avoidance-avoidance conflict *n.* An animal's simultaneous behavioral tendencies to move away from two different objects (Hinde 1970, 362), *e.g.*, a negatively phototactic fly larva's moving away from both equally bright lights that are on each side of it.

motivational conflict See ²conflict.

♦³**conflict** *n.* An evolutionary, or genetical, competition between two, or more, genes within an organism or between two, or more, conspecific organisms that have nonidentical genetic interests (Brockmann and Grafen 1989, 232).

syn. evolutionary conflict (Brockmann and Grafen 1989, 232)

ecological conflict *n.* A behavioral conflict between, or among, conspecific animals, viewed from an evolutionary, or ultimate, perspective (Selander 1972 in Hand 1986).

intergenerational conflict *n.* For example, in some gull (bird) species: Conflict between a chick that leaves its parents due to inadequate parental care and an unrelated adult that resists adopting the chick (Pierotti and Murphy 1987, 435).

mate conflict *n.* In haplodiploid arthropods: A mother's and father's conflict over the sex of their offspring, *i.e.*, a mother would favor 50% sons and daughters, and a father would favor production of daughters rather than sons (Brockmann and Grafen 1989, 232).

cf. ³conflict: reproductive conflict

parent-offspring conflict (POC) *n.*

1. For example, in some mammal species: A parent's tendency to stop investing resources in an offspring while at the same time, this offspring continues to try to obtain these resources from its parent (Trivers 1974, 249; Immelmann and Beer 1989, 215–216).

2. The concept that parents and offspring have divergent fitness interests; this divergence creates “disagreements” between these parties over the allocation of parental investment; individual offspring “value” themselves more highly than their siblings (as reflected by coefficients of relatedness), but parents value each offspring equally, and this results in offspring that theoretically should behave more selfishly than their parents “desire” (Mock and Forbes 1992, 409).

Notes: If a parent-offspring conflict exists in a species, both parties affect each other in ways that change their fitnesses. Most studies of avian brood reduction are open to multiple interpretations and thus do not definitely support this concept; some plant species, *e.g.*, *Dalbergia sissoo* (Shisham, a tree), have siblicide, but it is not known if this is parental-offspring conflict (Mock and Forbes 1992, 409, 412).

cf. ³conflict: queen-worker conflict, weaning conflict

Comment: Parent-offspring conflict, queen-worker conflict, and weaning conflict are analyzed with the theory of parent-offspring conflict which has not

been rigorously tested in field studies (Mock and Forbes 1992, 409).

queen-worker conflict *n.* In haplodiploid social insects: A queen's and one of her worker's being in competition because the worker could hypothetically maximize her inclusive fitness by channeling $\frac{1}{4}$ of her colony's resources into male reproductives and $\frac{3}{4}$ of its resources into female reproductives; however, the queen could maximize her inclusive fitness by channeling of her colony's resources into reproductive males and $\frac{1}{2}$ into reproductive females (Trivers and Hare 1976; Fisher 1987, 1026).

Comment: Queen-worker conflict is supported by empirical studies (Mock and Forbes 1992, 412–413).

reproductive conflict *n.* In many animal species: A conspecific conflict between males and females, viewed from an evolutionary (or ultimate) perspective (Trivers 1972 and Emlen 1982 in Hand 1986), *e.g.*, a mother's favoring obtaining as much paternal care for her offspring as she can from their father and the father's favoring seeking additional mates and, thus, decreasing his paternal care.

syn. sexual conflict (Davies 1989, 226)

cf. ³conflict: mate conflict

sexual conflict See ³conflict: reproductive conflict.

weaning conflict *n.* For example, in some mammal species: A parent's tendency to attempt to wean its offspring sooner than the offspring is willing to be weaned (Trivers 1974, 251; Immelmann and Beer 1989, 215–216).

cf. ³conflict: parent-offspring conflict, investment: parental investment

Comment: The offspring might increase its fitness if it weans latter, but its parent might lower its own fitness because it invests in this offspring rather than in a new one (Trivers 1974, 251). Most studies of mammalian weaning are open to multiple interpretations and, thus, do not definitely support this concept as it relates to parent-offspring conflict (def. 2) (Mock and Forbes 1992, 409).

♦**conflict behavior** See behavior: conflict behavior.

♦**conflict block** *v.t.* To show an opposing behavior instead of a usual behavior toward a stimulus (Blume 1967 in Heymer 1977, 45).

♦**conflict hypothesis** See hypothesis: conflict hypothesis.

♦**conflict of interest** *n.*

1. A behavioral conflict viewed from an evolutionary (or ultimate) perspective (Maynard Smith 1982, 123, in Hand 1986).

2. A set of conditions in which one's professional judgment concerning a primary interest, such as a patient's welfare or the validity of research, tends to be unduly influenced by a secondary interest, such as financial gain (Thompson 1993, 573).

Comments: One's perception that scientists are under the influence of conflicts of interests can undermine one's trust in science and, thus, reduce that values of the scientists' work for improvement of society (Wade et al. 2010, 320). Repercussions of conflict of interest are evidently occurring in some areas of science, such as pharmaceutical research. Conflict of interest may have lead to misrepresentation of noise effects on marine mammals in both primary and secondary literature and may be misinforming public policy decisions.

- ♦ **conflict theory of display** See ³theory: conflict theory of display.
- ♦ **conformer** *n.* An animal with certain aspects of its bodily condition that tend to be similar to its environmental conditions, *e.g.*, its body temperature's being similar to environmental temperature (McFarland 1985, 284). *cf.* regulator
- ♦ **confusion effect** See effect: confusion effect.
- ♦ **congener** *n.*
1. A member of the same genus (Lincoln et al. 1985).
 2. A fellow member of the same genus, class, family, or kind (Michaelis 1963).
- ♦ **cogenetic** *adj.* "Having the same origin" (Lincoln et al. 1985). *cf.* -genetic
- ♦ **congenital** See -genous: geneogenous.
- ♦ **congested** *adj.* "Crowded together; packed close together" (Lincoln et al. 1985).
- ♦ **conglobation** *n.* For example, in Chrysidid Wasps, *Dasypus novemcinctus* (Nine-banded Armadillo), and some woodlice and millipede species: An individual's rolling up its body (Lincoln et al. 1985). *v.t.* conglobate, conglobes
- ♦ **congregate** *v.t.* To collect together, or assemble, into a group (Lincoln et al. 1985).
- ♦ **congregation** See ²group: congregation.
- ♦ **conidium** *n., pl. conidia* In many fungus species: A nonsexually produced propagative cell, or spore, borne upon special branches of a hypha (Michaelis 1963). *syn.* conidiospore ((Michaelis 1963) [New Latin < Greek *kōnis*, dust])
- ♦ **coniferous forest** See ²community: coniferous forest.
- ♦ **conifruiticeta** See ²community: conifruiticeta.
- ♦ **conilignosa** See ²community: conilignosa.
- ♦ **coniophile** See ¹-phile: coniophile.
- ♦ **conisilvae** See ²community: conisilvae.
- ♦ **conjugation** *n.*
1. Reproductive union, or fusion, of two (apparently) similar cells of a less derived plant or animal (Oxford English Dictionary 1972, entries from 1843).
 2. Union of gametes, nuclei, cells, or individuals (Lincoln et al. 1985).
 3. Sexual reproduction in which two cells unite but have only limited genetic exchange (Lincoln et al. 1985).
 4. Direct transfer of DNA from one prokaryote to another (Campbell 1996, 504). *cf.* transduction, ¹transformation *syn.* zygosis (Lincoln et al. 1985)
- ♦ **conjunct mimicry system** See ¹system: mimicry system: conjunct mimicry system.
- ♦ **conlocal** *adj.* Referring to a local character species whose geographical range coincides with that of a vegetation unit (Lincoln et al. 1985).
- ♦ **connascent** *adj.* Referring to organisms that are born in the same clutch (Lincoln et al. 1985).
- ♦ **connectedness** *n.*
1. "The number and direction of communication links within and between societies" (Wilson 1975, 581).
 2. "The number and frequency of interactions between the member species of a community" (Lincoln et al. 1985).
- ♦ **connections, principle of** See principle: principle of connections.
- ♦ **connubial display** See display: connubial display.
- ♦ **conodrymium** See ²community: conodrymium.
- ♦ **conophorium** See ²community: coniferous forest.
- ♦ **conophorophile** See ¹-phile: conophorophile.
- ♦ **consanguineous** *adj.* Referring to individuals that share a common recent ancestor (Lincoln et al. 1985).
- ♦ **consanguinity** *n.* "Relationship by descent from a common ancestor" (Lincoln et al. 1985).
- ♦ **conscious awareness** See awareness: conscious awareness.
- ♦ **conscious behavior** See behavior: conscious behavior.
- ♦ **¹consciousness** *n.* In psychoanalysis, human conscious (Michaelis 1963).
- ♦ **²consciousness** *n.*
1. In Humans and possibly some other animals: "The presence of mental images, and their use by an animal to regulate its behavior;" an individual's "ability to think about objects and events, whether or not they are part of the immediate situation" (Griffin 1976, 5).
 2. In some animal species: An individual's "immediate awareness of things, events, and relations" (Immelmann and Beer 1989, 57).
- ♦ **³consciousness** *n.*
1. A person's awareness of himself and surroundings (Oxford English Dictionary 1971, entries from 1678; Michaelis 1963).
 2. A person's state, or fact, of being mentally conscious, or aware, of anything (Oxford English Dictionary 1971, entries from 1746).
 3. A person's mental and emotional experience and awareness of another individual or a group: mob consciousness (Oxford English Dictionary 1971, entries from 1837; Michaelis 1963).
 4. A person's "awareness of some object, influence, etc.; a feeling or conviction" (Michaelis 1963).
 5. A person's attribute with many elements such as self-awareness (knowledge of oneself as distinct from other selves), anticipation of the future, ability to manipulate abstract ideas, and ability to pay and switch attention (Hubbard 1975 in Dawkins 1980, 24).
 6. In Humans and nonhuman animals: Awareness "of what one is doing or intending to do, having a purpose and intention in one's actions" (Griffin 1982 in McFarland 1985, 526).
 7. A person's special kind of self-awareness, which is not simple awareness of parts of his body or of processes occurring within his brain; "a propositional awareness that it is I who am feeling or thinking, *I am* the animal aware of the circumstances" (McFarland 1985, 523).
 8. "A concept of your own self, something that you reconstruct moment by moment on the basis of the image of your own body, your own autobiography and a sense of your intended future" (A. Damasio in Nash et al. 1995, 52).
- Note:* If a person does not have one of these parts, he has a diminished consciousness (Nash et al. 1995, 52). Consciousness does not appear to reside in a specialized, delineated portion of a person's physical brain.
- See ³consciousness: self-consciousness.
- cf.* awareness: conscious awareness, self-awareness; cognition; ³consciousness: self-consciousness, true consciousness; intention; theory of mind
- Note:* Bateson (1991, 831) uses the phrase "full-blown human-style reflective consciousness" which relates to this definition.

A

syn. awareness (Michaelis 1963, Griffin 1976), cognizance, intention (according to some workers by not others)

Comments: Mayr (1982, 74) says consciousness is impossible to define. Harnad (1985) states, "The only individual one can know is conscious is oneself." According to Watson (1913 in Crook 1983, 11), consciousness is a term irrelevant to nonhuman animals. Definitions and synonyms of consciousness and related terms are very confusing; it is controversial whether nonhuman animals have consciousness (McFarland 1985, 526). Although Griffin has defined consciousness in his writing, in 1987, I heard him say that we do not know enough about consciousness to define it. Despite all of the controversy regarding whether consciousness exists in nonhuman animals, some animal behaviorists now consider non-human animal consciousness to be a legitimate area of study. De Waal (1989, 87) suggests that the differences in consciousness between Chimpanzees and most other nonhuman primates seem to be gradual rather than radical. Kinds of consciousness include "objective consciousness" and "subjective consciousness" (Duval and Wicklund 1972 in Crook 1983, 12). Researchers continue to debate on how to define "consciousness."

[Latin *conscius*, knowing inwardly < *com-*, together + *scire*, to know]

group consciousness *n.* A person's feeling of belonging to a particular group, or organization; group consciousness in a well-integrated group increases aggressiveness toward other groups (Heymer 1977, 80).

self-consciousness *n.*

1. A person's state of being unduly conscious that he is observed by others; embarrassed by inability to forget himself; ill at ease (Oxford English Dictionary 1971, entries from 1712; Michaelis 1963).
2. A person's intentionality in performing a behavior (Oxford English Dictionary 1971, entries from 1860; Crook 1983, 12).
3. A person's consciousness of his existence (Michaelis 1963).

syn. consciousness (Gallup 1982, 243)

4. In Humans, possibly in *Pan troglodytes* (Chimpanzees) and *Pongo borneo* (Orangutans): An individual's having a consciousness of some of its own past conscious states (Bunge 1984, 186-187; Lewin, 1987b).

Comment: Researchers continue to debate on how to define "self-consciousness."

cf. awareness: conscious awareness, self-awareness; consciousness; self

true consciousness *n.* A self-scanning mechanism in an animal's central nervous system (Armstrong 1984).

♦ **consecutive hermaphrodisim** See hermaphrodisim: consecutive hermaphrodisim.

♦ **consecutive sexuality** See hermaphrodite: consecutive hermaphrodite.

♦ **consensus sequence** *n.* A particular (idealized) nucleotide sequence in which each position represents the base most often found when many actual sequences of a given class of genetic elements are compared (Rieger et al. 1991).

Comments: Researchers have defined consensus sequences by comparison of those naturally occurring DNA, or RNA, sequences that they believe to encode a particular genetic function, and by generation of many mutations of an individual genetic element (Rieger et al. 1991).

♦ **conservation** *n.*

1. A person's, or group's, preserving natural resources, such as endangered species, forests, fisheries, for economic use, recreational use, scientific use, scientific interest, aesthetic value, or for a combination of these things (Michaelis 1963).

2. An area preserved for conservation reasons (Michaelis 1963).

[Latin *conservare* < *com-* thoroughly + *servare*, to keep, save]
cf. preservation

♦ **conservation umbrella** See ²species: umbrella species.

♦ **consilience of inductions** *n.* A form of argumentation based on a group of compatible inductions that support a hypothesis (Whewell 1840).

Comment: This kind of reasoning is used to support Darwin's theory of organic evolution (Ruse 1984).

♦ **consilva** See ²community: coniferous forest.

♦ **consociation** See ²community: consociation.

♦ **consociation dominant** See ²species: physiognomic dominant.

♦ **consocie** See ²community: consocies.

♦ **consort pair** See ²pair: consort pair.

♦ **consort relationship** See relationship: consort relationship.

♦ **consortium** *n.* A group of heterospecific individuals, typically of different phyla, that live in close association (Lincoln et al. 1985).

See symbiosis: consortium.

♦ **conspecific** *adj.* Referring to organisms that belong to the same species (Wilson 1975, 581).

ant. heterospecific

♦ **constant-environment principle** See principle: constant-environment principle.

♦ **constant extinction, law of** See hypothesis: Red Queen hypothesis.

♦ **constant species** See ²species: constant species.

♦ **constitutive hierarchy** See hierarchy: constitutive hierarchy.

♦ **constitutive reductionism** See reductionism: constitutive reductionism.

♦ **constipated** *adj.* Referring to objects that are crowded together (Lincoln et al. 1985).

cf. dispersion; distribution: contagious distribution

♦ **constraint** *n.*

1. "Confinement; restriction" (Michaelis 1963).
2. The act of constraining; the state of being constrained (Michaelis 1963).
3. "Anything that constrains" (Michaelis 1963).

[Old French *constreindre* < Latin *constringere* < *com-* together + *stringere*, to bind]

architectural constraint *n.* An organism's morphological restriction that was never an adaptation, but rather a necessary consequence of materials and designs used to build its basic *Bauplan*; e.g., the patterns of ridges on shells of some mollusc species (Seilacher 1970 in Gould and Lewontin 1979, 595).

developmental constraint *n.* The resistance of an organism's developmental pathways to evolutionary change (Gould and Lewontin 1979, 594).

Comments: Developmental constraint is a form of phyletic constraint (Gould and Lewontin 1979, 594).

♦ **phyletic constraint**

See phylogenetic inertia.

♦ **consumable** See resource: consumable.

♦ **consumer** *n.* An organism that feeds on another organism, or on existing organic matter; consumers

include herbivores, carnivores, parasites, and all other saprotrophs and heterotrophs (Lincoln et al. 1985).
cf. parasite, primary producer, -troph-, -vore

primary consumer *n.* "A heterotrophic organism that feeds directly on a primary producer" (Lincoln et al. 1985).

secondary consumer *n.* A heterotrophic organism that feeds directly on a primary consumer (Lincoln et al. 1985).

♦ **consumer psychology** See study of: psychology: consumer psychology.

♦ **consummatory act, consummatory behavior** See behavior: consummatory behavior.

♦ **contact avoidance** *n.*

1. For example, in Humans, the Orangutan, and praying mantids: Avoidance of close bodily contact and maintenance of individual distance (Heymer 1977, 102).
2. Human avoidance of social relations (Heymer 1977, 102).

cf. distance: individual distance

♦ **contact behavior, contactual behavior** See behavior: contact behavior.

♦ **contact greeting** See greeting: contact greeting.

♦ **contact pair** See ²pair: contact pair.

♦ **contact-seeking behavior** See behavior: contact-seeking behavior.

♦ **contact withdrawal** *n.* Removal of contact with conspecifics in early childhood that may lead to irreversible damage, e.g., long hospitalization in Humans (hospitalism, Tinbergen and Tinbergen 1973 in Heymer 1977, 101), isolation in monkeys (Harlow and Harlow 1962a, b in Heymer 1977, 101).

♦ **contagious distribution** See distribution: contagious distribution.

♦ **contamination theory** See ³theory: Castle's theory.

♦ **contemporaneous polygamy** See mating system: polygamy: simultaneous polygamy.

♦ **contest** See game.

♦ **contest competition** See competition: contest competition.

♦ **context** *n.* The setting (including recipient's sex, other signals besides the one in question, etc.) in which a signal is emitted and received that can influence its effect on its recipient (Dewsbury 1978, 99; Immelmann and Beer 1989, 59).

cf. ¹system: communication system; ³theory: communication theory; syntax

♦ **contiguity, law of** See law: law of contiguity.

♦ **continental drift** See hypothesis: continental drift.

♦ **"continental-drift hypothesis"** See hypothesis: hypotheses regarding the origin of the Cambrian explosion: "continental-drift hypothesis."

♦ **contingency** *n.*

1. Uncertainty of occurrence; the condition of being subject to chance or accident" (Michaelis 1963).
2. An unforeseen, but possible occurrence or conditions; accident (Michaelis 1963).
3. Something incidental; an adjunct (Michaelis 1963).
4. The simultaneous, or sequential, occurrence of two behaviors, a stimulus and behavior, or behavior and reinforcement, that can give rise to persistent linkage (Immelmann and Beer 1989, 59).

- cf.* learning: conditional learning, prenatal learning
5. The dependence of a course of evolution on highly improbable and unpredictable events, such as great extinctions (Gould 1992 in Gerhart and Kirschner 1997, 45).

6. A cell's responses to extracellular, or intracellular, conditions (Gerhart and Kirschner 1997, 45).

syn. control, regulation (Gerhart and Kirschner 1997, 45)

Note: Gerhart and Kirschner (1997, 45) use contingency in the sense of something's being dependent on something else. They give the example of the dependence of an activity of a conserved core protein, or process, on particular conditions, and the rules for its activation with regard to circumstance, place, and time.

♦ **continuity of germ plasm, theory of** See ³theory: theory of continuity of germ plasm.

♦ **continuous drift** See drift: genetic drift: continuous drift.

♦ **continuous modular society** See ²society: modular society.

♦ **continuous patrolling** See patrol.

♦ **continuous reinforcement schedule** See reinforcement schedule: continuous reinforcement schedule.

♦ **continuous variable** See variable: continuous variable.

♦ **continuous variation** See variation: continuous variation.

♦ **contranatant** *adj.* Referring to swimming, moving, or migrating against water current (Lincoln et al. 1985).
cf. denatant

♦ **contronym** *n.* A word, or phrase, that is an antonym of itself through distortion, if not misuse (Safire 1997, 4 May, 22).

syn. antilogy, Janus word

Comments: "Arguably" is a contronym which can mean certainly or hardly. "True altruism" and "overdispersed distribution" (both in this book) each have opposite meanings, but it is not clear if they meet the criterion(a) of Safire's (1997) definition.

[Janus word, after Janus the Roman god of beginnings; Latin, *ianus*, gateway (Safire 1997, 4 May, 22). Janus' face was on the gates of his temple in the Roman Forum. They were open in wartime and closed in peace time, requiring a head with two faces. One sense of Janus-faced is deceitful and two-faced. Another is sensitive to dualities and polarities.]

♦ **contrast** See statistical test: multiple-comparisons test: planned-multiple-comparisons procedure: contrast.

♦ **¹control** *n.*

1. A parallel experiment, or test, carried out to provide a standard against which an experimental result can be evaluated (Lincoln et al. 1985); any treatment against which one, or more, other treatments is compared (Hurlbert 1984, 191).

2. In experimental design, all of the obligatory design features (e.g., control treatments, randomized assignment of experimental units to treatments, and replication of treatments) that reduce, or eliminate, sources of confusion, e.g., temporal change in measured units, procedure effects on these units, experimenter bias, and experimenter-generated variability (Hurlbert 1984, 191).

3. In experimental design, one's regulation of the conditions under which an experiment is conducted, e.g., homogenizing experimental units, making procedures as precise as possible, or most often, regulating the physical environment in which one conducts an experiment (Hurlbert 1984, 191).

♦ **²control** *n.* For example, in some primate species: The intervention by one, or more, individuals to reduce, or halt, aggression between other members of the group (Wilson 1975, 581).

♦ **³control** *n.*

1. Power to regulate and direct; verify; rectify (Michaelis 1963).
2. "A restraining influence, check" (Michaelis 1963).

bottom-up control *n.*

1. Either a primary producer's, or a limiting nutrient's, regulating an ecosystem's higher food-web components; contrasted with top-down control (Pace et al. 1999, 483).
2. The control of an organism(s) at one level in a food chain (or food web) on the next highest level (inferred from Steiner 2001, 2495).

Comments: For example, the species composition and abundance of algae can influence the species composition and abundance of algal parasites and predators. Researchers often find it difficult to separate bottom-up control and top-down in practice (Pace et al. 1999, 483). Both phenomena occur in many ecosystems. Also researchers often use these concepts in the context of equilibrium conditions, but most natural food webs are probably rarely near equilibrium.

top-down control *n.*

1. An upper-level predator's regulating an ecosystem's lower food-web components; contrasted with bottom-up control (Pace et al. 1999, 483); contrasted with bottom-up control.
2. The control of an organism(s) at one level in a food chain (or food web) on the next lowest level (inferred from Steiner 2001, 2495).

Comment: For example, the species composition and abundance of algal parasites and predators can influence the species composition and abundance of algae.

- ♦ **control theory** See study of: mathematics: cybernetics.

- ♦ **controlled variable** See variable: independent variable.

- ♦ **convenience polyandry** See mating system: polyandry: convenience polyandry.

- ♦ **convention** *n.* A formal meeting of delegates, members, representatives, or a combination of these people, such as conservationists (Morris 1982).

Bern Convention on the Conservation of European Wildlife and Natural Habitats

1979 *n.* A meeting whose goals were to conserve wild organisms and their natural habitats, promote co-operation among European states, monitor and control endangered and vulnerable species, and help with the provision of assistance concerning legal and scientific issues (FOCUS News Agency 2009, swissinfo.ch 2009).

syn. Bern Convention

- ♦ **conventional behavior** See behavior: conventional behavior.

- ♦ **conventional signal** See signal: conventional signal.

- ♦ **conventional statistics** See study of: statistics: conventional statistics.

- ♦ **convergence, convergent evolution** See ²evolution: convergent evolution.

- ♦ **convulsionism** See ³theory: catastrophism.

- ♦ **Coolidge effect** See effect: Coolidge effect.

- ♦ **cooperation** *n.*

1. An organism's showing (sociobiological) altruism toward genetic relatives (given as a verb in Axelrod and Hamilton 1981, 1393).
2. An organism's helping conspecific nonrelatives, *e.g.*, with reciprocal altruism (given as a verb in Axelrod and Hamilton 1981, 1395).

syn. protocooperation (Lincoln et al. 1985)

See symbiosis: mutualism, protocooperation.

cf. altruism

v.i. cooperate

Comment: "Symbiosis," "protocooperation," "obligacy," "facilitation," and "altruism" are used with partial to total overlap in meaning with cooperation and mutualism in the literature; this makes these terms confusing (Boucher 1992, 208).

weak cooperation *n.* An interaction between an actor and recipient in which neither has a fitness change (Gadagkar 1993, 233).

- ♦ **cooperative altruism** See altruism (def. 2).

- ♦ **cooperative breeding** See breeding: communal breeding.

- ♦ **cooperative foraging** See foraging: cooperative foraging.

- ♦ **co-option** *n.* The transfer of an adaptation from an earlier evolutionary situation to a later one; *e.g.*, the transfer of the sucking mouthparts of an insect family from seed plants that occurred before angiosperms to angiosperms when these plants originated on Earth (inferred meaning from Labandeira and Sepkoski 1993, 314).

- ♦ **coordination** *n.*

1. Interaction among units of a group such that the overall effort of the group is divided among the units without leadership being assumed by any one of them; *e.g.*, formation of a school of fish, trophallaxis between worker ants, and encirclement of prey by a pack of wolves (Wilson 1975, 10, 581).

Note: Coordination may be influenced by a unit in a higher level of a social hierarchy, but such outside control is not essential (Wilson 1975, 10).

2. The special postural and locomotor behaviors that always occur together in a given context, *e.g.*, in mammalian elimination behavior (Heymer 1977, 79).

syn. basic-movement pattern

cf. taxis

- ♦ **coordination signal** See signal: coordination signal.

- ♦ **contiguous-gene-deletion syndrome** See syndrome: continuous-gene-deletion syndrome.

- ♦ **copal** *n.* A hard, transparent resin that is almost colorless through bright yellowish-brown, exuded by several species of tropical trees (Michaelis 1963; Preece 1973, 458).

cf. fossil: amber

[Spanish < Nahuatl *copalli*, incense]

- ♦ **Cope's law, Cope's rule** See law: Cope's rule.

- ♦ **copia element** See transposable element: copia element.

- ♦ **coprobiont** See biont: coprobiont.

- ♦ **coprolite** See fossil: coprolite.

- ♦ **coprology** See study of: coprology.

- ♦ **coprophage, coprophagy, coprophagous** See -phage: coprophage.

- ♦ **coprophile** See ¹-phile: coprophile.

- ♦ **coprophilia** See -philia: coprophilia.

- ♦ **coprophilous** See -philous: coprophilous.

- ♦ **coprozoite** See -zoite: coprozoite.

- ♦ **copula** See *in copulo*.

- ♦ **copulation, copulatory behavior** *n.* In many animal species: An animal's engaging in sexual intercourse (Michaelis 1963); animals' "uniting" male and female sex organs which can lead to fertilization; in many bird species: pressing together cloacae during which a male ejaculates sperm into a female's reproductive tract (Heymer 1977, 104); in Mammals, a

male's mounting a female, usually from behind, intromission (insertion of his penis into her vagina), and pelvic thrusting and ejaculation (forceful discharge of sperm into her vagina) (Immelman and Beer 1989, 61).

syn. cloacal kiss (euphemistic, refers to birds), coition, coitus, courting (some authors, seemingly an euphemistic term for copulation), fucking (obscene), mating (used somewhat euphemistically for copulation in scientific literature), making love and pairing (somewhat euphemistic), pairing behavior, treading (in male birds)
v.i., v.t. copulate

cf. behavior: precopulatory behavior, postcopulatory behavior; courtship; *in copulo*; insemination; interest in participation with a copulating pair; mating; mounting; pair; sexual reproduction, sperm plug; stuck; tie
Comments: "Copulation," as "homosexual copulation," is also used when same sexed individuals engage in "sexual intercourse." There are scores of euphemistic synonyms for "copulation," especially related to Humans (Spears 1981). "Mating" alone does not indicate whether insemination, conception, or both occur. I suggest that one should use "inseminative mating," "inseminative copulation," "conceptual mating," and "conceptual copulation" to clarify matters. "Successful mating" is a confusing term which could be considered synonymous with inseminative, and conceptual, copulation.

[Latin *copulatus*, past participle of *copulare*, to fasten < *copula*, a link]

aerial copulation *n.* For example, in many insect and some swift (bird) species: Copulation in flight (Rothgänger 1973 in Heymer 1977, 112).

bond-oriented copulation *n.* For example, in Humans: Copulation that maintains pair bonds, rather than fertilizes ova (Heymer 1977, 104).

extrapair copulation *n.* For example, in many bird species and Humans: Copulation involving a pair-bonded individual and an individual outside its pair bond (Wittenberger 1981, 615; McKinney et al. 1984; Westneat 1987, 865; Lank et al. 1989, 86).

syn. adultery (for Humans, sometimes for non-humans)

forced copulation *n.*

1. An animal's forced coition or insemination (Gladstone 1979; Burns et al. 1980; Gowaty 1982).
2. A male animal's forced insemination of a female that simultaneously enhances his fitness and decreases her fitness (Thornhill 1980; Thornhill and Alcock, 1983).
3. A male animal's forced coition with a resisting female that is willing, or unwilling, to mate (Estep and Bruce 1981).
4. "A copulation forced onto an unwilling female by an aggressive or overpowering male" (Thornhill and Alcock 1983, 272, 275, 404).

syn. coercive copulation, sexual coercion (Bisazza et al. 2001, 59)

cf. rape

Comments: Forced copulation occurs in animals including *Anas platyrhynchos* (Mallards), some insect species (Gladstone 1979; Burns et al. 1980), Humans, and *Pongo borneo* (Orangutans) (Galdikas 1995, 178). A male Orangutan forced copulation with a female Human (Galdikas 1995, 294). McKinney et al. (1984, 528) indicate that "forced copulation" is shorthand for "forced extrapair copulation" in waterfowl which was reported as early as 1912 by Huxley; female

ducks can be exhausted, wounded, or even killed during forced copulation attempts. Many behaviorists prefer to use "forced copulation," rather than "rape," for nonhuman animals because "rape" has so many emotional connotations (Wittenberger 1981, 615; Gowaty 1982).

homosexual copulation *n.* For example, in an acanthocephalan-worm species, Humans, *Porphyrio porphyrio* (Purple Swamphens), and *Uta* lizards: "Copulation" between two male animals that may involve one male's ejaculating semen into an orifice of the other (Tinkle 1967 in Wilson 1975, 444; Jamieson and Craig 1987, 1251).

syn. homosexual mating

cf. behavior: homosexual behavior; copulation: pseudocopulation: homosexual pseudocopulation

pseudocopulation *n.*

1. In some bird, fish, and mammal species: Heterosexual and homosexual mounting with, or without, intromission, that is not used for inseminative purposes (Immelman and Beer 1989, 237).

syn. pseudocopulatory behavior

cf. behavior: sexual behavior: pseudosexual behavior

Note: Pseudocopulation in the parthenogenetic *Cnemidophorus uniparens* (Whiptail Lizard) facilitates ovarian growth, much like male courtship behavior stimulates ovarian growth in sexual species (Crews 1989 in Crews and Young 1991, 512).

2. In some species of bees and wasps: A male's making copulatory movements with a flower of some orchid species which resemble conspecific females, but do not offer nectar rewards (Correvon and Pouyanne 1916, Wolff 1950, Kullenberg 1973, etc. in Faegri and van der Pijl 1979, 74).

Note: The orchids are pollinated by this process; this appears to be a case of a plant's parasitizing an animal's behavior.

cf. mimicry: Pouyannean mimicry

heterosexual pseudocopulation *n.* Pseudocopulation between a male and female that may serve to reinforce their pair bonding (Immelman and Beer 1989, 237).

homosexual pseudocopulation *n.*

1. Pseudocopulation between males (Wilson 1975, 22, 281; Immelman and Beer 1989, 237).

Notes: In all-male groups, homosexual pseudocopulation may serve to maintain males' reproductive readiness; in some baboon and macaque species, it may be used to express rank among males (Maslow 1936, 1940 in Wilson 1975, 281; Carpenter 1942a in Wilson 1975, 22; Immelman and Beer 1989, 237). Depending on the situation, dominant males either mount or are mounted by other males. Similar behavior occurs in Domestic Cattle (Thornhill and Alcock 1983).

2. A male insect's attaining a copulatory position on a conspecific male.

Note: This occurs in a meloid beetle and may result from female incitation of male aggression (Thornhill and Alcock 1983, 406). When this occurs in *Popillia japonica* (Japanese Beetles), it may be due to female sex attractant's being on males under laboratory conditions (Barrows and Gordh 1978).

syn. homosexual mounting

- cf. perversum simplex*; copulation: rage copulation
- rage copulation** *n.* For example, in some baboon species, *Canis lupus* (Gray Wolves), Humans, and *Mus musculus* (House Mice): An animal's mounting a conspecific of the same sex, representing an aggressive dominance demonstration (Heymer 1977, 203).
cf. homosexual mounting
- sneak copulation** *n.*
1. For example, in a carpenter-bee species, some fish species, and Humans: A copulation by a male that invades another's territory and copulates with a female in the territory (Barrows 1983, 806; Constanz 1984, 474; Parker 1984, 33).
 2. In a bat species: A male's copulation with a sleeping female during her hibernation (Fenton 1984, 581).
- ◆ **copulator** *n.* An animal engaged in copulation.
syn. mater
cf. copulation
- ◆ **copulatory afterplay** See behavior: postcopulatory behavior.
- ◆ **copulatory organ** See organ: copulatory organ.
- ◆ **copulatory plug** See mating plug. [updated 5 July 1991]
- ◆ **copulin** See chemical-releasing stimulus: semiochemical: pheromone: copulin.
- ◆ **copulo** See *in copulo*.
- ◆ **copy DNA** See nucleic acid: deoxyribonucleic acid: copy DNA.
- ◆ **coquette call** See call: coquette call.
- ◆ **coquette swimming** See swimming: coquette swimming.
- ◆ **coral bleaching** *n.*
1. A coral's expelling its symbiotic algae due to damage by light at higher than normal temperatures, leaving stark, white skeletons (Pockley 1999, 98; www.wri.org/indictrs/rrbleach, 1999, illustrations, references).
 2. The result of the process of coral bleaching as defined in definition 1 above (inferred from Pockley 1999, 98).
cf. habitat: coral reef
- Comments:* Ove Hoegh-Guldberg predicts that given global warming, coral bleaching will eliminate most coral reefs by 2100 (Pockley 1999, 98). His prediction is controversial.
- ◆ **coral reef** See habitat: coral reef.
- ◆ **corbicula** See organ: corbicula.
- ◆ **core area** *n.*
1. The area that an animal uses more frequently than other areas within its home range (Kaufmann 1962 in Wilson 1975, 256, 581).
Note: In some mammal species, conspecifics of the same sex usually exclude others from their core areas (Eisenberg 1981, 506).
 2. The central location of a colony, or other central-place system, around an animal (or group of animals) in which it focuses its activities and movements (Wittenberger 1981, 614).
cf. 3range, territory
- ◆ **core temperature** See temperature: core temperature.
- ◆ **corkscrew swimming** See swimming: corkscrew swimming.
- ◆ **cormidium** *n.* In siphonophores: A group of zooids (individual members) of a colony that can separate from the remainder of the colony and live an independent existence (Wilson 1975, 581).
Note: The cormidium is the unit of organization between a zooid and a complete colony (Wilson 1975, 581).
- ◆ **Cornell-style Malaise trap** See trap: Malaise trap: Cornell-style Malaise trap.
- ◆ **cornicle** *n.* In some aphid species: An external abdominal organ that produces a quickly hardening wax that is used in defensive behavior (Wilson 1975, 356; Boyle and Barrows 1978, 452).
- ◆ **corolla flare** *n.* The distance that separates opposite corolla lobes of a flower (Galen 1996, 120).
- ◆ **corpse** *n.* A dead embryo (*e.g.*, of a *Drosophila* fly) (White et al. 1994, 677).
- ◆ **corpus-allatum hormones** See hormone: juvenile hormones.
- ◆ **corpus callosum** See organ: brain: corpus callosum.
- ◆ **corpuscular theory of the gene** See theory: classical-gene-chromosome theory.
- ◆ **correction procedure** See procedure: correction procedure.
- ◆ **correlation** See statistical test: correlation.
- ◆ **correlation of parts, principle of** See principle: principle of correlation of parts.
- ◆ **Corrositex** See test: Corrositex.
- ◆ **corticole** See -cole: corticole.
- ◆ **corticospinal tract** See 2system: pyramidal system.
- ◆ **corticosteroid** See hormone: corticosteroid.
- ◆ **corticotropin** See hormone: adrenocorticotrophic hormone.
- ◆ **corticotropin-releasing factor** See hormone: corticotropin-releasing factor.
- ◆ **coryphile** See 1-phile: coryphile.
- ◆ **coryphium** See 2community: coryphium.
- ◆ **coryphophile** See 1-phile: coryphile.
- ◆ **cosexual** See hermaphrodite.
- ◆ **Cosmic Background Explorer** See satellite: Cosmic Background Explorer.
- ◆ **cosmic dust** *n.* Micrometeoroids that are present in the space between planets of our Solar System (Mitton 1993).
syn. interplanetary dust (Mitton 1993)
- Comments:* Cosmic dust might originate from collisions between asteroids in the asteroid belt and from gradual break up of comets (Mitton 1993). Cosmic dust that settled on Earth might have brought organic compounds important in the origin of life. About 50,000 tons of cosmic dust fall on Earth annually (exhibit, U.S. Museum of Natural History, 2002).
- ◆ **cosmic microwave background** *n.* A faint microwave radiation that fills our Universe, and may be the heat leftover from the Big Bang (Glanz 2001, D1).
Comments: Some scientists believe that the cosmic microwave background derives from light waves that formed several about 300,000 yr after the Big Bang's initiation (Glanz 2001, D1, D5). The cosmic microwave background is evidently our Universe's oldest light. Some people consider the background to be an inorganic "fossil." George Gamow and colleagues predicted in the 1940s that the Big Bang should have produced some sort of radiation that we could detect. Arno A. Penzias and Robert W. Wilson discovered the background in 1965, and received a Nobel Prize in 1978 for its discovery.
- ◆ **cosmic ray** *n.* An extremely energetic elementary particle (nucleus) that travels through the Universe at practically the speed of light (Mitton 1993).
syn. cosmic radiation, cosmic wave
- Comments:* V. F. Hess first discovered cosmic rays during a balloon flight in 1912 (Mitton 1993). Cosmic rays

are the only particles we can detect that have traversed our Galaxy. Very high-energy cosmic rays might come from quasars and active galactic nuclei. Lower-energy cosmic rays are generated within our Galaxy in pulsars and supernova explosions and remnants. Solar flares produce very low-energy cosmic rays which increase in intensity at times of maximum solar activity. Cosmic rays may have provided energy used in synthesis of organic molecules before the origin of life on Earth (Strickberger 1996, 115).

♦ **cosmic teleology** See teleology: cosmic teleology.

♦ **cosmology** See study of: philosophy: metaphysics: cosmology.

♦ **cosmopolitan** See ubiquitous.

♦ **Cosquer Grotto** See place: Chauvet Grotto (comments).

♦ **cost** *n.*

1. What a person gives, or surrenders, in order to acquire, produce, accomplish, or maintain something; the price he pays for something (Oxford English Dictionary 1972, entries from 1300).
2. A person's "loss; suffering; detriment" (Michaelis 1963).
3. Any consequence of a phenotypic trait that decreases an organism's Darwinian fitness, due to an energy expenditure, loss in viable offspring, etc. number (Dawkins 1986, 31).

Note: "Sometimes, costs are operationally defined in terms of direct and indirect fitness, especially during empirical studies or theoretical analyses pertaining to them" (Wittenberger 1981, 614).

cf. benefit, risk, trade-off, utility

cost of anisogamy *n.* "The twofold reduction in Darwinian fitness that results from producing male progeny in anisogametic, sexually reproducing organisms" (Wittenberger 1981, 614).

cost of males *n.* The decrease in number of females produced by a sexually reproducing form of a species in subsequent generations compared to an asexually reproducing form of this same species (Maynard Smith 1978 in Willson 1983, 48).

cf. cost: cost of meiosis

cost of meiosis *n.*

1. The decrease in the number of genes passed on into future generations by a sexually reproducing form of a species compared to an asexually reproducing form (Williams 1975, 1980 in Willson 1983, 47).
2. "The alleged twofold reduction in Darwinian fitness that results from being only 50% related to each progeny in sexually reproducing organisms, as compared to the 100% relatedness present in asexually reproducing organisms" (Wittenberger 1981, 614).
3. A female sexually reproducing organism's halving her chromosome number but not being able to double her gamete number (Dawkins 1986, 135).

syn. cost of sex, meiotic cost

cf. cost: cost of males

cost of mating *n.*

1. A male's expenditures in time and energy due to factors such as attracting predators and parasites by conspicuous courting, growing, producing pheromones, securing "ornamentation," securing mates, and undertaking dangerous travels (Daly and Wilson 1983, 62).
2. A female's expenditures in time and energy due to factors including the above plus a male's badgering

her so that she cannot feed, wounding her in battling for her, and even killing her *in copulo* (Daly and Wilson 1983, 62).

cost of outcrossing *n.* An organism's fitness loss (in the short run) from outbreeding compared to inbreeding (Bernstein et al. 1985, 1279).

Comment: The cost comes from having offspring with poorly adapted gene complexes, etc. (Bernstein et al. 1985, 1279).

cost of parthenogenesis *n.* An organism's fitness loss due to parthenogenetic reproduction resulting in poor egg hatching success caused by abnormal development, reduced fecundity, etc. (Bernstein et al. 1985, 1980).

cost of recombination *n.*

1. A parent's cost due to producing offspring with new genetic combinations that might not survive well in the parent's present habitat (Daly and Wilson 1983, 62).
2. In genetics, recombinational load, *q.v.* (Daly and Wilson 1983, 62).

cost of selection *n.* The accumulating cost to a population, in terms of genetic deaths, or replacing one allele by another during evolution (Lincoln et al. 1985). *syn.* cumulative-substitutional load (Lincoln et al. 1985) *cf.* genetic load: substitutional load

substitutional load, transitional load *n.*

Genetic load due to one allele's being replaced by another during evolutionary change (Lincoln et al. 1985).

Comment: Substitutional load is the expression of the cost of selection, *q.v.*, as a kind of genetic load (Ridley 1996, 160).

costs of sex *n. pl.* Costs including costs of males, mating, meiosis, and recombination (*q.v.*) (Daly and Wilson 1983, 60; Willson 1983, 46).

See cost: cost of meiosis.

cf. benefit: benefits of sex, cost: cost of mating, major costs of sex, hypothesis: hypotheses of the evolution and maintenance of sex

energy cost of play *n.* The "net daily energy expenditure (in excess of resting metabolism) that is due to play, expressed as a percentage" of an individual's total daily energy budget (Martin 1982, 295).

expected cost *n.* Cost, measured in fitness, that an individual can expect to incur at some future time by performing a particular behavior rather than some alternative behavior [in any behavior context] at a given time; "expected cost equals cost multiplied by the probability of incurring the cost" (Wittenberger 1981, 615, 621).

cf. risk

leverage cost *n.* Cost, measured in fitness, incurred by the winner of a social conflict when it wins in a situation where winning ultimately reduces its fitness; during a social conflict, an animal has a leverage advantage, *q.v.*, if the leverage cost it incurs if it wins is less than the leverage cost its opponent incurs [coined by Hand 1986, 213].

major costs of sex *n. pl.* Cost of high recombinational load, lower genetic relatedness between parents and their offspring, males, and mating (Bernstein et al. 1985, 1279).

cf. benefit: benefits of sex, cost: cost of mating, major costs of sex, hypothesis: hypotheses of the evolution and maintenance of sex

meiotic cost See cost: cost of meiosis.

opportunity cost *n.* An organism's cost of performing one activity (equal to the value of some

alternative foregone activity) that results from the organism's investing its resources in this former activity instead of the foregone one (Mishan 1975 in Winterhalder 1983, 74).

syn. principle of lost opportunity (Stephens and Krebs 1986, 11)

♦ **cost function** See function: cost function.

♦ **co-suppression** See post-translational gene silencing.

♦ **coterie** See ²group: coterie.

♦ **counseling psychology** See study of: psychology: counseling psychology.

♦ **counter singing** See animal sounds: song: duet: countersinging.

♦ **counteracting selection** See selection: counteracting selection.

♦ **counteraction** See need: counteraction.

♦ **counterconditioning** See learning: conditioned learning: counterconditioning.

♦ **counterevolution** See ²evolution: counterevolution.

♦ **counterfeit signal** See signal: counterfeit signal.

♦ **countershading** See camouflage: countershading.

♦ **countersinging** See animal sounds: song: duet: countersinging.

♦ **counting, counting ability** *n.*

1. A person's action, or process, of listing, or calling off, the units of a group, or collection, one by one to determine the total; numbering; enumerating; calculating; computing; reckoning (Oxford English Dictionary 1989, entries starting at 1330; Michaelis 1963).
2. For example, in some dolphin, magpie, mouse, rat, and raven species; Humans; *Macaca mulatta* (Rhesus Macaques); and *Procyon lotor* (Common Raccoons): An individual's capacity for forming nonverbal counting or number recognition (Koehler 1937–1955, Bucholtz 1973 and Rensch 1973 in Heymer 1977, 203; Davis and McIntire 1969 in Davis and Memmott 1983, 95; Davis 1984, 409; Davis and Albert 1986, 57).

Comments: In counting tests, an African Gray Parrot, magpies, ravens, and squirrels can "count" up to 6; Budgerigars and Jackdaws, up to 7; and Rock Doves, up to 8 (Immelmann and Beer 1989, 61). In most tests of "counting," nonhuman animals do not enumerate objects by applying a series of cardinal labels. "Counting" has been applied to cases of behavior control when all nonnumerical properties of an animal's stimulus environment (e.g., visual, auditory, and temporal) have been controlled (Davis 1984, 409). Davis and Memmott (1983, 99) conclude that after laboratory training, nonhuman animals will not continue to count simply because they have been taught to do so; however, they will continue to count if their environment demands this behavior. Fully developed counting includes a person's producing a standard sequence of number words, applying a unique number word to each item of a set that he counts, remembering which items he has already counted, and comprehending that the last used number word indicates how many items he counted (Pepperberg 1987, 37).

♦ **court** *n.*

1. In some species of birds and mammals: An area defended by individual males within a lek or communal display area (Wilson 1975, 331).

cf. ²lek

2. In social insects, especially *Apis mellifera* (Western Honey Bees): The group of workers in an insect colony that surrounds its queen; a court's worker composition changes constantly (Wilson 1975, 581). *syn.* retinue (Wilson 1975, 581)

3. *v.i., v.t.* To show courtship behavior, *q.v.*

Note: This definition is preferable to def. 4.

4. To mate or copulate.

cf. copulation

♦ **courtship, courtship behavior** *n.*

1. A man's action, or process of paying court to a woman with a view to marriage; wooing; courting (Oxford English Dictionary, entries starting at 1596).

2. Mating, copulating.

cf. copulation

3. Broadly, precopulatory, pair-forming, and pair-bonding behavior (Immelmann and Beer 1989, 62).

4. Behavior that brings two conspecific animals of different sexes together under conditions where inseminative copulation, or fertilization, is likely to occur (Dewsbury 1978, 71).

Note: This definition seems appropriate for wide use. "It may be difficult to designate the point at which courtship ends and mating begins" (Oliver 1955, 218). Halliday and Adler (1986, 146) indicate that courtship can accompany the act of fertilization. Wickman's (1986, 153) "courtship solicitation" in the small heath butterfly is "courtship" based on this definition. White et al. (2000, 883) divide courtship (in the broad sense) into "courtship" (strict sense) and "copulatory-induction behavior" with regard to Fruit Flies (Tephritidae).

5. All of a male's behavior that he directs towards a female after he detects her and before he attempts to copulate with her (Boake 1983, 29).

See display: sex advertisement.

syn. copulation (some authors), mating (some authors, especially with regard to mammals, Immelmann and Beer, 1989), precopulatory or precoital behavior (Immelmann 1977)

cf. behavior: postcopulatory behavior; court; dance: mating dance; display: advertisement: sex advertisement; estrus: heat, rut; play: foreplay

Comments: Armstrong (1965, 22) suggests that "courtship" be restricted to prenuptial display and postnuptial display be called "connubial display." "Courtship" helps an animal find a mate, determine that a potential mate is the correct species, form a pair bond, reinforce a pair bond, stimulate a mate, and synchronize sexual arousal of mates (Immelmann 1977). Also "courtship" may allow an animal to choose among potential mates that are competing for it. It is useful for a scientist to state at the beginning of his publication precisely how he is using "courtship" (Immelmann and Beer 1989, 62). Jamieson and Craig (1987) describe male-male and female-female courtship and copulatory behavior in a bird.

♦ **behavioral dichotomy** *n.* Courtship in which the sexes distinctly differ in their behaviors (Aronson 1949 in Heymer 1977, 198).

♦ **communal courtship** *n.*

1. Courtship in which a group of conspecific males displays to females (Heymer 1977, 79; Immelmann and Beer 1989, 50).

cf. heterogenous summation

2. For example, in Flamingos: Courtship in which both males and females display to one another

more, or less, equally (Immelmann and Beer 1989, 50).

syn. group courtship, group mating (Immelmann and Beer 1987, 121)

Comment: Communal courtship is found in lekking species including the Cock-of-the-rock, Ruff, and Uganda Kob; birds-of-paradise; some bat dance-fly, fruit-fly, and bee species; and in nonlekking species including the Oyster Catcher (bird) and some insect species.

homosexual courtship *n.* For example, in *Porphyrio porphyrio* (Purple Swamphens): Male-male, or female-female, courtship (Jamieson and Craig 1987, 1251).

mutual courtship *n.* Courtship in which both partners participate equally (Huxley 1923, 1938 in Heymer 1977, 198).

unilateral display *n.* Courtship in which only one partner is a courter (Heymer 1977, 198).

♦ **courtship chain** See chain: courtship chain.

♦ **courtship colors** *n. pl.* For example, in male stickleback fish: Colors and color patterns that occur only during a species' mating season (Heymer 1977, 37). *cf.* coloration

♦ **courtship dance** See dance: courtship dance.

♦ **courtship feeding** See feeding: courtship feeding.

♦ **courtship flight** See flight: courtship flight.

♦ **courtship pheromone** See chemical-releasing stimulus: semiochemical: pheromone: aphrodisiac.

♦ **courtship rippling** *n.* In *Rhagadotarsus* sp. (water-striders): Propagation of patterned-water-surface waves by a male and female during their courtship (Wilcox 1972 in Wilson 1975, 238).

♦ **courtship ritual** *n.* A genetically determined characteristic behavior involving the production and reception of a complex sequence of visual, auditory, and chemical stimuli by a male and female animal before mating (Lincoln et al. 1985).

♦ **courtship song** See animal sounds: song: courtship song.

♦ **covert** See ²group: covert.

♦ **covey** See ²group: covey.

♦ **cow** See animal names: cow.

♦ **cowardess** See ²group: cowardess.

♦ **coy** *adj.*

1. Quiet, still (Oxford English Dictionary 1972, entries from 1330).
2. Referring to a person's being not demonstrative; shyly reserved or retiring; displaying modest backwardness or shyness (sometimes with emphasis on the displaying); not responding readily to familiar advances; now especially referring to a girl or young woman (Oxford English Dictionary 1972, entries from 1386).
3. In sociobiology, referring to an animal that is hesitant to copulate and thus evokes more courtship displays from a potential mate (Wilson 1975, 320).

cf. Lex-Heinze mood

syn. cautious

Comment: Cronin (1992, 293) explains why "coy" is a terminological oddity: When females choose mates, they are often called "coy" and males "eager, but if males were choosy, would they be coy or discriminating, judicious, and prudent; would females then be eager or wanton, brazen, and flighty?

[French *coi* (fem. *coite*), at rest, still, quiet]

♦ **coyness** *n.* An animal's being coy (Wilson 1975, 320).

♦ **cpDNA** See nucleic acid: deoxyribonucleic acid: chloroplast DNA.

♦ **CPOM** See particulate-organic matter: coarse-particulate-organic matter.

♦ **crash** *n.* A precipitous decline in population size (Lincoln et al. 1985).

See ²group: crash.

ant. flush

♦ **craton** *n.* A part of Earth's crust that has been stable (*i.e.*, did not have orogenic activity) for at least 1,500 Ma (Lapidus 1987).

Comments: Cratons usually formed of the Lower through Middle Precambrian metamorphosed sedimentary and volcanic rocks and are overlain by generally flat-lying Upper Precambrian, or younger, sedimentary rocks (Lapidus 1987). Shield areas are craton portions that are generally exposed, even during times of maximum continental submergence. Cratons underlie large parts of each of the seven continents and make up about 50% of Earth's continental land mass.

♦ **crawling** See creeping.

♦ **creaght** See ²group: creaght.

♦ **creation science** *n.*

1. A subject involving "scientific evidence to explain geology by 'catastrophism, including the occurrence of a worldwide flood,' and evidence that showed Earth to be no more than a few thousand years old (S. Nelson quoting B. Keith in Kamet 1986a).
2. "The scientific evidences for creation and inferences from those scientific evidences" (Kamet 1986a); the evidence involves the abrupt appearance of complex life in the fossil record and the systematic gaps between fossil categories without transitional forms (W. R. Bird in Kamet 1986a).

syn. creationism (Gillam 1999, 12 August, A13)

cf. special creation; study of: evolution; ²theory: intelligent-design theory

Comments: It is controversial whether creation science is a science and should be taught in U.S. schools; the U.S. Supreme Court tried to define creation science (Kamet 1986b). In 1982, a federal district court ruled in *McLean v. Arkansas Board of Education* that creation science is in fact religion and that it should not be taught alongside evolution in Arkansas public schools (Schmidt 1996, 422; Gillam 1999, 12 August, A13). A court also struck down a similar law in Louisiana in 1982. In 1987, the U.S. Supreme Court ruled in *Edwards v. Aguillard* that Louisiana could not mandate that schools give equal time to teaching creation science and evolution (Rosin 1999, 8 August, A22). In 1999, the Kansas Board of Education voted to eliminate most evolutionary concepts including common ancestors, evolution as an underlying principle of biology and other sciences, as a way to describe the emergence of new species, natural selection, and the origin of our Universe, in grades kindergarten through 12th (Rosin 1999, 8 August, A1; Belluck 1999, 12 August, A1; Gillam 1999, 12 August, A13; Holden 1999, 20 August, 1186). This move did not eliminate teaching evolution in Kansas, however. According to a Gallup Poll, about 44% of U.S. citizens believe in a biblical creationist view that God created Humans essentially in their present form at one time within the last 10,000 yr (Rosin 1999, 8 August, A22). About 40% believe in "theistic evolution" (= the idea that God oversaw and guided the millions of years of evolution that culminated with Humans. About 10% believed in a strict secular evolutionist perspective. The U.S. National

Academy of Sciences declared evolution is “one of the strongest and most useful scientific theories we have” and that it is supported by an overwhelming scientific consensus (Anonymous 2005, A15).

♦ **creationism** See creation science, special creation.

♦ **creationist** *n.* A person who believes that an intelligent creator somehow brought about the origin of life on Earth (inferred from Todd 1999, 423).

Comment: A creationist, depending on the person, also believes one or more of the following: DNA changes (mutations) give rise to variation in an organism's characteristic(s) that are subject to natural selection, DNA encodes the features of an organism, genetic and phenotypic changes could result in speciation, macroevolution is empirically proven, scientific enquiry should take the place of biblical reasons, and the Earth is not older than 10,000 yr (Rosen 1999, 8 August, A22; Todd 1999, 423).

♦ **CREB gene** See gene: CREB gene.

♦ **creche, crèche, crêche** See ²group: creche.

♦ **creeping** *n.* For example, in many protozoan, insect, and mammal species: An individual's moving with its body close to, or touching, its substrate (Michaelis 1963; Ricci 1990, 1052).

syn. crawling

♦ **cremnum** See ²community: cremnum.

♦ **cremophile** See ¹-phile: cremophile.

♦ **crenicole** See -cole: crenicole.

♦ **crenium** See ²community: crenium.

♦ **crenon** See biotope.

♦ **crenophile** See ¹-phile: crenophile.

♦ **creophage, creophagous** See -phage: creophage.

♦ **crepitation** *n.* A defense mechanism involving explosive discharge of fluid, *e.g.*, in insects (Lincoln et al. 1985).

See animal sounds: crepitation.

♦ **crepuscular, vespertine** *adj.* Referring to a species that is active at twilight hours of dawn, dusk, or both (Lincoln et al. 1985).

cf. diurnal, matinal, nocturnal, pomeridanus

♦ **Creutzfeldt-Jakob disease** See disease: Creutzfeldt-Jakob disease.

♦ **criterion of minimum specification** *n.* In sociobiology, “the number of individuals which, on the average, must be put together in order to observe the full behavioral repertory of the species” (Wilson 1975, 19).

♦ **critical habitat** See habitat: critical habitat.

♦ **critical period** See period: sensitive period.

♦ **croak** See animal sounds: croak.

♦ **cron** See unit of measure: cron.

♦ **cronism** See cannibalism: cronism.

♦ **crop** *n.* In many insect species: A dilated posterior portion of an individual's foregut just behind its esophagus (Borror et al. 1989).

Comment: Ant repletes (workers) store liquid food in their crops (= “social stomachs”) and regurgitate it for nest mates (Hölldobler and Wilson 1990, 643).

♦ **crop milk** *n.* In Ring Doves and other dove species: A regurgitated substance produced by the epithelial lining of a bird's crop that is used to feed young (Dewsbury 1978, 86).

♦ **cropper** *n.* An organism that feeds actively on other organisms from its surrounding environment (Lincoln et al. 1985).

♦ **cross** *n.*

1. Interbreeding of specific organisms, *e.g.*, members of two genera, species, populations, varieties, or genetic types.

2. The product of a cross (def. 1); a hybrid, *q.v.* (Michaelis 1963).

cf. crossing, generation: backcross generation, hybrid, mating

♦ **backcross** *n.*

1. An organism produced by a hybrid's breeding with either of its two parental species (Mayr 1982, 643; Dewsbury 1978, 118).

2. The cross of a heterozygote with an individual with a genotype like one of its parents (Rieger et al. 1991).

♦ **diallel cross** *n.* An experimental design in which one produces all possible F_1 crosses among three, or more, inbred strains, which suggests which traits are relevant to fitness and estimates a wide range of genetic parameters (Dewsbury 1978, 128). *See* method: methods for studying adaptive significance of behavior.

♦ **dihybrid cross** *n.* Interbreeding of two individuals that are heterozygous for two pairs of alleles (Lincoln et al. 1985).

cf. cross: monohybrid cross

♦ **incross** *n.* Interbreeding of homozygotes (Lincoln et al. 1985).

cf. cross: intercross

♦ **intercross** *n.* Interbreeding of heterozygotes (Lincoln et al. 1985).

cf. cross: incross

♦ **Mendelian crosses** *n.* Interbreeding between a homozygous recessive parent and a homozygous dominant parent and interbreeding of their F_1 offspring which produces F_2 offspring (Dewsbury 1978, 116–119).

♦ **monohybrid cross** *n.* Interbreeding of two individuals that are heterozygous for only one pair of alleles (Lincoln et al. 1985).

cf. cross: dihybrid cross

♦ **test cross** *n.* A cross between conspecific organisms that is designed to reveal the genotype of the organism that exhibits a dominant trait, such as purple flowers of *Pisum sativum* (Peas) (Campbell et al. 1999, 224).

♦ **reciprocal crosses** See hybrid: reciprocal hybrids.

♦ **cross-cultural comparison** See study of: ³ethology: human ethology.

♦ **cross-fertilization** See fertilization: cross-fertilization.

♦ **cross-fostering** See fostering: cross-fostering.

♦ **cross-gait** See locomotion: cross-gait.

♦ **cross-pollination** See pollination: cross-pollination.

♦ **crossbreeding** See breeding: outbreeding; crossing.

♦ **crossing** *n.* Organisms' making a cross (Michaelis 1963).

syn. hybridizing, crossbreeding (Lincoln et al. 1985)

♦ **crossing over** *n.*

1. “A complicated process whereby chromosomes, while engaged in meiosis, exchange portions of genetic material,” resulting in an almost infinite variety of gametes (Dawkins 1982, 285).

2. The reciprocal exchange of homologous parts between two nonsister chromatids at the four-strand stage.

cf. chiasma

Comments: De Vries (1903) originally proposed that crossing over might occur (Mayr 1982, 764, 766, 957). Crossing over rarely occurs during mitosis (Lincoln et al. 1985).

- unequal crossing over, oblique crossing over** *n.* For example, in bar-eyed and ultrabar *Drosophila*: Crossing over of sister chromosomes resulting in one's having a duplicate piece of a chromosome some and the latter lacking this piece (Mayr 1982, 769, 798).
- ◆ **cross-validation** See statistical test: cross-validation.
- ◆ **Crow-Kimura Hypothesis, Crow-Kimura Model** See hypothesis: hypotheses of the evolution and maintenance of sex: Crow-Kimura Hypothesis.
- ◆ **crown group** See clade: crown group.
- ◆ **cruel bind** *n.* In animals with both maternal and paternal care: An animal's dilemma involving whether, or not, to rear its offspring alone, or abandon them and attempt to promote its fitness with a new mate and brood, after it has placed much parental investment into them and its mate deserts them (Trivers 1972 in Wilson 1975, 326).
- ◆ **crustecdysone** See hormone: crustecdysone.
- ◆ **crymum** See ²community: crymum.
- ◆ **crymophile** See ¹-phile: crymophile.
- ◆ **-cryo** *comb. f.* "Cold; frost" (Michaelis 1963). [Greek *kryos*, frost]
- ◆ **cryophile** See ¹-phile: cryophile.
- ◆ **cryothermy** See -thermy: cryotherapy.
- ◆ **-cryspsis** *adj.* **cryptic** See mimicry: cryspsis. *cf.* coloration: cryptic coloration; mimesis
- allocrypsis** *n.* An organism's concealing itself under a covering of living, or nonliving, material that it does not produce (Lincoln et al. 1985).
- anticrypsis** *n.*
1. An organism's coloration that facilitates attack of its enemies (Lincoln et al. 1985).
 2. A predator's protective coloration that facilitates attack, or capture, of its prey (Lincoln et al. 1985). *cf.* -cryspsis: procrypsis; mimicry: aggressive mimicry
- procrypsis** *n.* An organism's coloration, or behavior, that affords protection against its enemies (Lincoln et al. 1985). *cf.* behavior: cryptic behavior
- syncrypsis** *n.* Resemblance between unrelated organisms that have similar cryptic coloration (Lincoln et al. 1985).
- ◆ **cryptohybrid** See hybrid: cryptohybrid.
- ◆ **cryptomere** *n.* "A hidden recessive hereditary factor" (Lincoln et al. 1985).
- ◆ **cryptozoology** See study of: zoology: cryptozoology.
- ◆ **crystallochore** See -chore: crystallochore.
- ◆ **C-selected species, C strategist, C-strategist** See ²species: c-selected species.
- ◆ **C-S-R triangle** *n.* A three-component ecological strategy system that is conceptualized as a triangle with its three extremes representing competitive species (C-strategists), stress-tolerant species (S-strategists), and ruderal species (R-strategists) (Lincoln et al. 1985). *cf.* ²species: C-selected species, R-selected species, S-selected species
- ◆ **CT** See method: computed tomography.
- ◆ **cteinotrophic** See -trophic: cteinotrophic.
- ◆ **ctetology** See study of: ctetology.
- ◆ **C₃ photosynthesis** See biochemical pathway: C₃ photosynthesis.
- ◆ **cub** See animal names (table).
- ◆ **cuckoldry** *n.*
1. A wife's dishonoring her husband by committing adultery with another person; another person's

dishonoring a man by committing adultery with his wife (Oxford English Dictionary 1972, entries from 1529).

Note: Due to his wife's adultery, the husband is said to be cuckolded or a cuckold, a state socially disgraceful to him (C. K. Starr, pers. comm.).

2. In sociobiology, a male animal's taking care of offspring that are not his (Wilson 1975, 327).

syn. kleptogamy (May and Robertson 1980; Gowaty 1981)

Comment: Cuckoldry is expected to lower the male's fitness.

[Old French *cucu*, cuckoo, a parasitic bird]

◆ **cuckoo** *v.t.*

1. To repeat without cessation (Michaelis 1963).
2. To utter, or imitate, a cuckoo's cry (Michaelis 1963). See animal sounds: cuckoo, Animalia (Appendix 1): bee: cuckoo bee, wasp: cuckoo wasp.

[Old French *cucu*, *coucou*, imitative word]

◆ **cue** *n.* "A hint or suggestion; reminder" (Michaelis 1963).

extrinsic cue *n.* A label that an animal acquires from its environment that enables a discriminating conspecific to identify it as kin, or nonkin, with a certain probability (Wilson 1987, 10). *cf.* odor

intrinsic cue *n.* A phenotypic label of an animal that enables a discriminating conspecific to identify the animal with respect to its genetic relatedness (Wilson 1987, 11).

◆ **cultivar** See variety (def. 5).

◆ **cultural anthropology** See study of: anthropology: cultural anthropology.

◆ **cultural ethology** See study of: ³ethology: cultural ethology.

◆ **cultural evolution** See ²evolution: cultural evolution.

◆ **cultural exchange** *n.* Animal's passing information from one generation to the next one by nongenetic means (McFarland 1985, 514). *cf.* learning: social imitation, meme

◆ **cultural fitness** See fitness: cultural fitness.

◆ **cultural heritability** See ²heritability (comments).

◆ **cultural inheritance** See tradition.

◆ **cultural selection** See selection: cultural selection.

◆ **¹culture** *n.* A person's cultivation or development of his mind, faculties, manners, etc.; improvement by education or training (Oxford English Dictionary 1972, entries from 1510).

◆ **²culture** *n.*

1. Human "culture or civilisation, taken in its wide ethnographic sense, is that complex whole which includes knowledge, belief, art, morals, law, custom, and any other capabilities and habits acquired by man as a member of society" (Tylor 1871 in Seymour-Smith 1986).

Note: There is no overall consensus as to the precise meaning of "culture" (Seymour-Smith 1986). Kroeber and Kluckhohn (in Seymour-Smith 1986) list nearly 300 definitions of culture.

2. The sum total of human attainments and learned behavior (including artistic, social, ideological, and religious patterns of behavior and techniques for coping environmentally) of any specific period, race, or people, regarded as expressing a traditional way of life subject to gradual, but continuous

- modification by following generations (Winick 1956; Michaelis 1963).
3. A nonhuman primate's discovering a new way to do something, other members' of its group using its new method, and persistence of this acquired method over generations (Immelman and Beer 1989, 65).
 4. Information that an animal acquires from a conspecific individual(s) by learning, *e.g.*, social-imitative learning and vocal learning, and may cause variation in this acquiring animal's behavior (Boyd and Richerson 1985 in Whitehead 1998, 1710).
- Note:* Some cetacean species have vocal learning and possibly cultural transmission of feeding specializations (Whitehead 1998, 1708).
- cf.* selection: cultural selection; tradition
- ♦³**culture** *n.* The conditions produced by human culture; refinement, enlightenment (Michaelis 1963).
- ♦⁴**culture** *n.*
1. A specific stage, or period, in the development of a civilization (Michaelis 1963).
 2. "An autonomous population unit defined by distinctive cultural characteristics or shared tradition" (Seymour-Smith 1986).
- ♦⁵**culture** *n.* A system of human values, ideas, and behaviors that may be associated with one, or more, social, or national, group, *e.g.*, Black American Culture or Western Culture (Seymour-Smith 1986).
- human culture** *n.* The highest form of tradition, *q.v.*, in animals (Wilson 1975, 168).
- ♦⁶**culture** *n.* The medium in which one cultivates microorganisms or cell types (Immelman and Beer 1989, 65).
- v.t.* culture
- ♦**culture community** See ²community: agrium.
- ♦**cumulative distribution** See distribution: cumulative distribution.
- ♦**cumulative recorder** *n.* A special type of event recorder (Lehner 1979, 160).
- ♦**cumulative-substantial load** See cost: cost of selection.
- ♦**cuniculine** *adj.* Referring to an animal that lives in burrows resembling rabbit burrows (Lincoln et al. 1985).
- ♦**cupola** See nest: wasp nest: cupola.
- ♦**curiosity** See behavior: exploratory behavior.
- ♦**curiosity drive** See drive: curiosity drive.
- ♦**cursorial** See -orial: cursorial.
- ♦**curve** *n.* A diagram that represents variations in a relationship between (among) two, or more, factors by means of a series of connected points, bars, curves, lines, etc.; a curve can have two or more axes (Michaelis 1963).
- cf.* -gram, graph
- syn.* graph, plot (Lincoln et al. 1985), model (Colwell and Coddington 1994, 107)
- Comment:* Curves are used in nonparametric methods for estimating species richness from samples; see method.
- Environmental Kuznets Curve (EKC)** *n.*
1. A hypothetical graph (with an inverted U-shape) of Kuznets' hypothesis of how human economic inequality changes over time while a country is developing (Cropper and Griffiths 1994, 251, Richmond et al. 2007).
 2. A hypothetical graph, with an inverted U-shape, that shows that per capita income versus the use of natural resources, the production of wastes, or both increase to a turning point and then decrease (Richmond et al. 2007).

Comments: The EKC is used as an hypothesis of the relationship of per capita income and environmental quality over time in a particular place (Richmond et al. 2007). The curve shows that at relatively low levels of income, human use of natural resources, production of wastes, or both increase with income. Beyond a turning point of the curve, these phenomena decline with income. Possible reasons for this inverted U-shaped relationship include income-driven changes in the composition of production, consumption, or both; human preference for high environmental quality; institutions that are needed to internalize externalities; increasing returns to scale associated with pollution abatement; or a combination of these factors. A 1992 World Bank Development Report made the notion of EKC popular by suggesting that environmental degradation can be slowed by policies that both protect our environment and promote economic development. Studies have provisionally supported the hypothesis of an EKC in only a few of many studied cases. Results of the Cropper and Griffiths (1994) study are partially consistent with an EKC for Africa and Latin America.

[After Simon Kuznets, 1901–1985, American economist]

extinction curve *n.* A graph of the total number of species in a particular habitat, or area, plotted against either time or extinction rate (Lincoln et al. 1985).

frequency curve *n.* A graph of a number of individuals, particular traits, etc., versus their frequency (Wilson 1975, 584).

hollow curve *n.* A plot of Y versus X in which Y decreases quickly and shows a long right tail as X increases (Krebs 1985, 514).

Comment: Plots of number of species vs. number of individuals represented in a community are often hollow curves indicating that rarer species are more abundant in communities than commoner ones (Krebs 1985, 514).

immigration curve *n.* A graph of a species' immigration rate versus either the number of resident species or time (Lincoln et al. 1985).

learning curve *n.* A graph of an animal's performance in a learning situation (Storz 1973, 144).

linear curve *n.* A straight-line graph of the relationship between two variables, plotted against each other on orthogonal Cartesian coordinates (Bateson 1979, 242).

cf. curve: nonlinear curve, regression curve: linear-regression curve

logistic-population-growth curve *n.* One of many graphs of population increase described by mathematical equations, *e.g.*, an S-shaped curve (Wilson 1975, 81).

Lyellian-survivorship curve *n.* A graph of the proportion of taxa in any interval of geologic time that are still alive today (Labandeira and Sepkoski 1993, 311, figure 3).

Comment: Lyellian-survivorship curves that decay backward rapidly through time represent groups that undergo rapid extinction (*e.g.*, bivalve families); those that decay slowly, represent groups that undergo slow extinction (*e.g.*, insect families) (Labandeira and Sepkoski 1993, 312).

nonlinear curve *n.* A graph (which is not a straight line) of the relationship between two variables, plotted against each other on orthogonal Cartesian coordinates, which is not a straight line.

cf. curve: linear curve; regression curve: curvilinear-regression curve

normal curve *n.* The typical bell-shaped graph of a normal distribution (Lincoln et al. 1985).

cf. distribution: normal distribution

regression curve *n.* A graph of one, or more, dependent variables versus one, or more, independent variables (Sokal and Rohlf 1969, Chapter 14; Kleinbaum and Kupper 1978, Chapters 9 and 10, who describe many kinds of regression curves).

Comment: One kind of regression curve is a regression line (*q.v.*).

cf. regression line; statistical test: regression

► **curvilinear-regression curve** *n.* A regression curve in which the dependent variable has a curvilinear relationship with one, or more, independent variables, *e.g.*, one represented by the equation:

$$Y = b_0 + b_1 X_1^{z_1} + \dots + b_n X_n^{z_n}$$

where Y = the dependent variable; b_0 = the Y intercept; $b_1 \dots b_n$ = the coefficients of X ; $X_1 \dots X_n$ = the independent variables; $z_1 \dots z_n$ = exponents of the independent variables (Sokal and Rohlf 1969, 468).

► **linear-regression curve** *n.* A regression curve in which the dependent variable has a linear relationship with one, or more, independent variables, *e.g.*, one represented by the equation:

$$Y = b_0 + b_1 X_1 + \dots + b_n X_n$$

where Y = the dependent variable; b_0 = the Y intercept; $b_1 \dots b_n$ = the coefficients of X ; $X_1 \dots X_n$ = the independent variables (Sokal and Rohlf 1969, 413).

reproduction curve *n.* A curve of the relationship between the number of individuals at a given stage of one generation and the number of individuals at that stage in the previous generation (Lincoln et al. 1985).

sigmoid curve *n.* “An S-shaped curve,” *e.g.*, a kind of population growth curve (Lincoln et al. 1985).

species-abundance curve *n.* A graph of species numbers versus the number of individuals per species (Lincoln et al. 1985).

species-accumulation curve *n.* A plot of the cumulative number of species [$S(n)$] versus the number of samples pooled (Colwell and Coddington 1994, 104, illustration).

cf. curve: species-area curve

syn. collector's curve (Colwell and Coddington 1994, 105), species-sample curve (Willett 2001, 415)

Comment: Colwell and Coddington (1994, 105) use species-accumulation curves from an area of a habitat that is roughly homogeneous. They use “species-area curve” to refer to one from a heterogeneous area. These authors discuss the pros and cons of using different species-accumulation curves for estimating species richness.

► **asymptotic-species-accumulation curve** *n.* A species-accumulation curve that asymptotes (Holdridge et al. 1971 in Colwell and Coddington 1994, 106).

Comments: An asymptotic species-accumulation curve starts at 0 and reaches an asymptote (Colwell and Coddington 1994, 106). Different functions for these curves are in Holdridge et al. (1971, trees in Costa Rica) and de Caprariis et al. (1976, palaeo-ecology) and Clench 1979 (entomology). All of these

references are in Colwell and Coddington (1994, 106). The equation of Holdridge et al. (1971) is the same as that for the Michaelis-Menten equation of enzyme kinetics in different notation. A transformation of the equation of Caprariis et al (1976) is the Eadie-Hofstee Equation.

► **nonasymptotic-species-accumulation**

curve *n.* A late species-accumulation curve that does not asymptote (Colwell and Coddington 1994, 106).

Comments: The nonasymptotic-species-accumulation curve is a species-accumulation curve that does not reach an asymptote (Palmer 1990 in Colwell and Coddington 1994, 107). Examples are the log-linear model (Gleason 1922) and log-log model (MacArthur and Wilson 1967).

log-linear curve *n.* A nonasymptotic-species-accumulation curve that assumes $S(n)$ is a linear function of the logarithm of the area (Gleason 1922 in Colwell and Coddington 1994, 107).

log-log curve *n.* A nonasymptotic-species-accumulation curve that assumes the logarithm of $S(n)$ is a linear function of the logarithm of area (MacArthur and Wilson 1967 in Colwell and Coddington 1994, 107).

Comment: This is the standard species-area curve of island biogeography (Colwell and Coddington 1994, 107).

► **rank-abundance curve** *n.* A curve of species abundances in large samples (May 1975 and others in Colwell and Coddington 1994, 108).

Comments: Rank-abundance curves include the lognormal curve, log-series curve, Poisson-lognormal curve, and zero-truncated-generalized-inverse-Gaussian-Poisson curve.

log-normal curve *n.* A parametric rank-abundance curve of number of species versus abundance class on a log scale, using log base 2 so that each class, or octave (= R), involves doubling the size of the population (Preston 1948, 1960, 1962 in Southwood 1979, 424, illustration).

log-series curve *n.* A parametric rank-abundance curve that assumes that the modal class is always the singleton species, regardless of how large the sample becomes (Williams 1964 in Colwell and Coddington 1994, 108).

Poisson-lognormal curve *n.* A parametric rank-abundance curve that does not require the assumption that discrete numbers of individuals approximate a continuous curve (Bulmer 1974 in Colwell and Coddington 1994, 108).

syn. discrete-lognormal curve (Colwell and Coddington 1994, 108)

zero-truncated-generalized-inverse-Gaussian-

Poisson curve *n.* A parametric rank-abundance curve (Colwell and Coddington 1994, 108).

species-area curve, area-species curve *n.* A curve of the number of species found [$S(n)$] versus the size of an area surveyed (Lincoln et al. 1985).

cf. curve: species-accumulation curve; ³theory: theory of island biogeography; hypothesis: Red Queen hypothesis

species-sample curve *n.* See curve: species-accumulation curve.

survivorship curve *n.* A curve of the number of surviving individuals of a given cohort versus age (Lincoln et al. 1985).

► **Type-1-survivorship curve** *n.* A survivorship curve in which the probability of an organism's survival decreases with age (Lincoln et al. 1985).

► **Type-2-survivorship curve** *n.* A survivorship curve in which the probability of an organism's survival is constant with age (Lincoln et al. 1985).

► **Type-3-survivorship curve** *n.* A survivorship curve in which the probability of an organism's survival increases with age (Lincoln et al. 1985).

♦ **cut-off** *n.* In social-conflict situations, an animal's means of reducing stimulation that tends to make it distressed or behave in ways contrary to what it is "aiming at," e.g., an animal's looking away, or averting its eyes, from another animal that is arousing its fear or hostility; a person's covering his ears to avoid hearing something embarrassing (introduced by Chance 1962 in Immelmann and Beer 1989, 66).

♦ **cut-off posture** See posture: cut-off posture.

♦ **cuticle** *n.*

1. The outer, nonvascular covering of human skin, overlying the corium (Michaelis 1963).
syn. epidermis, scarfskin Michaelis 1963
2. The crescent of toughened skin around the base of a human fingernail or toenail (Michaelis 1963).
3. The transparent film that covers a plant's surface, derived from layers of epidermal cells (Michaelis 1963).
4. A thick lining membrane, e.g., the integument of an arthropod (Michaelis 1963).

Notes: In insects, a cuticle is secreted by epidermal cells, and it covers an insect's entire body as well as lining ectodermal invaginations such as the proctodaeum, stomodaenum, and tracheae (Torre Bueno 1989). Kinds of cuticle are endocuticle, epicuticle, exocuticle, and procuticle.
syn. cuticula (Michaelis 1963)

[Latin *cuticula*, diminutive of *cutis*, skin]

adj. cuticular

♦ **cuticula** See cuticle.

♦ **cybernetics** See study of: mathematics: cybernetics.

♦ **cycle** *n.*

1. A recurring period within which particular events, or phenomena, occur and complete themselves in definite sequence: a round of years or ages (Michaelis 1963).
2. "A pattern of regularly recurring events; a series that repeats itself" (Michaelis 1963).

biogeochemical cycle *n.* The cycling and recycling of an inorganic substance (e.g., calcium, carbon, chlorine, cobalt, magnesium, nitrogen, phosphorus, potassium, sodium, sulfur, or water) through the biosphere (Curtis 1983, 986).

► **nitrogen cycle** *n.*

1. The process by which nitrogen is cycled and recycled through Earth's biosphere, with the principal stages of ammonification, nitrification, and assimilation (Curtis 1983, 402, 988).
2. A description of the balance, changes, and nature of nitrogen-containing compounds that circulate among the Earth's atmosphere, soil, and organisms (Allaby 1994).

Comments: Earth's atmosphere is the chief reservoir of nitrogen (Curtis 1983, 402, 988). Most species cannot use elemental atmospheric nitrogen to make nitrogen-containing compounds. A shortage of nitrogen in soil is often a major limiting factor in plant growth. Ammonification is the release of ammonia and ammonium primarily by certain soil bacteria and fungi that decompose organic matter.

Nitrification is oxidation of ammonia and ammonium by several species of bacteria common in soil that produce nitrite (NO_2^-) and energy from these compounds. Another group of bacteria oxidizes nitrites and produce nitrate (NO_3^-) and energy. Nitrogen moves as nitrate from soil into roots. Assimilation is a plant's reducing nitrate to ammonium which is then transferred into carbon-containing compounds making amino acids and other required nitrogenous organic compounds.

developmental cycle *n.* In Insects: The period from the birth of an egg to the eclosion of an adult (Wilson 1975, 582).

estrous cycle, estrual cycle, oestrous cycle *n.* In Mammals: A female's repeated series of changes in her reproductive physiology and behavior that culminates in estrus, *q.v.* (Wilson 1975, 583).
syn. estrual cycle, *Brit.* oestrous cycle

functional cycle *n.*

1. The relation of an animal's organs and behavior to particular aspects of its environment — essentially the part of its surroundings that is filtered out by its sensory receptors and contains certain objects whose recognition and perception is necessary for the animal's survival (Heymer 1977, 71).

Notes: These aspects act as effector cues that control the animal's evolutionary preprogrammed behavior. As soon as such an aspect is perceived, an animal may react toward it in some manner, thereby, eliminating it as an effector cue.

[coined as *Functionskreis* by von Uexküll and Kriszat 1934 and von Uexküll 1937 in Heymer 1977, 71]

2. A set of behaviors that serve the same, or similar, functions, e.g., aggression, courtship, foraging, locomotion, or parental care (Immelmann and Beer 1989, 115).

syn. behavior system, functional system (Immelmann and Beer 1989, 114)

hydrologic cycle *n.* Water flow (in its different states) through Earth's terrestrial and atmospheric environments (Allaby 1994).

syn. water cycle (Bates and Jackson 1984)

Comments: In the hydrologic cycle, water is stored in the atmosphere, groundwater, ice-caps, oceans, and surface water (Allaby 1994). Water is a condensation (clouds), a liquid (precipitation), and a vapor (during evaporation and transpiration) in the cycle.

life cycle *n.*

1. The sequence of events from an organism's origin as a zygote through its death; the stages through which an organism passes between the production of gametes from one generation and the next (Wilson 1975, 588; Lincoln et al. 1985).
2. In social insects: A society's life span from its origination to reproduction time (Wilson 1975, 588).

► **dimorphous life cycle** *n.* A life cycle with two different types of individuals, each bearing a different type of reproductive structure, e.g., in plants, alternation of sporophyte and gametophyte generations (Lincoln et al. 1985).

cf. cycle: life cycle: monomorphous life cycle

► **diploitic life cycle** *n.* A life cycle characterized by a diploid adult stage that produces haploid gametes by meiosis and zygotes that form by fusion of a pair of gametes (Lincoln et al. 1985).

► **direct life cycle** See cycle: life cycle: homogonic life cycle.

► **heterogonic life cycle** *n.*

1. A life cycle composed of alternating parthenogenetic and sexually reproducing phases (Lincoln et al. 1985).

2. A life cycle with an alternation of a parasitic and a free living generation (Lincoln et al. 1985).
syn. indirect life cycle

► **homogonic life cycle** *n.* “A life cycle in which all generations are either parasitic or free living” (Lincoln et al. 1985).

syn. direct life cycle (Lincoln et al. 1985)

► **indirect life cycle** See cycle: life cycle: heterogonic life cycle.

► **monomorphic life cycle** *n.* “A life cycle in which successive generations comprise only one type of individual and a single reproductive strategy” (Lincoln et al. 1985).
cf. cycle: life cycle: dimorphous life cycle

limit cycle *n.* An oscillation that endlessly passes through the same sequence of points and if perturbed returns to this sequence after the removal of the perturbing force (Bell 1982, 508).

Milenkovich cycles *n.* Changes in the Earth's axis of rotation and eccentricity of its orbit (Carroll 2000, 30).

Comment: Milenkovich cycles are associated with significant climatic changes of intervals of from 20,000 through 100,000 yr (Carroll 2000, 30).

sex cycle *n.* A cycle leading to genetic recombination, such as the alternation of karyogamy and meiosis (Lincoln et al. 1985).

taxon cycle *n.* “A cycle in which a species spreads while adapted to one habitat and restricts its range and splits into two or more species while adapting to another habitat” (Wilson 1975, 597).

Comment: Taxon cycles have been especially noted in large systems of islands. Dispersal commonly occurs in open habitats, and restriction and speciation occur in forests (Wilson 1975, 597).

♦ **cycloecology** See study of: cycloecology.

♦ **cyclic** *adj.*

1. Of, or referring, to a cycle; revolving, or recurring, in cycles (Oxford English Dictionary 1972, entries from 1794).

2. Referring to a flower with parts arranged in whorls (Oxford English Dictionary 1972, entries from 1875).

acyclic *adj.*

1. Referring to an organism that reproduces by obligate thelytoky (Bell 1982, 501).

2. Referring to an organism without sexual periods (Bell 1982, 501).
cf. cyclic: holocyclic

dicyclic *adj.* For example, in *Cladocera*, *Rotifera*: Referring to an organism that has two sexual periods in a single growing season (Bell 1982, 505).

holocyclic *adj.* For example, in aphids: Referring to an organism that has sexual periods (Bell 1982, 507).

cf. cyclic: acyclic

monocyclic *adj.* Referring to a species that has two, or more, broods, or generations, per year, and that changes its mode of reproduction once a year, typically producing resting stages (Lincoln et al. 1985).
cf. -voltine: multivoltine

pleiocyclic *adj.* “Existing through more than one cycle or activity” (Lincoln et al. 1985).

polycyclic *adj.* For example, in *Cladocera* and *Monogononta*: Referring to an organism that has more than two sexual periods in a single growing season (Bell 1982, 511).

♦ **cyclic evolution** See ²evolution: cyclic evolution.

♦ **cyclic parthenogenesis** See parthenogenesis: cyclic parthenogenesis.

♦ **cyclical selection** See selection: cyclical selection.

♦ **cycloalexy** See behavior: defensive behavior: cycloalexy.

♦ **cyclogeny** See -morphosis: cyclomorphosis.

♦ **cygnet** See animal names (table).

♦ **cynophobia** See -phobia: cynophobia.

♦ **-cyte** *cf.* cell

oocyte *n.* A cell that produces female gametes by meiosis (Lincoln et al. 1985).

spermatocyte *n.* A cell that produces male gametes by meiosis (Lincoln et al. 1985).

♦ **cytocalytic evolution** See ²evolution: cytocalytic evolution.

♦ **cytodeme** See deme: cytodeme.

♦ **cytodiaeresis** See mitosis.

♦ **cytogamy** See -gamy: cytogamy.

♦ **cytogenesis** See -genesis: cytogenesis.

♦ **cytogenetic map** See map: genetic map.

♦ **cytogenetics** See study of: genetics.

♦ **cytokinesis** See -kinesis: cytokinesis.

♦ **cytokinins** See hormone: cytokinins.

♦ **cytology** See study of: cytology.

♦ **cytophage, cytophagous** See -phage: cytophage.

♦ **cytoplasm** *n.* The aggregate of organelles and other structures in a cell's fluid (Mayr 1982, 654).

[Kölliker proposed this term which has generally replaced the term protoplasm (*q.v.*) (Mayr 1982, 654).]
Note: Some vitalists believed that organisms were constructed of a special substance very different from inanimate matter, and this substance was cytoplasm (Mayr 1997, 13).

In a prokaryotic cell: A cell's interior (Campbell and Reece 1995, 98).

♦ **cytoplasmic androgamy** See -gamy: cytoplasmic androgamy.

♦ **cytoplasmic determinant** See determinant: cytoplasmic determinant.

♦ **cytoplasmic gynogamy** See -gamy: cytoplasmic gynogamy.

♦ **cytoplasmic inheritance** See inheritance: cytoplasmic inheritance.

♦ **cytoplasmic-inheritance theory** See ³theory: cytoplasmic-inheritance theory.

♦ **cytosol** *n.* A cell's semifluid substance that contains organelles and is enclosed by a plasma membrane (Campbell and Reece 1995, 98).

♦ **cytotaxis** *n.*

1. Movement of cells in relation to each other; used to describe cell's separating (negative cytotaxis) or aggregating (positive cytotaxis) (Lincoln et al. 1985).

2. “The arrangement of cells within an organ” (Lincoln et al. 1985).
cf. taxis

♦ **cytotaxonomy** See study of: taxonomy: cytotaxonomy.

♦ **cytotype** See -type, type: cytotype.

d

- ♦ **d** See unit of measure: dalton, day.
- ♦ **D** See index: species-diversity index: Simpson's Index of Diversity.
- ♦ **dabbling** *n.*
1. A person's moving his feet, or hands, in shallow water, or liquid mud, causing some splashing (Oxford English Dictionary 1972, entries from 1611).
 2. An individual duck's moving its bill in shallow water, or liquid mud, causing some splashing (Oxford English Dictionary 1972, entries from 1661).
 3. A person's playing in shallow water; paddling (Oxford English Dictionary 1972, entries from 1611); his playing in a liquid, as with his hands; splashing gently (Michaelis 1963).
 4. In surface-feeding ducks: An individual's feeding on aquatic vegetation by moving its bill in water and tipping up it's a head without completely submerging its body under water (Peterson 1947, 36).
- v.i.* dabble
cf. dive
- ♦ **dairy** See ²group: dairy.
- ♦ **dalton** See unit of measure: dalton.
- ♦ **dam** *n.* In animal breeding, a female parent (Lincoln et al. 1985).
cf. sire
- ♦ **damaging fight** See fight: damaging fight.
- ♦ **damming up** *n.* An animal's being stopped from displaying a particular behavior (e.g., sexual behavior) for a considerable period (Immelmann and Beer 1989, 67).
Comment: "Damming up" is a now rarely used, metaphorical term linked with hydraulic models of motivation (Immelmann and Beer 1989, 67).
- ♦ **dance** *n.*
1. A person's rhythmical skipping and stepping with regular body and limb turnings and movements, usually to musical accompaniment, either as an expression of joy, exultation, and the like or as an amusement or entertainment; the action, act, or round of dancing (Oxford English Dictionary 1972, entries from 1300).
 2. An individual animal's highly stylized repetitive movement, often associated with courtship behavior (Lincoln et al. 1985).
- bee dance** *n.* In *Apis mellifera* (Western Honey Bees): A worker's communicative dance.
cf. dance-language communication
- **bumping run** *n.* A returning forager's bounding forward onto her comb and trampling over other workers may cause them to leave their hive (Schmid 1964; Frisch 1965 in Heymer 1977, 149).
- **buzzing run, breaking dance, Schwirrlauf** *n.* A worker's buzzing her wings and running through her colony, or swarm, randomly and energetically butting into hive mates (Frisch 1967, 283).
Comment: A buzzing run increases nest-mate activity and leads to flight; it signals the exit of a swarm or induces a swarm to alight (Winston 1987, 162).
- **doroventral-abdominal-vibrating dance** *n.* A worker's vibrating her body, particularly her metasoma, dorsoventrally while grasping a queen or another worker with her legs (Milum 1955 in Schneider et al. 1985, 377; Winston 1987, 152).
syn. dorso-ventral-abdominal vibration, D-VAV (Milum 1955 in Frisch 1967); jerking dance (Frisch 1967, 281); DVAV, vibration dance (Schneider et al. 1985, 377), vibratory dance (Frisch 1967, 284)
Comments: This dance prevents a queen from destroying developing queens in their cells (Fletcher 1975, 722), thus it controls queen emergence and times of swarming during colony reproduction (Winston 1987, 152, 160). This dance also regulates both daily and seasonal foraging (Schneider et al. 1986a, 377), and it may operate as a two-level feedback system that allows a colony to adjust its foraging activity to both long- and short-term fluctuations in food availability (Schneider et al. 1986b, 386).
- ♦ **DVAV, D-VAV** See dance: bee dance: dorsoventral-abdominal-vibrating dance.
- **grooming dance** See dance: bee dance: shaking dance.
- **jerk dance** *n.* A forager's short abdominal-wagging bouts made between bouts of depositing scopal (pollen-sac) contents into comb cells (Frisch 1965 in Heymer 1977, 149).
- **jostling dance** *n.* A returning, successful forager's running into her nest mates and pushing them aside (Frisch 1967, 283; Winston 1987, 162).
syn. jostling run (Frisch 1967, 283)
Comment: A jostling dance might alert nest mates that a dance is about to occur (Winston 1987, 162).
- **jostling run** See dance: bee dance: jostling dance.
- **night dance** *n.* A worker's Sun-oriented dance performed at night when she cannot see the Sun's position (Lindauer 1954 in Heymer 1977, 122).
- **persistent dance** *n.* A scout's spontaneous Sun-oriented dance performed inside her nest without a new view of the Sun (Lindauer 1954, 1955; Frisch 1965 in Heymer 1977, 50).
- **quiver dance** *n.* A bee's wandering on four legs slowly over her comb, rocking back and forth

and left and right in jerky fashion and holding her twitching forelegs in the air (Frisch 1923, 90, in Frisch 1967, 282; Winston 1987, 162).

syn. trembling dance (Frisch 1967, 282)

Comments: A bee shows this dance in response to rough handling by Humans; her getting her legs stuck in viscous sugar water or on a milkweed pollinium; discovering a sugar solution that is suddenly adulterated with salt, quinine, acid, or poisons; crowding at a feeding dish; and hive robbing (Frisch 1967, 282). Winston (1987, 162) says the function of quiver dances is unknown.

► **round dance** *n.* A forager's running in circles, going clockwise or counterclockwise for 1–2 circles before changing directions (Aristotle; Spitzner 1788, 102; Unhock 1823, 115; and Park 1923 in Frisch, 1967, 5–6).

Comments: A round dance signifies a rich food source near a hive. Different *A. mellifera* subspecies signify different food distances with their round dances. *Apis mellifera* show a continuum of round dance, sickle dance, and waggle dance depending on food distance and direction (Frisch, 1967). Round dances are used primarily for recruitment to resources (Winston 1987, 151).

[possibly coined by Spitzner (1788) based on translation in Frisch (1967, 6)]

► **scout dance** *n.* A scout's dance that indicates the presence of a nesting site for a queen with her swarm of workers (Frisch 1953, 132–133).

► **shaking dance** *n.*

1. A worker's shaking her body rapidly from side to side and back and forth (Frisch 1967, 283).

Note: A shaking dance induces nearby workers to groom her in places that are hard for her to reach (Frisch 1967, 283).

2. A worker's shaking her abdomen rapidly up and down, frequently in response to a queen bee (Hammann 1957; Allen 1959a, b; and Frisch 1965 in Heymer 1977, 150).

syn. grooming dance (Milum 1947, 1955, in Heymer 1977, 137)

[coined by Haydak (1929, 1945 in Heymer 1977, 137)]

► **sickle dance** *n.* A forager's running in a path that is roughly a bowed figure eight (Frisch 1967, 283).

Comments: This dance is a transitional dance between the round and waggle dances. A sickle dance indicates the direction of food to other bees (Frisch 1967, 283).

► **spasmodic dance** *n.* A worker's dance in which her crop-contents distribution into comb cells is interspersed with short tail-wagging movements (Frisch 1967, 283).

Comment: This dance might signify that another kind of dance is about to occur (Frisch 1967, 283).

► **trembling dance** See dance: bee dance: quiver dance.

► **vibration dance, vibratory dance** See dance: bee dance: dorsoventral-abdominal-vibrating dance.

► **waggle dance, wagging dance** *n.* A forager's running a short, straight distance while wagging her body and then making an approximate semi-circle while running to the right of her straight run, returning to her starting point, making another straight run in essentially the same place as her first one, and then making an approximate semicircle to the left of her straight run, returning to her starting point, and then repeating these movements (Frisch

1953, 116–117, 1965 in Heymer 1977, 161; Winston 1987, 157).

syn. figure-eight dance (Winston 1987, 154), Schwanzelltänze, tail-wagging dance (Frisch 1923 in Frisch 1967, 4)

Comments: A raspy sound accompanies the straight run. The waggle dance communicates distance and direction of food to other bees and number of waggles per run and dance tempo have information value (Frisch 1953, 116–117, 1965 in Heymer 1977, 161; Winston 1987, 157). The workers use waggle dances when the indicated resources are 15, or more, m from their hive (Michener 1974, 164).

cleaner-fish dance *n.* A set of signals sent to a customer fish by a cleaner fish that communicates it will clean it (Wickler 1963 in Heymer 1977, 136).

syn. cleaning-appetence swimming (Heymer 1977, 136)

combat dance See dance: courtship dance.

courtship dance *n.* In some snake species: Two, or more, individuals' contacting each other with their bodies parallel and partially entwined and struggling, each trying to tighten its body loops around others' bodies (combat dance of Oliver 1955, 217).

cf. display

Comments: The snakes are usually males and probably interacting aggressively. This is a misnamed phenomenon (Dewsbury 1978, 74, Burghardt, pers. comm.).

mating dance *n.* For example, in some ciliate protozoan species: A series of rarely performed, periodically recurrent, modular behavior patterns that lead to the fusion of potential partners into conjugating pairs (Ricci 1990, 1059).

cf. courtship

zigzag dance *n.* In male Three-spined Sticklebacks: A stereotyped swimming display, involving movements toward and away from a gravid female (Tinbergen 1951, 79–80).

♦ **dance language, dance-language communication** See communication: dance language.

♦ **dance-“language” hypothesis** See hypothesis: dance-“language” hypothesis.

♦ **Darling effect** See effect: Fraser-Darling effect.

♦ **dark adaptation** See ³adaptation: ¹physiological adaptation: dark adaptation; ²physiological adaptation (comment).

♦ **darwin** See units of measure: darwin.

♦ **Darwin’s abominable mystery** *n.* The unknown origin and rapid evolution of Angiosperms (Darwin’s letter to Hooker 1879 in Darwin 1903).

cf. hypothesis: anthophyte hypothesis; Plantae: plant: *Amborella trichopoda* (Appendix 1)

Comment: Doyle (1978, 387) suggests a monophyletic origin of angiosperms by progenetic modification of caytoniaceous, corynospermaceous, or related seed ferns. On the other hand, molecular data suggest that the dicot lineage and gymnosperm lineage split about 290 Ma in the late Carboniferous Period (Kenrick 1999, 359; Que et al. 1999, 404).

Darwin’s admonition *n.* “Never say higher or lower!” (Mayr 1982, 367).

Comment: Dawkins (1992) also recommends that evolutionary writers should no longer use the adjectives higher and lower, and he suggests that would be as sensible to present animal taxa alphabetically as in their presumed phylogenetic order. Futuyma (1986, 8) indicates that Darwin did not always follow his own admonition.

♦ **Darwin's theory of gemmules** See ³theory: theory of pangenesis.

♦ **Darwinian** *n.*

1. A follower of Charles R. Darwin; one who accepts part to all of his theory (Oxford English Dictionary 1972, entries from 1871).

syn. Darwinist, Darwinite (Oxford English Dictionary 1972)

cf. neo-Darwinist

Note: Which ideas and theories that are concerned with Darwinian thinking vary with the different times of Darwin's career and thereafter.

2. *adj.* Of, or referring to, Erasmus Darwin (1731–1802) and his speculations or poetical style (Oxford English Dictionary 1972, entries from 1804).
3. Of, or referring to, Charles Robert Darwin (1809–1882) and his scientific views and observations, especially his theory of evolution (Oxford English Dictionary 1972, entries from 1867).

neo-Darwinist *n.* A person holding the beliefs of neo-Darwinism, *q.v.*

♦ **Darwinian evolution** See Darwinism.

♦ **Darwinian fitness** See fitness (def. 2, 4); fitness: genetic fitness.

♦ **Darwinian sexual selection** See selection: sexual selection.

♦ **Darwinism** *n.*

1. The theory of evolution by natural selection, as originally set forth by Charles R. Darwin in *On the Origin of Species ...* (1859) and other works by Darwin and co-thinkers (Oxford English Dictionary 1972, entries from 1871).

syn. scientific Darwinism (Ruse 1992, 80)

Notes: Darwinism includes five lines of thought: (1) life evolves rather than being constant, (2) all organisms evolved from only one, or a few, common ancestors, (3) adaptation is the result of natural selection, (4) speciation occurs in populations of organisms, and (5) evolution is usually gradual, rather than saltational (Darwin 1859 in Mayr 1982, 505–510). In the period immediately after 1859, Darwinism “referred most often to the totality of Darwin's thinking, while it strictly means natural selection for the evolutionary biologist of today” (Mayr 1982, 505). Ruse (1992, 75) further elucidates that conception of Darwinism. The hundreds of attempts to invalidate Darwinism in the last 130 yr have been unsuccessful (Mayr 1997, 47).

2. Popularly, evolution (Gould 1982, 380).

Note: Some workers are including evolutionary thinking in economics, psychology, and social sciences (Williams 1997, 29).

3. A world view that “everything, certainly in the material world but usually also in the world of thought and human culture is in a state of Heraclitean flux or becoming so; change is seen as unidirectional, but almost always value-impregnated, *i.e.*, progressive (Ruse 1992, 75).

syn. metaphysical Darwinism (Ruse 1992, 75)

Notes: This world view is a metaphysical notion in a nonpejorative sense, a framework for “understanding the world rather than of something read directly from the surface of nature” (Ruse 1992, 75). It is a sort of philosophy even akin to a faith or religion. This concept teleologically views Humans as the endpoint of already accomplished change, a mere stepping stone to even better organisms, or a fallback from an endpoint, or peak, in the organic

world. This view existed before Darwin wrote and has continued after him.

Neo-Darwinism *n.*

1. A synthesis of Darwinian natural selection theory and the new population genetics that first occurred in the 1920s (Wilson 1975, 63).

2. Darwin's theory of evolution, except for any inheritance of acquired characters (Mayr 1982, 698, 958). *Note:* This was Weismann's theory of evolution which Romanes (1896 in Mayr 1982, 698, 958) designated as neo-Darwinism. “Near universal acceptance [of Weismann's theory of evolution] did not occur until the 1930s and 1940s, as a result of the evolutionary synthesis (Mayr and Provine, 1980)” (Mayr 1982, 701).

3. The ideas held by a group of evolutionists in the 1880s (Dawkins 1982, 291).

Note: The purpose of neo-Darwinism “was to emphasize (and in my opinion exaggerate) the distinctness of the modern synthesis of Darwinism and Mendelian genetics, achieved in the 1920s and 1930s, from Darwin's own view of evolution. I think the need for the ‘neo’ is fading, and Darwin's own approach to ‘the economy of nature’ now looks very modern” (Dawkins 1982, 291).

syn. adaptive neutrality, neo-Darwinian evolution, neo-Darwinist evolutionary theory, synthetic theory
cf. drift: genetic drift; ²evolution: non-Darwinian evolution; modern synthesis; ³theory: neutral theory

Comment: Neo-Darwinists seem to dismiss three seeds of Darwin's thought: species evolution should be modeled on individual evolution, evolution is progressive, and embryogenesis recapitulates phylogenies (Richards 1992, 105).

Social Darwinism *n.* Praise of the struggle for existence, unmerciful competition, and social bias under the erroneous excuse that this is what Darwin taught (Mayr 1982, 536).

Comments: The concept social Darwinism was created by, and the term was coined by Herbert Spencer. Because Spencer is the intellectual father of this concept, it would be better to call it social Spencerism. Social Darwinism was confused with real Darwinism during the 1880s and 1890s (Mayr 1982, 536, 598, 883). Ruse (1992, 75) also discusses social Darwinism.

♦ **darwinize** *v.i.* To theorize wildly (Moorehead 1969, 26).

[derived from speculation about evolution done by Erasmus Darwin, 1731–1802, grandfather of Charles R. Darwin (Moorehead 1969, 26)]

cf. ³theory

♦ **database** *n.* A data collection.

Comments: Thousands of databases are now on the Internet. I list and define some of them in Appendix 3.

♦ **“data-set-choice-p”** See *p.*: “data-set-choice-p.”

♦ **date-rape drug** See drug: gamma hydroxybutyrate.

♦ **dating** *n.* A person's participating in a social appointment or engagement for a specified time, in particular with a person of the opposite sex (inferred from date, Michaelis 1963).

v.i., v.t. dating

pack dating *n.* A person's socializing in an unpartnered group (pack) (Gabriel 1997, 22).

Comments: U.S. college students frequently pack date, rather than date as conventional couples (Gabriel 1997, 22). People may pair up during pack dating and have intimate experiences with another individual, often after getting inebriated. The packs give the people a

sense of self-assurance and identity, but keep them from deeper, more committed relationships.

♦ **dating method** See method: dating method.

♦ **datum** *n., pl. data*

1. Something given or granted; something known as, or assumed to be, a fact and used as the basis of reasoning or calculation; an assumption, or premise, from which one draws inferences (Oxford English Dictionary 1972, entries from 1646).
2. Part of the results of an experiment or study (Lincoln et al. 1985); one of a group of data (facts or figures) from which one draws conclusions (Michaelis 1963).

syn. fact, observation (Lincoln et al. 1985)

Comments: Some workers use “data” with a singular article and verb, *e.g.*, “this data is interesting.” It is preferable to use data with a plural article and verb, *e.g.*, “these data are interesting.” It is also preferable to use “those data” rather than “that data.”

[Latin *datus*, past participle of *dare*, to give, grant]

♦ **raw data, uncooked data** *n.* Collected data that have not been organized numerically or treated statistically (Lincoln et al. 1985).

♦ **“datum-choice-p”** See p: “datum-choice-p.”

♦ **dauer state** See dormancy: dauer state.

♦ **daughter** *n.*

1. A female offspring (Michaelis 1963).
2. Any offspring of a given generation, referring to either sex (Lincoln et al. 1985).

[Old English *dohtr*]

♦ **Davian behavior** See behavior: Davian behavior.

♦ **Dawkins' Aphorism** *n.* An organism is only the genes' way of making more genes (Dawkins 1977).

♦ **dawn chorus** See animal sounds: song: chorus: dawn chorus.

♦ **day** See unit of measure: day.

♦ **dB** See unit of measure: decibel.

♦ **d.b.h.** See unit of measure: diameter at breast height.

♦ **DCA** See method: detrended-correlation analysis.

♦ **dead-end replicator** See replicator (comment).

♦ **dead gene** See gene: pseudogene.

♦ **“dead-plant shredders”** See ²group: functional feeding group: animal piercers.

♦ **deafferentation** *n.* One's surgically severing an animal's afferent nerves to eliminate its external stimulation and allow investigation of the spontaneous component of its behavior (Immelmann and Beer 1989, 68).

♦ **dealate** *n.*

1. In Ants and Termites: An individual that has shed its wings, usually after mating (Wilson 1975).
2. *adj.* Referring to dealate.

♦ **dear-enemy phenomenon** *n.* An animal's recognizing its territorial neighbors as individuals, with the result that it keeps aggressive interactions with them at a minimum (Fisher 1954 in Getty 1989; Wilson 1975, 273–274, 582).

♦ **death** *n.*

1. The act, or fact, of dying; the end of life; an animal's, or plant's, final cessation of vital functions (Oxford English Dictionary 1972, entries from 1971).

2. The total and irreversible cessation of all life processes in an organism (Lincoln et al. 1985).

♦ **apoptosis** *n.* (AP poe TOE sis, with a silent second p.) Cell death that is controlled genetically during an organism's metamorphosis (White et al. 1994, 677; Campbell 1996, 980).

cf. mutation: repeat

syn. programmed-cell death

Comments: *Caenorhabditis elegans* (a round worm) shows 31 apoptotic bouts during its normal development (Campbell 1996, 980; Campbell et al. 1999, 407) In this worm, three protein products of three main genes control apoptosis. A cell remains alive as long as Ced-9 (the product of the master-control gene *ced-9*) remains active. Ced-9 directly inhibits Ced-4 (encoded by *ced-4*), preventing it from activating Ced-3 (encoded by *ced-3*). A “death signal” inactivates Ced-9, which allows production of Ced-3 (a protease) which activates the next protein in an activation cascade. The final result is the activation of the protease and nuclease enzymes that kill the cell. Apoptosis is an essential part of normal development in vertebrates, as well.

[Greek *apo*, from, off; New Latin < Greek *ptōsis*, falling < *ptipēin*, to fall; referring to dead, or dying, cell's falling away from other tissue in development. Ced proteins and *ced genes* are named after cell death.]

♦ **death feign, death feigning, death feint** See playing dead.

♦ **death pheromone** See chemical-releasing stimulus: semiochemical: pheromone: death pheromone.

♦ **death phobia** See -phobia: necrophobia.

♦ **death shake** *n.* In many carnivore species, especially canids: A predator's shaking a prey that is held loosely in its teeth, causing respiratory failure, death by neck dislocation, or both in the prey (Leyhausen 1965 in Heymer 1977, 174).

♦ **Death Valley National Park** See place: Death Valley National Park.

♦ **decay** See error: observer error.

♦ **¹deceit, evolutionary deceit** See deception.

♦ **²deceit** See ²group: deceit.

♦ **deceitful signal** See signal: deceitful signal.

♦ **deceitful signaler** See signaler: deceitful signaler.

♦ **decent** See ²group: decent.

♦ **deception** *n.*

1. A person's deceiving or cheating (Oxford English Dictionary 1972, entries from 1490).

2. An individual organism's use of its behavior, appearance, signs, signals, or a combination of these things in a way that creates a “false impression” to another organism; misinforming; disinforming; *e.g.*, an *Ophrys* orchid's “tricking” a wasp, or bee, that pseudocopulates with it; mate mimicry of heterospecific fireflies by the firefly *Photuris versicolor*; distraction displays of some species of ground-nesting birds; or possibly the Beau-Geste effect (Immelmann and Beer 1989, 69). In many cases such deception is evidently a result of evolution, not goal-oriented thought of deceivers.

See deceit.

syn. deceit, evolutionary deceit

cf. intentionality; lie; signal: counterfeit signal, deceitful signal

Comments: Mitchell and Thompson (1986 in Krebs 1986, 1906) define deception in terms of intention and effect. Alexander (1987) discusses human deception from an evolutionary point of view. Whether deception is intentional in some animals, *e.g.*, some bird and nonhuman-primate species, is currently under study (Immelmann and Beer 1989, 69). Waal (1989, 238–241) describes deception examples in Humans and *Pan troglodytes* (Chimpanzees).

tactical deception *n.* In Primates: “An individual's capacity to use an ‘honest act’ from his normal repertoire in a different context such that even familiar individuals are misled” (Byrne and Whiten in Lewin, 1987b).

Comments: “Tactical deception” is compelling evidence that animals understand enough of their own intentions to manipulate those of others; it suggests that nonhuman animals have self-awareness, *q.v.* (Bateson 1991, 831).

♦ **deception advergence, advergence** *n.* The tendency of a deceptive signaling animal to resemble more closely an “honest” signaling conspecific animal (Brower and Brower 1972; P. J. Weldon, pers. comm. 1985).

cf. deception divergence

♦ **deception divergence** *n.* “The [evolutionary] tendency of “honest” signalers to become noticeably different from “deceptive” signalers which might be the “mechanism whereby conspicuous epigamic features evolve to extravagance in the runaway process hypothesized by Fisher (1958)” Weldon and Burghardt 1984, 89).

[coined by Weldon and Burghardt 1984]

♦ **deceptive analogies** See mimicry.

♦ **deceptive floral mimicry** See mimicry: deceptive floral mimicry.

♦ **deceptive resemblances** See mimicry.

♦ **deceptive signal** See signal: deceitful signal.

♦ **deciding** *n.* An animal's making a decision, *q.v.*

syn. decision making (Krebs and Kacelnik 1991, 105)
v.i., v.t. decide

♦ **deciduous** *adj.* Referring to an organism's structure that is shed at regular intervals, or at a given stage of an organism's development; *e.g.*, antler or leaf (Lincoln et al. 1985).

♦ **deciduous forest** See ²community: deciduous forest, ptenophyllum.

♦ **decision** *n.*

1. A person's act of determining (an issue, question, etc.) (Michaelis 1963).
2. A person's conclusion, or judgment, that he reaches by determining; a verdict (Michaelis 1963).
3. A person's making up his mind (Michaelis 1963).
4. A person's firmness in action, character, or judgment; determination (Michaelis 1963).
5. An animal's performance of one particular behavior out of a range of possible alternatives, with no conscious intent necessarily implied (McFarland 1985, 455; Immelmann and Beer 1989, 69–70; Krebs and Kacelnik 1991, 105).

syn. decision making (Krebs and Kacelnik 1991, 105)
[French *decision* < Latin *decisio, -onis* < *decidere*, to decide]

♦ **decision making** See deciding.

♦ **optimal decision making** *n.* Decision making that maximizes an organism's fitness, or some fitness index, under prevailing circumstances (McFarland 1985, 471, 479).

♦ **decision rule** See rule: decision rule.

♦ **declarative representation** See representation: declarative representation.

♦ **decoration stealing** *n.* In some bowerbird species: A male's taking a nest ornamentation, *e.g.*, blue poker chip, blue toy, feather, flower, or snail shell from another male's bower (Borgia and Gore 1986, 727).

Comment: Decoration stealing includes “feather stealing” (Borgia and Gore 1986, 727).

♦ **decremental conduction** *n.* An animal's loss of nerve impulses from a volley due to impulse expenditure in synaptic transmission, *e.g.*, volleys' diminishing with distance from stimulation site in a cnidarian nerve net (Immelmann and Beer 1989, 70).

cf. facilitation

♦ **dedifferentiation** *n.* Evolutionary regression to a less specialized structure or condition (Lincoln et al. 1985).

♦ **deduction** *n.* A person's reasoning from the general to the particular, *e.g.*, deducing facts from a biological concept (Michaelis 1963; Moore 1984).

cf. induction

♦ **deductive method** See method: deductive method.

♦ **deductive-nomological model** See ⁴model: deductive-nomological model.

♦ **deep-body temperature** See temperature: core temperature.

♦ **Deep Green Project** See project: Deep Green Project.

♦ **deep-sea trench** *n.* A deep, narrow, submarine depression found in certain areas of the sea floor where lithosphere descends into asthenosphere (Stanley 1989, 181, 185).

♦ **deep sleep, DS** See sleep: deep sleep.

♦ **deep structure** *n.* The origin of a generative process leading to an organism's overt characteristics (D. M. Lambert, pers. comm.).

♦ **deep structure of language** *n.* A clear, basic, abstract, cross-cultural core of language (Chomsky in Gould 1982, 538).

cf. innate-language-acquisition device

♦ **defaunation** *n.*

1. Depletion of animals, or symbiotic microorganisms, in a habitat (Lincoln et al. 1985).
2. A person's removing animals from a region, either unintentionally or in the course of experimentation (Buchmann and Nabhan 1996, 245).

adj. defaunated

♦ **defecation** See elimination.

♦ **defecation ceremony** See ceremony: defecation ceremony.

♦ **defended territory** See territory: defended territory.

♦ **defensive aggression** See aggression: defensive aggression.

♦ **defensive behavior** See behavior: defensive behavior.

♦ **defensive threat** See behavior: threat behavior: defensive threat.

♦ **deference** See need: deference.

♦ **“definable-model-virtual-model mimicry”** See mimicry: “virtual-model mimicry;” “definable-model-virtual-model mimicry.”

♦ **definition** *n.*

1. A precise statement of the nature of a thing; a statement, or form, by which anything is defined (Oxford English Dictionary 1972, entries from 1398).
2. A statement of the meaning of a word, phrase, term, etc. (Michaelis 1963).

♦ **operational definition** *n.*

1. A statement that identifies the conditions under which an empirical test gives a particular result that is related to the occurrence of a particular behavioral phenomenon; if this result is not obtained after testing, then the phenomenon does not occur (McFarland 1985, 390).

- A**
2. A definition that is restricted to a worker's observational, measurement, or manipulation procedures, or a combination of these procedures; e.g., a behavioral tendency's being defined in terms of stimulation level necessary, or sufficient, to elicit it, "with no surplus meaning" implied about unobservable states or processes (Immelmann and Beer 1989, 207).
- ♦ **definitive host** See ³host: definitive host.
- ♦ **deflection display** See display: distraction display.
- ♦ **degradation** See abasement.
- ♦ **degree-day** See unit of measure: day: degree day.
- ♦ **degree of genetic determination** See heritability: heritability in the broad sense.
- ♦ **degree of polyandry** *n.* The mathematical variance (within a group of females) in the number of males with which individual females have reproductive success (Thornhill and Alcock 1983, 82).
cf. degree of polygyny, mating system
Comment: Only females that have offspring are used in calculating the variance in number of mates.
- ♦ **degree of polygyny** *n.* The mathematical variance (in a group of males) in number of females with which individual males have had reproductive success (Thornhill and Alcock 1983, 82).
cf. degree of polyandry, mating system
Comment: Only males that have produced offspring are used in calculating the variance in number of mates.
- ♦ **degree of relatedness** See coefficient of relatedness.
- ♦ **degree of satisfaction (psi, ψ)** *n.* The index of the extent to which a density-dependent effect is limiting (Wilson 1975, 96).
Comment: At lowest densities, when the control is negligible, psi is equal to one (satisfaction with this aspect of the environment is total). As the population grows dense, and the control becomes severe, psi approaches its minimum value of zero (Wilson 1975, 96).
- ♦ **deimatic behavior** See behavior: defensive behavior: deimatic behavior.
- ♦ **deimatic display** See display: deimatic display.
- ♦ **delayed-density-dependent mortality** See mortality: density-dependent mortality: delayed-density-dependent mortality.
- ♦ **delayed dominance** See dominance (genetic): delayed dominance.
- ♦ **delayed-Mendelian inheritance** See inheritance: delayed-Mendelian inheritance.
- ♦ **delayed mortality** See mortality: delayed mortality.
- ♦ **delayed-reaction method, delayed-response method** See method: delayed-reaction method.
- ♦ **delayed reflex** See reflex: delayed reflex.
- ♦ **delayed return benefit** See altruism: reciprocal altruism.
- ♦ **deleterious** *adj.* Referring to a trait that impairs survivorship or a mutation that reduces fitness (Lincoln et al. 1985).
ant. beneficial
- ♦ **deletion** *n.* A chromosome's losing a part (Lincoln et al. 1985).
- ♦ **delousing** *n.* In many primate species: An individual's removing a conspecific's lice during social grooming (Immelmann and Beer 1989, 275).
- ♦ **$\delta^{15}\text{N}$** *n.* The ratio of the stable nitrogen isotopes $^{15}\text{N}/^{14}\text{N}$.
cf. isotope: radioactive isotope

Comments: These isotopes are widely used as natural tracers in ecosystem studies (Ehleringer and Rundel 1998 in Ben-David et al. 1998, 48). Pacific Salmon obtain ^{15}N in the ocean and bring this nitrogen into freshwater habitats when they spawn. Researchers use $\delta^{15}\text{N}$ (called $\delta^{15}\text{N}'$ in this book) as an indicator of consumer trophic position (Vander Zanden et al. 1999, 464). $\delta^{15}\text{N}'$ (in parts per thousand) = $[(\delta^{15}\text{N}_{\text{sample}} - \delta^{15}\text{N}_{\text{reference}})/\delta^{15}\text{N}_{\text{sample}}] \times 1000$. ^{15}N increases by 3–4 in a predator's tissue compared to its prey's tissues.

♦ **delta karyology** See study of: karyology: delta karyology.

♦ **delta sleep** See sleep: stage-3 and 4 sleep.

♦ **$\delta^{13}\text{C}$** *n.* The ratio of the stable carbon isotopes $^{13}\text{C}/^{12}\text{C}$.
cf. isotope: radioactive isotope

Comments: These isotopes are widely used as natural tracers in ecosystem studies (Ehleringer and Rundel 1998 in Ben-David et al. 1998, 48). Bass introduction into lakes previously without them causes *Salvelinus namaycush* (Lake Trout) to have more negative $\delta^{13}\text{C}$ values than *S. namaycush* in bass-less lakes indicating that the bass changed food-web structure (Vander Zanden et al. 1999, 464). $\delta^{13}\text{C}$ does not increase, or increases, very little, in a predator's tissues compared to its prey's tissues. Therefore $\delta^{13}\text{C}$ is useful for identifying the category of prey a consumer is eating, but not indicating its trophic position as does $\delta^{15}\text{N}$, *q.v.*

♦ **delta waves** See brain waves: delta waves.

♦ **deme** *n.*

1. An undifferentiated aggregation of cells, plastids, or monads (Oxford English Dictionary 1972, entry from 1883).

2. The smallest local set of organisms within which interbreeding occurs freely (Wilson 1975, 9, 582).

3. The smallest local set of organisms that is panmictic (has random interbreeding); hence a deme is the largest population unit that can be analyzed by the simpler models of population genetics (Wilson 1975, 9, 582).

syn. panmictic population (Wilson 1975, 590)

4. Any local group of individuals of a given species (Lincoln et al. 1985).

5. A local population in which mate choice is random with regard to most gene loci (Brown 1987, 299).
*[Greek *dēmos*, district, township, people]*

♦ **agamodeme** See deme: gamodeme.

♦ **autodeme** *n.* A deme composed predominantly of self-fertilizing organisms (Lincoln et al. 1985).

♦ **clinodeme** *n.* A deme that forms part of a graded sequence of demes distributed over a particular geographic area (Lincoln et al. 1985).

♦ **clonodeme** *n.* A deme composed predominately of vegetatively reproducing organisms (Lincoln et al. 1985).

♦ **coenogamodeme** See deme: gamodeme.

♦ **cytodeme** *n.* A deme that differs in cytological characters from other such demes within the same taxon (Lincoln et al. 1985).

♦ **ecodeme** *n.* A deme occurring in a particular habitat (Lincoln et al. 1985).

♦ **endodeme** *n.* A deme composed of predominantly inbreeding, but dioecious, individuals (Lincoln et al. 1985).

♦ **gamodeme** *n.* A relatively isolated deme (Lincoln et al. 1985).

- **agamodeme** *n.* A deme composed of predominantly asexual (apomictic) individuals (Lincoln et al. 1985).
- **agamodeme** *n.* A deme composed of predominantly asexual (apomictic) individuals (Lincoln et al. 1985).
- **coenogamodeme** *n.* A biosystemic unit comprising hologamodemes and that is capable of exchanging genes to some extent, but not with freedom, and hybridizing with other coenogamodemes producing sterile offspring (Lincoln et al. 1985).
- **hologamodeme** *n.*
1. A deme in which all individuals are able to interbreed with a high level of freedom under a particular set of conditions (Lincoln et al. 1985).
 2. A deme capable of hybridizing with other hologamodemes giving hybrids with some fertility (Lincoln et al. 1985).
- **merogamodeme** *n.* Part of a gamodeme; a phenodeme of intrapopulation variants (Lincoln et al. 1985).
- **syngamodeme** *n.* A biosystemic unit composed of all coenogamodemes that are linked by some members' abilities to form viable, but sterile hybrids; members of one syngamodeme are not capable of hybridizing with any other syngamodemes (Lincoln et al. 1985).
- **topogamodeme** *n.* A gamodeme occupying a specific area (Lincoln et al. 1985).
- genodeme** *n.* A deme characterized by genotypic features (Lincoln et al. 1985).
- genoecodeme** *n.* An ecodeme that is characterized by genotypic features (Lincoln et al. 1985).
- hologamodeme** See deme: gamodeme: hologamodeme.
- merogamodeme** See deme: gamodeme: merogamodeme.
- phenodeme** *n.* A deme characterized by observed structural and functional properties (Lincoln et al. 1985).
- plastodeme** *n.* A deme characterized by environmentally induced phenotypic features (Lincoln et al. 1985).
- plastoecodeme** *n.* An ecodeme characterized by environmentally induced phenotypic features (Lincoln et al. 1985).
- serodeme** *n.* A deme characterized by immunological properties (Lincoln et al. 1985).
- syngamodeme** See deme: gamodeme.
- topodeme** *n.* A deme occurring in a particular geographic area (Lincoln et al. 1985).
- topogamodeme** See deme: gamodeme.
- xenodeme** *n.* A deme of a parasite species that differs from the species' other demes in its host specificity (Lincoln et al. 1985).
- ♦ **demographic society** See ²society: demographic society.
- ♦ **demography** See study of: demography.
- ♦ **demonstration of trust** *n.* A person's display of defenselessness during a greeting gesture; e.g., Masai greet each other by throwing their spears into the ground in front of themselves (Heymer 1977, 193).
- ♦ **demonstrative character** See character: demonstrative character.
- ♦ **demonstrative movement** See ²movement: demonstrative movement.
- ♦ **demophobia** See -phobia: demophobia.
- ♦ **den** See ²group: den.
- ♦ **denatant** *adj.* Referring to an organism's swimming, moving, or migrating with water current (Lincoln et al. 1985).
cf. contranatant
- ♦ **denaturation** *n.*
1. Biochemistry, alteration of a protein by chemical, or physical, means (Michaelis 1963).
 2. Alteration of a DNA molecule by separating its strands by chemicals or heat (Campbell et al. 1999, 368).
- ♦ **dendricole** See -cole: dendrocole.
- ♦ **dendritic evolution** See ²evolution: cladogenesis.
- ♦ **dendrimum** See ²community: dendrimum.
- ♦ **dendrochronology** See method: dendrochronology.
- ♦ **dendroclimatology** See study of: climatology: dendroclimatology.
- ♦ **dendrogram** See -gram: dendrogram.
- ♦ **dendrology** See study of: dendrology.
- ♦ **dendrophage** See -phage: dendrophage.
- ♦ **dendrophile** See ¹-phile: dendrophile.
- ♦ **denitrification** See nitrification: denitrification.
- ♦ **de novo** *adj.* Arising anew (Michaelis 1963).
[Latin]
- ♦ **dense school** See ²group: school: dense school.
- ♦ **density** *n.* The number of specified units per specific space (Michaelis 1963).
- population density** *n.*
1. The number of conspecific organisms in an area or volume of a habitat (Lincoln et al. 1985).
 2. The mean number of individuals of a population per unit area (Immelmann and Beer 1989, 228).
syn. density (Lincoln et al. 1985)
- relative density** *n.* A measure (usually expressed as a percentage) of one species' density in an area, or community (N_a), to the total number of individuals (N_{tot}) of all other species within the same unit; relative density = $100 (N_a / N_{tot})$.
- ♦ **density dependence** *n.* A population density's being affected by a density-dependent factor that tends to retard growth (by increasing mortality and decreasing fecundity) as population density increases, or enhance population growth (by decreasing mortality and increasing fecundity) as density decreases (Lincoln et al. 1985).
cf. factor: density-dependent factor, density-independent factor; law: Allee effect
- inverse density dependence** *n.* A population density's being affected by a density-dependent factor that tends to enhance growth (by decreasing mortality and increasing fecundity) as density increases, or to retard population growth (by increasing mortality and decreasing fecundity) as density decreases (Lincoln et al. 1985).
cf. factor: density-dependent factor, density-independent factor; law: Allee effect
- ♦ **inverse density dependence** *n.* A population density's being affected by a density-dependent factor that tends to enhance growth (by decreasing mortality and increasing fecundity) as density increases, or to retard population growth (by increasing mortality and decreasing fecundity) as density decreases (Lincoln et al. 1985).
- ♦ **density-dependent factor** See factor: density-dependent factor.
- ♦ **density-dependent-growth model** See ⁴model: density-dependent-growth model.

- ♦ **density-independent-growth model** See ⁴model: density-independent-growth model.
- ♦ **density-dependent mortality** See mortality: density-dependent mortality.
- ♦ **density-dependent selection** See selection: density-dependent selection.
- ♦ **density-independent factor** See factor: density-independent factor.
- ♦ **deoxyribonucleic acid, DNA** See nucleic acid: deoxyribonucleic acid.
- ♦ **dependence** See dependent; need: dependence.
- ♦ **dependent** *adj.*
 1. Referring to a variable's being influenced, or controlled, by another variable (Lincoln et al. 1985).
 2. Referring to a datum whose value is affected by the magnitude of other variables in its set.

n. dependence
cf. independent
- ♦ **dependent character** See character: dependent character.
- ♦ **dependent rank** See ¹rank: dependent rank.
- ♦ **dependent variable** See variable: dependent variable.
- ♦ **Depret's rule** See law: Cope's law.
- ♦ **depletion effect** See effect: depletion effect.
- ♦ **deplumation** *n.* In birds: Molting (Lincoln et al. 1985).
- ♦ **Depo Provera** See drug: medroxyprogesterone.
- ♦ **deposit feeder** See -vore: detritivore.
- ♦ **deposit feeders** See ²group: functional feeding group: gathering collectors.
- ♦ **deposit feeding** See feeding: deposit feeding.
- ♦ **depression** *n.* A predator's lowering its capture rates of prey in its immediate vicinity due to its foraging activities [coined by Charnov et al. 1976, 247].
syn. resource depression (Charnov et al. 1976, 247, 257)
Comment: Depression results from a number of different processes and need not require actual harvesting of any prey items by a predator (Charnov et al. 1976, 247).
behavioral depression *n.* Depression due to a predator's visiting a focal area and causing prey to change their behaviors in ways that make them more difficult to capture by the predator or another one [coined by Charnov et al. 1976, 248].
Comment: Prey behavior changes include becoming more alert, decreasing activities (*e.g.*, advertising, courting, and feeding) that increase predation risk, and flocking differently (Charnov et al. 1976, 248).
exploitation depression *n.* Depression due to a predator's previously harvesting prey from a focal area [coined by Charnov et al. 1976, 247].
- ♦ **microhabitat depression** *n.* Depression due to a prey's changing its position in a focal habitat to where it is harder for a predator to find and capture it [coined by Charnov et al. 1976, 248].
Comments: "Behavioral depression" and "microhabitat depression" are often not distinct from one another in that a prey's position shift is usually accompanied by a change in its behavior (Charnov et al. 1976, 248). However, if the depression is mostly from a prey's position change, the prey may be still, or more, available to a second predator using a different hunting method.
- ♦ **depression effect** See effect: depression effect.
- ♦ **deprivation experiment** See experiment: deprivation experiment.
- ♦ **deprivation syndrome** See syndrome: deprivation syndrome.
- ♦ **depth perception** See perception: depth perception.
- ♦ **derived** *adj.* Referring to an organism with relatively many derived characters (Mayr 1982, 375).
syn. higher, modern (Mayr 1982, 344)
cf. ancestral; character: derived character; Darwin's admonition
- ♦ **derived character** See character: derived character.
- ♦ **derived-mitochondrial genome** See genome: derived-mitochondrial genome.
- ♦ **derived-primary-social dominance** See dominance: social dominance: primary-social dominance: derived-primary-social dominance.
- ♦ **derived species** See ²species: advanced species.
- ♦ **derived trait** See character: derived character.
- ♦ **-derm** See organ: -derm.
- ♦ **dermatotroph** See -troph: dermatotroph.
- ♦ **dermatozoon** See -zoon: dermatozoon.
- ♦ **descriptive behaviorism** See behaviorism: descriptive behaviorism.
- ♦ **descriptive observation** See observation: descriptive observation.
- ♦ **descriptive statistics** See study of: statistics: descriptive statistics.
- ♦ **desert** See ²group: desert.
- ♦ **deserticole** See -cole: deserticole.
- ♦ **desertion** See mate desertion.
- ♦ **desiccation** *n.* Water removal; the process of drying (Lincoln et al. 1985).
v.i. desiccate
- ♦ **desiccation avoidance** *n.* Delaying drying out by an organism that uses different mechanisms that enable it to maintain a favorable tissue water content despite dry air or soil (Lincoln et al. 1985).
- ♦ **desiccation avoidant** *n.* An organism that performs desiccation avoidance (Lincoln et al. 1985).
- ♦ **desiccation tolerance** *n.* An organism's capacity to tolerate its protoplasm's drying out without damage (Lincoln et al. 1985).
- ♦ **design** *n.* The concept that natural selection results in characters that enable an organism to compete for necessary resources (McFarland 1985, 427).
cf. optimality
- ♦ **designator** *n.* A component of a signal that identifies the nature of the object toward which the attention of the responder is directed (Marler 1961 in Wilson 1975, 217).
cf. appraiser
- ♦ **despot** *n.* For example, in some lizard species: One individual that dominates all other members of a group with no rank distinctions being made among the subordinates (Wilson 1975, 279).
cf. alpha
- ♦ **despotism** See hierarchy: despotism.
- ♦ **desynchronizing sleep** See sleep: stage-1 sleep.
- ♦ **determinant** *n.* An influencing, or determining, factor (Morris 1982).
- ♦ **cytoplasmic determinant** *n.* A maternal substance in an egg that influences its course of early development (Campbell et al. 1999, 397).
- ♦ **determinants of social organization** *n. pl.* Factors including the demographic parameters (birth rates, death rates, and equilibrium population size), the rates of gene flow, and the coefficients of relationship that influence how the social system of a species is organized (Wilson 1975, 32).

- ♦ **determination** *n.* The process that leads up to an observable differentiation of a cell (Campbell et al. 1999, 395).
Comments: A cell is “determined” when it is irreversibly committed to its final developmental fate (Campbell et al. 1999, 395). The expression of genes that encode tissue-specific proteins heralds differentiation (the outcome of determination). These proteins give a cell its characteristic structure and function.
- ♦ **determinants of social organization** See determinant: determinants of social organization.
- ♦ **determinism** *n.* A theory that the outcome of any process is strictly predetermined by definite causes and natural laws and is, therefore, predictable (Mayr 1997, 306).
- ♦ **deterministic** *adj.* In mathematics, “referring to a fixed relationship between two or more variables, without taking into account the effect of chance on the outcome of particular cases” (Wilson 1975, 582).
ant. probabilistic, stochastic
- ♦ **deterministic model** See ⁴model: deterministic model.
- ♦ **deterrent** See chemical-releasing stimulus: deterrent.
- ♦ **detour behavior** See behavior: defensive behavior: detour behavior.
- ♦ **detrended-correlation analysis** See method: detrended-correlation analysis.
- ♦ **detriophage** See -phage: detriophage.
- ♦ **detritivore** See -vore: detritivore.
- ♦ **detritus** *n.*
1. Loose fragments, or particles, separated from rock masses by erosion, glacial actions, or other forces (Michaelis 1963).
 2. “Any mass of disintegrated material; debris” (Michaelis 1963).
 3. Fragments of dead organic material, including corpses, feathers, feces, and leaves (Allaby 1994).
syn. organic debris (Lincoln et al. 1985)
[Latin *deterere* < *de-*, away + *terere*, to rub]
- ♦ **deuterogenesis** See -genesis: deuterogenesis.
- ♦ **deuterotoky** See parthenogenesis: deuterotoky.
- ♦ **development** *n.* An organism’s changing from earlier to later morphological stages in its life cycle (Pickett 2000).
Comment: In multicellular organisms, development involves formation and loss of new parts and changes in sizes and shapes of parts. Lewontin (2000, 5) explains how “development” is a metaphor that carries a preconceived notion of how development occurs. Historically, development meant an unfolding or unrolling of an organism’s cells and tissues from preformed material. However an organism’s ontogeny actually results from a unique interaction between its genes, the temporal sequence of external environments through which it passes during its life, and random events of molecular interactions within its cells (pages 18–19).
See study of: embryology.
syn. *desarrollo* (Spanish), *Entwicklung* (German), ontogeny, *sviluppo* (Italian)
cf. -genesis: epigenesis; ³theory: encasement theory
- ♦ **development, law of** See law: von Baer’s laws.
- ♦ **developmental canalization** See canalization.
- ♦ **developmental cycle** See cycle: developmental cycle.
- ♦ **developmental flexibility** See developmental homeostasis.
- ♦ **developmental-genetic conception of ethical behavior** *n.* One of several theories of

ethical behavior in Humans that opposes ethical behaviorism and claims that moral commitment is not entirely learned with operant conditioning being the dominant mechanism (Kohlberg 1969 in Wilson 1975, 562).

See behaviorism: ethical behaviorism; ethical institutionism.

♦ **developmental genetics** See genetics: developmental genetics.

♦ **developmental homeostasis** See canalization.

♦ **developmental mimicry** See mimicry: developmental mimicry.

♦ **developmental noise** See noise: developmental noise.

♦ **developmental psychology** See study of: psychology: developmental psychology.

♦ **developmentally fixed behavior** See behavior: developmentally fixed behavior.

♦ **de Vries’ genetic theory** See ³theory de Vries’ genetic theory.

♦ **de Vries’ mutation theory** See mutationism.

♦ **de Vries’ theory of pangens** See de Vries’ genetic theory.

♦ **de Vriesianism, mutationism** *n.* The belief that evolution, in general, and speciation, in particular, result from drastic and sudden mutational changes (Lincoln et al. 1985).

See mutationism.

♦ **DHEA** See hormone: dihydroepiandrosterone.

♦ **D horizon** See soil horizon: D horizon.

♦ **di-** prefix “Twice; double” (Michaelis 1963).
[Greek *di-* < *dis*, twice]

♦ **diacmic** See -acmic: diacmic.

♦ **diadromous** See -dromous: diadromous.

♦ **diogenesis** See -genesis: diogenesis.

♦ **diagnostic character** See character: diagnostic character.

♦ **diagram** See graph.

♦ **diakineses** *n.* A stage in meiosis, at end of prophase, during which chromosomes are strongly condensed and chiasmata are particularly visible (Mayr 1982, 957).

♦ **dialect** *n.*

1. In Humans: One of the subordinate forms of a language that arises from local peculiarities of vocabulary, pronunciation, and idiom (Oxford English Dictionary 1972, entries from 1577).

2. In some animal species: A population characteristic vocalization of one of two, or more, neighboring populations of potentially interbreeding individuals (Marler 1960 and Nottebohm 1969 in Conner 1982, 297).

Note: Dialect is distinguished from geographical variation in vocalization which occurs over long distances and between populations that normally do not come together (Nottebohm 1969 in Conner 1982, 297).

3. “A consistent difference in the predominant song type between one population and another of the same species” (Marler and Tamura 1962 in Conner 1982, 297).

Note: Conner (1982, 297) indicates how this definition has caused confusion between “dialect” and “geographical variation.”

4. In *Apis mellifera* (Western Honey Bees) and some amphibian, bird, cricket, mammal species: A variant of a species’ acoustical, or nonacoustical, trait that is restricted to the population of a particular region

- and differs from those of other regions (Immellmann and Beer 1989, 73).
syn. geographic variation (but Conner 1982, 297, tells why this is an inappropriate synonymy)
cf. tradition
- chemical dialect** *n.* A dialect of a species' sex attractant (in some lepidopteran species) or territorial marking pheromone (in some mammal species) (Immellmann and Beer 1989, 73).
- instrumental dialect** *n.* A dialect of a species' nonvocal sound production, *e.g.*, woodpeckers' drumming or wing clapping of a *Mirafra apiata* (Clapper Lark) (Immellmann and Beer 1989, 73).
cf. dialect: vocal dialect
- play dialect** *n.* For example, in *Ovis canadensis* (Big-horned Sheep): A dialect of a species' play behavior (Immellmann and Beer 1989, 74).
- regional dialect** *n.* A dialect with a large range (Immellmann and Beer 1989, 73).
- vocal dialect** *n.* A dialect of a species' vocal sound production (Immellmann and Beer 1989, 73).
cf. dialect: instrumental dialect
- ◆ **diallel cross** See cross: diallel cross.
- ◆ **diamesogamy** See -gamy: diamesogamy.
- ◆ **diapause** See dormancy.
- ◆ **diaphototaxis** See taxis: diaphototaxis.
- ◆ **diaspore** *n.* A seed plus its elaiosome (*q.v.*) (Swearingen 1992).
cf. elaiosome, myrmecochory
- ◆ **dichogamy** See -gamy: dichogamy.
- ◆ **dichopatric** See -patric: dichopatric.
- ◆ **dichotomous character** See character: dichotomous character.
- ◆ **dichthadiigyne, dichthadiiform ergatogynne** See caste: dichthadiigyne.
- ◆ **dilinious** See sexual: unisexual.
- ◆ **dictum** See law.
- ◆ **dicyclic** See cyclic: dicyclic.
- ◆ **dideoxy-chain-termination method** See method: dideoxy-chain-termination method.
- ◆ **diecdysis** See ecdysis: diecdysis.
- ◆ **diecioplygamy** See -gamy: diecioplygamy.
- ◆ **diecodichogamy** See -gamy: diecodichogamy.
- ◆ **diencephalon** See organ: brain: diencephalon.
- ◆ **dientiophile** See ²-phile: dientiophile.
- ◆ **dientomophile** See ²-phile: dientomophile.
- ◆ **diestrous, diestrus** See estrus: diestrus.
- ◆ **difference** *n.* Being unlike in amount, form, nature, quantity, or a combination of these characters (Morris 1982).
- ramp difference** *n.* Gradual change, *e.g.*, of the density of an organism from its central through the peripheral part of its natural range (New 2009, 115).
- step difference** *n.* Sudden change, *e.g.*, of the density of an organism from its central through the peripheral part of its natural range, including a change from present to absent and vice versa (New 2009, 115).
- ◆ **differential fertilizing capacity** *n.* The relative ability of sperm from rodent males of different genotypes to gain representation in litters that are the result of competitive matings, when order of mating, number of ejaculates, and time of matings are controlled (Lanier et al. 1979 in Dewsbury 1984, 551).
- ◆ **differential psychology** See study of: psychology: differential psychology.
- ◆ **differential species** See ²species: differential species.
- ◆ **differentiation** *n.* Cells' becoming specialized in structure and function during development (Campbell et al. 1999, 389).
- ◆ **diffuse coevolution** See ²evolution: coevolution: diffuse coevolution.
- ◆ **diffuse competition** See competition: exploitative competition.
- ◆ **diffusion** *n.*
1. In anthropology, the transmission of culture traits from one area, or group, to another (Michaelis 1963).
 2. The spread of an allele through a population of a species (inferred from Hartl and Clark 1997, 277).
 3. In Humans: The process by which an innovation is communicated through certain channels over time among the members of a social system (Rogers 1995, 5, in Reader and Laland 2000, 275).
 4. The increase of frequency of a novel learned behavior, irrespective of the process involved (Reader and Laland 2000, 275).
- Note:* This definition is based on defining "diffuse" as "widely spread out" as given in Michaelis (1963). Information can spread through a group by social-imitative learning, *q.v.*, or appear to be such learning by appearing to spread in group when individual animals learn for themselves at different times.
- Comment:* *Poecilia reticulata* (Guppies) showed diffusion of foraging innovations, with novel-foraging information's spreading at a significantly faster rate through subgroups of females than of males, under laboratory conditions (Reader and Laland 2000, 275).
[from diffuse, Latin *diffusus*, past participle of *diffundere* < *dis-* away, from + *fundere*, to pour]
- ◆ **digametic** See -gametic: heterogametic.
- ◆ **digamety** See -gamety: digamety.
- ◆ **digenesis** See -genesis: digenesis.
- ◆ **digenetic** See -genetic: digenetic.
- ◆ **digenetic parasite** See parasite: digenetic parasite.
- ◆ **digenic** See genic: digenic.
- ◆ **digenomic** *adj.* Referring to an organism that contains two independently derived genomes (Lincoln et al. 1985).
- ◆ **digenous** See -genous: digenous.
- ◆ **digeny** See sexual reproduction.
- ◆ **digital organism** See program: digital organism.
- ◆ **digital signal** See signal: digital signal.
- ◆ **digitigrade** See -grade: digitigrade.
- ◆ **digitigrade locomotion** See locomotion: digitigrade locomotion.
- ◆ **digoneutic** See -voltine: bivoltine.
- ◆ **digonic** *adj.* Referring to an organism that produces male and female gametes in different gonads (Lincoln et al. 1985).
- ◆ **DIH** See hypothesis: diversity-invasibility hypothesis.
- ◆ **dihybrid cross** See cross: dihybrid cross.
- ◆ **dihydroepiandrosterone** See hormone: dihydroepiandrosterone.
- ◆ **dilution factor** See factor: dilution factor
- ◆ **dimegaly** *n.* Gametes' having marked size dimorphism (Lincoln et al. 1985).
adj. dimegalic
- ◆ **dimension of preparedness** *n.* An organism's "predisposition to learn vitally relevant things more readily than anything else" (Immellmann and Beer 1989, 173).
cf. equipotentiality assumption, learning disposition
- ◆ **dimorphic** See -morphic: dimorphic.
- ◆ **dimorphism** See -morphism: dimorphism.

- ♦ **dimorphous life cycle** See life cycle: dimorphous life cycle.
- ♦ **dinosaur-extinction hypotheses** See hypothesis: dinosaur-extinction hypotheses.
- ♦ **dioecious** See -oecious: dioecious.
- ♦ **dioecopolygamy** See -gamy: dioecopolygamy.
- ♦ **diorama** *n.*
 1. An exhibit that consists of modeled figures, landscape objects, and so forth, set in a naturalistic foreground blended into a painted background (Michaelis 1963). *Note:* Diorama examples include a reconstructed Carboniferous swamp in the American Museum of Natural History (Cowan 2000, fig. 9.9), a reconstructed Cretaceous landscape with an *Albertasaurus* (the Royal Tyrrell Museum's mascot, Lilian) (Royal Tyrrell Museum 2002), and reconstructed landscapes of the ancient seas, Everglades, Galápagos Islands, and the Namib Desert at the National Museum of Natural History, U.S.
 2. A picture in which one produces changes by means of a cloth transparencies, arrangements of lights, and so forth (Michaelis 1963).
 3. A building with one or more exhibited dioramas (def. 1, 2) (Michaelis 1963).

Comment: The construction of the diorama of a carboniferous swamp at the Field Museum of Natural History, Chicago, Illinois, took about 3 million human-hours to manufacture and assemble its pieces (Stewart and Rothwell 1993, 125).
- ♦ **diphenic population** See ¹population: diphenic population.
- ♦ **diphysgenic** See -genic: diphysgenic.
- ♦ **diphytic group** See ²group: phytic group: diphytic group.
- ♦ **diphyly** See -phytic: diphytic.
- ♦ **diplanetic** See -planetic: diplanetic.
- ♦ **diplo-** *prefix* Double, twofold (Michaelis 1963).
- ♦ **diplobiont** See biont: diplobiont.
- ♦ **diploidiploidy, diplo-diploidy** See ploidy: diploidiploidy.
- ♦ **diplogenesis** See -genesis: diplogenesis.
- ♦ **diplohaplontic organism** See biont: diplobiont.
- ♦ **diploid** See -ploid: diploid.
- ♦ **diploid apogamy** See -gamy: diploid apogamy.
- ♦ **diploid effect** See effect: diploid effect.
- ♦ **diploid parthenogenesis** See -gamy: apogamy: parthenopagamy.
- ♦ **diploidy** See -ploidy: diploidy.
- ♦ **diplont, diplophase** See -plont: diplont.
- ♦ **diplontic life cycle** See life cycle: diplontic life cycle.
- ♦ **diploses** *n.* A cell's doubling its chromosome number; establishing a zygotic chromosome number (Lincoln et al. 1985).
- ♦ **diplotype** See -type: genoholotype.
- ♦ **direct aggression** See aggression: direct aggression.
- ♦ **"direct-benefit hypothesis"** See female-mate-choice hypothesis: "direct-benefit hypothesis."
- ♦ **direct competition** See competition: direct competition.
- ♦ **direct fitness** See fitness (def. 2, 4).
- ♦ **direct hyperparasitism** See parasitism: hyperparasitism: direct hyperparasitism.
- ♦ **direct life cycle** See life cycle: homogonic life cycle.
- ♦ **direct mimicry** See mimicry: direct mimicry.
- ♦ **direct role** See role: direct role.

- ♦ **direct scratching under the wing** See grooming: direct scratching under the wing.
- ♦ **direct selection** See selection: direct selection.
- ♦ **direct tradition** See tradition: direct tradition.
- ♦ **directed movement** See taxis: topotaxis.
- ♦ **directed mutation** See ²mutation: directed mutation.
- ♦ **directed-mutation hypothesis** See hypothesis: directed-mutation hypothesis.
- ♦ **directed panspermia** *n.* "The idea that Earth's original life arrived as microorganisms dispatched by intelligent beings who chose not to make the long journey themselves" (F. Crick in Gould 1981a).
- ♦ **directing stimulus** See ²stimulus: directing stimulus.
- ♦ **directional dominance** See dominance: directional dominance.
- ♦ **directional selection** See selection: directional selection.
- ♦ **directional signal** See signal: directional signal.
- ♦ **directionism, catastrophism** *n.* The views held by directionists (*q.v.*).
- ♦ **directionist** *n.* A member of a school of geologists who holds that the evolution of and life on the Earth are affected by direct divine intervention, different causes operated in the early history of the Earth compared to the later history, the intensity of causal forces were irregular and varied in and steadily decreased with in geological time, configurational causes were different in certain former geological periods, many truly cataclysmic changes occurred, and changes occur in a more or less directional manner, being progressive as indicated in the sequence invertebrates-fishes-reptiles-mammals (Mayr 1982, 365, 375-378). *syn.* catastrophist (Mayr 1982, 378) *cf.* special creation; ³theory: uniformitarianism *Comments:* Cuvier used the milder term "revolution" rather than "catastrophe" to refer to the presumed upheavals. Catastrophic elimination of species is supported by many data (Mayr 1982, 365, 375-378; Kerr 1984).
- ♦ **directive coloration** See coloration: directive coloration.
- ♦ **directive selection** See selection: directive selection.
- ♦ **directive species** See ²species: directive species.
- ♦ **directiveness** *n.*
 1. The concept that at least some of an organism's behavior has been modified by natural selection in a way that leads the organism towards states that favor survival and reproduction (Thorpe 1963, 4).
 2. The concept that animal behavior is "directed to a certain end (goal, or purpose)" (McDougall 1933 and Russell 1934, 1935 in Tinbergen 1951, 3). *cf.* purposiveness, teleology
- ♦ **disaccharide** See molecule: -saccharide: disaccharide.
- ♦ **disassortative mating** See mating: disassortative mating.
- ♦ **disclimax** See ²community: climax: disclimax.
- ♦ **discolorous** *adj.* An object's having a nonuniform coloration (Lincoln et al. 1985). *cf.* coloration
- ♦ **discontinuity** *n.*
 1. A marked gap in an organism's range (Mayr 1982, 542).
 2. A marked interruption in an otherwise continuous variation of sequence, populations, objects, or events (Lincoln et al. 1985).

syn. disjunction (Lincoln et al. 1985)

primary discontinuity *n.* A discontinuity in a species' range that originates when colonists reach an isolated area and succeed in establishing a permanent population there; *e.g.*, Scandinavian insects and plants dispersed to Iceland in the post-Pleistocene period, probably moving over a large watergap (Mayr 1982, 452).

secondary discontinuity *n.* A discontinuity in a species' distribution due to the fractionation of its originally continuous range resulting from a geological, climatic, or biotic event; *e.g.*, the Blue Magpie occurs in eastern Asia and in a completely isolated colony in Spain and Portugal (Mayr 1982, 452).

◆ **discontinuous distribution** See distribution: discontinuous distribution.

◆ **discontinuous modular society** See ²society: discontinuous modular society.

◆ **discontinuous variable** See variable: discontinuous variable.

◆ **discontinuous variation** See variation: discontinuous variation.

◆ **discounting, discounting future events** In *Sturnus vulgaris* (European Starlings) and Humans: An individual's trading off the value of future opportunities for immediate rewards (A. Kacelnik in Williams 1997, 30).

◆ **Discover Life in America** See inventory: All Taxon Biological Inventory (comment).

◆ **discrete character** See character: discrete character.

◆ **discrete-lognormal curve** See curve: Poisson-lognormal curve.

◆ **discrete signal** See signal: digital signal.

◆ **discrete variable** See variable: discontinuous variable.

◆ **discriminate analysis** See statistical test: discriminate analysis.

◆ **discriminating individual** See individual: discriminating individual.

◆ **discrimination learning** See learning: discrimination learning.

◆ **discrimination test** See test: discrimination test.

◆ **discriminator, recognition label** *n.* A genetically determined cue that permits an individual to classify another as kin or nonkin (Hölldobler and Wilson 1990, 637).

See chemical-releasing stimulus: semiochemical: pheromone: recognition pheromone.

◆ **disease** *n.* A condition of ill health, inherent weakness, or malfunctioning, in a living organism; especially a disordered physical condition, or processing with particular symptoms, and affecting part through all of an organism (Michaelis 1963, Morris).

cf. virus

Comments: Diseases are important factors that affect organism's behavior, ecology, and evolution. Humans may be infecting field populations of Baboons, Chimpanzees, Gorillas, and Monkeys with human diseases, such as measles, polio, and scabies, which appear to be killing some of these primates (Ferber 2000, 1277). A few of the thousands of organism diseases are below. The Web site for the Centers for Disease Control and Prevention (<http://www.cdc.gov/aboutcdc.htm>) describes many human diseases.

[Anglo-French, Old French *desaise* < *des-*, not (< Latin *dis-*) + *aise* < *adjacens*, ease]

African sleeping sickness *n.* A trypanosome disease of Humans transmitted by Tsetse Flies (McNeil 2000, A8).

syn. Human African trypanosomiasis, sleeping sickness (McNeil 2000, A8)

Comments: Without treatment, this disease is fatal (McNeil 2000, A8). Infected persons go from lethargy through madness, with terrifying hallucinations and painful sensitivity to even the lightest touch. A person in the last stages of this disease, loses his ability to feed himself, slips into a coma, and dies. About 450,000 Africans have this disease, and 60 million of them are at risk of contracting it.

allergic diseases *n.* Human diseases including asthma, rhinitis, and sinusitis (American Academy of Allergy, Asthma, and Immunology 1998, S-1).

Comments: Allergic diseases result from overreactions of human immune systems to just about any normally innocuous foreign substance including certain animal dander, cosmetics, drugs, dust, food, mold spores, and pollen (American Academy of Allergy, Asthma, and Immunology 1998, S-1, 10). Ragweed pollen is a major cause of outdoor allergy in the U.S. (S-8).

allergic rhinitis *n.* A human allergic disease that involves inflammation of nasal mucous membranes (American Academy of Allergy, Asthma, and Immunology 1998, S-10).

Alzheimer's disease *n.* A human age-related dementia (Hall 1998, 28).

Comments: Alzheimer's disease affects nearly 4 million U.S. citizens (Hall 1998, 28).

anaphylaxis *n.* A person's acute systemic, allergic reaction (American Academy of Allergy, Asthma, and Immunology 1998, S-10).

Comments: Anaphylaxis occurs after a person is exposed to an antigen, *e.g.*, an allergen, to which he was previously sensitized (American Academy of Allergy, Asthma, and Immunology 1998, S-10).

asthma *n.* A human allergic disease which involves inflammation and narrowing of bronchial tubes (American Academy of Allergy, Asthma, and Immunology 1998, S-21).

Comments: Asthma symptoms include chest tightness, coughing, whizzing while talking, shortness of breath, wheezing, and whistling while talking (American Academy of Allergy, Asthma, and Immunology 1998, S-21). About 15 million U.S. citizens have asthma.

breast cancer *n.* Cancer of a human breast (Campbell et al. 1999, 224).

Comments: Breast cancer strikes 10% of U.S. women (Campbell et al. 1999, 224). Breast cancer often runs in families due to an inherited genetic trait, an unidentified environmental agent, or both.

Canavan disease *n.* A human disease caused by a defect in the gene that encodes the brain enzyme aspartoacylase and is characterized by catastrophic brain damage (Gillis 2000, 30 December, A14, illustration of two children with this disease).

Comments: In a defective aspartoacylase gene, the 854th base, adenine, is replaced by cytosine, which disables the enzyme. This disease occurs most commonly in Jews of European ancestry. The ailment involves a defect in the development of brain and nerve tissues, resulting in major brain damage. Children with this disease never learn to feed themselves, talk, or walk and invariably die young, *e.g.*, before the age of 17 yr.

cancer *n.* A disease in which cells no longer divide and develop normally (Campbell et al. 1999, 261).

Comments: Cancer is always the consequence of changes in a person's DNA (M.-C. King in Campbell et al. 1999, 224). The majority of mutations that lead to cancer arise in the tissue where the cancer starts, e.g., in a breast or colon. The minority of cancers are in a person's germ lines.

chronic-wasting disease *n.* A disease, possibly caused by prions, that kills a brain cells of wild deer and elk in the U.S., and leaves brains full of holes (Blakeslee 2000, 31 October, D5).

Colony-Collapse Disorder (CCD) *n.* The rapid disappearance of adults of *Apis mellifera* (Western Honey Bee) from their colonies (Cox-Foster et al. 2007, 1).

Comments: In CCD, one does not find the missing Bees as dead adults inside or near their hive boxes, much capped brood and food reserves remain in their hive boxes, and the only bees that remain and attend their queens are newly emerged adults (Cox-Foster et al. 2007, 1). Beekeepers first noticed colony declines with CCD characteristics as early as 2004. The Israeli Acute Paralysis Virus may be one of the causes of CCD. At least eight other viruses are known in *A. mellifera*.

Creutzfeldt-Jakob disease (CJD) *n.* A disease that kills human brain cells and leaves a brain full of holes (Blakeslee 2000, 31 October, D5).

Comments: Researchers traced CJD directly to a person's eating meat from a *Bos primigenius* (Domestic Cattle) infected with bovine spongiform encephalitis (= mad-cow disease) (Blakeslee 2000, 31 October, D5). Prions may cause CJD which killed over 80 Britons in 2000.

dyslexia *n.* A neurologically-based, often familial, disorder that interferes with the acquisition and processing of language (New York Branch of the International Dyslexia Association, 2002).

Comments: According to the New York Branch of the International Dyslexia Association (2002), dyslexia varies in degrees of severity, is manifested by difficulties in receptive and expressive language, including phonological processing, in reading, writing, spelling, handwriting, and sometimes in arithmetic. Dyslexia is not a result of lack of motivation, sensory impairment, inadequate instructional or environmental opportunities, or other limiting conditions, but may occur together with these conditions. Although dyslexia is life-long, individuals with dyslexia frequently respond successfully to timely and appropriate intervention.

Ebola hemorrhagic fever, Ebola HF *n.* A severe, often-fatal disease in Humans and nonhuman primates (Centers of Disease Control and Prevention, 2000, 21 November).

Comment: The Ebola Virus causes this disease which has appeared sporadically since its initial recognition (Centers of Disease Control and Prevention, 2000, 21 November).

[after the Ebola River, Democratic Republic of the Congo (formerly Zaire), where people first recognized Ebola hemorrhagic fever]

filariasis *n.* One of a group of tropical diseases caused by filarial worms (Aschelminthes) that are transmitted to Humans by insect bites, including Bancroftian filariasis, Brugian lymphatic filariasis, Loiasis, and river blindness (Borror et al. 1989, 19;

Clayman 1989, 454; Filarial Genome Network 2000 (<http://circuit.neb.com/fgn/filgen1.html>)).

Comments: In lymphatic filariasis, *Wuchereria bancrofti* (Cobbald), or *Brugia malayi* (Brug), filaria live in lymphatic vessels which they block. After repeated infections a body part (e.g., a limb or scrotum) can become enormously enlarged, and the skin becomes coarse, fissured, and thick, which is a condition called "elephantiasis." Mosquitoes (principally *Aedes*, *Anopheles*, *Culex*, and *Mansonia*) and some biting midges (*Culicoides*) transmit this disease to Humans. In river blindness, *Onchocerca volvulus* (Leuckart) invades eyes and causes blindness. *Simulium* spp. (Black Flies) transmit this disease to Humans. The Filarial Genome Network 2000 (<http://circuit.neb.com/fgn/filgen1.html>) describes other filarial diseases, provides illustrations of the parasites and their pathologies in Humans, and gives information on filarial genetics.

hayfever, seasonal allergic rhinitis *n.* A Human allergic disease which includes the following symptoms: hot, red, swollen, and tender tissues, including nasal passages; itchy eyes; reduced general physical energy level; running nose; sneezing; and wheezing (American Academy of Allergy, Asthma, and Immunology 1998, S-9–10, pers. obs.).

Comments: About 35 million U.S. citizens suffer from this disease (American Academy of Allergy, Asthma, and Immunology 1998, S-1). About 1.8 million U.S. citizens required emergency-room services for asthma attacks.

intrinsic asthma *n.* Asthma, *q.v.*, that has no apparent external cause and can develop in a person of any age (American Academy of Allergy, Asthma, and Immunology 1998, S-10).

leishmaniasis *n.* A protistan disease of Humans that is transmitted by some species of sand flies and that occurs in many subtropical and tropical areas (www.cdc.gov/aboutcdc.html, 2000).

syn. leishmaniosis (Michaelis 1963)

Comment: This disease is commonly either in a cutaneous (skin) form or in a visceral (internal organ) form (www.cdc.gov/aboutcdc.html, 2000). Cutaneous leishmaniasis is characterized by one, or more, skin sores (either open or closed) that develop weeks through months after a person is bitten by infected sand flies. The manifestations of visceral leishmaniasis, such as anemia, enlargement of the spleen and liver, and fever, typically develop months, but sometimes years, after a person becomes infected.

[after *Leishmania*, a genus of protistan parasites < Sir William Leishman, 1865–1926, English army surgeon]

malaria *n.* A *Plasmodium*-caused disease that occurs in Birds, Mammals (e.g., Apes, Humans, Monkeys, and some rat species), and Reptiles (Encyclopedia Britannica, 2002, 725).

syn. paludism, swamp fever (Michaelis 1963)

Comments: Different *Plasmodium* sp. cause malaria in different species (Encyclopedia Britannica 2002, 725). Four *Plasmodium* spp. cause malaria in Humans by infecting their red blood cells and other body parts (Michaelis 1963). Chills, fatigue, fever, and even death characterize this disease. Female *Anopheles* mosquitoes transmit human malaria which kills about 3 million people annually (Campbell et al. 1999, 1120). This disease was once common in the continental U.S.; however, people virtually eliminated malaria from the conterminous U.S. by draining wetlands for

agriculture, increasing sanitation during the early 20th century, and killing mosquitoes with the problematical insecticide DDT in the early 1950s.

[Italian *mal'aria*, *mala aria*, literally, bad air, after the belief a person contracted malaria from bad air, e.g., in a swampy area]

mad-cow disease *n.* A disease first recognized in *Bos primigenius* (Domestic Cattle) in 1986 that kills a Cow's brain cells, and leaves its brain full of holes (Daley 2000, 3 November, A5).

Comments: Prions, that may act with viruses or other agents, might cause this disease (Daley 2000, 3 November, A5). Mad-cow disease is linked to its human form, Creutzfeldt-Jakob disease, which has killed 80 people in the United Kingdom. To control mad-cow disease people eliminate animal parts from cattle feed.

Nature Deficit Disorder (NDD) *n.* The "human costs of alienation from nature," including attention difficulties, diminished use of modalities, and higher rates of physical and emotional illnesses (Louv 2008, 10, 36).

Comments: Louv (2008, 10, 36) writes that NDD is not a *bona fide* medical term. He presents data that indicate that NDD exists and reports that NDD occurs in individual Humans, families, and communities. Further, he suggests that NDD can decrease the perceived value of nature in cities and have negative effects on urban planning.

[coined by Louv (2008, 10), evidently in parallel with Attention Deficit Hyperactivity Disorder, ADHD]

shock disease *n.* In *Lepus americanus* (Snowshoe Hares): "A hormone-mediated idiopathic hypoglycemia that can be identified by liver damage and disturbances in several aspects of carbohydrate metabolism" that occurs during population explosions (Green et al. 1939 in Wilson 1975, 83).

Comment: Similar diseases occur in rats and *Nauphoeta cinerea* (Smokey Cockroach) (Wilson 1975, 83).

sinusitis *n.* A human allergic disease that involves an inflammation of membranes lining facial tissues and often caused by bacteria, viruses, or both (American Academy of Allergy, Asthma, and Immunology 1998, S-10).

Wilson's disease *n.* A form of human retardation caused by one gene (Dewsbury 1978, 119).

♦ **diserotization** *n.* Interference with, or inhibition of, an organism's copulation by low temperature (Lincoln et al. 1985).

♦ **disgrace, dishonor** See abasement.

♦ **disgust** See facial expression: disgust.

♦ **disgust reaction** See reaction: disgust reaction.

♦ **dishabituation** See learning: habituation.

♦ **disharmony law** See law: disharmony law.

♦ **disinhibition** See inhibition: disinhibition.

♦ **disinhibition hypothesis** See hypothesis: disinhibition hypothesis.

♦ **disintegrative-capture hypothesis** See hypothesis: Moon-origin hypotheses: disintegrative-capture hypothesis.

♦ **disjunct mimicry system** See ¹system: mimicry system: disjunct mimicry system.

♦ **disjunct species** See ²species: disjunct species.

♦ **disorientation** *n.* An organism's temporary, or permanent, inability to maintain a point of reference with respect to its surroundings; disorientation includes spatial and temporal disorientation (Heymer 1977, 52).

cf. taxis

♦ **dispermy** *n.* Penetration of a single ovum by two spermatozoa at fertilization time (Lincoln et al. 1985).

♦ **dispersal** *n.*

1. Outward spreading of organisms, or propagules, from their point of origin or release (Lincoln et al. 1985).
2. Outward extension of a species' range, often by a chance event (Lincoln et al. 1985).
- syn.* accidental migration (Lincoln et al. 1985)
3. An animal's movement (excluding migration) from a source, such as its birth place (Johnston 1961; etc. in Brown 1987, 299).

natal dispersal *n.* An animal's successful, or non-successful, dispersal from its hatching site to first-breeding site (Brown 1987, 299).

presaturation dispersal *n.* Emigration of individuals (typically in good condition and of either sex) from a population that remains at low density, or is in its early growth phase (Lincoln et al. 1985).

saturation dispersal *n.* Emigration of surplus individuals (typically juvenile, aged, or in poor condition) from a population that is at, or near, its environment's carrying capacity (Lincoln et al. 1985).

♦ **dispersed lek** See ²lek: dispersed lek.

♦ **dispersion** *n.*

1. The distribution pattern of organisms, or populations, in space (Lincoln et al. 1985).
2. Nonaccidental movement of bionts into, or out of, an area or population, often a movement over a relatively short distance and of a more, or less, regular nature (Lincoln et al. 1985).

cf. migration

3. Statistically, the distribution, or scatter, of observations, or values, about the mean or central value (Lincoln et al. 1985).

cf. behavior: spacing behavior; distribution

♦ **displaced aggression, displacement** See aggression: displaced aggression.

♦ **displacement activity, displacement behavior** See behavior: displacement behavior.

♦ **displacement feeding** See behavior: displacement behavior: displacement feeding.

♦ **displacement preening** See behavior: displacement behavior: displacement preening.

♦ **displacement sleeping** See behavior: displacement behavior: displacement sleeping.

♦ **displacement theory** See hypothesis: continental drift.

♦ **display** *n.*

1. A organism's phenotypic characteristic that may alert, attract, repel, or a combination of these things, such as a plant's flower number that attracts pollinators (inferred from Cruzan et al. 1988, 505). See display: floral display.

2. A behavior (a kind of signal) modified by evolution (by ritualization) that conveys information (Wilson 1975, 560, 582), including all specifically differentiated behavior that serves in intraspecific and sometimes interspecific communication (Immelmann and Beer 1989, 76).

syn. expressive behavior, signaling behavior (Immelmann and Beer 1989, 75)

cf. animal sounds, behavior: treptic behavior, ceremony, dance, eyebrow flash, facial expression, *Flehmen*, posture, presentation, movement, signal

Comments: Some of the many kinds of described displays are given below. White et al. (2000, 891–

892) define many kinds of displays given by male Tephritidae (Fruit Flies).

advertising, advertisement *n.* A display, or other kind of signal.

cf. display

► **honest advertising** *n.* A signal, or display, that indicates to receivers, or viewers, the true information that is being broadcast (Wilson and Daly 1985, 66); *e.g.*, in Humans a competitive, risk-taking young male might be communicating to others that he has high quality-genes or other resources.

syn. honest signaling, honest salesmanship (Wilson and Daly 1985, 66)

ant. dishonest advertising, dishonest salesmanship, dishonest signaling

aerial display *n.* In *Megaptera novaeangliae* (Humpback Whales): An individual's breaching the water surface and exposing itself to aerial viewers (Baker and Herman 1985, 55).

Comment: An aerial display might be part of competitive behavior; communication used when a whale joins, or leaves, a group; or a result of human disturbance (Baker and Herman 1985, 55).

antidisplay *n.* A behavior that is effective in misleading its recipient(s), *e.g.*, the resting postures of many orthopteroid insects that increase their camouflaging (Moynihan 1975 in Baerends et al. 1975, 278).

appeasement display, appeasement, appeasement gesture *n.* A display that typically inhibits aggression from another animal, *e.g.*, some kinds of birds respond to conspecific threats, or attacks, as if they were about to be preened, and this usually stops the attacks (Wilson 1975, 209).

cf. appeasement

Comment: Appeasement displays may also involve an animal's making itself appear as small as possible, flattening its hair or feathers, retracting limbs, withdrawing combat-releaser weapons such as its teeth, or bill, from its superior adversary, and immobility (Cumming 1982, 73).

bared-teeth display, threat mimic *n.*

1. In most primate species: A phylogenetically ancestral social display involving an individual's opening its mouth, drawing back its lips, and showing its upper and lower teeth, commonly without making vocal sounds (van Hooff 1972 in Wilson 1975, 227).

Notes: This display is often shown when primates are confronted with aversive stimuli and have moderate to strong tendencies to flee. Chimpanzees may use a form of this display in making friendly within-troop contacts. It may be homologous to human smiling and laughing (van Hooff 1972 in Wilson 1975, 227). Some workers indicate that Humans have bared-teeth displays.

2. In some mammals, especially carnivores: A threat display involving an individual's curling back its lips and showing its teeth (Heymer 1977, 204).

cf. behavior: threat; teeth grinding; facial expression: smile

► **bared-teeth-scream display** *n.* In many primate species excluding Humans: A bared-teeth display, *q.v.*, accompanied with screaming; this display indicates extreme fear and submission, as well as readiness to attack if the animal is pressed further (van Hooff 1972 in Wilson 1975, 227).

► **silent-bared-teeth display, bared-teeth display** *n.* A barred-teeth display with no vocalizations (McFarland 1985, 486).

cf. smiling

bow-coo display *n.* In male *Streptopelia risoria* (Ring Doves): A courtship display, involving an individual's approaching a female in a stereotyped manner and emitting a distinctive cooing sound (Lehrman 1964, 1965 in Dewsberry 1978, 86).

broken-wing display See display: distraction display: broken-wing display.

buttocks display *n.* A person's buttocks presentation that represents scorn, or mockery, towards others, depending on the culture (Heymer 1977, 76).

cf. notify

Comments: In Bushmen, buttocks displays may involve grasping sand between pelvic cheeks and releasing it, and often gas, during a deep bow directed toward a mocked person. European children use buttocks displays as a form of protest to their parents. In European adults, buttocks display is sometimes ritualized in dancing (Heymer 1977, 76). Especially during the 1960s, in the U.S., some usually young persons of both sexes sometimes performed "mooning" for fun, which is presenting bare buttocks, *e.g.*, out of car windows, to strangers. "Streaking" (running partially through fully naked in front of other people) was also popular in some areas of the U.S. in the 1960s.

challenge display *n.* A high intensity, aggressive display performed by a male to a conspecific male (Lincoln et al. 1985).

claw-waving modes See display: fiddling display.

communal sexual display *n.* In male courting animals: A group display that can be spectacular as in synchronously flashing fireflies, mass emergences of cicadas, and battles of *Cervus canadensis* (Elk) and *Ovis ammon* (Mountain Sheep) (Wilson 1975, 331).

cf. lek

connubial display See courtship.

deflection display See display: distraction display.

deimatic display *n.* A display thought to scare off enemies, *e.g.*, the "snake-head" morphology of a hawk-moth caterpillar (McFarland 1985, 97) or eyespots on many kinds of moths (Immelmann and Beer 1989, 76).

cf. behavior: deimatic behavior

distraction display *n.*

1. A display used to attract an enemy's attention and draw it away from any object that a display is trying to protect (Armstrong 1947 in Wilson 1975, 122).

2. For example, in *Gasterosteus aculeatus* (Three-spined Sticklebacks) and many bird and other vertebrate species: A display used by an adult guardian to divert an predator's attention from its nest, eggs, or young (Simmons 1955; etc. in Woriskey 1991, 989).

syn. deflection display, paratrepisis (Lincoln et al. 1985)

cf. display: diversionary display

► **injury-feigning-distraction display** *n.* In *Charadrius vociferus* (Killdeer), Sandpipers, *Zenaida macroura* (Mourning Dove) and some other ground-nesting birds: A distraction display in which an individual acts as though it were injured and trails its apparently broken wing and lures a

potential predator from its nest (McFarland 1985, 500; Basket et al. 1993, 167).

syn. broken-wing feign (Basket et al. 1993, 167)

► **rodent run** *n.* In some plover species: A distraction display in which a parent mimics the movement of a mouse, or rat, thus diverting a predator's attention toward itself (Immelmann and Beer 1989, 77).

diversionary display *n.* A bird's activities that deflect a potential predator from its nest or young (Oliver 1955, 121).

cf. display: distraction display

epideictic display *n.*

1. The most refined form of "conventional behavior" in which members of a population reveal themselves and allow all to assess the density of the population (Allee et al. 1949; Kalela 1954; Wynne-Edwards 1962 in Wilson 1975, 87, 110).
2. A hypothesized social display whose function is to convey information about local population density.

Note: This term is used solely in the context of inter-demic selection for population-regulating mechanisms (Wittenberger 1981, 615).

syn. epideictic behavior

Comment: The existence of epideictic displays is controversial.

epigamic display *n.* Courtship behavior that an animal, usually a male, performs in a situation of epigamic selection (*e.g.*, lekking of Ruffs and Sage Grouse (Immelmann and Beer 1989, 88).

fiddling display *n.* In Fiddler Crabs: Claw-waving used as a courtship signal (Heymer 1977, 201).

fin flicking *n.* In the *Hemigrammus erythrozonus* (Glowlight Tetra), an individual's very rapid moving its caudal, dorsal, and pectoral fins, with no resulting change in its body position (Brown and Godin 1999 in Brown et al. 1999, 470).

Comment: An individual shows fin flicking after detecting a conspecific's alarm pheromone, signalling alarm to conspecifics, and possibly reducing its risk to predation (Brown et al. 1999, 469).

floral display *n.* The number of open flowers, including both receptive and no longer receptive ones, that an individual plant has at a particular time, *e.g.*, during 1 day (Cruzan et al. 1988, 505; Huang et al. 2006).

genital display *n.* In some primate species: An individual's using its genitals for signalling (Immelmann and Beer 1989, 118).

► **genital presentation, presentation** *n.* In some primate species including Humans: A behavior that ranges, depending on species, from simply exposing genitals (which are colorful in some species), raising a tail and showing a swollen often colorful scrotum, to showing an erect penis (phallic threat) (Ploog et al. 1963, etc., in Heymer 1977, 76). *cf.* behavior: treptic behavior: apotreptic behavior: phallic threat

► **pubic presentation** *n.* In Bushman girls: A frontal genital display, often made before and after vulva presentation, as part of ridiculing another person (Eibl-Eibesfeldt 1972 in Heymer 1977, 152). *cf.* display: sticking out one's tongue

► **vulva presentation** *n.* In Bushman girls: A deep bow, similar to a buttocks display, in which one exhibits genitals toward a person who is being ridiculed, followed by raucous laughter (Eibl-Eibesfeldt 1972 in Heymer 1977, 151).

cf. display: genital display: genital presentation

Comment: Among the thousands of angiosperm species, mean floral-display size varies from one through thousands of flowers (Lawrence 1951, pers. obs.). Besides floral characteristics, plants have colored bracts and leaves that attract pollinators.

hula display *n.* In the *Notophthalmus viridescens* (Red-spotted Newts): A male's undulating his body in front of a stationary female as part of his reproductive behavior (Arnold 1972 in Massey 1988, 205).

machismo *n.* Aggressive displays made by male animals during competition for females, *e.g.*, horn fighting of male Antelopes, Deer, and Sheep; spectacular displays of male Grouse and other lek birds; or male fights in Rhinoceros and Stag Beetles (Wilson 1975, 243, 320).

[Spanish]

major-domo stroll *n.* In *Macaca mulatta* (Rhesus Macaques): A individual's display involving leisurely walking with its head and tail up (Wilson 1975, 242). *cf.* morphological support, movement

paratrepsis See display: distraction display.

presentation *n.* An animal's displaying, or "showing off" specific body parts or appendages to a conspecific, including horn presentation in some antelope species and making a genital display in some primate species (Immelmann and Beer 1989, 232).

cf. behavior: solicitation behavior

pronking See display: stotting.

protean display *n.* The unpredictable random flights of fleeing animals, which may stymie a predator more effectively than a more orderly retreat, *e.g.*, a group of resting butterflies' taking wing (Humphries and Driver 1967, 1970 in Matthews and Matthews 1978, 351).

pushup *n.* In the lizard *Anolis cristatellus*: an individual's moving its body up and down in a vertical plane by flexion and extension of its legs (Leal 1999, 522).

cf. signal: pursuit-deterrant signal

relaxed-open-mouth display *n.* In more derived primates including Humans: A display that involves an individual's opening its mouth, without drawing its lips back as much as in a bared-teeth display, that is often accompanied by a short exspiratory vocalization, and ordinarily associated with play (van Hooff 1972 in Wilson 1975, 227–228).

ritualized display *n.* A display that evolved a new communicatory function, *e.g.*, courtship displays in Fiddler Crabs that evolved from threat displays (Heymer 1977, 201).

sex advertisement *n.*

1. All of an animal's behavior and appearance that may contribute to its pair formation in nonpair-bonding species; in general, this term refers to an animal, usually a male that initiates, or takes the more active role in, pair formation (Immelmann and Beer 1989, 265).
2. Courtship behavior; see behavior: courtship.

sigmoid display *n.* In some poeciliid-fish species: A male's s-shaped movement used in courtship (Bisazza et al. 2001, 59).

sticking out one's tongue *n.* A person's gesture of contempt and rejection (Heymer 1977, 207).

cf. display: genital display: pubic presentation, vulva presentation

Comment: This gesture is widespread in human cultures (Heymer 1977, 207).

stotting *n.* In many antelope, bovid, deer, and gazelle species; *Dolichotis patagonium* (rodent): A individual's display involving a conspicuous stiff-legged, bounding gait, with its tail raised and white rump flashing (Walther 1948, 1966, etc. in Heymer 1977, 132, Estes and Goddard 1967 in Wilson 1975, 124; Caro 1988, 26). *syn.* pronking

Comments: Walther (1969 in Caro 1986, 650) gives a more detailed definition of stotting in ungulates. Caro (1986, 649; 1988) suggests that *Eudorcas thomsoni* (Thomson's Gazelles) inform *Acinonyx jubatus* (Cheetahs) that they see them, and mother Gazelles distract Cheetahs from their young with stotting. [coined by Percival (1928 in Caro 1986, 650)]

stripes display *n.* In the stenogastrine wasp *Parischnogaster mellyi*: A male's showing his three white stripes on his tergites by fully stretching his abdomen (Beani and Turillazzi 1999, 1233).

Comment: There is a positive relationship between mating and both display frequency and successful aerial duels (Beani and Turillazzi 1999, 1233).

submissive display *n.*

1. In animals: A display of a fight's loser that is demonstrably nonassertive in all contexts (*i.e.*, when it "indicates complete capitulation, Marler 1956, 47") (Hand 1986, 216).
2. The display of a subordinate animal shown after it meets a dominant animal (inferred from Henry 1993, 51).

Note: In *Vulpes vulpes* (Red Fox), a submissive display involves a subordinate Fox's acting as if it is a young Fox begging for food (Henry 1993, 51). This Fox crouches low, whines, and beats its tail quickly in every direction. Then it slowly creeps up to the dominant Fox and carefully reaches up and smells and licks the corner of its mouth.

cf. display: threat display; submission

threat display *n.* An animal's intimidation display (inferred from Immelmann and Beer 1989, 311).

cf. behavior: threat behavior; display: submissive display; submission

Comments: In *Vulpes vulpes* (Red Fox), threat displays involve an animal's arching its back and erecting its body hair which increase its size, two Foxes' rising up and pressing their forepaws against each other's shoulders while gekkering and jaw-gaping; and a Fox's walking stiff legged and staring at a subordinate Fox (Henry 1993, 53).

threat mimic See display: bared-teeth display.

tidbitting *n.*

1. In some gallinaceous-bird species: A display that consists of an adult's pecking at the ground and calling and that entices chicks to approach and feed near the adult (Immelmann and Beer 1989, 313).
2. In some gallinaceous-bird species: A ritualized display, consisting of a male's pecking at the ground and calling, that lures a female to him (Immelmann and Beer 1989, 313).

Comment: Analogous behavior is found in other bird species (Immelmann and Beer 1989, 313).

unilateral display See courtship: unilateral display.

upward stretch *n.* In some species of bovids, cervids, and giraffids: An individual's stretching its neck and pointing its nose upward, associated with

threat, dominance, or mating depending on the species involved (Walther 1966 in Heymer 1977, 33).

wing display *n.* For example, in Diptera (Flies), a wing movement, apart from one used for flight (White et al. 2000, 906).

Comment: Tephritidae (Fruit Flies) have complex, elaborate wing displays which include "arching," "enanton," "hamation," "lofting," and "supination."

wing fanning *n.* For example, in Tephritidae (Fruit Flies): wing displays that occur during reproductive behavior (White et al. 2000, 907).

♦ **display circling** *n.* In Bovids and Cervids: Two animals' of the opposite sex circling around each other as they are trying to back up beside each other within a small area, *e.g.*, in savanna-dwelling animals, or around a vegetation island in forest-dwellers (Backhaus 1958, Walther 1958 in Heymer 1977, 127).

cf. witch's circle

♦ **display flight** See flight: courtship flight.

♦ **display territory** See territory: display territory.

♦ **disruptive coloration** See camouflage: background imitation: disruptive coloration.

♦ **dispute** *n.*

1. "A controversial discussion; debate" (Michaelis 1963).
2. "An altercation; quarrel" (Michaelis 1963).

v.i., v.t. dispute

escalated-showing-off dispute *n.* Two, or more, persons trying to best one another in front of witnesses (Wilson and Daly 1985, 64).

♦ **disruptive selection** See selection: disruptive selection.

♦ **dissimulation** See ²group: dissimulation.

♦ **¹dissociation** *n.* For example, in some geese species: The process that dissolves connections and associations responsible for integrated mental function resulting in memory disturbances, poorly coordinated movements, etc. (Heymer 1977, 52).

♦ **²dissociation** *n.* In some mite and pseudoscorpion species: A male's depositing a spermatophore on a substrate irrespective of a female's presence (Alexander 1964 in Thomas and Zeh 1984, 180–182).

♦ **dissogony, dissogeny** *n.* Sexual maturation at two different life-cycle stages, with an intervening period of no gamete production (Lincoln et al. 1985).

♦ **dissonance** *n.* Lack of consistency between, or among, a person's attitudes, beliefs, or both (Hinde 1982, 278).

♦ **distal-less** See gene: *distal-less*.

♦ **distance** *n.* "The extent of spatial separation between things, places, or locations" (Michaelis 1963).

evolutionary distance *n.* The amount of character difference between taxa, *e.g.*, based on DNA sequences, or gross morphology, measured as a distance, often on a phylogenetic tree (Niesbach-Klsgen et al. 1987, 219).

genetic distance *n.*

1. In population genetics, a quantitative measure of genetic relationship between two individuals, or populations, from which an evolutionary tree may be constructed (Rieger et al. 1991).

Note: Measurement is in terms of the probability of the common possession of a given gene or character (= coefficient of genetic distance) (Rieger et al. 1991). The cumulative genetic difference between two populations is a summary of their evolutionary history and is proportional to their separation

- time and inversely related to their intermigration (Rieger et al. 1991).
2. The distance between two gene loci as defined by the average number of crossover points per chromatid (Rieger et al. 1991).

Haldane Map Distance *n.* A distance on a linkage map measured in centimorgans, cm (Bradshaw et al. 1995, 763).

flight distance *n.*

1. The distance between an animal and its predator, or rival, which causes the animal to flee (Heymer 1977, 68).
2. The distance an animal will flee due to its being alarmed by a predator or intimidated by a rival's threat; flight distance in hand-reared animals can be very short (Immelmann and Beer 1989, 107).

individual distance *n.* In many animal species: The minimum distance tolerated between conspecific individuals under different social conditions (Hediger 1942, 1950 in Heymer 1977, 91).

syn. social distance (Heymer 1977, 91)

cf. territoriality

peck distance *n.* In colonial nesting birds: The distance that individuals nest from one another that stops them from pecking one another when they remain in their nests (Heymer 1977, 91).

social distance See distance: individual distance.

♦ **distance greeting** See greeting: distance greeting.

♦ **distance methods** See method: distance methods.

♦ **Distance Wagner Tree** See -gram: distance Wagner tree.

♦ **distraction display** See display: distraction display.

♦ **distress call** See animal sounds: call: distress call.

♦ **distribution** *n.*

1. Scattering, or spreading, of infectious agents, seeds, spores, or other propagules (Lincoln et al. 1985). *syn.* dissemination (Lincoln et al. 1985)
2. "The geographical range of a taxon or group" (Lincoln et al. 1985). *cf.* local
3. The spatial pattern, or arrangement, of organisms, organism groups, values, or observations (Lincoln et al. 1985).
4. The geometric plot of a data set with frequencies of observations per group versus kind of group. *cf.* dispersion

aggregated distribution See distribution: contagious distribution.

bimodal distribution *n.* An extreme platykurtic distribution, *q.v.* (Sokal and Rohlf 1969, 113).

binomial distribution *n.* A distribution which is described by the formula $\{N!/[x!(N-x)!]\}(P^xQ^{N-x})$; $x = 0, 1, 2, \dots, N$; has values, each of which gives the probability that a particular event will occur; becomes normal when the sample size upon which it is formulated is large; and is used as a model when each individual in a sample may exhibit a character in either one of two alternative states (Siegel 1956; Lincoln et al. 1985).

► **negative-binomial distribution** *n.* A distribution in which the presence of a datum at any given point increases the probability of another datum's occurring nearby and in which its variance is greater than its mean; this results in an aggregated, or contagious, distribution (Lincoln et al. 1985), *e.g.*, sizes of troops of Baboons, Gibbons, and Langurs during healthy periods (Wilson 1975, 134).

► **positive-binomial distribution** *n.*

1. A distribution of frequency of sample versus kind of sample composed of individuals that can exhibit a character in one of two character states (Lincoln et al. 1985).

2. A distribution whose variance is less than its mean and is used as an approximate model of a uniformly distributed population in which the presence of one individual at any given place decreases the probability of another one's occurring nearby (Lincoln et al. 1985).

cf. distribution: uniform distribution

clumped distribution See distribution: contagious distribution.

contagious distribution *n.* A distribution in which values, observations, or individuals are more aggregated, or clustered, than in a random distribution, indicating that the presence of one individual, or value, increases the probability of another's occurring nearby (Lincoln et al. 1985).

syn. aggregated distribution, clumped distribution, overdispersed distribution, patchy distribution, superdispersed distribution, underdispersed distribution (sometimes)

cf. constipated

cumulative distribution *n.* A distribution showing the number of observations above, or below, a given value (Lincoln et al. 1985).

discontinuous distribution *n.* A species' occurrence in two, or more, separate areas, but not in intervening regions (Lincoln et al. 1985).

frequency distribution *n.*

1. "The array of numbers of individuals showing differing values of some variable quantity," *e.g.*, the numbers of animals of different ages, or nests containing different numbers of young (Wilson 1975, 584).
2. "The arrangement of data grouped into classes, each with its corresponding frequency of occurrence" (Lincoln et al. 1985).

Gaussian distribution See distribution: normal distribution.

hyperdispersed distribution See distribution: overdispersed distribution.

hypodispersed distribution See distribution: underdispersed distribution (def. 1).

ideal-dominance distribution *n.* A theoretical dispersion pattern in which individuals that occupy intrinsically higher-quality habitats achieve higher fitness than those that occupy intrinsically poor-quality habitats (Wittenberger 1981, 616).

cf. distribution: ideal free distribution

ideal-free distribution *n.* A theoretical dispersion pattern in which individuals that occupy intrinsically higher-quality habitats achieve the same average fitness as those that occupy intrinsically poorer-quality habitats (Wittenberger 1981, 616).

cf. distribution: ideal-dominance distribution

infradispersed distribution See distribution: underdispersed distribution.

J-shaped distribution *n.* A distribution with the general shape of a J that describes the rapid exponential phase of population growth (Lincoln et al. 1985).

leptokurtic distribution *n.* A distribution with more items near its mean and at its tails and with few items in its intermediate regions relative to a normal distribution with the same mean and variance (Sokal and Rohlf 1969, 113).

cf. distribution: bimodal distribution, mesokurtic distribution, platykurtic distribution

log-normal distribution, logarithmic normal distribution *n.* A distribution of logs of a variable that is normal.

mesokurtic distribution *n.* A distribution that has a close resemblance in peakedness to a normal one (Lincoln et al. 1985).

n. mesokurtosis

normal-demographic distribution *n.* The age distribution of the sexes and castes in a population with a high degree of fitness (Wilson 1975, 15).

normal distribution, Gaussian distribution

n. A probability distribution described by $[2/\pi] \exp -1/2] \exp (-x^2/2)$; if x has a normal distribution then $y = \mu + \sigma(x)$ is said to have a normal distribution with mean μ and a standard deviation σ (Lincoln et al. 1985).

syn. bell-shaped distribution, Gaussian distribution

overdispersed distribution *n.*

1. A spatial dispersion pattern characterized by individuals' being more evenly distributed than would be the case in a random dispersion pattern (Wittenberger 1981, 619).

syn. hyperdispersed distribution

cf. distribution: underdispersed distribution, uniform distribution

2. Contagious distribution, *q.v.* (Lincoln et al. 1985).

Comment: This term can have opposite meanings depending on the author.

patchy distribution See distribution: contagious distribution.

platykurtic distribution *n.* A distribution with fewer items near its mean and at its tails and with more items in its intermediate regions relative to a normal distribution with the same mean and variance (Sokal and Rohlf 1969, 113).

cf. distribution: bimodal distribution, leptokurtic distribution, mesokurtic distribution

Poisson distribution *n.* A mathematical distribution used to describe, or test for, a random distribution, or process, and as a model of randomly distributed populations in which an individual's presence at any given point does not increase, or decrease, another individual's probability of occurring nearby (Sokal and Rohlf 1969, 83); the variance is equal to the mean in a Poisson distribution.

syn. Poisson series (Lincoln et al. 1985)

random distribution *n.*

1. A distribution whose outcome is a result of chance alone (Lincoln et al. 1985).

2. A distribution in which the presence of one biont has no influence on the distribution of other bionts (Lincoln et al. 1985).

syn. random dispersion pattern (Lincoln et al. 1985)

regular distribution See distribution: uniform distribution.

spatial distribution *n.* "The distribution of organisms in space" (Lincoln et al. 1985).

superdispersed distribution See distribution: contagious distribution.

underdispersed distribution *n.*

1. Uniform distribution, *q.v.*

syn. hypodispersal distribution

2. Contagious distribution, *q.v.*

syn. infradispersal distribution (Lincoln et al. 1985)

Comment: This term has opposite meanings.

uniform distribution, regular distribution *n.* A distribution (def. 3) with observations more regularly spaced than in a random distribution, indicating that the presence of one observation decreases the probability of another nearby observation (Lincoln et al. 1985).

zero-truncated-Poisson distribution *n.* A Poisson distribution with groups of one or more individuals; *e.g.*, sizes of troops of Howler Monkeys following epidemics show this distribution (Wilson 1975, 133).

♦ **disturbance stridulation** See animal sounds: stridulation.

♦ **ditch** *n.* A long, narrow trench, or channel, dug in the ground, typically used for irrigation or drainage (Michaelis 1963).

Comment: A ditch is usually at least seasonally wet; contrasted with a swale, a natural depression, *q.v.* (Voss 1972, 20).

[Old English *dīc*, related to dike]

♦ **ditopogamy** See -gamy: ditopogamy.

♦ **ditotoky** See -toky: ditotoky.

♦ **ditypism** See -morphism: dimorphism.

♦ **diurnae** *adj.* Referring to day-flying insects (Lincoln et al. 1985).

cf. nocturnae

♦ **diurnal** *adj.*

1. Referring to an organism that is active during daylight hours (Lincoln et al. 1985).

2. Referring to a phenomenon that lasts for only one day (Lincoln et al. 1985).

cf. ephemeral

3. Referring to a phenomenon that occurs during the day, as distinct from the night (Bligh and Johnson 1973, 945).

cf. crepuscular, matinal, nocturnal, pomeridanus
[Latin *adj. diurnus < dies*, day]

semidiurnal *adj.* Referring to a phenomenon, *e.g.*, a tide, that has a period of about one half a lunar day (12.42 hr) (Lincoln et al. 1985).

♦ **diurnal migrant** See migrant: diurnal migrant.

♦ **diurnal rhythm** See rhythm: diurnal rhythm.

♦ **dive, diving** See behavior: dive, diving.

♦ **divergent evolution, divergence** See ²evolution: divergent evolution.

♦ **diversifying selection** See selection: disruptive selection.

♦ **diversionary display** See display: diversionary display.

♦ **diversity** *n.*

1. The total number of species in an assemblage, community, or sample (Lincoln et al. 1985).

syn. species richness (a confusing synonym) (Lincoln et al. 1985)

See index: species richness.

2. A measure of the number of species and their relative abundances in a community (Lincoln et al. 1985).

syn. species diversity

3. The condition of having differences with regard to a given character or trait (Lincoln et al. 1985).

cf. index: diversity index

α-diversity *n.* The diversity of animal species within a community or habitat (Whittaker 1972 in Southwood 1978, 420).

Comments: Researchers describe α-diversity as a single number (a scalar) (Southwood 1978, 420), and they use α-diversity with regard to all organism taxa.

β-diversity *n.* A measure of the rate and extent of change in species along a gradient, from one habitat to another (Whittaker 1972 in Southwood 1978, 420).

Comment: Researchers describe β-diversity as a single number (a scalar) (Southwood 1978, 420). Researchers use α-diversity with regard to all organism taxa.

τ-diversity *n.* The richness in species of a range of habitats in a geographical area (e.g., an island) (Whittaker 1972 in Southwood 1978, 420).

Comment: τ-diversity is a consequence of α-diversity of habitats together with the extent of β-diversity among them (Southwood 1978, 420).

low diversity *n.* Diversity (def. 2) involving only a few species or species with unequal abundances (Lincoln et al. 1985).

high diversity *n.* Diversity (def. 2) involving many species or species with similar abundances (Lincoln et al. 1985).

hyperdiversity *n.* Diversity in which a certain taxon contains more species, genera, or higher ranked groups than is expected by a null model of random assortment (Dial and Marzluff 1989 in Ehrlich and Wilson 1991, 759).

species diversity See diversity (def. 2).

♦ **diversity index** See index: species-diversity index: diversity index.

♦ **Diversity University MOO Campuses** *n.*

pl. Internet locations for serious experimentation in network-based, interactive teaching, learning, and social services (www.duets.org/, 2000; <telnet://moo.du.org:8888/>, 2000).

cf. BioMOO Center

♦ **diving** See dive.

♦ **diving reflex** See reflex: diving reflex.

♦ **division of labor** *n.*

1. Organisms' parceling out functions among their body parts; life-history stages; or colony, or society, members; that are at least to some degree specialized for these functions (Immelmann and Beer 1989, 77).

2. In social animals: Workers' (of different body types, sex, or age) performing different tasks in their colonies (Lindauer 1952 in Heymer 1977, 31; Immelmann and Beer 1989, 77).

syn. work division
cf. sociality

♦ **divorce** *n.* Two animals' breaking their pair bond, *q.v.* (Wilson 1975, 331).

♦ **dixenic** See -xenic: dixenic.

♦ **dixenous** See -xenous: dixenous.

♦ **dixeny** See -xeny: dixeny.

♦ **dizygotic** See -zygotic: dizygotic.

♦ **dll** See gene: *distal-less*.

♦ **DNA** See nucleic acid: deoxyribonucleic acid.

♦ **DNA chip** *n.* A devise that determines which genes are expressed in a particular tissue (Wade 1998, 10 March, C1).

♦ **DNA fingerprint, DNA fingerprinting** See method: DNA fingerprinting.

♦ **DNA world** See world: DNA world.

♦ **DNAML Computer Program** See program: DNAML Computer Program.

♦ **D-N model** See ⁴model: deductive-nomological model.

♦ **doctrine, dogma** *n.*

1. That which a person, or group, presents for acceptance or belief; teachings, as of a religious or political group (Michaelis 1963).

2. A particular principle or tenet that is taught, or a body of such principles or tenets (Michaelis 1963). See dogma.

cf. axiom, dogma, law, principle, rule, theorem, theory, truism

[Old French < Latin *doctina*, teaching < *docere*, to teach]

doctrine of specific nerve energies *n.* A given nerve always produces the same type of sensation regardless of its mode of stimulation (Mller 1827 in McFarland 1985, 166).

♦ **document** *n.* A printed, or written, paper that bears the official, original, legal, or combination of these forms of something that can be used to furnish decisive evidence or information (Morris 1982).

v.t. document

Proposed Priority Assessment List (PPAL)

n. A list of species to be conserved under Australia's Environment Protection and Biodiversity Conservation Act (New 2009, 58).

Red Data Book *n.* A book of organisms that require conservation and which is a guideline for policy makers (New 2009, 14, 59).

cf. Red List

Comment: Listed organisms are based on threat categories of the International Union for the Conservation of Nature or reasoned alternatives depending on the taxon (New 2009, 14). Red Data Books include the IUCN Invertebrate Red Data Book (1983), the Threatened Swallowtail Butterflies of the World (1985), and the British Red Data Book 2, Insects.

Red List *n.* A list of organisms that are endangered to some degree and which is a guideline for policy makers (Stevens 1996, 17 September, C1).

Comment: This List is based on threat categories of the International Union for the Conservation of Nature or reasoned alternatives depending on the taxon (New 2009, 14).

syn. Red Data List (New 2009, 14)

♦ **Dodsonian mimicry** See mimicry: Dodsonian mimicry.

♦ **doe** See animal name: doe.

♦ **dogma, doctrine** *n., pl. dogmas, dogmata*

1. A person's, or group's, belief, principle, or tenet more, or less, formally stated and held to be authoritative (Michaelis 1963).

2. A system of such beliefs or principles: the dogmas of art (Michaelis 1963).

See doctrine.

cf. axiom, doctrine, law, principle, rule, theorem, theory, truism

[Latin < Greek *dogma*, *-atos*, opinion, tenet < *dokein*, to think, deem right]

♦ **Dollo's law, Dollo's law of irreversibility** See law: Dollo's law.

♦ **domain** *n.*

1. A chromosome's region within which supercoiling is independent of other domains (Rieger et al. 1991, 154).

2. A discrete continuous part of a protein's amino-acid sequence (Rieger et al. 1991, 154).

3. A nucleic acid's nucleotide sequence that can be equated with a particular function (Rieger et al. 1991, 154).

homeodomain *n.* The portion of a homeoprotein (*q.v.*) that is specified by its gene's homeobox (Dye 2002, 73).

♦ **domatium** *n., pl. domatia*

acarodomatium *n.* A specialized chamber produced by a plant that houses mites that may maintain leaf hygiene (Lundstrem 1887 in O'Dowd et al. 1991, 88).

syn. domatium (O'Dowd et al. 1991, 88)

Comment: Domatia and associated mites are found in Eocene fossils (O'Dowd et al. 1991).

myrmecodomatium *n.* A plant's specialized structure, *e.g.*, a hollow thorn, a hollow root, an inflated leaf base, an inflated stem, a leaf-blade pouch, a pseudobulb, or a swollen node with a cavity, where ants reside (Bequaert 1922, etc., in Hölldobler and Wilson 1990, 536, who describe many kinds of myrmecodomata).

syn. domatium (Hölldobler and Wilson 1990, 531)

♦ **domestic-bliss strategy** See strategy: domestic-bliss strategy.

♦ **domestication** *n.*

1. A person's accustoming a nonhuman animal to live under human care and near human habitations; taming or bringing (another Human, a nonhuman animal) under control (Oxford English Dictionary 1972, verb entries from 1641).
2. A person's more, or less, controlling the breeding, care, and feeding of a particular kind of nonhuman animal, *e.g.*, *Bos primigenius* (Domestic Cattle) or *Ovis aries* (Domestic Sheep) (Hale 1969, 22, in Dewsbury 1978, 267).
3. Organisms' adaptation to life in intimate association with Humans (Lincoln et al. 1985).

cf. parasitism: social parasitism: slavery, selection: artificial selection, taming

Comment: Nonhuman animals may undergo behavioral, morphological, physiological, etc., changes due to domestication (Dewsbury 1978, 267).

[*v.t.* domesticate, Medieval Latin *domesticatus*, past participle of *domesticare*, to live in a house < Latin *domus*, house]

♦ **domestication character, domestication trait** See character: domestication character.

♦ **domicile** *n.* A burrow, den, home, nest, tube, or other refuge (Lincoln et al. 1985).

See ³range: home range.

cf. hibernaculum

♦ **domicile** See -cole: domicile.

♦ **dominance, ecological dominance** *n.*

1. The extent to which a particular species predominates in a community due to its abundance, coverage, size, or a combination of these traits, and affects the fitnesses of its associated species (Lincoln et al. 1985).
2. The abundance of one taxon compared to others and its overall "ecological and evolutionary impact" on all other organisms (Wilson 1990 in Ruse 1993, 58).

See need: dominance.

cf. dominance: faunal dominance, genetic dominance, social dominance

codominance *n.* A plant community's having two equally dominant species (Lincoln et al. 1985).

n. codominant

faunal dominance *n.* A species' dominating its community (*sensu* dominance def. 3) or dispersing to another community and dominating it (Michener 1987, 449).

cf. hypothesis: age-and-area hypothesis

Comment: Some biologists deny the existence of "faunal dominance."

interspecific dominance *n.* In some bird, rodent, and ungulate species and Humans: One species' dominance over another during their encounters (Wilson 1975, 296).

relative dominance *n.* A measure of one species' relative importance in a habitat calculated as this species basal area as a percentage of all species' total basal area (Lincoln et al. 1985).

♦ **dominance, genetic dominance** *n.* An allele's fully manifesting its phenotype when present in a heterozygotic, heterokaryotic, or homozygous state (King and Stansfield 1985).

syn. complete dominance

cf. allele: dominant allele, dominance (genetic): incomplete dominance, law: Mendel's laws, pleiotropy; recessiveness, ³theory: Fisher's theory of dominance

Comment: In classical genetics, which is normally confined to macromutations, alleles are normally either dominant or recessive. However, in natural populations (and especially in loci that underlie quantitative variation), alleles are seldom absolutely recessive or dominant. The interactions of alleles at the same locus can range from complete dominance through complete recessiveness through overdominance (Tanksley 1993, 220).

[This term was introduced by Gregor Mendel as *dominierend* (Mayr 1982, 715).]

codominance See dominance (genetic): incomplete dominance.

delayed dominance *n.* An allele's dominance that expresses itself late in an organism's development; *e.g.*, in Huntington's chorea in Humans (King and Stansfield 1985, 144).

directional dominance *n.* An *F*₁ character's being closer to one parental value than to the other (Dewsbury 1978, 127).

incomplete dominance *n.* The effect of alleles upon one another resulting in a heterozygote that shows intermediate phenotypic characteristics (Dawkins 1982, 285).

syn. codominance, semidominance (Lincoln et al. 1985)

cf. dominance: complete dominance; recessiveness

Comments: Incomplete dominance was first noted by Mendel and is found in both plants and animals (Mayr 1982, 735, 959). An example of incomplete dominance is the pink flowers of a Snapdragon that result from the crossing of a red-flowered plant and a white-flowered plant (Campbell et al. 1999, 248).

overdominance *n.* Superior phenotypic expression of a heterozygote over both of its related homozygotes (Lincoln et al. 1985).

cf. heterosis

semidominance See dominance (genetic): incomplete dominance.

♦ **dominance, social dominance** *n.*

1. An animal's showing behavior without reference to similar behavior of a subordinate animal (Maslow 1935, 58).
2. One animal's determining behavior of others by aggressive behavior or other means (Collias 1944, 83).
3. An animal's priority in feeding, sexual, and locomotion, and its being superior in aggressiveness in controlling one, or more, other animals (Wilson 1975, 287).
4. One individual's priority of access to an approach situation, or of leaving an avoidance situation, that it

- has over another individual (van Kreveld 1970, 146, in Dewsbury 1978, 92, 298).
5. One animal's, or conspecific group's, ruling another animal or group (Morse 1974, Rowell 1974 in Wilson 1975, 279).
 6. An animal's chastising "another with impunity" (Klopfer 1974, 154, in Dewsbury 1978, 92).
 7. An animal's "consistent winning at points of social conflict, regardless of tactic used" (Hand 1986, 201).

Note: Crawford's (1939) definition is similar to this one.
syn. dominance, primary-social dominance (in many papers; Hand 1986, 206)

cf. dominance (ecological); dominance (genetic); need: dominance; spheres of dominance; submission; subordination

Comments: Hand (1986, 202) indicates that there is no agreement regarding how to define, or measure, social dominance. Kinds of social dominance include primary social dominance and secondary-social dominance (Hand 1986, 201).

intergroup dominance *n.* In some social-insect species, *Macaca mulatta* (Rhesus Macaques), and *Semnopithecus* sp. (langur): One conspecific group's rule over another such group in a confrontation (Wilson 1975, 295).

monarchistic dominance *n.* One individual's dominance of its intraspecific group that represses, the interactions between, or among, other group members (Lincoln et al. 1985).

syn. monarchy (Lincoln et al. 1985)

primary-social dominance *n.* Social dominance that an animal obtains chiefly by using superior force, real or apparent; contrasted with secondary-social dominance [coined by Hand 1986, 206].

syn. dominance, social dominance (in many contexts, Hand 1986, 206)

► **derived-primary-social dominance** *n.* Primary-social dominance that results from a focal animal's asymmetry in potential force that is not primarily intrinsic to the focal animal which usually has a strong dominance tendency when it utilizes the asymmetry (Kawai 1958); *e.g.*, the animal may "be supported by allies" (Walters 1980) or may use an instrument, or weapon, of intimidation (Lawick-Goodall 1968 in Hand 1986, 206–207).

► **intrinsic-primary-social dominance** *n.* Primary-social dominance that "is due to superiority in an asymmetry of some relevant *personal* trait that determines the amount of force than can or would be exercised (superior size, age, fighting experience, or confidence born of familiarity with the arena, Yasukawa, 1979)" (Hand 1986, 206).

secondary-social dominance *n.* Social dominance that an animal obtains chiefly by using leverage advantage, *q.v.*, not superior force; contrasted with primary-social dominance [coined by Hand 1986, 207].

◆ **dominance aggression** See aggression: dominance aggression.

◆ **dominance hierarchy** See hierarchy: dominance hierarchy.

◆ **dominance hypothesis** See hypothesis: dominance hypothesis.

◆ **dominance order** See hierarchy: dominance hierarchy.

◆ **dominance rank** See ¹rank: dominance rank.

◆ **dominance-subordination social relationship** See relationship: dominance relationship: dominance-subordination social relationship.

◆ **dominance system** See hierarchy: dominance hierarchy.

◆ **dominant** *n.*

1. "The highest ranking animal in a dominance hierarchy" (Lincoln et al. 1985).

syn. α, alpha (Lincoln et al. 1985)

2. An organism that exerts considerable influence upon a community due to its size, abundance, or coverage (Lincoln et al. 1985).

cf. allele: dominant allele, dominance: faunal dominance

◆ **dominant allele** See allele: dominant allele.

◆ **dominant species** See ²species: dominant species.

◆ **dominate** See dominance (social).

◆ **dominion** *n.* "A form of spatial organization in which individuals defend nonexclusive use of their home ranges; the degree to which intruders are excluded usually decreases with increasing distance from a central area of exclusive use" (Wittenberger 1981, 614).

cf. territory, ³range

◆ **dominule** *n.* A dominant organism in a microhabitat, or a community, in a serule (Lincoln et al. 1985).

◆ **-domous**

lithodomous, lithotomous *adj.* Referring to an organism that lives in holes in rock or that bores into rock (Lincoln et al. 1985).

monodomous, monodomic *adj.* In some ant species: Referring to single colonies that occupy one nest (Lincoln et al. 1985).

polydomous *adj.* In some ant species: Referring to single colonies that occupy more than one nest (Wilson 1975, 592).

syn. polycalic, polydomic (Lincoln et al. 1985)

◆ **donor** *n.* An organism that helps another organism.

super-donor *n.* An organism that is a very efficient helper and may have extreme morphological specializations, *e.g.*, workers of some kinds of social insects (West Eberhard 1975, 13).

cf. altruism, super-beneficiary

◆ **Doppler effect, Doppler shift** See effect: Doppler effect.

◆ **dormancy** *n.* In many animal species: A state of relative metabolic quiescence, including anabiosis (cryptobiosis), diapause, estivation (aestivation), hibernation, and hypobiosis (Lincoln et al. 1985).

cf. hypnotic

anabiosis See biosis: anabiosis.

dauer state *n.* In the nematode *Caenorhabditis elegans*: Dormancy similar to insect diapause (Hu 2007; Sim and Denlinger 2008, 6777). [German *dauer*, enduring]

diapause *n.* In some annelid and arthropod species: An animal's state of arrested development and reduced metabolic rate, during which its growth, differentiation, and metamorphosis cease (Barnes 1974, 300; Borror et al. 1989, 794).

Comments: Diapause can occur during dry, warm periods or cool periods. It is not necessarily correlated with adverse environmental conditions (Borror et al. 1989, 794). Some workers classify "hibernation" and "estivation" as kinds of "diapause" (Immelmann and Beer 1989, 131).

reproductive diapause *n.* In some arthropod species: A female's state of arrested ovarian development which occurs, *e.g.*, in overwintering adult female mosquitos (Sim and Denlinger 2008, 6777).

estivation, aestivation *n.*

1. An organism's passing the summer in a state of torpor or suspended animation (given as the verb *aestivate* in the Oxford English Dictionary 1972, entries from 1626).
2. An organism's remaining dormant, or torpid, during a dry season or extreme heat of summer; "summer sleep" (Darwin 1845 in the Oxford English Dictionary 1972).
3. For example, in some arthropod, crocodile, fish, and frog species and many desert-animal species: An individual's passing a dry, warm period in a dormancy (Dewsbury 1978, 54).

v.i. estivate, aestivate

cf. aestival; dormancy: diapause, hibernation

hibernation *n.* For example, in some amphibian, bird, mammal, reptile, and terrestrial-mollusc species: An individual's passing an unfavorable period of low temperature in dormancy characterized by a sleep-like state with lowered body temperature, heartbeat, and rates of respiration (McFarland 1985, 294–295).

v.i. hibernate

cf. dormancy: diapause, estivation

[Latin *hibernatus*, past participle of *hibernare*, to pass the winter < *hiems*, winter]

► **partial dormancy** *n.* For example, in *Ursus americanus* (American Black Bears) and *Ursus arctos arctos* (European Brown Bears): An individual's hibernation in which its body temperature falls to about 30°C (McFarland 1985, 295).

► **true hibernation** *n.* In some species of small mammals including *Marmota monax* (Groundhog), *Procyon lotor* (Common Raccoon), and *Taxidea taxus* (American Badger): An individual's hibernation in which its body temperature falls as low as 2°C (McFarland 1985, 295; Line 1997, 28 January, C2).

Comments: Some birds show a similar kind of torpor (McFarland 1985, 295). Body temperature of hibernating woodchucks is about 5°C, and if a hibernating Woodchuck is not below that frost line, it can freeze to death (Line 1997, 28 January, C2).

hypobiosis See *biosis: hypobiosis*.

torpidity, torpor *n.* In Hummingbirds: Dormancy that lasts only a few hours during which an individual's body temperature falls to that of its environment (McFarland 1985, 295).

♦ **dormer** See *nest: wasp nest: dormer*.

♦ **dorsal-light reaction** See *taxis: dorsal-light reaction*.

♦ **dorso-ventral abdominal vibration** See *dance: bee dance: dorsoventral abdominal vibration*.

♦ **dorsoventral flattening** See *camouflage: background imitation: dorsoventral flattening*.

♦ **double autogamy** See *-gamy: cytogamy*.

♦ **double-blind experiment** See *experiment: double-blind experiment*.

♦ **double crossover** *n.* The phenomenon in which two crossovers occur on the same chromosome and which simulates a nonoccurrence of crossing over for distant genes (Mayr 1982, 767).

♦ **double helix** *n.* The Watson-Crick model of DNA structure that involves plectonemic coiling of two hydrogen-bonded polynucleotide, antiparallel strands

wound into a right-handed spiral; the strands are connected by base pairs (one purine and one pyrimidine per pair) (King and Stansfield 1985).

Comments: In plectonemic coiling, two parallel threads coil in the same direction about one another and cannot be separated unless they are uncoiled. Antiparallel strands are those that have opposite orientations, *i.e.*, one string is oriented from left to right 5' to 3', and the other is oriented from left to right 3' to 5' (King and Stansfield 1985). Watson and Crick's discovery of the double helix in 1953 had a profound impact not only on genetics, but also on embryology, evolutionary theory, physiology, and even philosophy (Mayr 1982, 824).

♦ **double selection** See *selection: double selection*.

♦ **double-stranded RNA** See *nucleic acid: ribonucleic acid: double-stranded RNA*.

♦ **dout** See ²group: *dout*.

♦ **down** See ²group: *down*.

♦ **down-up movement** See ²movement: *down-up movement*.

♦ **downward causation** *n.* The phenomenon that a whole can affect properties of components at lower levels (Campbell 1974, 182 in Mayr 1982, 64).

♦ **downward classification** *n.* Classification by logical division (Mayr 1982, 150).

ant. upward classification

♦ **doylt** See ²group: *doylt*.

♦ **Dr. Fox effect** See *effect: Dr. Fox effect*.

♦ **draught** See ³lactation: *milk ejection (comments)*.

♦ **drave** See ²group: *drave*.

♦ **dray** See ²group: *dray*.

♦ **dress** *n.*

1. In later use, a person's external clothing that serves for adornment as well as covering (Oxford English Dictionary 1972, entries from 1868).

2. An external covering and adornment, *e.g.*, birds' plumage (Oxford English Dictionary 1972, entries from 1713).

cf. coloration

advertising dress *n.* For example, in males of many animal species, females of Phalaropes and Seed Snipe: Sexual dimorphism in which one sex (usually males, sometimes females) is more conspicuous in form, coloration, or both, than the other sex (Immelmann and Beer 1989, 7).

syn. nuptial dress

cf. eclipse plumage

juvenile dress, juvenile coloration *n.* In many vertebrate species: Coloration of a juvenile that is markedly different than a conspecific adult (Immelmann and Beer 1989, 161).

♦ **nuptial dress, nuptial coloration** *n.* For example, in some duck, salamander, and stickleback-fish species: Advertising dress that occurs only during a species' breeding season (Bakker and Sevenster 1983 in Rowland 1989, 282; Immelmann and Beer 1989, 7).

♦ **drift** *n.*

1. An object's moving along, or being carried along, in a current of fluid; an object's drifting; a slow course or current (Oxford English Dictionary 1972, entries from 1562).

2. A force, or influence, that drives something along steadily in a given direction (Michaelis 1963).

3. "The course along which something is directed, or the direction in which it tends; tendency or intent: the *drift* of conversation" (Michaelis 1963).

See ²group: drift.

cf. error: observer error

continental drift See hypothesis: continental drift.

continuous drift *n.* Genetic drift in which a population remains small in size and sampling error is effective in each generation (Wilson 1975, 65).

developmental-system drift (DSD) *n.* In many taxa: The phenomenon in which different developmental pathways give rise to the same highly conserved phenotypic trait in a group of organisms (True and Haag 2001, 109; Kionthke et al. 2007, 1925; Nahmad et al. 2008, 360).

Comment: For example, ants have DSD in that the ability of an ant embryo to develop into a winged queen or wingless worker (= wing polyphenism) in response to an environmental cue is evolutionarily conserved across ant species; however, the gene networks that underlie wing polyphenism have evolved and are variable (Nahmad et al. 2008, 360). Therefore, wing polyphenism is a presumed homologous trait in Ants because their common ancestor likely had this trait, but the trait's gene networks have different degrees of presumed homology with one another. The predominant mechanism for the evolution of developmental-system drift can be "either stochastic processes (*e.g.*, [genetic] drift and absence of selection-independent constraints) or deterministic processes (*e.g.*, [natural] selection or constraints)" (Kionthke et al. 2007, 1925).

[coined by True and Haag (2001, 109)]

genetic drift *n.* Alteration of a population's gene frequencies through sampling error (chance processes) alone, not natural selection, mutations, or immigration; its most important effect is the loss of population heterozygosity (Wilson 1975, 64, 585).

See drift: random drift.

syn. drift, Sewall-Wright effect (Lincoln et al. 1985); neutral drift (Ridley 1996, 151); random drift, random genetic drift (Dobzhansky et al. 1977, 108, 568)

cf. bottleneck; drift: intermittent drift, social drift; ³theory: shifting-balance theory, Sewall-Wright theorem

Comments: "In his first major account Wright (1931a) expressed himself in a way that sounded as if he were proposing genetic drift as an alternative mechanism to natural selection, and this caused considerable confusion." Also, although Wright meant genetic drift to designate stochastic processes of changes in allele frequencies in small populations, it was misinterpreted by some workers as a steady one-directional drift (Mayr 1982, 555). Some researchers view the bottleneck effect, founder effect, and Hagedoorn effect as special cases of genetic drift.

[coined by Sewall Wright (Mayr 1982)]

intermittent drift *n.* Genetic drift occurring during one generation, not in succession with another generation in which genetic drift occurred (Wilson 1975, 65).

random drift *n.* Fluctuations in the frequency of variations that have no adaptive significance or are otherwise equally fit (concept suggested by Darwin 1859 in Beatty 1992, 274).

See drift: genetic drift

syn. genetic drift (in some cases, Dobzhansky et al. 1977, 568)

Comments: "Random drift is a heterogenous category of evolutionary causes and effects, whose overall significance relative to other modes of evolution (especially evolution by natural selection) has been greatly disputed" (Beatty 1992, 271). Phenomena called "random drift" usually involve a biological form of random, or indiscriminate, sampling, and consequent sampling error. Beatty (1992) seems to synonymize random drift and genetic drift; depending on the author, phenomena included in the category random drift are the founder effect, Gulick effect, Hagedoorn effect, and Sewall-Wright effect. Wright broadened "random drift" "to include some cases of natural selection (where selection pressures vary at random)" (Beatty 1992, 278). The "Gulick effect" is named after J. T. Gulick. Fisher and Ford (1950 in Beatty 1992, 273) referred to random drift as the "Sewall Wright effect," named after the first and last names of Wright; perhaps they tried to avoid the self-fulfilling sense conferred by the "Wright effect."

social drift *n.* "The random divergence in the behavior and mode of organization of societies or groups of societies;" contrasted with tradition drift (Wilson 1975, 13, 595).

Comment: This process is due to behavioral differences that are not the result of adaptation to physical environmental conditions or underlying genetic changes due to genetic drift (Wilson 1975, 13, 595), *e.g.*, in Humans, a new idea that spreads (Wilson 1975, 14).

tradition drift *n.* Social drift that is based purely on differences in experience of individuals, and hence passed on as part of tradition; contrasted with social drift (Burton 1972 in Wilson 1975, 14, 597).

♦ **drifting** *n.* An organism's passive transport by wind or water current; distinguished from locomotion (Immelmann and Beer 1989, 176).

cf. locomotion

♦ **drimium** See ²community: drimium.

♦ **drimophile** See ¹-phile: drimophile.

♦ **drinking** *n.* An animal's taking liquid into its mouth and swallowing it (Michaelis 1963).

cf. ingestion

vacuum drinking *n.* An animal's drinking movements made without accompanying fluid uptake (Heymer 1977, 180).

♦ **driodium** See ²community: driodium.

♦ **¹drive** *n.*

1. An energizing, as opposed to a directing, aspect of motivation (Woodworth 1918 in McFarland 1985, 275).

Note: Woodworth introduced drive as an alternative to McDougall's concept of instinct (McFarland 1985, 275).

2. A complex of internal and external states and stimuli leading to a given behavior (Thorpe 1951, 4).

3. A strong, motivating power or stimulus (Michaelis 1963).

4. A hypothetical physiological variable that in some way reflects an organism's internal state and alters its tendencies to employ certain behaviors (Alcock 1979, 144).

5. An organism's internal mechanism that works over a longer term than a motivation, *q.v.*, and turns on and off, or modulates, behavioral programs, and as a consequence the organism's responsiveness to stimuli (Gould 1982, 189).

6. In psychology, the mobilization of an animal's action as a consequence of its bodily need (Immellmann and Beer 1989, 80).
7. A quantitative factor (e.g., hours of food deprivation, rate of bar pressing) that relates the dependent and independent variables in an equation (Immellmann and Beer 1989, 80).

Note: This is an operational definition.

syn. arousal (Dewsbury 1978, 172), concept of drive, instinct (in one sense) motivation, mood (in one sense of drive, Immelmann and Beer 1989, 80), motivation (Hinde 1970, 200), motivational state (Wilson 1975, 153), tendency, variable: intervening variable
cf. arousal, instinct, motivation, motivational state, urge

Comments: "Drive" is a problem term with many definitions. Schne et al. (1972, etc., in Heymer 1977, 83) suggests that "drive" be used in preference to "motivation" because motivation has diverse psychological and ethological connotations. Some authors state that "drive" is not synonymous with "instinct;" others seem to make them synonymous. McFarland (1985, 275–278) discusses why some animal behaviorists no longer use "drive." Immelmann and Beer (1989, 80) state that "drive" "is now more or less avoided except in contexts that do not pretend to theoretical precision." Some of the hundreds of kinds of named "drives" are defined below.

[Old English *drifian*, introduced to behavior by Woodworth 1918]

activity drive *n.* In psychology, an animal's "fundamental need to expend physical energy, as expressed in restlessness or in general movement" (Storz 1973, 3).

affectional drive *n.* In psychology, an animal's "urge or need to be close to or in contact with another living being either physically or emotionally through some form of tie or bond" (Storz 1973, 7).

affiliative drive *n.* In psychology, an animal's "urge or need to associate with other living beings in order to form social attachments" (Storz 1973, 7).

allochthonous drive *n.* A drive that causes a displacement behavior; contrasted with autochthonous [introduced by Kortlandt (1940 in Immelmann and Beer 1989, 10)].

autochthonous drive *n.* A drive that causes a nondisplaced behavior; contrasted with allochthonous drive [introduced by Kortlandt 1940 in Immelmann and Beer 1989, 11].

bonding drive, gregarious disposition, herd instinct, social drive, social tendency *n.* A drive that draws conspecifics together (Immellmann and Beer 1989, 34–35).

Comment: This is a controversial concept (Immellmann and Beer 1989, 34–35).

cleaning drive *n.* A drive that relates to a bird's having a strong tendency to preen after bathing or a fish's strong tendency to get cleaned at a cleaning station (Heymer 1977, 135).

curiosity drive *n.* In psychology, an animal's "motive or need for stimulation" (Storz 1973, 62).

exploratory drive *n.* In psychology, an animal's "drive related to curiosity" (Storz 1973, 95).

general drive *n.*

1. Possibly in many animals species: An individual's central drive that governs all of its other drives (Thorpe 1963, 8).

Note: "General drive" is closely linked with the ideas of "expectancy" and "purpose" (Thorpe 1963, 13).

2. An organism's overall tendency to behave (McFarland 1985, 278).

predatory drive *n.* A drive that activates an animal to hunt prey (Heymer 1977, 42).

syn. predatory motivation

primary drive *n.* A drive resulting from tissue needs; contrasted with secondary drive (Woodworth 1918 in McFarland 1985, 275).

secondary drive *n.* A drive resulting from learned habits; contrasted with primary drive (Woodworth 1918 in McFarland 1985, 275).

sex drive *n.* In psychology, an animal's urge, or "need," to engage in sex (Storz 1973, 252).

social drive See drive: bonding drive.

thirst drive *n.* In psychology, an animal's "need to satisfy thirst" (Storz 1973, 276).

♦**2drive** *n.* An urgent pressure or rush (Michaelis 1963).

meiotic drive *n.* A deviation from a Mendelian segregation ratio in heterozygotes that results exclusively from a disturbance in their meiotic mechanisms (Rieger et al. 1991).

syn. segregation distortion (Lincoln et al. 1985)

cf. allele: meiotic-drive locus, segregation-distorter allele, t allele; chromosome: driving-X-chromosome

Comments: A driven allele, or chromosome, (= one that becomes more frequent by meiosis) may increase in frequency even when it is deleterious (Rieger et al. 1991). In some cases, meiotic drive might result from the action of complex genetic systems rather than a single gene (= a meiotic-drive locus). "Drive" refers to the fact that favored genes spread through a population in spite of any deleterious effects they may have on organisms (Dawkins 1982, 290). Meiotic drive is a cause of maintenance of otherwise deleterious genes in populations (Mayr 1982, 768), changes allele frequencies, and is usually viewed as a peculiar form of natural selection (Futuyma 1998, 237).

Meiotic drive can affect the evolution of female mate preference (Presgraves et al. 1997, 1169; Wilkinson et al. 1998, 276–278). In *Cyrtodiopsis dalmanni*, a stalk-eyed fly with sexual dimorphism in eye span, females that mated with males artificially selected to have wider eye spans tended to have more sons than males in a control stock population with no artificial selection for male eye span. Females that mated with artificially-selected males with narrower eye spans produced female-biased sex ratios. Males with driving X-chromosomes (X^d) and usual Y-chromosomes (Ys), tended to produce a greater number of X^d -bearing sperm than Y-bearing sperm, and therefore, more daughters than sons. X^dY^m males tended to produce more Y^m -bearing sperm (those with modifying Y-chromosomes) than X^d -bearing sperm, and therefore, had more sons than daughters, because the X^d damages some X^d -bearing sperm, but not Y^m -bearing sperm. Artificially-selected males with a wider eye spans tended to have a higher frequency of Y^m -chromosomes than males in the control stock population, but no difference in the frequency of X^d -chromosomes compared to the stock population. Females that mated with wider-eye-span males tended to produce more sons than those that mated with narrower-eye-span males. Sons had higher reproductive values than daughters in the control stock because they were less frequent than daughters; thus, a mother that produced a higher ratio of sons would be expected to have

- more grandoffspring than a mother that produced a lower ratio of sons.
- ♦ **drive model** See ⁴model: drive model.
- ♦ **drive reduction** *n.* In drive-reduction theory, reinforcement's removal of a need state, and hence reduction of the drive associated with it (Immelmann and Beer 1989, 80).
- ♦ **drive satisfaction** *n.* An organism's cessation of showing a behavior after performing an appropriate consummatory act (Heymer 1977, 177).
- ♦ **drive-training interlocking** See instinct-training interlocking.
- ♦ **driving-X-chromosome** See chromosome: driving-X-chromosome.
- ♦ **driving Y-chromosome** See chromosome: driving Y-chromosome.
- ♦ **-dromous** *comb. f.* Running (Michaelis 1963).
n. -dromy
 [Greek *dromous*, a running + -ous]
- anadromous** *adj.* Referring to an animal that migrates from salt to fresh water, *e.g.*, a fish that migrates from the sea into a river where it spawns (Lincoln et al. 1985).
n. anadromesis, anadromy
- cataudromous, katadromous** *adj.* Referring to an animal that migrates from fresh to salt water, *e.g.*, a fish that moves into the sea where it spawns (Lincoln et al. 1985).
- diadromous** *adj.* Referring to an animal that migrates between salt and fresh water (Lincoln et al. 1985); *e.g.*, anadromous and catadromous fish.
- oceanoendromous** *adj.* Referring to organisms that migrate only within the ocean (Lincoln et al. 1985).
- potamodromous** *adj.* Referring to organisms that migrate only within fresh water (Lincoln et al. 1985).
- ♦ **drone** See animal sounds: drone; male: drone; Appendix 1, Part 3, bee: drone.
- ♦ **drone parasitism** See parasitism: drone parasitism.
- ♦ **dropping** See feces.
- ♦ **drosophile** See ²phile: drosophile.
- ♦ **drought** *n.* A period of abnormally low precipitation (Michaelis 1963).
syn. drouth (Michaelis 1963)
Comments: The worst recent drought in the U.S. occurred from March 1930 through February 1931 and gave rise to the Dust Bowl (Salmon and Bombardier 1999, 2 August, A1). The second worst drought occurred in the Mid-Atlantic and Northeast U.S. from August 1998 through July 1999. Organisms resist drought in different ways; for example, *Verbascum thapsus* (Common Mullein) draws its leaves together (fig. 11) as occurred in a dry prairie habitat in Wisconsin, U.S. When there is adequate soil moisture, leaves of this species are apart (fig. 12).
 [Old English *drūgath*. Akin to dry.]
- ♦ **drove** See ²group: drove.
- ♦ **drug** *n.*
1. Any chemical, or biological, substance, other than food, that a person uses to treat, prevent, or diagnose a disease in a Human or nonhuman animal (Michaelis 1963).
 2. A chemical, or biological, substance, other than food, that a person uses to modify his own, or another animal's, behavior, *e.g.*, a psychedelic drug.
cf. Animalia: Arthropoda: *Orthoporus dorsovittatus* (Appendix 1)
- Comment:* A few of the thousands of kinds of drugs are below.
- Ampakine** *n.* A drug that enhances memory amplifying signals received by AMPA receptors (Gary Lynch in Hall 1998, 28, 49).
- avermectins** *n.* A complex of related antibiotic compounds that is produced by the microbe *Streptomyces avermitilis* and has potent antihelminthic activity (Burg et al., 1979, 361).
Comment: People administer avermectins to Domestic Cows, the antibiotics remain in their feces, and the antibiotics might kill beneficial dung-breeding beetles and flies (New 2009, 129).
- Donepezil** *n.* A drug, developed in Japan in the early 1980s, used for treating Alzheimer's disease (Hall 1998, 49).
syn. Aricept (a brand name) (Hall 1998, 49)
- gamma hydroxybutyrate (GHB)** *n.* A highly addictive drug that depresses a person's central nervous system, and even causes death (Bradsher 1999, 16 October, A8).
Comments: Very small doses of GHB can cause mild euphoria and sometimes hallucinations (Bradsher 1999, 16 October, A8). Larger amounts, even tiny doses, cause lassitude, unconsciousness, or even respiratory failure and death. Gamma hydroxybutyrate can also stop someone from remembering, and sexual predators have put it in women's drinks, giving it the name "date-rape drug."
- Inderal** *n.* A drug, used as a beta blocker for cardiac patients (Hall 1998, 49).
syn. Aricept (a brand name) (Hall 1998, 49)
- L-DOPA** *n.* A drug used to treat Parkinson's disease, a nervous system disorder in Humans (Campbell et al. 1999, 52, illustration).
cf. isomer: enantiomer
- Prozac** *n.* A drug that is widely used to treat human depression (Hall 1998, 56).
Comments: Cesare Mondadori, head of research for central-nervous-system drugs at Hoechst Marion Roussel, says that people pay about \$1.8 billion per year for Prozac, and one third of the users have no medical need for it (Hall 1998, 56).
- psychopharmacological drug** *n.* A drug that affects an animal's central nervous system and leads to changes in its behavior; *e.g.*, strychnine which affects human short-term memory or certain antibiotics that affect human long-term memory (Immelmann and Beer 1989, 239).
- medroxyprogesterone acetate, Depo Provera** *n.* A drug used for treating male sex offenders (Leary 1998, 12 February, A11).
- Tacrine** *n.* A drug, discovered in 1977, used for treating Alzheimer's disease (Hall 1998, 49).
syn. Cognex (a brand name) (Hall 1998, 49)
- Triptorelin** *n.* A drug that reduces the blood level of testosterone, pedophilia, and other sexual tendencies in men (Leary 1998, 12 February, A11).
Comments: Triptorelin is a synthetic hormone that mimics a hormone made by a person's hypothalamus (Leary 1998, 12 February, A11).
- ♦ **drumming** See animal sounds: drumming.
- ♦ **dry-bulb temperature** See temperature: ambient temperature.
- ♦ **dry prairie** See habitat: prairie: dry prairie.
- ♦ **dryft** See ²group: dryft.
- ♦ **drymium** See ²community: drymium.
- ♦ **DS** See sleep: deep sleep.

- ◆ **dsRNA** See nucleic acid: ribonucleic acid: double-stranded RNA.
- ◆ **DSD** See drift: developmental-system drift.
- ◆ **dual-inheritance model** See ⁴model: dual-inheritance model.
- ◆ **dualism** *n.*
 1. The theory, or system of thought, that recognizes two independent principles: (1) mind and matter exist as distinct entities; opposed to idealism and materialism, and (2) there are two independent principles, one good and the other evil (Oxford English Dictionary 1972, entries from 1794).
 2. The theory that a human's body and mind are two different entities, but intimately related and interacting (Michaelis 1963).
 3. A belief that organisms have separate material and spiritual attributes (Mayr 1982, 357).

cf. ³theory: organismic theory
- ◆ **duet, duette, duetting** See animal sounds: duetting; animal sounds: song: duet.
- ◆ **Dufour's gland** See gland: Dufour's gland.
- ◆ **dule** See ²group: dule.
- ◆ **dulosis** See parasitism: social parasitism: slavery.
- ◆ **dummy** See ²model: stimulus model.
- ◆ **dune slack** See habitat: dune slack.
- ◆ **Dunnett's test** See statistical test: multiple-comparisons test: Dunnett's test.
- ◆ **dupe** *n.* An animal enemy, or victim of a mimic, whose senses are receptive to a model's signals and which is, thus, deceived by the mimic's similar signals in a mimicry system, *q.v.* (Pasteur 1972 in Pasteur 1982, 169).
syn. enemy, operator, predator, signal receiver (Pasteur 1982, 171, who discusses problems with these synonyms)
cf. mimicry
- ◆ **duplicate gene** See gene: duplicate gene.
- ◆ **duration-meaningful behavior** See behavioral state.
- ◆ **DVAV, D-VAV** See dance: bee dance: dorsoventral-abdominal-vibrating dance.

- ◆ **dwarfism** See nanism.
- ◆ **dyad** *n.* An interrelationship of two individual animals, *e.g.*, often a sexually-interacting pair (Hinde 1982, 278).
- ◆ **dyadic relationship** See relationship: social relationship: dyadic relationship.
- ◆ **Dyar's rule** See law: Dyar's rule.
- ◆ **dymantic behavior** See behavior: deimatic behavior.
- ◆ **dynamic** *adj.* Producing, or involving, changes or action (Michaelis 1963).
Comment: This is one of several definitions of dynamic.
- ◆ **heterodynamic** *n.*
 1. Referring to an organism that has a life cycle with two, or more, distinct forms, or stages, with dissimilar biological activity (Lincoln et al. 1985).
 2. Referring to different genes that simultaneously effect the same developmental process (Lincoln et al. 1985).
- ◆ **homodynamic** *n.*
 1. Referring to an organism with a life cycle that progresses from generation to generation without a resting stage with a distinct change of biological activity (Lincoln et al. 1985).
 2. Referring to different genes that simultaneously effect different developmental processes (Lincoln et al. 1985).
- ◆ **dynamic psychology** See study of: psychology: dynamic psychology.
- ◆ **dynamic selection** See selection: directional selection.
- ◆ **dynamics** See study of: dynamics; study of: physics: dynamics.
- ◆ **dysgenesis** See -genesis: dysgenesis.
- ◆ **dysgenic** See -genic: dysgenic.
- ◆ **dysmetric load** See genetic load: dysmetric load.
- ◆ **dyploidy** See -ploidy: dysploidy.
- ◆ **dysteleology** See teleology: dysteleology.
- ◆ **dystropic** See -tropic: dystropic.
- ◆ **dyticon** See ²community: dyticon.
- ◆ **Dzierzon's rule** See rule: Dzierzon's rule.

e

- ♦ **e** See unit of measure: erg.
- ♦ **eat-and-run hypothesis** See hypothesis: eat-and-run hypothesis.
- ♦ **eavesdropper** *n.* In some firefly species: An illegitimate receiver of another firefly's signal (Burk 1982, 93). *syn.* illegitimate receiver (Burk 1982, 93; Alcock 1983, 449). *v.i.* eavesdrop
- ♦ **Ebola hemorrhagic fever, Ebola HF** See disease: Ebola hemorrhagic fever.
- ♦ **Ebola Virus** See virus: Ebola Virus.
- ♦ **ecad** *n.* A plant, or animal, form produced in response to particular habitat factors and with characteristic adaptations that are not heritable (Lincoln et al. 1985). *syn.* oecad, ecophene, ecophenotype, oecophne, habitat type. See -type, type: ecophene, ecotype, phenotype: ecophenotype. *cf.* ²group: variety
- ♦ **ecdemic species** See ²species: ecdemic species.
- ♦ **ecdysis** *n.* For example, in arthropods: An individual's shedding, or molting, its external skeleton (= exoskeleton) (Lincoln et al. 1985). *cf.* molt
Comment: Many insect species molt during the night including *Magicicada septendecim* (Linnaeus' 17-yr Cicada, fig. 13).
- ♦ **diecdysis** *n.* An animal's continuous molting with one molting grading rapidly into the next (Lincoln et al. 1985).
- ♦ **ecdysteroids** See hormone: ecdysteroids.
- ♦ **ece** See habitat.
- ♦ **echo detector** See cell: echo detector.
- ♦ **echolocation** *n.* In many bat species, *Collocalia* sp. (cave swiftlets), Dolphins, Porpoises, some shrew species, *Steatornis caripensis* (Oilbirds), and Whales: An animal's finding objects, often food, in its environment by using sonar (Spallanzani 1793 in Heymer 1977, 57; Wilson 1975, 475; Immelmann and Beer 1989, 82). *v.t., v.i.* echolocate
cf. analysis: auditory-scene analysis, bat (Appendix 1), cell: echo detector
Comments: Many bat species produce ultrasounds whose echos they hear with finely-tuned ears (Allen 1996, 639). The echos enable them to locate nearby objects and fly among objects without bumping into them.
- ♦ **eclectic taxonomy** See taxonomy: evolutionary taxonomy.
- ♦ **eclipse plumage** *n.* In many bird species: A male's dull, inconspicuous plumage that alternates with his brighter breeding plumage (Lincoln et al. 1985). *cf.* dress: advertising dress
- ♦ **eclosion** *n.*
 1. In holometabolous insects: The emergence of an adult (imago) insect from its pupa (Torre-Bueno, 1978).
 2. In most insect species: An individual's hatching from its egg (Torre-Bueno, 1978). *v.i.* eclose
- ♦ **ecochronology, oekochronology** *n.* A person's dating biological events using paleoecological evidence (Lincoln et al. 1985).
- ♦ **ecoclimatology** See study of: climatology: ecoclimatology.
- ♦ **ecoclinal** See cline: ecoclinal.
- ♦ **ecodeme** See deme: ecodeme.
- ♦ **ecodichogamic** See -gamic: ecodichogamic.
- ♦ **ecoethology** See study of: ecology: behavioral ecology.
- ♦ **ecogeographical rule** See rule: ecogeographical rule.
- ♦ **ecography** See study of: -graphy: ecography.
- ♦ **ecological aggression** See aggression: ecological aggression.
- ♦ **ecological biochemistry** See study of: ecology: chemical ecology.
- ♦ **ecological biogeography** See study of: geography: biogeography: ecological biogeography.
- ♦ **ecological community** See ²community.
- ♦ **ecological conflict** See ³conflict: ecological conflict.
- ♦ **ecological death** See mortality: density-dependent mortality.
- ♦ **ecological dominance** See dominance (ecological).
- ♦ **ecological efficiency** See ¹efficiency: ecological efficiency.
- ♦ **ecological efficiency rule** See rule: ecological efficiency rule.
- ♦ **ecological engineering** *n.* Restoring a habitat for a threatened or endangered species with measures such as restoring its population, habitat, and resource(s) (Morris et al. 1994 in New 2009, 147). *cf.* habitat restoration
- ♦ **ecological environment** See environment: ecological environment.
- ♦ **ecological equivalent** See ²species: ecological equivalent.

- ♦ **ecological genetics** See study of: genetics: ecological genetics.
- ♦ **ecological geography** See study of: geography: ecological geography.
- ♦ **ecological isolation** See isolation: ecological isolation.
- ♦ **ecological longevity** *n.* A biont's mean life span in a particular population under stated conditions (Lincoln et al. 1985).
- ♦ **Ecological Monitoring and Assessment Program** See program: Ecological Monitoring and Assessment Program.
- ♦ **ecological niche** See niche.
- ♦ **ecological pressure, environmental pressure** *n.* The set of all environmental influences that constitute the agents of natural selection (Wilson 1975, 32).
- ♦ **ecological pyramid** *n.* A graphical representation of the trophic structure and function of an ecosystem (Allaby 1994, 131)
 - syn.* Eltonian pyramid [after Charles Elton, British ecologist, who devised the ecology pyramid]
 - Comments:* The first trophic level is the producers (usually plants) which form the base of the pyramid. The second level is the primary consumers; the third, the secondary consumers; the forth, the tertiary consumers.
- ♦ **pyramid of biomass** *n.* An ecological pyramid of biomass (organism weight) at different trophic levels, usually plotted as dry matter or calorific value per unit area or volume; contrasted with pyramid of energy and pyramid of numbers (Allaby 1994, 321).
 - Comments:* A pyramid of biomass is typically a gradually sloping pyramid, except where organism sizes vary dramatically from one trophic level to another (Allaby 1994, 321). In this case, smaller organisms' higher metabolic rate may result in a greater biomass of consumers than producers, giving an inverted pyramid. Aquatic communities in winter typically show inverted-biomass pyramids.
- ♦ **pyramid of energy** *n.* An ecological pyramid of rates of energy flow through different trophic levels of an ecosystem; contrasted with pyramid of biomass and pyramid of numbers (Allaby 1994, 321).
 - Comments:* A pyramid of energy reflects the rates of photosynthesis, respiration, etc. (and not the standing crop, as in a pyramid of biomass), can never be inverted because energy is dissipated through the ecosystem, and is the most fundamental and most useful of the three ecological pyramids.
- ♦ **pyramid of numbers** *n.* An ecological pyramid of numbers of individual organism present at each trophic level of an ecosystem; contrasted with pyramid of biomass and pyramid of energy (Allaby 1994, 321).
 - Comments:* A pyramid of numbers is less useful than a pyramid of biomass and a pyramid of energy because it makes no allowance for the organisms' different sizes and metabolic rates (Allaby 1994, 321). A pyramid of numbers typically slopes more steeply than the other pyramids and can be inverted, *e.g.*, when it is based on studies of temperate forests in summer.
- ♦ **ecological race** See ¹race: ecological race.
- ♦ **ecological release** *n.*
 1. The reduction in interspecific competition that allows a species' trait variation (*e.g.*, in social structure) which seems suboptimal to persist (Wilson 1975, 550).
 2. A species' using a broader range of resources in the absence of a competitor compared to in its presence (Futuyma 1986, 32).
- syn. niche expansion
- ♦ **ecological restoration** *n.* A person's effort to bring back a lost ecosystem; contrasted with compensatory mitigation (Roberts 1993b, 1891).
 - Comment:* Many ecologists favor this practice (Roberts 1993b, 1891).
- ♦ **ecological sociology** See study of: synecology.
- ♦ **ecological succession** See ²succession.
- ♦ **ecological time** See time: ecological time.
- ♦ **ecological zoogeography** See study of: geography: zoogeography: ecological zoogeography.
- ♦ **ecology** See study of: ecology.
- ♦ **economic defensibility** *n.*
 1. An animal's defending the amount of terrain whose defense gains more energy than the animal expends (Brown 1964 in Wilson 1975, 268).
 2. The value of an animal's aggressively controlling a particular resource in terms of its inclusive fitness (Wittenberger 1981, 615).
- cf.* optimality, parsimony, territoriality
- Note:* A resource is economically defensible if the benefits of defense exceed the costs (Wittenberger 1981, 615).
- ♦ **ecoparasitism** See parasitism: ecoparasitism.
- ♦ **ecophene** See -type: ecophene.
- ♦ **ecophysiology** See study of: physiology: ecophysiology.
- ♦ **ecophene** See -type, type: phenotype.
- ♦ **ecophenotype** See -type, type: phenotype: eco-phenotype.
- ♦ **ecospace** See niche (def. 7).
- ♦ **ecospecies, ecological species** See ²species: ecospecies.
- ♦ **ecosphere** See -sphere: biosphere.
- ♦ **ecosystem** See ¹system: ecosystem.
- ♦ **ecosystem ecology** See study of: ecology: ecosystem ecology.
- ♦ **"ecosystem-diversity-productivity hypothesis"** See hypothesis: "ecosystem-diversity-productivity hypothesis."
- ♦ **ecosystem-engineer species** See ²species: ecosystem-engineer species.
- ♦ **ecosystem science** See study of: ecosystem science.
- ♦ **ecosystematics** See systematics.
- ♦ **ecotone** *n.*
 1. A zone of tension between two ecological communities (Clements 1907, 297 in Harris, 1988, 330); the zone wherein two different groups of plants contend for dominance (Michaelis 1963).
 2. The boundary, or transitional zone, between adjacent communities or biomes (Lincoln et al. 1985).
 - syn.* tension zone (Lincoln et al. 1985)
 - cf.* boundary, effect: edge effect
- Comment:* Some biologists consider an ecotone to be a distinct community because it is inhabited by distinct species (Johnson 1947 in Harris 1988, 330).
- [Greek *oikos*, home + *tonus*, stress, tension]
- ♦ **edge-interior ecotone** *n.* An area of a focal habitat where it has an edge with another habitat that is partly within the focal one (Didham 1997, 69).
- ♦ **ecotope** *n.*
 1. A habitat type within a large geographic area (Lincoln et al. 1985).
 2. A "species' full range of environmental relationships including both niche and habitat factors (some of

- which are closely related (Whittaker et al., 1973) (Whittaker 1977, 27).
- ♦ **Ecotron** *n.* A greenhouse-like chamber used for experiments on species diversity and productivity (British group, Nature 1994 in Yoon 1996, C4).
cf. hypothesis: “ecosystem-diversity-productivity hypothesis”
- ♦ **ecotrophobios** See trophallaxis.
- ♦ **ecotype** See -type, type: ecotype.
- ♦ **ecotypification** *n.* Formation of ecotypes in a particular habitat (Lincoln et al. 1985).
- ♦ **ectendotroph** See -troph-: ectendotroph.
- ♦ **ecto-, ect-** *comb. f.* “Without, outside; external” (Michaelis 1963).
[Greek *ekto-* < *ektos*, outside]
- ♦ **ectocommensal** See symbiosis: commensalism.
- ♦ **ectocrine substance** See chemical-releasing stimulus: semiochemical: allelochemic: allomone: exocrine substance.
- ♦ **ectoderm** See organ: -derm: ectoderm.
- ♦ **ectogenesis** See -genesis: ectogenesis.
- ♦ **ectogenous** See -genous: ectogenous.
- ♦ **ectohormone, ectoincretion** See chemical-releasing stimulus: semiochemical: pheromone.
- ♦ **ectophag(e)** See -phage: ectophage.
- ♦ **ectoparasite** See parasite: ectoparasite.
- ♦ **ectophage** See -phage: ectophage.
- ♦ **ectophagous hyperparasitism** See parasitism: hyperparasitism: ectophagous hyperparasitism.
- ♦ **ectosite** See parasite: ectoparasite.
- ♦ **ectosymbiosis** See symbiosis: ectosymbiosis.
- ♦ **ectotherm** See -therm: ectotherm.
- ♦ **ectotroph** See -troph-: ectotroph.
- ♦ **ectozoon** See -zoon: ectozoon.
- ♦ **ecumene** See -sphere: biosphere.
- ♦ **ecumenical** See ubiquitous.
- ♦ **edaphic climax** See ²community: climax: edaphic climax.
- ♦ **edaphology** See study of: edaphology.
- ♦ **edge-interior ecotone** See ecotone: edge-interior ecotone.
- ♦ **edge species** See ²species: edge species.
- ♦ **Ediacaran fossils** See fossil: Ediacaran fossils.
- ♦ **Ediacara Hills** See place: Ediacara Hills.
- ♦ **education psychology** See study of: psychology: education psychology.
- ♦ **EEG** See -gram: electroencephalogram.
- ♦ **EEH** See hypothesis: exploitation-ecosystems hypothesis.
- ♦ **EETA 78001 meteorite** See meteorite: EETA 78001 meteorite.
- ♦ **effect** *n.*
- Something brought about by a particular cause, or agency; result; consequence (Michaelis 1963).
 - Something's capacity to produce a particular result; efficacy (Michaelis 1963).
- area effect** *n.* The effect of an area of a habitat on its organisms; *e.g.*, the size of a patch of forest on the kinds of organisms that live in the patch (Didham 1997, 55).
- Baldwin effect, Baldwin-Waddington effect** *n.*
- A phenomenon in which an extreme individual's previously hidden genetic potential (and its associated trait) is exposed by an environmental change, the change favors an increase in the number of individuals with the trait, and finally the population may evolve to a point where most individuals develop the trait spontaneously even if the species' environment returns to its original state,

e.g., a population's shifting from individuals with territories to one with dominance hierarchies (Baldwin 1896 and Waddington 1953 in Wilson 1975, 72–73).

2. A largely hypothetical evolutionary process ... whereby natural selection can create an illusion of the inheritance of acquired characteristics. Selection in favour of a genetic tendency to acquire a characteristic in response to environmental stimuli, and eventual emancipation from the need for them” (Spalding 1873 in Dawkins 1982, 284).

syn. organic selection (Baldwin 1902 in Bowler, 1992, 192)

cf. genetic assimilation, organic selection
[after J. M. Baldwin]

beater effect *n.* An animal's, or human-made vehicle's, flushing up prey by its moving, and thus making prey more vulnerable to capture by predators (Wittenberger 1981, 613).

Beau-Geste effect, Beau-Geste hypothesis *n.*

An animal's ‘pretending’ to be several animals at once, *e.g.*, a male bird's “fooling” other birds that the density of males in his area is high with his large song repertoire, thus the other birds do not settle in the area (Immelmann and Beer 1989, 283).

[named from the novel of the same name in which a unit of the French Foreign Legion used a comparable tactic]

bottleneck effect *n.* Genetic drift that occurs in a population that has become reduced in size, typically by a natural disaster, and results in a population that is no longer genetically representative of the original population (Lincoln et al. 1985; Campbell 1980, G-3).
syn. bottlenecking (Campbell 1996, 422)

cf. bottleneck; drift: genetic drift; effect: founder effect
Comments: Early Humans might have witnessed the bottleneck effect when calamities decimated tribes (Campbell 1990, 443). *Mirounga angustirostris* (Northern Elephant Seal) witnessed this effect due to overhunting. This effect caused by the last ice age and overhunting might have caused low genetic variability in *Acinonyx jubatus* (Cheetahs).

[after the metaphor of a population's genes moving through the narrow neck of a bottle (Campbell 1996, 422, illustration)]

Bruce effect *n.* In some strains of mice: A recently impregnated female's failure to implant embryos and rapid return to estrus after she is exposed to a male with an odor sufficiently different from that of her stud (Bruce 1960 in Dewsbury 1978, 185; Whitten and Bronson 1970 and Bronson 1971 in Wilson 1975, 154, 321; Forsyth 1985, 31).

cf. infanticide, natural birth control
[after Hilde Bruce]

cage effect *n.* The inadvertent differences in organisms in different cages of an experiment that result from different environments within the cages (or other chambers), although a researcher attempts to maintain the cages under the same conditions.

Comments: Rigorous biologists control for cage effects in their experiments. The chambers (cages) include aquaria, terraria, and wire cages. “Plot effects,” which are analogous to cage effects, can occur when a researcher uses areas such as cultivated fields, indoor greenhouse areas, lakes, ponds, streams, watersheds, and woodlots. Regarding a cage effect, consider an experiment that tests the H_0 that male longevity = female longevity in adult Mexican Bean

Beetles. A researcher tries to make the environment of each cage identical by putting five 1-day-old beetles of the same sex and a flower pot of five bean seedlings of the same age and variety into each of 20 cages, and using a growth chamber designed to have uniform conditions throughout. However, the cage environments will still vary due to differences among the individual plants, different beetle interactions, slight differences in climate in different parts of the growth chamber, and other possible factors. Further as beetles die, the cages will have different numbers of interacting individuals. In this experiment to control for a cage effect, a researcher uses one mean value of longevity per cage for quantitative analysis. The experiment has 20 longevity means as its data, not 100 individual longevity values which would be a data set with pseudoreplication, *q.v.* Another way to control for cage effect, is to place only one Beetle in a cage at the onset of an experiment.

Coolidge effect *n.* In some fish and mammal species: The phenomenon that a male animal can be stimulated to resume copulation (that just previously waned) by replacing his mate with a new one or reoffering his present mate in a new setting (Immelmann and Beer 1989, 60).

Concorde effect, Concorde fallacy, Concorde strategy *n.* An organism's "deciding" what its future behavior will be based on its past resource investment in "goal A" in which it has already invested resources, instead of on the possible future benefits that it could obtain from abandoning goal A and investing in a new goal; it may, thus, continue to invest in goal A even though its costs will exceed its benefits from that investment (Dawkins and Carlisle 1976 in McFarland 1985, 108).

Comment: The Concorde effect might occur in the *Sphecius ichneumoneus* (Great Golden Digger Wasp) (Dawkins and Brockmann 1980).

[after the Concorde airliner and decisions regarding building it]

confusion effect *n.* Prey animals' grouping that decreases a predator's efficiency in obtaining a prey, e.g., the schooling of fish (Heymer 1977, 101).

Darling effect See effect: Fraser-Darling effect.

depletion effect *n.* A species' decline in immigration rate to an island as its number of resident species increases (Lincoln et al. 1985).

depression effect *n.* In laboratory rats: One group of test animals, that initially received a larger reward for a particular behavior than a second test group, shows the behavior at a lower rate, or intensity, than the second group, if its reward is decreased to the second group's level (Dewsbury 1978, 354).

diploid effect *n.* A phenotypic character of a sperm that is dictated by its producer's diploid genotype (Sivinski 1984, 95).

Doppler effect, Doppler shift *n.* In physics, the change in frequency of a sound, light, or other wave, caused by movement of its source relative to an organism perceiver (Michaelis 1963).

Comment: Bats can use Doppler shifts in their echoes to determine relative velocities of their prey (D. B. Quine, pers. comm.).

[after C. J. Doppler]

Dr. Fox effect *n.* Students' possessing the "illusion of having learned" due to a lecturer's personality, presentation style, or both, even if the lecturer

gives erroneous information [coined by Naftulin et al. 1973 in Brewer 1981, 121].

edge effect *n.*

1. The increase in species richness and population sizes in edges, formed by the junction of two communities, habitat types, or seral stages; compared to the communities, habitats, or stages, themselves (Leopold 1933, Odum 1971, Smith 1977, and others in Reese and Ratti 1988, 127).

syn. edge-effect principle (Harris 1988, 330)

Note: These edges are ecotones, *q.v.* (Lincoln et al. 1985). This edge effect occurs in organisms including birds and spiders (Aspey 1976, 42; LaRue et al. 1994), but not in mammals in highly fragmented landscapes (Heske 1995, 562). Wildlife managers often consider edges to be beneficial because they enhance the amount of big-game forage and make improved habitats and nesting sites for woodland passerine birds (references in Reese and Ratti 1988, 127). Standard habitat management guides include the prescription to create as much 'edge' as possible because wildlife is a product of the places where two habitats meet" (Yoakum and Dasmann 1971 in Harris 1988, 330). Wildlife managers and others debate the value to creating edges for wildlife.

2. The effect of a habitat edge on a species' abundance, behavior, disease incidence, distribution, or other attribute (inferred from Dennis 1984a, 85, 1984b, 157; Alverson et al. 1988, 348; Roland and Kaupp 1995, 1175; Sekgororane and Dilworth 1995, 1432; Oğurlu 1996, 427).

Note: Many butterfly species, primarily Pieridae, tend to lay their eggs on host plants at the edges of host-plant patches (Dennis 1984a, 85).

3. The effect of Humans', or other factors', rapid creation of abrupt edges in a large unit of previously undisturbed habitat on the community in this habitat (Lovejoy et al 1986 and Soul 1986 in Reese and Ratti 1988, 127).

Note: This edge effect can lead to reduced populations of species that are dependent on large blocks of previously undisturbed habitat, large blocks of forest interior, or both (references in Reese and Ratti 1988, 127).

cf. boundary, ecotone

Comment: Edge effects are among the more highly studied ecological phenomena. Ries and Sisk (2004) develop a general, predictive framework for understanding the patterns and variability of edge effects.

effect of volition See hypothesis: volition.

fixed effect *n.* A main effect "whose levels are the only relevant levels of interest," contrasted with random effect, *q.v.* (given as "fixed factor" in Kleinbaum and Kupper 1978, 246).

Comment: Fixed effects include sex, age, marital status, and education. Locations, treatments, drugs, and tests can be either fixed effects, or random effects, depending on the experimental situation.

founder effect *n.*

1. A new population's being started by a small number of individuals that carry only a fraction of the genetic variability of the parental population, and hence the new population statistically differs from its parental population (Mayr 1942, 237, in Beatty 1992, 274; Wilson 1975, 65, 584).
2. The genetic differentiation of isolated populations that arises because founders of these populations

differ genetically from each other and the average members of their parent population (Wittenberger 1981, 615).

3. A cause of genetic drift that is attributable to colonization by a limited number of individuals from a parent population (Campbell 1990, G-10).
4. Genetic drift in a new colony of organisms (Campbell 1990, 444).

Notes: The founder effect probably contributed to divergent evolution of Darwin's Finches after the first birds landed on the remote Galápagos Islands from the mainland of South America (Campbell 1990, 444). This effect is also probably responsible for the relatively high frequency of certain inherited disorders found in human populations that were established by small numbers of colonists; e.g., congenital total color blindness in Pingelap Islanders, diastrophic dys trophy in Finns, familial hyperchylomicronemia in Québécois, retinitis pigmentosa on Tristan da Cunha, and Tay-Sachs disease in Ashkenazi Jews (Campbell 1996, 423; Hartl and Clark 1997, 291).

syn. founder principle

cf. drift; genetic drift, random drift; effect: bottleneck effect

Fraser-Darling effect, Fraser-Darling law *n.*

1. For example, in *Agelaius phoeniceus* (Red-winged Blackbirds), *Agelaius tricolor* (Tri-colored Blackbirds), *Larus argentatus* (Herring Gulls), *Ploceus cucullatus* (Village Weavers), and *Ploceus nigerrimus* (Viellot's Black Weavers): An individual's stimulation, or synchronization, of breeding with conspecifics due to social stimulation beyond its sexual pairing alone (Darling 1938 in Wilson 1975, 41–42, 584; Wittenberger 1981, 615).
2. A breeding group's acceleration and synchronization of its reproductive state due to communal social stimulation (Lincoln et al. 1985).

syn. Darling effect (Lincoln et al. 1985)

cf. courtship: communal courtship; effect: Orians effect [after Fraser Darling, biologist (Immelmann and Beer 1989, 113)]

green-beard effect See hypothesis: green-beard effect.

greenhouse effect *n.*

1. A greenhouse's warming as a result of sunlight's entering it and heating it and the building's glass' stopping the heat from radiating out of it (Rensberger 1993, 1 June, A1).

Note: A greenhouse also warms because due to having still air (Allaby 1994).

2. The warming of Earth's lower atmosphere that results from sunlight's passing through its atmosphere as short-wave radiation (< 4 µm) and heating it because clouds and gases (including carbon dioxide, chlorofluorocarbons and other halocarbons, methane, and water vapor) absorb the heat and reradiate it as long-wave radiation (> 4 µm) much of which does not exit the atmosphere (Rensberger 1993, 1 June, A1; Allaby 1994).

cf. global warming; molecule: carbon dioxide, greenhouse gas; treaty: Kyoto Protocol

Note: The clouds and gases make the atmosphere transparent to incoming short-wave radiation but partially opaque to long-wave radiation.

group effect *n.*

1. An alteration in behavior, or physiology, within a conspecific group caused by signals that are

directed in neither space nor time (Wilson 1975, 415, 585).

syn. partner effect, sympathetic induction (Tinbergen 1951, 143)

Note: A simple example is social facilitation, in which there is an increase of an activity merely from the sight of, or sound, or other form of stimulation from other individuals engaged in the same activity (Wilson 1975, 415, 585); other examples are eating more by group-housed chicks and other animals compared to solitary animals and facilitation of yawning in a human group (Katzran and Révész 1909 in Tinbergen 1951, 143; Heymer 1977, 168).

2. All the benefits that individual animals accrue from group living, e.g., antipredator vigilance, collective defense, cooperative foraging, and reproductive synchronization (Immelmann and Beer 1989, 121).

cf. effect: Fraser-Darling effect, Orians effect; mood induction; ³facilitation: social facilitation

Gulick effect See drift: genetic drift.

Hagedoorn effect *n.*

1. The phenomenon that much genetic variation in natural populations exists because it is selectively neutral (Fisher 1922, 328 in Mayr 1982, 555).

2. Reduction of genetic variation in a population by means other than natural selection, e.g., a gene can be lost because heterozygous parents may leave homozygous offspring (Beatty 1992, 274).

cf. drift: genetic drift; ³theory: the neutral theory

Comment: Fisher thought that most allelic polymorphism in populations was due to a superiority of heterozygotes rather than genetic drift (Mayr 1982, 555).

[coined by Ronald A. Fisher (1922, 328, in Mayr 1982, 555) after A. L. and A. C. Hagedoorn, Dutch geneticists, who gathered a great deal of evidence in support of a category of random drift]

haploid effect *n.* A phenotypic characteristic of sperm that is produced by expression of its haploid genotype (Thornhill and Alcock 1983, 8).

Comment: Haplod effects are rare in sperm; generally, gamete attributes are controlled by their parents' diploid genotypes (Thornhill and Alcock 1983, 8).

Haldane effect *n.* "Sterility or deficiency of the heterogametic sex among offspring in F₁ hybrids" (Scriber 1996, 25).

hitch-hiking effect *n.* The increase in frequency of a selectively neutral, or nearly neutral, gene that is closely linked to a gene that is favored by selection (introduced by Kojima and Schaffer 1967 in Reiger et al. 1991).

syn. hitchhiking, hitchhiking effect (Kaplan et al. 1989, 887)

Comments: The hitch-hiking effect can cause changes in gene frequency, changes in association of alleles at different loci, and gametic disequilibrium (Reiger et al. 1991).

Lagerstätten effect *n.* One's recording a taxon's apparent, possibly erroneous, time of evolutionary origination based on sampling a single exceptional fossil deposit (Benton 1995, 54).

Comments: The actual origination time of the taxon might be earlier than the one indicated by known fossils (Benton 1995, 54). The actual time of origination of many insect families might be earlier than the date based on their fossils in Baltic amber.

Lansing effect *n.* The phenomenon that a mother's age can influence the life histories of her offspring (Lints 1978 in Willson 1983, 34).

Comment: Lansing effects can be transmissible from one generation to the next and are often cumulative over several generations. A Lansing effect is sometimes reversible (Lints 1978 in Wilson 1983, 34).

Lee-Boot effect *n.*

1. In *Mus musculus* (House Mice). Loss of regular estrous cycling and display of spontaneous pseudopregnancies of females housed as a group (van der Lee and Boot 1955, in Dewsberry 1978, 185).
2. In female *Mus musculus* (House Mice): The suppression of estrus and occurrence of pseudopregnancies that occurs in an all-female group in the absence of a male (Whitten and Bronson 1970 and Bronson 1971 in Wilson 1975, 154).

[after S. van der Lee and L. M. Boot]

magnet effect *n.* A fish fin's, or pair of fins', maintaining a constant rhythm and inducing other fins to follow the rhythm (von Holst 1937, 1939 in Heymer 1977, 112).

[coined by von Holst]

main effect *n.*

1. In statistics, an independent variable (manipulated, or not manipulated, by an investigator), that might, or actually, affect a dependent variable (Sokal and Rohlf 1969, 187, 305).
2. *syn. factor* (Kleinbaum and Kupper 1978, 246), treatment effect (Sokal and Rohlf 1969, 187), treatment effect (Whitten and Bronson 1970, Bronson 1971 in Wilson 1975, 154, 247).

cf. level

Marsden's effect *n.* As subordinate troops of Rhesus Monkeys are confined to smaller spaces due to intergroup dominance, their members fight less among one another; but within the dominant group, which acquires more space, aggressive interactions increase (Marsden 1971 in Wilson 1975, 295–296).

minority effect See rare-male mating advantage.

multiplier effect *n.* Amplification of a small evolutionary change (in the behavior pattern of individuals) into a major social effect by the expanding upward distribution of the effect into multiple facets of social life (Wilson 1975, 11, 589).

Comment: Multiplier effects can speed social evolution (Wilson 1975, 11, 589).

oddity effect *n.* The increased risk of predation that a focal fish witnesses because it is smaller, or larger, than the other fish in its shoal which are similar in size (Peuhkuri 1997, 271).

Orians effect *n.* Localized breeding synchrony due to individuals' in the same reproductive state attracting one another to the same area [after Gordon H. Orians, biologist (1961 in Immelmann and Beer 1989, 113)].

cf. courtship: communal courtship; effect: Fraser-Darling effect

Petit effect See rare-male mating advantage.

position effect *n.* A change in the phenotypic effect of a gene owing to a change of its position on its chromosome [coined by Sturtevant (1925) in Mayr (1982, 798, 805)].

Comment: A given gene may have a different effect if it is on the same chromosome as a second gene or on the second gene's homologous chromosome.

random effect *n.* A main effect "whose levels may be regarded as a sample from some large population

of levels," contrasted with fixed effect, *q.v.* (given as "random factor" in Kleinbaum and Kupper 1978, 246).

Comment: Random effects include subjects, litters, observers, days, and weeks.

rare-male effect See rare-male mating advantage.

reproductivity effect *n.* In social insects, perhaps other colonial organisms: A colony's productivity rate decreases as its colony size increases (Michener 1964 and Wilson 1971, in Wilson 1975, 36, 594).

Comment: The productivity rate is measured as the number of the colony's new individuals divided by the number of its already-existing ones.

Ropartz effect *n.* A decrease in reproductive capacity of a mouse resulting from its perception of odor of other mice that causes its adrenal glands to grow heavier and increase corticosteroid production (Whitten and Bronson 1970, Bronson 1971 in Wilson 1975, 154, 247).

runting effect *n.* One human twin's being smaller than another because the latter obtained more nutrients while it was a fetus than the former (Allen 1998, 22).

Sewall-Wright effect See drift: random drift.

Signor-Lipps effect *n.* One's recording a taxon's extinction time that is erroneously too soon because of inadequate sampling up to its actual extinction time (Benton 1995, 54).

sperm effect *n.* In *Drosophila melanogaster*: A female's long-term re-mating inhibition due to stored sperm in her ventral receptacle (Scott, 1987, 142).

Tryon effect *n.* The phenomenon that the F_2 variance of a behavioral trait often fails to exceed the variance of the F_1 or parental strains (Hirsch 1967 in Dewsberry 1978, 123).

Comment: This is probably a result of a behavioral trait's being affected by a large number of genes (Dewsberry 1978, 123).

Wallace effect *n.*

1. The development and reinforcement of reproductive isolation between sexual populations that have reached the level of elementary biological species due to selection against hybrids that have relatively lower fitness than members of these populations (Lincoln et al. 1985).

syn. Wallace's hypothesis (Lincoln et al. 1985)

2. The situation in which hybrids of two species have low fitness, introgression does not occur, and natural selection then improves reproductive isolating mechanisms so that hybridization diminishes (Price 1996, 79).

Comment: Butlin (1989 in Price 1996, 79) questions whether the Wallace effect occurs.

Whitten effect *n.* In *Mus musculus* (House Mice): The more, or less, simultaneous entrance into the state of sexual receptivity by a group of females (whose estrus cycles have been suppressed by being with other females alone) that results from the females' smelling an odorant found in the urine of a male (Whitten 1956 in Dewsberry 1978, 1985; Whitten and Bronson 1970 and Bronson 1971 in Wilson 1975, 154).

cf. effect: Bruce effect

[after W. K. Whitten]

Zajonc effect *n.* For example, in *Rattus norvegicus* (Norway Rats): The phenomenon in which repeated exposure of an animal to a given stimulus object is

enough to increase its attraction to the object (Zajonc 1971 in Wilson 1975, 274).

♦ **effect, law of** See law: law of effect.

♦ **effect size** *n.* The quantitative difference between a treatment group and a control group of an experiment (Milinski 1997, 178).
cf. power of a statistical test

♦ **effective core temperature** See temperature: effective core temperature.

♦ **effective population number** See population size: effective population size.

♦ **effective population size** See population size: effective population size.

♦ **effector** *n.* A muscle, gland, or color cell that can produce behavior (Immelmann and Beer 1989, 84).

♦ **efference** See -ference: efference.

♦ **efference copy** See *Sollwert*.

♦ **efferent neuron** See cell: neuron: efferent neuron.

♦ **¹efficiency** *n.* The ratio of work done, or energy expended, by an organism, or machine, to the energy supplied in the form of food or fuel (Michaelis 1963).

ecological efficiency *n.*

1. A food-cycle level's efficiency of production at any level (λ_m) relative to the productivity of any of its previous levels (λ_n), defined as the percentage: $100(\lambda_n)/(\lambda_m)$ (Hutchinson 1942 in Lindeman 1942, 407; Odum 1971, 75; McClendon 1975, 214; Conrad 1977).
2. The ratio of energy per unit time obtained by one population (e.g., a predator population) divided by energy per unit time ingested by another population (e.g., a prey population) (Slobodkin 1960, 222, in Conrad 1977, 99).
3. (Gross) ecological efficiency = $\epsilon = Y/I$; where Y is the yield (or food extracted from the population), and I is the food (or light energy) available to the population (Phillipson 1966 in Conrad 1977, 101).

syn. biological efficiency, efficiency

cf. ³theory: optimal-diet theory

♦ **²efficiency** *n.* The relative cost in time, energy, and other resources of collecting data balanced against the strength of the data (Lehner 1979, 83).

♦ **effort** *n.*

1. An organism's expenditure of physical, or mental, energy to get something done; exertion (Michaelis 1963).
2. "Something produced by exertion" (Lincoln et al. 1985).

reproductive effort *n.*

1. An organism's effort required to reproduce at present, measured in terms of the decrease in its ability to reproduce at later times (Williams 1966, 171–172; Wilson 1975, 95, 317, 594).
2. An organism's effort, related to putting its genes into its next generation, which is partitioned into mating and parental effort (Low 1978 in Gwynne 1984, 119).
3. The proportion of an organism's total available resources that it uses in reproduction (Thornhill and Alcock 1983, 65–67).

► **mating effort** *n.* Reproductive effort (including nuptial gifts) expended by a male in trying to and actually obtaining a mate(s) (Alexander and Borgia 1979 in Thornhill and Alcock 1983, 65–67).

nonpromiscuous mating effort *n.* Resources donated by a male to his mate in exchange for copulation (Gwynne in Thornhill and Alcock 1983, 66).

promiscuous mating effort *n.* All activities whereby an organism finds a mate(s) (Thornhill and Alcock 1983, 67).

► **parental effort** *n.* The sum of an individual organism's parental investments in its offspring (Gwynne in Thornhill and Alcock 1983, 66).

♦ **egalitarian social relationship** See relationship: social relationship: egalitarian social relationship.

♦ **egalitarian society** See ²society: egalitarian society.

♦ **egestion** See elimination: egestation.

♦ **egg** See gamete: egg, trophic egg.

♦ **egg brood** See brood: egg brood.

♦ **egg cannibalism** See cannibalism: egg cannibalism.

♦ **egg dumping** *n.*

1. In some bird species: A female's depositing one, or more, eggs in a conspecific, or heterospecific, individual's nest (Weller 1959, etc., in Tallamy 1986, 599).
2. In a lace-bug species: A mothers' placing her eggs in the egg mass of a neighboring female (Tallamy 1985 in Tallamy 1986, 599).

♦ **egg follicle** *n.* In Vertebrates: A ripening ovum's covering which provides it with nourishment and secretes estrogen, thereby influencing behavior (Immelmann and Beer 1989, 210).

syn. Graafian follicle (in Mammals) (Immelmann and Beer 1989, 210)

♦ **egg-laying hormone** See hormone: egg-laying hormone.

♦ **egg imprinting** See learning: imprinting: egg imprinting.

♦ **egg mimicry** See mimicry: egg mimicry, Gilbertian mimicry, Wicklerian-Barlowian mimicry.

♦ **egg-polarity genes** See gene: egg-polarity genes.

♦ **egg robbing** *n.* In *Zacco temminckii* (Dark Chub): An individual's eating eggs of another species that are guarded by a male of that species (Baba et al. 1990, 776–777).
cf. robber

♦ **egg-rolling behavior** See behavior: egg-rolling behavior.

♦ **eide** *n.* The limited number of fixed and unchanging forms that comprises the variable world of phenomena (Plato in Mayr 1982, 38).
syn. essences (of the Thomists in the Middle Ages) (Mayr 1982, 38)

♦ **eidetic mental image** *n.* A mental image that has all "characteristics of a percept, especially if it is referred to a sense organ and so seems to come in from the outside" (Bateson 1979, 241).

♦ **eidos** *n.* Something that "orders the raw material into the patterned systems of living beings" (Aristotle in Mayr 1982, 636).
Comments: "Eidos" is conceptually virtually identical with the ontogenetic program of developmental physiology (Mayr 1982, 56). Aristotle's theory of inheritance indicates that semen contributed the *eidos* (form-giving principle) and menstrual blood, *catamenia*, is the unformed substance that is shaped by the *eidos* (Mayr 1982, 636).

♦ **eight-months fear** See fear: fear of strangers.

♦ **18S-ribosomal RNA** See nucleic acid: ribonucleic acid: 18S-ribosomal RNA.

♦ **ejaculate, ejaculation** *n.*

1. An animal's, or plant's, sudden and quick discharge of something, *e.g.*, seminal fluid, seeds; emission (Oxford English Dictionary 1972, entries from 1603).
2. The sperm and other secretions that an animal discharges at one time (Immelmann and Beer 1989, 289).

v.t. ejaculate

♦ **EKC** See curve: Environmental Kuznets Curve.♦ **elaboration** *n.* Evolution, or production of, complex structures from simpler ones (Lincoln et al. 1985).

cf. reduction

♦ **elaio-** *comb. f.* (EL ee ah)

Also elaeo-, eleo-

[Greek *elaion*, olive oil]

♦ **elaiosome** *n.* An outgrowth from a seed's surface that contains fats or oils (Usher 1996).

cf. diaspore, myrmecochory

Comments: Ants of many species disperse seeds with elaiosomes of more than 3,000 flowering-plant species in over 60 families (Handel and Beattie 1990 in Swearingen 1992). These insects take such seeds to their nests where larvae consume the elaiosomes. Those plant species include members of *Amsonia*, *Anemone*, *Asarum*, *Carex*, *Claytonia*, *Corydalis*, *Croton*, *Dicentra*, *Hepatica*, *Jeffersonia*, *Luzula*, *Polygonum*, *Protea*, *Sanguinaria*, *Trillium*, and *Viola*. Many species of Proteaceae produce seeds with elaiosomes, which ants disperse (Christian 2001, 636, illustration). An elaiosome encases a seed of a large-seeded proteaceous species and occurs at one end of a seed of small-seeded species.

♦ **elan vital** See *Lebenskraft*.♦ **electrical communication, electrocommunication** See communication: electrical communication.♦ **electrical reception** See modality: electrical reception.♦ **electroencephalogram** See -gram: electroencephalogram.♦ **electron transport chain** See chain: electron transport chain.♦ **electronic synapse** See synapse: electronic synapse.♦ **electrophoresis** See method: electrophoresis.♦ **electroporation** See method: electroporation.♦ **electroretinogram** See -gram: electroretinogram.♦ **electrotaxis** See taxis: galvanotaxis.♦ **element** *n.* A substance that chemical reactions cannot break down into another substance(s) (Campbell et al. 1999, 23).

cf. compound, molecule

Comments: Chemists recognize 92 naturally occurring elements, *e.g.*, carbon, copper, gold, or oxygen (Campbell et al. 1999, 23). About 25 of these elements are essential to life. Carbon, hydrogen, nitrogen, and oxygen make up 96% of living matter. Calcium, chlorine, magnesium, phosphorous, potassium, sodium, and sulfur account for most of the remaining 4%. Each element has a symbol derived from English, German, or Latin names. For example, the symbol for sodium is Na which is derived from Latin (*natrium*).

carbon *n.* An element composed of six electrons and protons and six through eight neutrons (Campbell et al. 1999, 50).

Comments: Most of the chemicals that make up organisms are based on carbon (Campbell et al. 1999, 48). No other element forms molecules that are as large, complex, and diverse. Carbon made possible

by Earth's biodiversity (*q.v.*). Cells are composed of about 70–95% water. Carbon-based compounds are most of the rest of these cells. Hydrogen, nitrogen, oxygen, phosphorus, and sulfur are also frequently in these compounds.

♦ **trace element** *n.* An element that an organism requires in only a minute quantity (Campbell et al. 1999, 23).

Comments: Trace elements include iodine, iron, and zinc (Campbell et al. 1999, 23).

♦ **Elephant Moraine 78001 meteorite** See meteorite: EETA 78001 meteorite.♦ **elfin forest** See ²community: elfin forest.♦ **elimination** *n.* An organism's expelling something (waste matter, foreign substances, etc.), especially to get rid of it from its tissues (Oxford English Dictionary 1972, entries from 1794 as the verb eliminate).

cf. behavior: eliminative behavior; elimination: egestion; movement

♦ **defecation** *n.* An animal's excretion of its feces or egesta (Heymer 1977, 105).

syn. pooping (euphemistic), shitting (obscene)

v.t. defecate, defaecate (*Brit.*)

Comment: "Defecation" has many euphemistic synonyms, especially related to Humans (Spears 1981).

♦ **egestion** *n.* An organism's voiding fecal, or regurgitated, matter (Lincoln et al. 1985).

syn. defecation, elimination, and movement (for fecal matter) (Lincoln et al. 1985)

cf. behavior: defensive behavior: enteric discharge; elimination; excretion; ingestion; movement

♦ **excretion** *n.* An organism's eliminating wastes from its body (Lincoln et al. 1985).

v.t. excrete

♦ **urination** *n.* An animal's voiding, or passing, urine (Michaelis 1963).

syn. peeing (euphemistic), pissing (obscene)

v.t. urinate

Comment: "Urination" has scores of other euphemistic synonyms, especially related to Humans (Spears 1981).

♦ **eliminative behavior**

See behavior: eliminative behavior.

♦ **elite, élite** *n.*

1. The choicest part, as of a particular social group (Michaelis 1963).

2. An insect colony member that displays greater than average initiative and activity (Wilson 1975, 285).

3. *adj.* Referring to an elite (Wilson 1975, 582).

[French < *élire* < Latin *eligere*]

♦ **El Niño** *n., pl. Los Niños* Above average surface warming of water in the South Pacific; contrasted with *La Niña* (Claiborne 1997, 4 July, A14; Mydans 1997, 27 September, A6).

Comments: *Los Niños* occur every 3 through 7 yr and are associated with the Southern Oscillation. They have occurred for several millennia and have major effects on Earth's weather including delay of onset of monsoon rains in Indonesia; droughts in Australia, Borneo, Indonesia, and New Guinea; dry weather or ice storms in northern U.S., dry weather in the South Pacific and West Africa; above average rainfall in Asia, Europe, and southern U.S.; and unseasonable warmth in Southern America and Europe (Mydans 1997, 27 September, A6; Suplee 1997, 21 September, 13 December 2002, A1, illustration; Los Angeles Times 2002, 13 December, A26). Effects on organisms include food shortages and surpluses and changing ocean temperatures that result in more southern animals' occurring in northern

waters. In Peru, *Los Niños* reduce the numbers of offshore fish, and cause deserts to bloom (WGBS and PBS 2002). Norwegian meteorologist Jacob Bjerknes was the first researcher to see a connection between unusually warm sea-surface temperatures in *El Niño* and the weak easterlies and heavy rainfall that accompany Southern Oscillation conditions. Ultimately, his discovery led to the recognition that the warm waters of *El Niño* and the pressure seesaw of the Southern Oscillation are facets of the same phenomenon, referred to as the *El Niño*–Southern Oscillation Event (*q.v.*).

[Spanish *El Niño*, little boy, the little one, referring to the Christ child, named by Peruvian fisherman, referring to the fact that *Los Niños* typically show up around Christmas time in Peru (WGBS and PBS 2002). The term “*El Niño*” appeared in print for the first time in 1892 in a Peruvian scientific journal.]

♦ ***El Niño*–Southern Oscillation Event (ENSO Event)**

n. The collective effects of *El Niño* and the Southern Oscillation (Allaby 1994).

cf. oscillation: Arctic Oscillation

Comments: The ENSO Event affects climate in many parts of the world (Allaby 1994). A similar phenomenon occurs in the Atlantic Ocean. Exceptional ENSO Events occurred in 1891, 1925, 1953, 1972–1973, 1982–1983 (strongest one on record), and 1992–1995 (possibly three ENSO events in these 4 yr) (Allaby 1994; Suplee 1997, 21 September, A16). A major ENSO Event occurred in 1997–1998. Effects of ENSO Events during the Christmas season are weakening of prevailing trade winds and strengthening of the Equatorial countercurrent in the Pacific Ocean. These Events can cause stringent droughts on the Galápagos Islands and change evolution of Darwin’s Finches and other organisms (Weiner 1994, 193).

[coined by Gilbert Walker, meteorologist, after the rise of barometric pressure in the east and lowering in the west during and vice versa during ENSO Events (WGBS and PBS 2002)]

♦ **eluvium** See ²community: eluvium.

♦ **emancipation** *n.*

1. The evolutionary process that results in a new signal function’s being derived from an animal’s pre-existing motor pattern with a different original function (Tinbergen 1952 in Wilson 1975, 225), *e.g.*, genital presentation displays of baboons (Wickler 1966 in Heymer 1977, 119).

2. A derived behavior’s disengagement during ritualization, *q.v.*, from its original causal control and its transferral to the control of the causal system in which it functions in communication (Immelmann and Beer 1989, 85).

cf. behavior: ritualized behavior, ritualization

♦ **EMAP** See program: Ecological Monitoring and Assessment Program.

♦ **emasculcation** See castration.

♦ **embarrassment** See gesture of embarrassment.

♦ **emblem** See communication: nonverbal communication.

♦ **embryo** *n.*

1. An animal’s developmental state that extends from fertilization of an egg to birth or hatching (Oxford English Dictionary 1972).

Note: Older embryos can make distinct and controlled movements including vocalization in some bird species (Immelmann and Beer 1989, 85).

2. A human fetus *in utero*, less than 4 mo old (Oxford English Dictionary 1972, entries from 1350).
3. A rudimentary plant contained in a seed (Oxford English Dictionary 1972, entries from 1728).

♦ **embryogenesis** See -genesis: embryogenesis.

♦ **embryology** See study of: embryology.

♦ **embryonic lethal** See ²mutation: embryonic lethal.

♦ **emergence** *n.* The appearance of previously unsuspected new characteristics, or properties, at higher levels of integration in complex hierarchical systems (Morgan 1894 in Mayr 1982, 63, 131).

syn. compositional method (Simpson 1964b), emergentism (Gherardi 1984, 387), fulguration (Lorenz 1973) *cf.* ²evolution: emergent evolution, organicism

Comments: Wheeler wrote that a novel behavior arises “from the specific interaction or organization of a number of elements, whether inorganic, organic, or mental, which thereby constitute a whole, as distinguished from their mere sum, as ‘resultant’” (Gherardi 1984, 387). The concept of emergence first gained prominence in Lloyd Morgan’s (1923) book on emergent evolution (Mayr 1997, 19).

♦ **emergent character** See character (comments).

♦ **emergent evolution** See ²evolution: emergent evolution.

♦ **emergentism** See emergence.

♦ **energy, solar emjoule** *n.* The amount of solar energy (low-quality energy) to make a product of high-quality energy, expressed in emjoules (Odum et al. 1988, 28).

cf. solar transformity

Comment: The “energy” to required to produce 1 emjoule of coal is 40,000 emjoules.

♦ **Emery’s rule** See rule: Emery’s rule.

♦ **emetophobia** See -phobia: emetophobia.

♦ **emigration** *n.* An individual’s, or society’s, movement from one nest site, or other location, to another (Wilson 1975, 583).

♦ **emoticon, smiley** *n.* A combination of typewriter characters that is used to make symbols that represent a psychological state, a physiological state, or a person; commonly used in computer messages to improve communication (Garreau 1993, D1, D10).

Comments: Emoticons are turned 90 degrees clockwise. [emoticon, *emotion + icon*; smiley, after the happy face of “Have a nice day”]

SOME EMOTICONS

EMOTICON	MEANING
%--)	befuddled
:--o	shocked and amazed
:--*	a kiss
':-('	very hot

:(=)	President Jimmy Carter
+O<:-)	The Pope
7:^]	President Ronald Reagan
*>--< --	Bill the ant run over by a truck
8(--)	Mickey Mouse
8(--)8	Annette Funicello
--)-!<	Hank Aaron

◆ emotion *n.*

1. That which leads a person's "condition to become so transformed that his judgement is affected, and which is accompanied by pleasure and pain" (Aristotle in Calhoun and Solomon 1984, 44).
2. Any agitation or disturbance of a person's mind, his feeling, passion; "any vehement or excited emotional state" (Oxford English Dictionary, entries from 1660).
3. "A person's mental 'feeling' or 'affection' (of pleasure or pain, desire or aversion, surprise, hope or fear, etc.), as distinguished from cognitive or volitional states of consciousness" (Oxford English Dictionary 1972, entries from 1808).
4. "Feeling" as distinguished from other classes of mental phenomena (Oxford English Dictionary, entries from 1808).
5. Modifications of a person's body, that increase, or decrease, his active powers (Spinoza in Calhoun and Solomon 1984, 72).
6. A person's "hereditary 'pattern-reaction' involving profound changes of the bodily mechanism as a whole but particularly of the visceral and glandular systems" (Watson 1919, 195 in Lyons 1980, 18).
7. Broadly, an animal's episodes, or sequences, of overt and incipient somatic adjustment, often loosely patterned and variable, usually with concurrent exciting sensory effects, perhaps also perceptual attitudes characterizable as desirable or undesirable, pleasant or unpleasant, related to the intensity effects or perceptual meaning of a stimulus, and synergic with organic changes of approach or withdrawal types (Schneirla 1959, 26).
8. A person's "felt tendency toward an object judged suitable, or away from an object judged unsuitable, reinforced by specific bodily changes according to the type of emotion" (Arnold and Gasson 1968, 203).
9. A person's "acutely disturbed affective state that is psychological in origin and revealed in three aspects as: (1) behavior, (2) conscious experience, (3) bodily processes, especially visceral functioning" (Young, 1961, 358).
10. A person's "strong surge of feeling marked by an impulse to outward expression and often accompanied by complex bodily reactions; any strong feeling, as love, hate, or joy" (Michaelis 1963).

11. A person's "power of feeling; sensibility" (Michaelis 1963).

12. In Humans: One of "a set of processes that (1) reflect the state of relative organization or disorganization of an ordinarily stable configuration of neural systems; and (2) reflect those mechanisms which operate to redress an imbalance, not through action, but by the regulation of input" (Pribram 1967, 4).

Note: Characteristics of emotion include input from sensory systems and viscera, orienting behavior evoked by this input, arousal or activation, cognitive processes in the form of memory, against which input is matched and which provides direction and course of emotional experience and response (Pribram 1967, 4).

13. "An inferred complex sequence of reactions to a stimulus, and includes cognitive evaluations, subjective changes, autonomic and neural arousal, impulses to action, and behavior designed to have an effect upon the stimulus that initiated the complex sequence" (Plutchik 1980, 81–83).

14. In nonhuman animals: "An internal motivator that creates a readiness to change behavior to increase adaptation" (Weinrich 1980, 133).

Note: Characteristics of an emotion include: it can be discharged by an act that would (if successful) bring the external world more into line with what would be adaptive for an individual having the emotion or it can be dissipated by a further change in the individual's environment, or internal cognition, and reduces the value of adaptive action; and it is the result of a conscious, or unconscious, decision-making process, and its results from an external event's changing what is adaptive to do for the individual feeling the emotion (Weinrich 1980, 133).

15. "One of a set of welfare responses marked by total nervous system action in which that of the vegetative system predominates" (Jacobson 1987, xi).

syn. affect, emotional stimulus (in some cases, Hinde 1985)

cf. behavior: emotional behavior; emotionality; test: open-field test

Comments: Many workers generally do not use subjective connotations of "emotion" with regard to nonhuman animals. For these animals, they use emotion, or kind of emotion, in a sense close to that of motivational state, arousal, or action tendency (Immelmann and Beer 1989, 85–86). Storz (1973, 81) indicates that there is no satisfactorily precise definition of "emotion."

[Latin *emotio*, -*onis* < *e-*, out + *move*re, to move]

emotion-as-a-state *n.* An emotional stimulus intervening between another stimulus(i) and a response (Hinde 1985, 986).

Comment: As a state, emotion may affect behavior of a short to long duration (state-trait continuum); may carry physiological implications; may be thought of as energizing behavior directly, as a reinforcing event, as a goal or positive incentive, or as a modulator, or disrupter, of behavior; may be seen as related to different numbers of behavior from one, or more, limited groups of behavior to many, or all, types of behavior; and may, or may not, be regarded as associated with subjective experience (Hinde 1985).

emotion-as-an-output *n.* An animal's behavior occurring in conditions of excitement, danger, joy, etc. (Hinde 1985, 986).

syn. emotional behavior (sometimes), motivated behavior (sometimes), emotional expression (sometimes, Hinde 1985, 986)

Comment: Both an animal's somatic and autonomic nervous systems are usually involved, and its movement involved may, or may not, have been adapted for a signal function. This definition has problems because one cannot clearly distinguish emotional from nonemotional behavior. Emotional behavior may lie along a continuum from behavior that is more, or less, purely expressive to that concerned primarily with negotiation between individuals (Hinde 1985, 989).

♦ **emotional ambivalence** *n.* A person's simultaneously having two incompatible emotions, *e.g.*, love and hate (Heymer 1977, 22).

♦ **emotional behavior** See behavior: emotional behavior; emotion-as-an-output.

♦ **emotional deprivation** *n.* Removal of certain emotional stimuli by an experimenter from an animal or group of animals (Hinde 1985, 985).

♦ **emotional intelligence** See intelligence: emotional intelligence.

♦ **emotive** *adj.* Referring to emotional responses that are induced in communication (Sebeok 1962 in Wilson 1975, 217).

cf. cognitive

♦ **empathic learning** See learning: empathic learning.

♦ **empiricism** *n.* The doctrine that human experience is the only reliable source of knowledge (Oxford English Dictionary 1972, entries from 1803), as exemplified in the philosophies of John Locke, George Berkeley, and David Hume (C. K. Starr, pers. comm.).

Comments: Empiricism was dominant in biological thinking in Great Britain from 1790 through 1860 (Mayr 1982, 110). The great flowering of empiricism which occurred in England "resulted in an overemphasis on the physical and experimental science. The pursuit of natural history was entirely in the hands of ordained ministers and inevitably led to the belief in the perfect design of a created world, a belief totally incompatible with the concept of evolution" (Mayr 1982, 340).

logical empiricism *n.* In philosophy, scientific confirmation of an hypothesis (or theory) using the hypothetico-deductive method and verification through repeated testing (Mayr 1997, 49).

cf. logical positivist

Comments: After testing confirms an hypothesis (or theory), a logical empiricist considers it to be verified (Mayr 1997, 49). Verification does not mean that it is proved unambiguously, however. The method of logical empiricism does not work for all areas of biology, *e.g.*, studies of past evolutionary forces that affected organisms (Mayr 1997, 55).

♦ **empirical taxonomy** See taxonomy: empirical taxonomy.

♦ **empty niche** See niche: vacant niche.

♦ **Emsleyan mimicry** See mimicry: Emsleyan mimicry.

♦ **enantiomer** *n.* One of two forms of a molecule that are mirror images of one another; a mirror-image isomer (King and Stansfield 1985; Bradley 1993, 1117). *syn.* enantiomorph (King and Stansfield 1985)

Comment: Different enantiomers of the same compound can have very different effects on an organism; *e.g.*, one enantiomer of the drug thalidomide sedates a

person, but the other interferes with fetal development (Bradley 1993, 1117).

♦ **enantiomorph** See enantiomer.

♦ **enantion** See display: wing display: enation.

♦ **enuophile** See ¹phile: enauophile.

♦ **encasement theory** See ³theory: encasement theory.

♦ **encephalization quotient** *n.* In Mammals: The degree to which an animal's brain size exceeds or falls below the mean brain size for animals of this focal animal's weight (Jerrison 1973 in Eisenberg 1981, 506).

♦ **encounter call** See animal sounds: call: territorial call.

♦ **encounter site** See mating site.

♦ **enculturation** *n.*

1. "The act of learning one culture in all its uniqueness and particularity" (Mead 1963 in Wilson 1975, 159).
2. "The transmission of a particular culture, especially to the young members of the society" (Wilson 1975, 583).

♦ **end act** See behavior: consummatory behavior.

♦ **endangered** *adj.* Referring to a species, or population, that is in danger of becoming extinct (Cooper 1984, 9, in Norden et al. 1984).

cf. extant, extinct, extirpated, threatened

♦ **endangered species** See ²species: endangered species.

♦ **Endangered Species Act (ESA)** See law: Endangered Species Act.

♦ **¹endemic** *n.* An organism that is ³endemic, *q.v.*

Comments: There are two principal schemes for classifying endemic taxa: the cyto-evolutionary scheme and the historical-biogeographic scheme; both approaches have their disadvantages (Keener 1983, 78). Keener (1983) presents a cyto-evolutionary scheme which contains "apoendemic," "paleoendemic," "patroendemic," and "schizoendemic" (including "neoschizoendemic" and "holoschizoendemic").

apoendemic *n.* A geographically restricted neopolyploid taxon that is derived from a widely distributed diploid, *e.g.*, most British endemics (Favarger and Contandriopoulos 1961, etc., in Keener 1983, 81).

cf. ¹endemic: paleoendemic, patroendemic, schizoendemic

insular endemic *n.* An endemic that evolved in a restricted geographical area and has retained its limited range without spreading to a wider area (Lincoln et al. 1985).

paleoendemic *n.* A generally morphologically uniform, taxonomically isolated ancient relict with an obscure origin and which may now be nearly extinct (Favarger and Contandriopoulos 1961, etc., in Keener 1983, 80).

cf. ¹endemic: apoendemic, patroendemic, schizoendemic

Comment: Paleoendemics are often ecological specialists with contracted ranges, may occupy areas remote from their locus of origin, are diploids, or high polyploids, without closely related diploids, and are usually monotypic genera, or sections of genera (Keener 1983, 80).

patroendemic *n.* An ancient element of a restricted, relatively old diploid that is ancestral (at least in part) to widespread polyploids (Favarger and Contandriopoulos 1961, etc., in Keener 1983, 81).

cf. ¹endemic: apoendemic, paleoendemic, schizoendemic

schizoendemic *n.* A diploid, or polyploid, species that originated from diploid ancestors by gradual speciation involving a progressive divergence of a taxon throughout its area (Favarger and Contandriopoulos 1961, etc., in Keener 1983, 81).

cf. ¹endemic; apoendemic, paleoendemic, patro endemic

► **holoschizoendemic** *n.* A “mature,” stabilized, and diversified schizoendemic that occupies a relatively maximum area but is restricted by habitat, geography, or both; contrasted with neoschizoendemic (Favarger and Contandriopoulos 1961, etc., in Keener 1983, 81).

► **neoschizoendemic** *n.* A relatively youthful schizoendemic that is restricted geographically principally because of its age, not ecology, nor depauperate biotypes, etc.; contrasted with neoschizoendemic (Favarger and Contandriopoulos 1961, etc., in Keener 1983, 81).

► **strict endemic** *n.* An endemic that occurs only, or preferentially, in a certain habitat, *e.g.*, a bog (Keener 1983, 82).

♦ **²endemic** *adj.* Epidemiologically and ecologically, referring to a non-outbreak size of a population (Lodge 1603, etc. in Frank and McCoy 1990, 4).

ant. epidemic (Frank and McCoy 1990, 4)

♦ **³endemic** *adj.*

1. Biogeographically, referring to a group, or species, found in a particular area and nowhere else (Darwin 1887, 187, etc., in Frank and McCoy 1990, 3). *syn.* indigenous (sometimes, Frank and McCoy 1990, 3)

Notes: Allaby (1977 in Frank and McCoy 1990, 3) adds “and having originated in the particular area” to this definition. Frank and McCoy (1990, 4) suggest that “precinctive” is a more valid alternative to “endemic” with regard to this definition, and they consider “endemic” to be a subclass of “indigenous.”

2. Referring to a geographically restricted organism that evolved from a geographically neighboring species (Ridley 1925 in Keener 1983, 78).

3. Referring to a taxon with a relative degree of restriction to a single, natural, geographical, or ecological region (Cain 1971 and Daubenmire 1978 in Keener 1983, 78).

4. Referring to a taxon that is “restricted, for whatever reason, to a relatively narrowly circumscribed geographic region, although an exact operational delimitation of such an area can be problematic” (Keener 1983, 78).

5. Referring to an insect species that is rare or uncommonly abundant (Wallner 1987 in Frank and McCoy 1990, 3).

cf. adventive, autochthonous, endemicity, immigrant, indigenous, introduced, precinctive, ²species: endemic species

[French *endémique* < Greek *en*, in + *demos*, population]

♦ **endemic species** See ²species: endemic species

♦ **endemicity** *n.*

1. A trait’s being peculiar to a particular country or people (Michaelis 1963).

2. An organism’s being native to, and restricted to, a particular geographical region (Lincoln et al. 1985).

syn. endemism (Lincoln et al. 1985)

cf. precinctive

adj. endemic

[Greek *ēndēmos*, native < *en-* in + *dēmos*, people]

♦ **endemism** See endemicity.

♦ **endo-, end-** *comb. f.* “Within; inside” (Michaelis 1963).

[Greek < *endon*, within]

♦ **endobenthos** See ²community: benthos: endobenthos.

♦ **endobiont** See biont: endobiont.

♦ **endocrine disrupter** *n.* An artificial environmental pollutant that affects an organism’s endocrine systems (Suplee 1996, 7 June, A4).

Comments: Endocrine disrupters include breakdown products of certain plastics, polychlorinated biphenyls (PCBs), and some pesticides (Suplee 1996, 7 June, A4). Combinations of endocrine disrupters might increase the risk of human birth defects, cancers, and other ills.

cf. environmental estrogen

♦ **endocrine gland** See gland: endocrine gland.

♦ **endocrine signaling** See signaling: hormonal signaling.

♦ **endocrine system** See ²system: endocrine system.

♦ **endocrinology** See study of: endocrinology.

♦ **endocyclic selection** See selection: cyclical selection.

♦ **endodeme** See deme: endodeme.

♦ **endoderm** See organ: -derm: endoderm.

♦ **endodyogeny** See -geny: endodyogeny.

♦ **endogamy** See -gamy: endogamy.

♦ **endogenous** See -genous: endogenous.

♦ **endogenous clock** See clock: biological clock.

♦ **endogenous pyrogen** See pyrogen: endogenous pyrogen.

♦ **endogenous rhythm** See rhythm: endogenous rhythm.

♦ **endokaryogamy** See -gamy: endogamy.

♦ **endolithophage** See -phage: lithophage (*Comment*).

♦ **endomitosis** See mitosis: endomitosis.

♦ **endomixis** See -mixis: endomixis.

♦ **endomorphology** See morphology: endomorphology.

♦ **endoophagae** See -phage: endoophagae.

♦ **endophagae** See -phage: entophagae.

♦ **endoparasitism** See parasitism: endoparasitism.

♦ **endophagous hyperparasitism** See parasitism: hyperparasitism: endophagous hyperparasitism.

♦ **endophenotypic** See -typic: endophenotypic.

♦ **endopolygeny** See -geny: endopolygeny.

♦ **endoreceptor** See ²receptor: interoceptor.

♦ **endorphin** See hormone: endorphin.

♦ **endosite** See parasite: endoparasite.

♦ **endosymbiont** See symbiont: endosymbiont.

♦ **endosymbiont hypothesis** See hypothesis: endosymbiosis hypothesis.

♦ **endosymbiosis** See symbiosis: endosymbiosis.

♦ **endosymbiosis hypothesis, endosymbiotic hypothesis** See hypothesis: endosymbiosis hypothesis.

♦ **endotherm** See -therm: endotherm.

♦ **endotoxic pyrogen** See pyrogen: endotoxic pyrogen.

♦ **endotroph** See -troph-: endotroph.

♦ **endozoochore** See -chore: endozoochore.

♦ **enemy specification** *n.* In some ant species: A colony’s exaggerated alarm response to an ant, or other arthropod, species that poses a threat to the colony (Hölldobler and Wilson 1990, 637).

cf. alarm; behavior: alarm behavior

- ♦ **energetic-equivalence rule** See rule: energetic-equivalence rule.
- ♦ **energetics** See study of: energetics.
- ♦ **energy** *n.*
 1. A person's vigor, or intensity, of action, expression, or vocalization (Oxford English Dictionary 1972, entries from 1809).
 2. A person's capacity, or tendency, to perform vigorous action (Michaelis 1963).
 3. Something's inherent power to produce an effect (Michaelis 1963).
- ♦ **action-specific energy (ASE)** *n.* "A hypothetical construct inferred from changes in stimulus threshold, intensity, and rate of occurrence of an [animal's] unlearned response with time and with frequency of occurrence of the response. Its quantity becomes very low when the response is made; it then recovers with time in the absence of response" (Symposia of the Society for Experimental Biology 1950 in Verplanck 1957).

syn. motivation energy (Immelmann and Beer 1989, 192), specific-action energy
cf. instinct, ⁴model: energy model of behavior
Comments: "This concept is almost identical with Skinner's respondent reflex reserve" (Skinner 1938 in Verplanck 1957), and it dates back to Lorenz 1950 and Tinbergen 1951. "Specific-action potential(ity)," *q.v.*, came to be preferred to "ASE" (Immelmann and Beer 1989, 2).
- ♦ **energy cost of play** See cost: energy cost of play.
- ♦ **energy maximizer** See ²species: energy maximizer.
- ♦ **energy model of behavior** See ⁴model: energy model of behavior.
- ♦ **engineering psychology** See study of: psychology: engineering psychology.
- ♦ **English name** See name: nonscientific name.
- ♦ **engulfers** See ²group: functional feeding group: engulfers.
- ♦ **engram** See -gram: engram.
- ♦ **ENIAC** *n.* The first electronic computer (Levy 1995, B4).
Comments: John V. Atanasoff conceived the idea of an electronic computer in 1937, and J. P. Eckert and J. W. Mauchly, drawing on Atanasoff's ideas and prototype computer, built and patented ENIAC in the mid-1940s (Levy 1995, B4). [electronic numerical integrator and computer, named by J. P. Eckert and J. W. Mauchly (Levy 1995, B4)]
- ♦ **enrichment** *n.* An experimenter's introduction of some kind of environmental manipulation, or event, above and beyond an animal's usual early laboratory environment (Dewsbury 1978, 148).
- ♦ **ENS** See external-nontranscribed spacers.
- ♦ **Ensembl** *n.* A software system that produces and maintains automatic annotation on selected eukaryotic genomes produced by EMBL-EBI and the Sanger Institute (Ensembl 2008).
Comment: Ensembl provides free access to all the data produced by the project and to the software used to analyse and present it (Ensembl 2008).
- ♦ **ENSO Event** See El Niño–Southern Oscillation Event.
- ♦ **Entelechie** See *Lebenskraft*.
- ♦ **entelechy** See ²evolution: orthogenesis.
- ♦ **enteric discharge** See behavior: defensive behavior: enteric discharge.
- ♦ **enteroreceptor** See ²receptor: interoreceptor.
- ♦ **entomochore** See -chore: entomochore.

- ♦ **entomogamous** See ²-phile: entomophile.
- ♦ **entomogenous** See -genous: entomogenous.
- ♦ **entomography** See -graphy: entomography.
- ♦ **entomology** See study of: entomology.
- ♦ **entomophage** See -vore: insectivore.
- ♦ **entomotomy** See study of: entomotomy.
- ♦ **endoparasite** See parasite: endoparasite.
- ♦ **endoparasitism** See parasitism: endoparasitism.
- ♦ **entophagie** See -phage: entophagie.
- ♦ **entrainment** *n.* An organism's coupling, or synchronizing, its biological rhythm to an external time source (*zeitgeber*) causing its rhythm to display the *zeitgeber*'s frequency, *e.g.*, entraining to lunar periodicity (Lincoln et al. 1985).

v.t. entrain
adj. entrained
- ♦ **entropy** *n.* "The degree to which relations between [among] components of any aggregate are mixed up, unsorted, undifferentiated, unpredictable, and random" (Bateson 1979, 242).
ant. negentropy
Comment: "In physics, certain sorts of ordering are related to quantity of available energy" (Bateson 1979, 242). [first proposed by Clausius (1865) as *entropie* (German) (Oxford English Dictionary 1972)]
- ♦ **negentropy** *n.* The degree of ordering, sorting, or predictability in an aggregate (Bateson 1979, 242).
ant. entropy
- ♦ **enurination** *n.* In *Cavia porcellus* (Guinea-pigs), *Chinchilla* sp. (chinchillas), a porcupine species, and Rabbits: A male's releasing urine in the direction of a female (Dewsbury 1978, 60).
syn. epuresis (Southern 1948, 177)
cf. behavior: marking behavior
Comment: This behavior may reflect a male's "frustration" or rejection (Ewer 1968 in Dewsbury 1978, 60).
- ♦ **envelope** See nest: wasp nest: envelope.
- ♦ **environment** *n.* The complex of biotic, climatic, edaphic, and other conditions that comprise an organism's immediate habitat; the physical, chemical, and biological surroundings of an organism at any particular time (Lincoln et al. 1985); including factors that affect and do not affect the organism (Immelmann and Beer 1989, 87).
cf. environmentalist; -welt: *Umwelt*
Comment: Any to all of these factors can influence behavior, but their effects vary greatly from one individual to another (Storz 1973, 88).
- ♦ **coarse-grained environment** *n.* The environment experienced by an organism (*e.g.*, with poor homeostatic mechanisms or low behavioral plasticity and mobility) as sets of alternative, disconnected conditions; contrasted with fine-grained environment (Lincoln et al. 1985).
cf. variation: fine-grained variation
- ♦ **ecological environment** *n.* The features of an organism's external environment that affect the organism's contribution to its population growth; contrasted with external environment and selective environment (Brandon 1992, 82).
- ♦ **external environment** *n.* The sum total of both biotic and abiotic factors that are external to an organism of interest; contrasted with ecological environment and selective environment (Brandon 1992, 81).
- ♦ **fine-grained environment** *n.* The environment experienced by an organism (*e.g.*, with good

homeostatic mechanisms or high behavioral plasticity and mobility) as a succession of interconnected conditions; contrasted with coarse-grained environment (Lincoln et al. 1985).

cf. variation: coarse-grained variation

patchy environment *n.* An environment with resource patches, *q.v.*

selective environment *n.* An environment that "is measured in terms of the relative actualized fitnesses of different genotypes [of the same species] across time or space," contrasted with ecological environment and external environment (Brandon 1992, 82).

total environment *n.* All abiotic and biotic environmental factors that exert an influence on an organism and to which it must be adequately adapted in order to survive (Bligh and Johnson 1973, 958).

◆ **Environment Protection and Biodiversity Conservation Act of 1999** See law: Environment Protection and Biodiversity Conservation Act of 1999.

◆ **environmental canalization** See canalization: environmental canalization.

◆ **environmental estrogen** *n.* A chemical, such as a pesticide, that has the effect of estrogen on a culture of yeast cells genetically modified to carry the human estrogen receptor (Leary 1996, A15; Suplee 1996, 7 June, A4).

Comments: Pairs of the pesticides chlordane, dieldrin, endosulfan, and toxaphene synergize and act as environmental estrogens (Leary 1996, A15). These chemicals alone produce no to little estrogen-like effects.

cf. endocrine disrupter

◆ **environmental hormone** See chemical-releasing stimulus: semiochemical: allelochemical: allomone: exocrine substance.

◆ **environmental imprinting** See learning: habitat imprinting.

◆ **Environmental Kuznets Curve** See curve: Environmental Kuznets Curve.

◆ **environmental odor** See odor: environmental odor.

◆ **environmental patchiness** See environment: patchy environment.

◆ **environmental pressure** See prime mover of social evolution.

◆ **environmental sex determination** See sex determination: phenotypic sex determination.

◆ **environmental tracking** *n.* An organism's changing its foraging gains, or other resource gains, in relation to changes in resource availability (Stephens and Krebs, 1986; Kramer and Weary 1991, 443).

syn. tracking (Kramer and Weary 1991, 443)

◆ **environmental variance (V_E)** See variance: environmental variance.

◆ **environmentalism** *n.*

- Analysis that stresses the role of environmental influences in the development of an organism's behavioral or other traits (Wilson 1975, 583).

- Doctrine emphasizing the role of environmental factors rather than hereditary ones in the development of biological traits, especially behaviors (Lincoln et al. 1985).

◆ **environmentalist** *n.* A person who believes that all, or most significant, behavior, or knowledge, is a product of an animal's experience (Immellmann and Beer 1989, 88).

◆ **enzyme** *n.*

1. A protein produced by a cell that initiates, or accelerates, its specific chemical reactions in metabolism without being more than transiently changed in the process; an organic catalyst; ferment (Michaelis 1963; Immelmann and Beer 1989, 88).

2. A ribozyme; RNA that cuts and joins preexisting RNA and can carry out some of the more important subreactions of RNA replication (Orgel 1994, 78–79).

Note: Thomas R. Cech and Sidney Altman independently discovered the first known ribozymes in 1983 (Orgel 1994, 78) for which they won the 1989 Nobel Prize in Chemistry (Hart 1996, 318). Searchers are working on how to use ribozymes to correct genetic codes.

Comment: Some enzymes are named by elaborate standardized nomenclature (Berenbaum 1996, 5).

cf. RNA world

[Latin < Greek *enzymos*, leavened < *en-*, in + *zyme-*, leaven]

allozyme *n.* Any of the multiple forms of a multimeric enzyme whose subunits are coded by alleles of the same gene (Rieger et al. 1991).

cf. enzyme: isozyme

Comment: Individual heterozygotes usually carry more than one form of a particular enzyme (Rieger et al. 1991).

coenzyme *n.* A nonprotein organic molecule that is necessary for an enzyme to function (Campbell 1990, 106).

Comments: Most vitamins are coenzymes or raw materials from which cells make coenzymes (Campbell 1990, 106). Coenzymes generally act as donors, or acceptors, of groups of atoms that have been added, or removed, from substrates (King and Stansfield 1985). Coenzymes include ATP, coenzyme A (CoA), coenzyme Q, FAD, FMN, NAD, and NADP.

chalcone synthase (CHS) *n.* A key enzyme of the anthocyanin biosynthesis pathway in plants (Niesbach-Klösgen et al. 1987, 213).

Comment: The gene for this enzyme is rather conserved among investigated plants and is useful for exploring the evolutionary relationships among plants (Niesbach-Klösgen et al. 1987, 219; Clegg and Durbin 2000, 7020).

DNA ligase *n.* An enzyme that seals strands of DNA together by catalyzing the formation of phosphodiester bonds (Campbell et al. 1999, 367).

Comment: This enzyme functions in DNA replication and repair, and making recombinant DNA bonds (Campbell et al. 1999, 367).

flavin-adenine dinucleotide (FAD) *n.* A coenzyme that assists enzymes in electron transfer during metabolic redox reactions (Campbell 1990, 184).

Comment: FADH₂ is the reduced form of FAD.

housekeeping enzyme *n.* An enzyme that is active in all cell types (inferred from Niesbach-Klösgen et al. 1987, 213).

Comment: Housekeeping enzymes include cytochrome-c, ferredoxin, plastocyanin, and ribulose-1,5-bisphosphate carboxylase-oxygenase (Niesbach-Klösgen et al. 1987, 213).

isoenzyme See enzyme: isozyme.

isozyme *n.* Any of a class of multiple, separate forms of enzymes that occur within the same organism and have similar, or identical, catalytic activities (Rieger et al. 1991).

syn. isoenzyme

cf. enzyme: allozyme

Comment: Three major classes of isozymes are alloenzymes, primary isozymes, and secondary isozymes (Rieger et al. 1991).

luciferase *n.* An enzyme, in bioluminescent organisms, that catalyzes oxidation of luciferin, *q.v.* (McDermott 1948, 17).

cf. firefly, glowworm (Appendix 1); molecule: luciferin [named by Raphael DuBois, French physiologist (1886) in McDermott 1948, 17]

nicotinamide-adenine dinucleotide (NAD⁺) *n.*

A coenzyme that assists enzymes in electron transfer during metabolic redox reactions (Campbell 1990, 184–185, illustration).

Comment: NADH is the reduced form of NAD⁺.

nicotinamide-adenine-dinucleotide phosphate (NADP⁺) *n.*

A coenzyme that accepts two energized electrons from FAD and one proton from the light reactions of photosynthesis and provides electrons that fix carbon in the Calvin cycle (Campbell 1990, 209–210).

syn. coenzyme 2, TPN

Comment: NADPH is the reduced form of NADP⁺.

protein kinase *n.* An enzyme that transfers a phosphate group(s) from ATP to a protein (Campbell et al. 1999, 195).

Comment: About 1% of human genes may code for protein kinases (Campbell et al. 1999, 196). A single cell can have hundreds of different protein kinases that probably regulate a large proportion of its thousands of proteins.

repair enzyme *n.* An enzyme that repairs DNA (Bernstein et al. 1985, 1278).

► **excision repair enzyme** *n.* A repair enzyme that removes damages to only one strand of DNA (single-strand damages) (Bernstein et al. 1985, 1278).

restriction enzyme *n.* An enzyme that cuts double-stranded DNA at, or near, specific short nucleotide sequences (Campbell 1990, G-21; Rieger et al. 1991; Futuyma 1998, glossary).

syn. restrictase, restriction endonuclease (Rieger et al. 1991)

Comments: The resulting DNA fragments are called “restriction fragments,” and they have discrete molecular weights (Rieger et al. 1991). Variation in the short nucleotide sequences within a population results in variation in DNA sequence lengths after treatment with a restriction enzyme or restriction-fragment-length polymorphism (RFLP). Restriction enzymes are widespread in bacteria, and are classified as type-I restrictionases, type-II restrictionases, and type-III restrictionases.

serine kinase *n.* An enzyme that transfers a phosphate group(s) from ATP to a protein’s serine part (Campbell et al. 1999, 195).

Comment: Serine kinases and threonine kinases are widely involved in signaling pathways in Animals, Fungi, and Plants (Campbell et al. 1999, 195).

threonine kinase *n.* An enzyme that transfers a phosphate group(s) from ATP to a protein’s threonine part (Campbell et al. 1999, 195).

Comment: Serine kinases and threonine kinases are widely involved in signaling pathways in Animals, Fungi, and Plants (Campbell et al. 1999, 195).

♦ **eobiogenesis** See biopoiesis.

♦ **eobiont** See biont: eobiont.

♦ **eonism** *n.* A male Human’s adopting a female’s clothing, mannerisms, etc. (Michaelis 1963).

cf. mimicry: automimicry: female mimicry, sex-role reversal, transvestism

[after Chevalier Charles d’Eon, 1728–1810, French diplomat]

♦ **epacme** See acme: epacme.

♦ **EPBC Act** See law: EPBC Act.

♦ **epiropohoresis theory** See hypothesis: continental drift.

♦ **ephobic** *adj.*

1. Referring to adult animals’ stages between juvenile and old age (Lincoln et al. 1985).

2. Referring to an evolutionary peak or acme (Lincoln et al. 1985).

3. Referring to features that first appeared in evolution in adult stages of organisms (Lincoln et al. 1985).

cf. neanic

♦ **ephemer** *n.*

1. An organism that survives only a short period when introduced into a new area (Lincoln et al. 1985).

2. An organism that is sexually mature for only one day (Lincoln et al. 1985).

♦ **ephemeral, short-lived, transient** *adj.* Referring to an organism, or other phenomenon, that lasts for a relatively short time, *e.g.*, an organism that grows, reproduces, and dies within a few hours or days, or a flower that lasts for 1 day or less (Lincoln et al. 1985).

cf. horary

♦ **ephdrogamous** See -gamous: ephdrogamous.

♦ **epi-** *prefix*

1. Upon; above; among; outside (Michaelis 1963).

2. Besides; over; in addition to (Michaelis 1963).

3. Near; close to; beside (Michaelis 1963). Also *epi-* before vowels; *eph-*, before an aspirate: ephemeral.

[Greek *epi*, *epi*, *eph*- < *epi*, upon, on, besides]

♦ **epibenthos** See ²community: benthos: epibenthos.

♦ **epibiont** See -cole: epicole.

♦ **epibiosis** See -biosis: epibiosis.

♦ **epicole** See -cole: epicole.

♦ **Epicurean** *n.* One who believes that everything is made of unchanging atoms which whirl about and collide at random, all things happen through natural causes, and life is due to the motions of lifeless matter as proposed by Epicurus (342–271 B.C.) (Mayr 1982, 90). See atomistic materialist, Stoic.

♦ **epideictic behavior, epideictic display** See display: epideictic display.

♦ **epideictic pheromone** See chemical-releasing stimulus: semiochemical: pheromone: epideictic pheromone.

♦ **epidemic** *adj.* Epidemiologically and ecologically, referring to an outbreak size of a population (Lodge 1603, etc. in Frank and McCoy 1990, 4).

ant. ²endemic (Frank and McCoy 1990, 4)

[French *épidémique* < Late Latin *epidemia* < Greek *epi*, on + *demos*, population]

♦ **epidemiology** See study of: epidemiology.

♦ **epidermis** See cuticle.

♦ **eperic sea** See sea: eperic sea.

♦ **epifauna** See fauna: epifauna.

♦ **epigamic behavior** See behavior: epigamic behavior.

♦ **epigamic character** See character: epigamic character.

♦ **epigamic display** See display: epigamic display.

♦ **epigamic selection** See selection: epigamic selection.

♦ **epigamy** See -gamy: epigamy.

♦ **epigenesis** See -genesis: epigenesis.

♦ **epigenetic approach** *n.* An experimental approach to animal development (including behavioral development) that holds that all of an animal's response systems are synthesized during its ontogeny, this synthesis involves integrative influence of both intraorganic processes and extrinsic stimulative conditions, gene effects are contingent on environmental conditions, an animal's genotype is capable of entering into different relationship classes depending on its prevailing environment, and an animal's environment is not benignly supportive, but actively implicated in determining the very structure and organization of each of an animal's response systems (Moltz 1965, 44, in Dewsbury 1978, 132).

cf. -genesis; epigenesis

♦ **epigenetics** See study of: genetics: epigenetics.

♦ **epigenotype** See -type, type: genotype.

♦ **epigenous** See -genous: epigenous.

♦ **epilithophage** See -phage: lithophage (comment).

♦ **epimelectic behavior** See behavior: epimelectric behavior.

♦ **epimorphosis** See morphosis: epimorphosis.

♦ **epinephrine** See hormone: adrenalin.

♦ **epineuston** See neuston: epineuston.

♦ **epiontology** See study of: epiontology.

♦ **epiorganism** See organism: superorganism (Appendix 1, part 1).

♦ **epiparasite** See parasite: ectoparasite.

♦ **epiphénoménon, Epiphänomen** See phenom-enon: epiphénoménon.

♦ **epiphysis** *n., pl. epiphyses* The extremity of some mammal bones that at first is separated from the bone by cartilage but later consolidated with it by ossification (Michaelis 1963).

Comment: Epiphyses can occur as fossils, e.g., those of Miocene marine mammals (Ashby 1995, 3). Fossil bones with epiphyses are from younger animals those bones without epiphyses.

[New Latin < Greek, an outgrowth < *epi*, upon + *phyein*, to grow]

♦ **epiphyte** *n.*

1. A plant that grows on another plant (the phorophyte) where it obtains support, anchorage, or both, rather than water or nutrients (Lincoln et al. 1985). *syn.* aerophyte (Lincoln et al. 1985)

2. Any organism that lives on the surface of a plant (Lincoln et al. 1985).

Comments: Epiphytic organisms are common on trees in many habitats. Many epiphytes such as *Tillandsia* sp. and *Tillandsia usneoides* (Spanish-moss) (Bromeliaceae), two kinds of lichens, and moss inhabit tree trunks in Florida, U.S. (fig. 14).

cf. zoon: epizoon

♦ **episematic character** See character: episematic character.

♦ **episite** See parasite: ectoparasite.

♦ **episodes of proliferation** See ²evolution: explosive evolution.

♦ **episodic memory** See memory: episodic memory.

♦ **episome** See plasmid: episome.

♦ **epistasis** *n.*

1. A nonreciprocal interaction of an organism's nonallelic genes (King and Stansfield 1985).
2. One gene's (the epistatic gene) masking the effect of another gene (hypostatic gene) in an organism (King and Stansfield 1985), e.g., with regard to wing condition in *Drosophila* or coat color in rabbits.

3. In molecular and biochemical genetics, one gene's product's being conditional upon the success, or failure, of another gene that operates at an earlier step in the same pathway (Wade 1992, 87).

4. In statistical and quantitative genetics, "the between-locus 'nonadditive' component of the genetic variance for a trait" (Wade 1992, 87).

Note: This component measures statistical effects of variations in gene combinations between individuals in relation to the total phenotypic variance between individuals in a population (Wade 1992, 87). Epistasis (def. 1 and 2) could be pervasive, but yet undetectable, at the population level.

cf. hypostasis

Comment: Epistasis generally refers to genes at different loci, but some authors consider dominance and recessiveness to be special cases of it (Dawkins 1982, 286). [coined by Bateson (Mayr 1982, 792)]

♦ **epistatic gene** See gene: epistatic gene.

♦ **epistemology** See study of: epistemology; study of: philosophy: epistemology.

♦ **epitoky** See -toky: epitoky.

♦ **epitreptic behavior** See behavior: treptic behavior: epitropic behavior.

♦ **epitropism** See tropism: geotropism.

♦ **epizoochore** See -chore: epizoochore.

♦ **epizoon** See -zoon: epizoon.

♦ **epizootic** *n.* In nonhuman animals: An epidemic (Lincoln et al. 1985).

♦ **epuresis** See enurination.

♦ **equifinality** *n.* The phenomenon in which a structure, or behavior pattern, develops via different ontogenetic routes (McFarland 1985, 28).

♦ **equal-chance hypothesis** See hypothesis: hypotheses of species richness: equal-chance hypothesis.

♦ **equilibration** *n.* A threatened animal's adjusting the spatial relation between it and an actual, or potential, threat (Chance 1958, 2).

♦ **equilibratory behavior** See behavior: equilibratory behavior.

♦ **equilibrium** *n.*

1. "Any state of balance, compromise, or adjustment between opposites or opposing forces" (Michaelis 1963).

2. Any state of a system that once attained tends to persist indefinitely (Bell 1982, 505).

See homeostasis.

Nash equilibrium *n.* In an evolutionarily stable strategy, *q.v.*, an equilibrium in which a player's payoff is reduced if it deviates unilaterally from the equilibrium (Maynard Smith 1978 in Parker 1984, 3).

neutral equilibrium *n.* An equilibrium that conserves its new state after a perturbing force is removed, e.g., a ball's remaining in its position on a plane (Bell 1982, 505).

species equilibrium *n.* A condition in which the species' extinction rate in a certain place equals the arrival rate of new species by immigration (Lincoln et al. 1985).

stable equilibrium *n.* An equilibrium that moves to its previous state after a perturbing force is removed, e.g., a ball's eventually settling in the base of a trough (Bell 1982, 505).

unstable equilibrium *n.* An equilibrium that is not restored to its previous state after a perturbing force is removed, e.g., a ball's not remaining on a ridge (Bell 1982, 505).

- ♦ **“equilibrium hypothesis of species organization”** See hypothesis: hypotheses of species organization: “equilibrium hypothesis of species organization.”
- ♦ **“equilibrium hypothesis of species richness”** See hypothesis: hypotheses of species richness: “equilibrium hypothesis of species richness.”
- ♦ **equilibrium population** See ¹population: equilibrium population.
- ♦ **equinophobia** See -phobia: equinophobia.
- ♦ **equinox** *n.*
 1. One of two opposite points at which the Sun crosses the celestial equator, when day and night are equal (Michaelis 1963).
 2. The time when an equinox (def. 1) occurs (Michaelis 1963).

cf. solstice
[French *équinoxe* < Latin *aequinoctium* < *aequus*, equal + *nox*, night]

autumnal equinox *n.* The second equinox of a year which occurs on about 21 September in the northern hemisphere; the first day of autumn (Michaelis 1963).
Comment: This is when Earth's axis of tilt is sideways with regard to the Sun (diagrams in Lehr et al. 1975, 48–49).

vernal equinox *n.* The first equinox of a year which occurs on about 21 March in the northern hemisphere; the first day of spring (Michaelis 1963).
Comment: This is when Earth's axis of tilt is sideways with regard to the Sun (diagrams in Lehr et al. 1975, 48–49).
- ♦ **equipotentiality assumption** *n.* An assumption implicit in earlier learning theory that one of an organism's stimulus-response associations is as easily formed as another (Immelmann and Beer 1989, 173).
cf. dimension of preparedness, learning disposition
- ♦ **equivocation** *n.* The potential effectiveness of more than one signal's evoking a particular response (Wilson 1975, 195).
- ♦ **Erbkoordination** *n.*
 1. One of two main components of an organism's oriented movement; a more, or less, fixed pattern that is controlled by external releasing stimuli in cooperation with internal motivating factors, and which, once released, is integrated by internal mechanisms only, often quite independently of further external stimulation (Tinbergen 1951, 87).
 2. The “aspect of a stereotyped species-characteristic movement that, though elicited by external stimuli, is not subsequently guided by them” (Hinde 1982, 278).
cf. *Taxiskomponente*
[Possibly coined by Khn (1919) in Tinbergen (1951, 87). Tinbergen translated this term as fixed pattern.]
- ♦ **erection** *n.*
 1. An erectile tissue's being filled with blood (Morris 1982).
 2. An erect penis (Morris 1982).
Comments: Bonobo males display to one another and to females with erections (Waal and Lanting 1997, 22–23, illustration)
- ♦ **eremium** See ²community: eremium.
- ♦ **eremobiont** See -cole: deserticole.
- ♦ **eremophile** See ¹-phile: eremophile.
- ♦ **erg** See unit of measure: erg.
- ♦ **ERG** See -gram: electroretinogram.
- ♦ **ergate** See caste: worker.
- ♦ **ergatandromorph** See morph: ergatandromorph.

- ♦ **ergatandrous species** See ²species: ergatandrous species.
- ♦ **ergatogyn** See caste: ergatogyn.
- ♦ **ergatomorphic** See morphic: ergatomorphic.
- ♦ **ergatomorphic male, ergatoid male** See morph: ergatandromorph.
- ♦ **ergonomic stage** See stage: ergonomic stage.
- ♦ **ergonomics** See study of: ergonomics.
- ♦ **erroneous imprinting** See behavior: abnormal behavior: erroneous imprinting; learning: imprinting: erroneous imprinting.
- ♦ **error** *n.*
 1. “Something done, said, or believed incorrectly; a mistake” (Michaelis 1963).
 2. One's deviating from what is correct, or true, in judgement, belief, or action (Michaelis 1963).
 3. In mathematics, the magnitude difference between an observed value and mean value (Michaelis 1963).
 4. In mathematics, any deviation from a true, or mean, value, not due to gross blunders of observation or measurement (Michaelis 1963).

Comment: In statistics, “error” is used as a shorthand for many different quantities or concepts, including random and systematic errors introduced by an experimenter, the discrepancy between type-I and type-II errors, variation among replicates, and variation among samples (Hurlbert 1984, 188).
- ♦ **experimental error** *n.*
 1. One's extraneous, chance variation in measurements of an experiment due to all of its nuisance variables (Lehner 1979, 83).
 2. Data variation that is not accounted for by a particular hypothesis (Lincoln et al. 1985).
cf. error: observer error, sampling error
- ♦ **measurement error** *n.* One's inaccurate measuring of a variable (Lewis-Beck 1980, 26).
Comment: Measurement error might result from one's making an experimental error, an observational error, observer error, or a combination of these errors.
- ♦ **observer error** *n.* Mistakes made by an investigator in observing behavior, analyzing behavior, or both (Lehner 1979, 128).
- **apprehending error** *n.* Observer error due to the physical arrangement of both an animal and its human observer (Lehner 1979, 128).
- **computational error** *n.* Observer error due to an investigator's inappropriate choice of a statistical test, its inappropriate performance, or both (Lehner 1979, 129).
- **decay** *n.* Observer error due to an observer's instrument (which includes the observer and scoring categories) that drifts beyond the bounds of acceptable measure error (Hollenbeck 1978, 96 in Lehner 1979, 128).
- **drift** *n.* Observer error due to movement of an observer in time from a base point in either a positive or negative direction (Hollenbeck 1978, 96 in Lehner 1979, 128).
- **recording error** *n.* Observer error due to an observer's inexperience, mental lapses, poor techniques, poor equipment, or a combination of these things (Lehner 1979, 129).
cf. error: recording error
- ♦ **orthographic error** *n.* One's unintentional misspelling (Lincoln et al. 1985).
- ♦ **prediction error** *n.*
 1. In regression analysis, the difference between a predicted \hat{Y}_i and Y_i (Lewis-Beck 1980, 38).

- syn.* residual (Lewis-Beck 1980, 38)
2. A quantity that measures how well a model predicts a response value of a future observation (Efron and Tibshirani 1993, 237).
- cf.* statistical test: cross-validation
- Comment:* Researchers often use prediction error to select models that they will use in their statistical work because a model with a lower prediction error can be more useful than one with a higher one (Efron and Tibshirani 1991, 237).
- random error** *n.* Any deviation whose magnitude and direction cannot be predicted (Lincoln et al. 1985).
- recording error** *n.* A person's incorrectly recording a datum or data.
- cf.* error: observer error: recording error
- residual** See error: prediction error.
- sampling error** *n.*
 1. "The difference between an observed value of a statistic and the parameter it is intended to estimate" (Lincoln et al. 1985).
 2. "The variation between the observations in any one cell of an analysis of variance" (Lincoln et al. 1985).*cf.* error: experimental error
- specification error** *n.* In statistical regression, one's assuming that a relationship between a dependent and independent variable is linear, when in fact it is not; excluding a relevant independent variable in a regression analysis; including an irrelevant independent variable in a regression analysis; or a combination of these errors (Lewis-Beck 1980, 26).
- type-I error** *n.* In statistics, one's rejection of a true null hypothesis; contrasted with type-II error (Siegel 1956, 9).
- Note:* One can calculate the probability of making a type-I error by using statistical tests.
- cf.* power of a statistical test
- syn.* Type I error (Milinski 1997, 177)
- **experimentwise-type-I error** *n.* The probability of one, or more, type-I errors when all of the possible comparisons in an experiment are made (Day and Quinn 1989, 434).
- type-II error** *n.* In statistics, one's nonrejection of a false null hypothesis; contrasted with type-I error (Siegel 1956, 9).
- Note:* One can calculate the probability of making a type-II error.
- syn.* Type II error (Milinski 1997, 178)
- ♦ **erst** See ²group: erst.
- ♦ **erucivore** See -vore: erucivore.
- ♦ **erucivory** See -vore: erucivore.
- ♦ **eruptive evolution** See ²evolution: eruptive evolution.
- ♦ **erythrism** *n.* For example, in some bird and mammal species: Excessive and abnormal redness in the color of an individual or population (Lincoln et al. 1985).
cf. albinism, melanism
- ♦ **erythrophobia** See -phobia: erythrophobia.
- ♦ **ESA** See law: Endangered Species Act.
- ♦ **escalated-showing-off dispute** See dispute: escalated-showing-off dispute.
- ♦ **escalation hypothesis** See hypothesis: escalation hypothesis.
- ♦ **escape behavior** See behavior: escape behavior.
- ♦ **escape conditioning** See learning: conditioned learning: escape conditioning.
- ♦ **escape learning** See learning: escape learning.
- ♦ **escapement clock** See clock: biological clock.
- ♦ **escargatoire** See ²group: escargatoire.
- ♦ **escort** *v.t.* For example, in a male Locust-leaf-miner Beetle: To remain with a female mate for a long time after copulating with her and while she feeds, rests, and moves about [coined by Kirkendall 1984, 909].
cf. behavior: mate-guarding behavior
- ♦ **escort phase** See phase: escort phase.
- ♦ **Eshkol-Wachmann movement notation** *n.* A notation for recording animal motor patterns, originally devised for ballet (Immelmann and Beer 1989, 194).
- ♦ **espèces jumelles** See ²species: sibling species.
- ♦ **E-species** See ²species (comments).
- ♦ **ESS** See strategy: evolutionarily stable strategy.
- ♦ **essences** See *eide*.
- ♦ **essentialism** *n.*
 1. Plato's view that nature is regulated by laws that can be stated in mathematical terms (Mayr 1982, 38, 45).
Note: Essentialism is similar to the deductive method of Descartes and the mechanistic world picture of Galileo (*q.v.*).
 2. "All members of a species share the same essence (unaffected by external influences or occasional accidents), the study of nature is simply the study of species" (Mayr 1982, 639).
Note: Essentialism completely dominated western thought from the Middle Ages through the 19th century (Mayr 1982, 639).
 3. One's belief that the variation of nature can be reduced to a limited number of basic classes that represent constant, sharply delimited types (Mayr 1997, 307).
syn. fulguration (Lorenz 1973 in Mayr 1982, 64), typological thinking
cf. population thinking, ²species (def. 4)
- ♦ **essentialist-species concept** See ²species (def. 4).
- ♦ **essentialism** See essentialism.
- ♦ **estival** See aestival.
- ♦ **estivation** See dormancy: estivation.
- ♦ **estriol** See hormone: estriol.
- ♦ **estrogen** See hormone: estrogen.
- ♦ **estrous cycle** See cycle: estrous cycle.
- ♦ **estrus, Brit. oestrus** *n.*
 1. A female mammal's "vehement bodily appetite or passion," specifically sexual orgasm; rut (Oxford English Dictionary 1972, entry from 1890).
 2. An female mammal's period of heat, or maximum sexual receptivity; ordinarily, estrus is also the time of egg release (Wilson 1975, 583).
 3. An female mammal's relatively delimited period of female sexual receptivity, a stage defined by that receptive behavior rather than by hormonal, or other physiological, factors (Daly and Wilson 1983).
See behavior: rutting behavior.
Note: "Estrus" or "heat," is sometimes synonymized with "courtship" in female mammals with the connotation of physiological readiness for mating (Immelmann and Beer 1989, 91).
syn. estrum (Michaelis 1963), heat, oestrum, *Rossigkeit* and *Rauschzeit* (German), rut (in mammals), season
cf. behavior: rutting, courtship, cycle: estrous cycle, rut
adj. estrous, oestrous, estrual
[Latin *oestrus* < Greek *oistros*, gad fly, breeze, hence frenzy, mad impulse]
- anestrus, anoestrus** *n.*
 1. A nonbreeding period (Lincoln et al. 1985).
 2. In Mammals: The phase of a female's reproductive cycle following estrus when she is sexually

- unreceptive and incapable of being fertilized (Immelman and Beer 1989, 14).
cf. cycle: estrus cycle
- diestrus, dioestrous, diestrous** *adj.* In Mammals: Referring to a female's being between estrous periods (Dewsbury 1978, 60).
- monestrus, monoestrous** *adj.* Referring to an organism that has a single breeding period in a sexual season.
- polyestrus species, polyoestrous species** See ²species: polyestrous species.
- Rammelzeit, shag time** *n.* The reproduction period of Hares and Rabbits (Heymer 1977, 47). [Rammelzeit, German sexually motivated chasing]
- Ranz** *n.* The reproduction period of Badgers and Foxes (Heymer 1977, 47). [German Ranz, hunting jargon]
- Rauschzeit** *n.* The reproduction period of Wild Boars (Heymer 1977, 47).
- Rolligkeit** *n.* The reproduction period of Cats (females) (Heymer 1977, 47).
- Rossigkeit** *n.* The reproduction period of Horses (Heymer 1977, 47).
- ♦ **estuary** *n.* A coastal body of water that has a free connection with the open sea and where fresh water from land drainages mixes with sea water (Allaby 1994, 143). *Comments:* Estuaries are often subject to oceanic tidal activity (Allaby 1994, 143–144). An estuary usually results from a postglacial rise in sea level that drowns a river valley.
- negative estuary** *n.* An estuary (*q.v.*) in which water evaporation exceeds freshwater inflow and the estuary water is hypersaline (Allaby 1994, 143–144).
- positive estuary** *n.* An estuary (*q.v.*) in which surface salinity is lower within the estuary than in the open sea, owing to the freshwater inflows' exceeding outflow caused by water evaporation (Allaby 1994, 143).
- ♦ **et-epimeletic behavior** See behavior: epimeletic behavior.
- ♦ **etheogenesis** See parthenogenesis: etheogenesis.
- ♦ **ethical behaviorism** See behaviorism: ethical behaviorism.
- ♦ **ethical institutionism** *n.* One of several theories of ethical behavior in Humans, proposing that a human mind has a direct awareness of true right and wrong that it can formalize by logic and translate into rules of social action (Wilson 1975, 562). *cf.* behaviorism: ethical behaviorism; developmental-genetic conception of ethical behavior
- ♦ **ethnobotany** See study of: botany.
- ♦ **ethnography** See study of: ethnography.
- ♦ **ethnology** See study of: ethnology.
- ♦ **ethoparasitism** See parasitism: social parasitism: ethoparasitism.
- ♦ **ethnozoology** See study of: zoology.
- ♦ **ethocline** See -cline: ethocline.
- ♦ **ethoendocrinology** See study of: endocrinology: behavioral endocrinology.
- ♦ **ethodynamic pollination** See pollination: ethodynamic pollination.
- ♦ **ethogenesis** See -genesis: ethogenesis.
- ♦ **ethogram** See -gram: ethogram.
- ♦ **ethological** *adj.* Pertaining to behavior, particularly species-specific aspects (Lincoln et al. 1985). *cf.* study of: ³ethology
- ♦ **ethological-isolating mechanism** See mechanism: isolating mechanism: sexual-isolating mechanism.
- ♦ **ethological isolation** See isolation: ethological isolation.
- ♦ **ethology** See study of: ^{1,2,3}ethology.
- ♦ **ethology of domestic animals** See study of ³ethology: applied ethology.
- ♦ **ethometry** See -metry: ethometry.
- ♦ **ethomimicry** See mimicry: behavioral mimicry.
- ♦ **ethospecies** See ²species: ethospecies.
- ♦ **ethosystematics** See study of: systematics: ethosystematics.
- ♦ **ethotype** See -type: ethotype.
- ♦ **ethylene** See hormone: ethylene.
- ♦ **etiology, aetiology** *n.* The demonstrated cause of a disease or trait (Lincoln et al. 1985). See study of: etiology. *syn.* causation (Lincoln et al. 1985)
- ♦ **etymology** *n.*
1. Tracing out and describing the elements of a word with their modifications of form and sense (Oxford English Dictionary 1972, entries from 1588); the derivation and meaning of a word, *e.g.*, scientific name or taxonomic epithet (Lincoln et al. 1985).
 2. A statement resulting from def. 1 (Michaelis 1963). See study of: etymology.
- ♦ **eu-** *prefix*
1. "Good; well; easy; agreeable" (Michaelis 1963).
 2. True, as in eusociality (true sociality). [Greek *eu*, well < *eus*, good]
- ♦ **euapogamy** See -gamy: euapogamy.
- ♦ **eubiosphere** See -sphere: biosphere: eubiosphere.
- ♦ **euclonal society** See ²society: euclonal society.
- ♦ **eucrypsis** See mimicry: eucrypsis.
- ♦ **eugenic, aristogenic** *adj.* Pertaining to, or having the capacity for, increasing the fitness of a breed of organisms (Lincoln et al. 1985). *cf.* dysgenic
- ♦ **eugenics** *n.*
1. "The 'science' of improving human stock by giving the 'more suitable races or strains of blood a better chance of prevailing speedily over the less suitable'" (Galton 1883, 24–25 in Kevles 1992, 92); the application of artificial selection to improve *Homo sapiens sapiens* biologically (Mayr 1982, 623). *Notes:* The idea of eugenics dates back at least to Plato (Kevles 1992, 92). "Eugenics" had many meanings that mirrored a broad range of social attitudes. No political bias was at first attached to eugenics, but in the long run it led to the horrors of Hitler's holocaust (Mayr 1982, 623). "Eugenics [with implications of social prejudice] remains a dirty word" (Kevles 1992, 94). [coined by Francis Galton, geneticist (1883 in Kevles 1992, 92)]
 2. The science of breeding (Lincoln et al. 1985).
 3. Application of genetic principles to improve inherited qualities of a breed (Lincoln et al. 1985).
- ♦ **negative eugenics** *n.*
1. A branch of eugenics that "endeavors to reduce the number of deleterious genes in a population by preventing the reproduction of carriers of dominant genes and by reducing the reproductive rate of heterozygous carriers of recessives (where such heterozygotes can be diagnosed); contrasted with positive eugenics (Mayr 1982, 623).
 2. Improvement of the genetic constitution of a population by preventing reproduction in individuals with undesirable heritable characteristics (Lincoln et al. 1985).

3. Encouraging socially unworthy people to breed less, or better yet, not at all (Kevles 1992, 92).
- positive eugenics** *n.*
1. Improvement of the genetic constitution of a population by selective breeding of individuals with desirable heritable characteristics; contrasted with negative eugenics (Lincoln et al. 1985).
 2. Fostering a greater representation of "socially valuable" people in society (Kevles 1992, 92).
- ♦ **euhydrophile** See ¹-phile: euhydrophile.
- ♦ **eukaryote** See -karyote: eukaryote.
- ♦ **eukaryotic sex** See sexual reproduction: eukaryotic sex.
- ♦ **eulectic** See -tropic: eutropic.
- ♦ **eophile** See ²-phile: euphile.
- ♦ **euplankton** See plankton: euplankton.
- ♦ **euploidy** See ploidy: euploidy.
- ♦ **eupyrene sperm** See gamete: sperm: eupyrene sperm.
- ♦ **European ethology** See study of: ³ethology: classical ethology.
- ♦ **europophile** See ¹-phile: eurotophile.
- ♦ **eury-** prefix Wide, broad (Michaelis 1963).
cf. steno-
[Greek *eurys*, wide]
- ♦ **uryadadaptive parasite** See parasite: euryadaptive parasite.
- ♦ **urybaric** *adj.* Referring to an organism that is tolerant of a wide range of atmospheric, or hydrostatic, pressure (Lincoln et al. 1985).
cf. stenobaric
- ♦ **urybathic** *adj.* Referring to an organism that is tolerant of a wide range of depth (Lincoln et al. 1985).
cf. stenobathic
- ♦ **urybenthic** See benthic: eurybenthic.
- ♦ **urybiot** See biot: eurybiot.
- ♦ **urychore** See -chore: eurychore.
- ♦ **urycladous** See -haline: euryhaline.
- ♦ **urycoenose** *adj.* Referring to a widespread organism (Lincoln et al. 1985).
cf. stenocoenose
- ♦ **uryhaline** See -haline.
- ♦ **uryhydric** *adj.* Referring to an organism that is tolerant of a wide range of moisture or humidity (Lincoln et al. 1985).
cf. stenoxydric
- ♦ **uryionic** *adj.* Referring to an organism that is tolerant of a wide range of pH (Lincoln et al. 1985).
cf. stenionic
- ♦ **urylume, euryphotic** *adj.* Referring to an organism that is tolerant of a wide range of light intensity (Lincoln et al. 1985).
cf. stenolume
- ♦ **uryoecism** See -oecism: euryoecism.
- ♦ **uryphage** See -phage: euryphage.
- ♦ **uryphotic** See eurylume.
- ♦ **uryplastic** *adj.* Referring to an organism that shows a broad developmental response (phenotypic variation) to different environmental conditions (Lincoln et al. 1985).
cf. stenoplastic
- ♦ **urysubstratic** *adj.* Referring to an organism that is tolerant of a wide range of substratum types (Lincoln et al. 1985).
cf. stenosubstratic
- ♦ **urytherm** See -therm: eurytherm.
- ♦ **urythermophile** See ¹-phile: thermophile: eurythermophile.

- ♦ **urytopic, eurytopic** See -topic: eurytopic.
- ♦ **urytropism** See -tropism: eurytropism.
- ♦ **uryxenous** See -xenous: euryxenous.
- ♦ **uryxeny** See -xeny: euryxeny.
- ♦ **eusexual** See sexual: eusexual.
- ♦ **eusexual reproduction** See sexual reproduction.
- ♦ **eusociality** See sociality: eusociality.
- ♦ **eusynanthropic** See anthropic: eusynanthropic.
- ♦ **eutely** *n.*
1. The phenomenon in which the adult-cell, or nuclear, number does not vary from that of a conspecific juvenile within a species (Lincoln et al. 1985).
 2. The phenomenon in which adult cell number does not vary among conspecific wildtype individuals as a consequence of invariant cell lineages (Azevedo et al. 2000, 71).
- adj.* eutelic
- Comments:* Researchers have generally considered nematodes to be eutelic (Azevedo et al. 2000, 71). A few strains of *Caenorhabditis elegans* are not eutelic, and adults of several other species vary within species in their number of epidermal nuclei. Most nematode species might not be eutelic after all (Cunha et al. 1999, 253).
- ♦ **euthenics** See study of: euthenics.
- ♦ **euthermy** See -thermy: cenothermy.
- ♦ **eutroglobiont, eutroglophile** See ¹-phile: troglophile: eutroglophile.
- ♦ **eutrogloxene** See -xene: eutrogloxene.
- ♦ **eutrophapsis** *n.* In some social-insect species: A female's feeding her young in a previously prepared nest (Lincoln et al. 1985).
- ♦ **eutrophy** See -trophy: eutrophy.
- ♦ **eutropic** See -tropic: eutropic.
- ♦ **eutropous** See -tropous: eutropous.
- ♦ **evaporation pan** See instrument: evaporation pan.
- ♦ **evapotranspiration** See transpiration: evapotranspiration.
- ♦ **Eve** See mitochondrial Eve.
- ♦ **Eve hypothesis, Eve theory** See hypothesis: African-origin hypothesis of human mitochondrial DNA evolution.
- ♦ **event** See behavior event.
- ♦ **event recorder** *n.* A time-based device used to record occurrences of behavioral events and states (Lehner 1979, 158–161).
- ♦ **Everglades** See place: Everglades.
- ♦ **¹evolution** *n.*
1. The process of opening out, unrolling, expanding (*e.g.*, tissues' developing during embryogenesis) (Oxford English Dictionary 1972, entries from 1641).
 2. An organism's process of developing from a less mature to a more mature, or fully mature or complete, state (Oxford English Dictionary 1972, entries from 1670; Richards 1992, 95).
 3. The concept that an embryo, or germ, expands from a pre-existing form that contains the rudiments of all the parts of the developed organism, rather than the new organism's arising from a fertilized egg (Bonnet 1762 in the Oxford English Dictionary 1972).
- Note:* This obsolete definition of evolution is the opposite of ideas under ²evolution below.
4. The process of change, production, or emission (*e.g.*, in a chemical reaction) (Oxford English Dictionary 1972, entries from 1800; Lincoln et al. 1985).

SOME CLASSIFICATIONS OF EVOLUTION

- I. Classification by what evolves
 - A. nonorganisms — inorganic evolution (= chemical evolution, nonbiological evolution) |
 1. universe evolution
 2. galaxy evolution
 3. element evolution
 4. molecule evolution
 5. etc.
 - B. organisms — organic evolution (= biological evolution, evolution)
 1. molecule evolution (in a living organism)
 2. biochemical-pathway evolution (in a living organism)
 - a. glycolysis evolution
 - b. photosynthesis evolution
 - c. etc.
 3. organelle evolution
 4. cell evolution
 5. organ evolution
 6. tissue evolution
 7. organism evolution
 8. family evolution
 9. society evolution
 10. community evolution
 11. etc.
- II. Classification with regard to genetic influences on organism evolution
 - A. genetic evolution (= “evolution,” a common sense of the term)
 - B. nongenetic evolution (= cultural evolution)
- III. Classification with regard to amount of organism evolution
 - A. microevolution
 - B. macroevolution (= speciation, “genusiation,” familiarization, etc.)
 1. gradual speciation (part of gradual evolution)
 2. instantaneous speciation (= instantaneous evolution)
- IV. Classification by kind of organism interactions
 - A. interspecific evolution
 1. diffuse coevolution (organisms in their communities: passionflower vine, butterflies, ants)
 2. pairwise coevolution
 - B. intraspecific evolution
 1. sexual evolution (includes female-male coevolution)
 2. family evolution
 3. society evolution
- V. Classification by speed of organism evolution
 - A. fast evolution (= tachytely) (e.g., instantaneous evolution)
 - B. medium-speed evolution (= horotely)
 - C. slow evolution (= bradytely) (e.g., slow speciation)
- VI. Classification by direction of organism evolution
 - A. convergent evolution
 - B. divergent evolution
 - C. parallel evolution
 - D. regressive evolution
- VII. Etc.

5. The process of undergoing “gradual directional change” (Lincoln et al. 1985).
6. The process of undergoing (organic) evolution (*q.v.*)

7. The result of any of these evolutionary processes (Oxford English Dictionary 1972).

v.t., v.i. evolve

Comment: Richards (1992) discusses the changes in the meaning “evolution” through time. Charles Darwin did not use the word “evolution” in his book *On the Origin of Species* (Weiner 1994, 297). “Biological evolution is the central organizing principle of modern biology” (National Academy of Sciences and Institute of Medicine 2008, 4).

[Latin *ēvolvēre*, to roll out, unroll]

chemical evolution *n.* A progressive development of organic molecules in a manner analogous to organic evolution (Immelmann and Beer 1989, 94). *syn.* inorganic evolution, nonbiological evolution

◆ **²evolution, organic evolution** *n.*

1. Development of a more highly organized biological phenomenon from a more rudimentary one during evolutionary time (Oxford English Dictionary 1972, entries from 1832).
2. Species gradual modification from earlier forms (Oxford English Dictionary 1972, entries from 1832).
3. Species’ origination from earlier forms, rather than by the process of “special creation” (Oxford English Dictionary 1972, entries from Lyell 1832). *syn.* doctrine of evolution (Oxford English Dictionary 1972)
4. Changes undergone by organisms in their phylogenetic histories (Immelmann and Beer 1989, 93).
5. Organism changes from generation to generation in gene frequencies of their gene pools, that generally lead to complex organizations and specialized forms from simpler precursors (Immelmann and Beer 1989, 93–94).

See ²evolution: macroevolution.

Note: A broad definition of “evolution” should include both “monotypic evolution” (= “transformation,” change of gene frequencies in populations) and “polytypic evolution” (diversification, processes that occur simultaneously like species multiplication) (Mayr 1982, 400).

See ²evolution: macroevolution; ³theory: theory of preformation.

syn. natural selection (a confusing synonym, Endler 1992, 223)

cf. elaboration; ¹evolution: chemical evolution; -genesis; diogenesis; ³theory; ³theory: autogenetic theory, central dogma of evolutionary theory, encasement theory, molecular theory of evolution, neutral theory, theory of evolution, uniformitarianism

Comments: “A retrospective survey of the various terms and definitions for evolution proposed since 1800 reveals quite clearly the ambiguities and uncertainties that have bedeviled evolutionists almost up to the present (Bowler 1975 in Mayr 1982, 400). Richards (1992) provides more information on the evolution of the term “evolution.” Broadly speaking, “evolution” can be “genetic evolution” or “nongenetic evolution” (= “cultural evolution”); it is also classified by many other criteria. “Evolution” can refer to a process or the result of an evolutionary process. I list only some of the many kinds of evolution here.

adaptation See ³adaptation: ^{1,2}evolutionary adaptation.

allomorphosis, evolutionary allometry, idioadaptation *n.* Evolution by a rapid increase in an organism’s structural specialization (Lincoln et al. 1985).

A

cf. ²evolution: aromorphosis

anagenesis *n.*

1. An evolutionary advance in organisms' general organization or perfection of some major biological function (Rensch 1954 in Huxley 1957, 454); "progressive evolution toward higher taxonomic levels" (Futuyma 1986, 550).
2. "All types or degrees of biological improvement from detailed adaptation to general organizational advance" (Huxley 1957, 454).
3. Directional evolution within a single lineage (Futuyma 1986, 286).
4. Directional evolution of a feature over an arbitrarily short lineage segment (Futuyma 1986, 550). See ²evolution: phyletic evolution.

syn. phyletic evolution (Dobzhansky 1962, 220; Mettler et al. 1988, 267)

cf. ²evolution: catogenesis, cladogenesis, stasigenesis

aromorphosis *n.* Evolution by an increase in an organism's degree of integration and organization without marked specialization (Lincoln et al. 1985).

cf. ²evolution: allomorphosis

arthrogenous evolution *n.* A hypothesis that a creative principle in living matter manifests itself in response to environmental stimuli (Lincoln et al. 1985).

bradygenesis, bradytely *n.*

1. Evolution with very slow, or almost no, change; contrasted with horotely and tachytely (Simpson in Boas 1984).
2. A smaller distribution of evolutionary speed within the total horotelic distribution of evolutionary speed, with a distinct central tendency of smaller values than the central tendency of the horotelic distribution (Simpson 1944 in Gould 1994, 6765). See ²evolution: horotely.

cataclysmic evolution See ²evolution: instantaneous evolution.

catagenesis, katogenesis *n.* Regressive evolution involving an organism's losing its independence from, and control over, its environment (Lincoln et al. 1985).

cf. ²evolution: anagenesis, stasigenesis

cladogenesis *n.*

1. Evolutionary splitting of organisms, "from subspeciation through adaptive radiation to the divergence of phyla and kingdoms" (Huxley 1957, 454, after Rensch 1947).
2. A single species' splitting into two species (Stebbins and Ayala 1985, 79).
3. Splitting and subsequent divergence of populations (Lincoln et al. 1985).

syn. dendritic evolution, evolutionary diversification, kladogenesis (Lincoln et al. 1985)

cf. ²evolution: anagenesis

coenogenesis, syngensis *n.* "Descent from a common ancestor" (Lincoln et al. 1985).

cf. -genesis: cenogenesis

coevolution *n.*

1. Evolution in which heterospecific organisms, *e.g.*, parasites and their hosts affect one another (Mode 1958, 158, who does not formally define coevolution).
2. The interaction between two major organism groups with a close and evident ecological relationship, such as plants and herbivores (Ehrlich and Raven 1964, 586, who do not formally define coevolution).
3. "Development of genetically determined traits in two species to facilitate some interaction, usually

mutually beneficial" (Ricklefs 1979 in Schemske 1982, 70, who states two drawbacks of this definition: many coevolution examples involve negative interactions between taxa, *e.g.*, predator versus prey, and coevolution results from the interaction, not to facilitate it).

4. "The simultaneous evolution of interacting populations" (Roughgarden 1979, 451).

Note: Schemske (1982, 70) states that this is a clear, and operationally correct, definition, but it "perhaps does not sufficiently emphasize the point made by both Ricklefs and Janzen that coevolution results from interactions between taxa at the level of particular traits."

5. "An evolutionary change in a trait of the individuals in one population in response to the trait of the individuals of a second population, followed by an evolutionary response by the second population to the change in the first" (Janzen 1980, 611).

cf. ²evolution: coevolution: diffuse coevolution

Note: Schemske (1982, 70) states that this definition "places unnecessary importance on the notion of reciprocity; coevolution can operate simultaneously or sequentially among interacting taxa."

6. "The joint selective effects on characters of interacting taxa, based on heritable variation in these characters" (Schemske et al. in Schemske 1982, 70, who indicates that this definition includes both positive and negative effects of an interaction and emphasizes that coevolution is dependent upon genetic variation in characters relevant to the interaction, and those characters that are genetically correlated with the selected ones).

7. Species adaptation to features of their biotic environments — features that may remain effectively constant for long periods (Futuyma and Slatkin 1983, 2).

Note: This is a very general definition that is equivalent to "evolution," therefore Futuyma and Slatkin (1983, 2) use a more restricted definition of "coevolution."

8. An adaptive response in two, or more, ecologically interacting species to genetic change in the other(s) (Futuyma and Slatkin 1983, 2).

Note: Some persons have interpreted this idea as a gene-for-gene coevolutionary reciprocity between heterospecific organisms; this kind of coevolution might not be common (Spencer 1988, 3).

9. "Stepwise, reciprocal evolution of ecologically intimate organisms" (Chu 1985).

See ²evolution: coevolution: diffuse coevolution.

Notes: Thompson (1983, 3), Futuyma (1989, 992), and others caution that evidence for "coevolution" requires evidence for reciprocal evolutionary response among interacting species. Buchmann and Nabhan (1996, 253) give the bee genus *Rediviva* and the plant genus *Diascia* as an example of reciprocal coevolution in which both organisms apparently directed each other's evolution. These organisms probably cannot live long without each other in nature. Roubik (1989, 55) illustrates these organisms.

Comments: "The idea of coevolution is as old as the study of evolution itself" (Futuyma and Slatkin 1983, 3). Janzen (1980) discusses misuses of the concept coevolution; he suggests removing "coevolution" as a synonym of "interaction," "symbiosis," "mutualism," and "animal-plant interaction." "Applied to plant-herbivore and predator-prey systems, it [coevolution] is often referred to as an evolutionary arms race between

two species: Adaptations in one species lead to counteradaptations in the other, which in turn provoke a response by the first, and so on" (Chu 1985). Slatkin (1987, 789) discusses parasite-host coevolution.

► **diffuse coevolution** *n.*

1. Coevolution that occurs when either, or both, interacting parties are represented by an array of populations that generate a selective pressure as a group (Janzen 1980, 611).
2. Evolution of a particular trait in one, or more, species in response to a trait, or suite of traits, in several other species; e.g., many plants have evolved chemical and physical defenses against a diverse suite of insects, and many insects have evolved the ability to detoxify a wide range of plant chemicals (Futuyma and Slatkin 1983, 2).

syn. coevolution (Futuyma and Slatkin 1983, 2)

organism-environment coevolution *n.* Evolution in which an organism changes its external environment, it changes the organism, it changes the external environment, and so forth (inferred from Lewontin 2000, 126).

cf. principle: principle of topological continuity

► **pairwise coevolution** *n.* Coevolution involving only two species, e.g. a plant and its herbivore or a plant and its pollinator (Futuyma and Slatkin 1983, 2).

► **runaway coevolution** *n.* A hypothetical kind of coevolution that has resulted in exaggerated traits, e.g., the bright orange body color in *Poecilia reticulata* (Guppies) or long male eyestalks of a stalk-eyed fly (Dugatkin and Godin 1998, 59).

community evolution *n.* The evolutionary interactions among different kinds of organisms where exchange of genetic information among them is assumed to be minimal or absent (Ehrlich and Raven 1964, 586).

concerted evolution *n.* The maintenance of a homogeneous nucleotide sequence in members of a gene family that evolves over time (Futuyma 1986, 551).

convergent evolution, convergence *n.*

1. Two, or more, distantly related organisms' evolving similar morphological, biochemical, behavioral, or other kinds of adaptations due to adapting to the same, or similar, ecological conditions (Wilson 1975, 25).

Note: Convergent evolution is on a continuum from very shallow through very deep, based on the degree of complexity of adaptation involved and the extent to which a species has organized its way of life around it (Wilson 1975, 25).

2. The evolution of similar nonhomologous apomorph characteristics (nonhomologous apomorphy or pseudoapomorphy) (Mayr 1982, 228); e.g., egg rolling and distraction displays in many species of ground-nesting birds; flight in Bats, Birds, and many insect species; hovering in some bird and insect species; gliding in Flying Lemurs and some frog, lizard, and squirrel species; grazing in Old World ruminants and New World rodents; mouth breeding in some fish species; nectar foraging in Old World Nectariniid Birds and New World Hummingbirds; sucking drinking by *Columba livia* (Rock Doves) and some estrildine-finch species; and swimming adaptations in Sharks and Whales (Brown 1975, 13; Heymer 1977, 102; Immelmann and Beer 1989, 60).

syn. evolutionary convergence, (Wilson 1975, 584), syntechny (Lincoln et al. 1985)

cf. ²evolution: divergent evolution, parallel evolution; mimicry

counterevolution *n.* Evolution of traits in members of a population in response to adverse interactions with another population (Lincoln et al. 1985).

cultural evolution *n.*

1. For example, in *Geospiza fortis* (Darwin's Medium Ground Finch), Humans, and *Macaca fuscata* (Japanese Macaques): "The patterns and processes involved in changes in behavioural traditions across generations" in a population (Cavalli-Sforza and Feldman 1981 and Boyd and Richardson 1985 in Gibbs 1990, 253).
2. The appearance of a new behavior and its transmission to subsequent generations by tradition (Immelmann and Beer 1989, 94).

syn. nongenetic evolution

cf. tradition

cyclic evolution *n.* A species' evolution involving an initial phase of rapid expansion, followed by a long period of relative stability and a final brief episode of degeneration and overspecialization leading to its extinction (Lincoln et al. 1985).

cytocalytic evolution *n.* In some plant species: Evolution that is initiated by an abrupt mutation that results in the formation of a polyploid or aneuploid (Lincoln et al. 1985).

dendritic evolution See ²evolution: cladogenesis.

diffuse coevolution See ²evolution: coevolution.

divergent evolution *n.*

1. "An arborescent multiplication of types arising simultaneously in space" (given as polytypic evolution in Romanes 1897, 22).
2. Evolution of dissimilar characters by related organisms (Lincoln et al. 1985).
3. Evolution in which a model changes in appearance from its mimic (Brower and Brower 1972, 65).

cf. ²evolution: convergent evolution, parallel evolution, phyletic evolution, polytypic evolution

emergent evolution *n.* Appearance of entirely novel and unpredictable characters by the rearrangement of existing potentialities (Lincoln et al. 1985).

cf. emergence

entelechy See -genesis: orthogenesis.

eruptive evolution See ²evolution: explosive evolution.

explosive evolution *n.* For example, in cichlid fish, Hawaiian *Drosophila*, and Honeycreepers (birds): A group's, or population's, splitting into numerous lines of descent within a relatively short geological period; rapid adaptive radiation (Greenwood 1974 and Mayr 1976, 268–270 in Greenwood, 819; Lincoln et al. 1985).

syn. episodes of proliferation, eruptive evolution (Simpson 1953, 234); explosive radiation (Lincoln et al. 1985); tachytelic evolution (Grant 1963, 555); *Virenzperioden* (Rensch 1947 in Simpson 1953, 234)

Comments: Simpson (1953, 234) coins "episodes of proliferation" and explains why he prefers it to other names for this phenomenon. He says "explosive evolution" is ill-chosen because it has a "certain unintended humor." The "explosions" commonly take millions of years and end with a "silent bang." "Eruptive evolution" suggests an inept mental picture to him. He writes that "*Virenzperioden*" might carry some undertone of a life-cycle analogy. About

500 cichlid-fish species apparently evolved in Lake Victoria in about 12,400 yr (Yoon 1996, 27 August, C1; Seehausen 1997, 1808). In contrast about 20 species of Darwin's Finches evolved on the Galápagos Islands in about 4 Ma. About half of Lake Victoria's original cichlid species are now extinct, probably primarily as a result of its eutrophication, which led to a breakdown of cichlid reproductive barriers and a loss of their diversity (Hanson 1997, 1737) and consumption by *Lates niloticus* (Nile Perch) (Vick 1999, 22 September, A28).

Falconer-style evolution *n.* Evolution in which adaptation is a rare event and in which most of the time, most species do not show structural changes even when these changes would apparently increase their adaptiveness to their changing environments; a species is a "stuttering and sporadic adaptive trajectory" (Bakker 1985, 74).

cf. hypothesis: hypothesis of punctuated equilibrium
Comment: Falconer-style evolution is being accepted by an increasing number of biologists (Bakker 1985, 74).

gradualism, gradual evolution See ²evolution: horotely.

haplogenesis *n.* Evolution of new forms (Lincoln et al. 1985).

hologenesis *n.*

1. The hypothesis that all species arose simultaneously throughout their modern distribution without subsequent dispersal (Lincoln et al. 1985).
2. Origin of species by multiple mutation from a single extinct ancestor (Lincoln et al. 1985).

homeotely *n.* Evolution of homologous structures (Lincoln et al. 1985).

horotely *n.*

1. Evolution with gradual change (Simpson 1944 in Boas 1984).
 2. The entire distribution of ordinary evolutionary rates which includes a left region of slower rates with a distinct central tendency (bradytely) and a right region of faster rates with a distinct central tendency (tachytely) (Simpson 1944 in Gould 1994, 6765).
- Notes:* In specifying bradytely, horotely, and tachytely, Simpson (1944) was trying to identify separate peaks (modes in the statistical sense) in the distribution of tempos of evolution in order to specify distinct modes (in the ordinary sense) of evolution (Gould 1994, 6766). Many researchers have misunderstood these kinds of evolution.
3. Evolution at a normal, or average, rate (Lincoln et al. 1985).

Comment: Many researchers have misunderstood these kinds of evolution, and definitions 1 and 3 are erroneous (Gould 1994, 6766).

hypertely *n.*

1. Evolutionary overspecialization (Lincoln et al. 1985).
2. An organism's, or structure's, progressive attainment of disproportionate size (Lincoln et al. 1985).

instantaneous evolution *n.* Evolution through polyploidy in which new species arise in as short a time as one generation (Stebbins 1951, 54–55; Stebbins and Ayala 1985, 73).

syn. cataclysmic evolution

cf. speciation: instantaneous speciation

introgressive evolution See introgression.

iterative evolution, iterative adaptation *n.*

Repeated production of an adaptive type at successive points in an organism's lineage (Lincoln et al. 1985).

kladogenesis See ²evolution: cladogenesis.

lipogenesis *n.* Accelerated evolutionary development due to loss of certain developmental stages (Lincoln et al. 1985).

lipopalingenesis *n.* A descendant's loss of one, or more, developmental stages that were present in its ancestral form (Lincoln et al. 1985).

cf. ²evolution: regressive evolution

Lizzie-Borden evolution *n.* Evolution in which first, daughter species bud off parental stock (hypothesis of punctuated equilibrium) and second, daughter species spread and exterminate their parental stock over most of its range (Bakker 1985, 74).

cf. Schankler immigration event

[After Lizzie Borden who allegedly killed her stepmother and father with a hatchet]

macroevolution *n.*

1. Evolution above the species level (Rensch 1959 in Futuyma 1986, 397).

Note: This is a common definition of macroevolution.

2. The origin of higher taxonomic units (Mayr 1982, 607; Lincoln et al. 1985).

syn. transpecific evolution, macrophylogensis, megaevolution (Lincoln et al. 1985)

3. Evolution as studied by paleontologists and comparative anatomists (Mayr 1982, 607).

4. Major evolutionary events, or trends, usually viewed through the perspective of evolutionary, or geological, time (Lincoln et al. 1985).

5. A change in species composition within a monophyletic group in space and time (Eldredge and Cracraft 1980).

Note: "If species are discrete reproductive units, microevolutionary processes cannot logically be extrapolated, in a reductionist manner, to explain macroevolutionary patterns" (Eldredge and Cracraft 1980).

syn. evolution (Wilson 1975, 589)

See study of: evolution: macroevolution.

cf. ²evolution: microevolution

Comments: "Macroevolutionary change is usually recognized as change in gross morphology in a series of fossils. There is some controversy over whether macroevolutionary change is fundamentally just cumulated microevolutionary change, or whether the two are 'decoupled' and driven by fundamentally different kinds of process" (Dawkins 1982, 289).

macrophylogensis See ²evolution: macroevolution.

megaevolution See ²evolution: macroevolution.

microevolution *n.*

1. A change in gene frequency within a population or species; evolution in its slightest, most elemental form (Wilson 1975, 64; Eldredge and Cracraft 1980; Futuyma 1986, 397).

Note: Microevolution is a highly frequent in organism populations. Many pathogens have developed resistance to antibiotic drugs and many arthropod pests have developed resistance to pesticides as a result of microevolution. These phenomena are problems for human health and agriculture (Falkow and Kennedy 2001, 397).

2. "A small amount of evolutionary change, consisting of minor alterations in gene proportions, chromosome structure, or chromosome numbers" (Wilson 1975, 589).

Note: "A larger amount of change would be referred to as macroevolution or simply as evolution" (Wilson 1975, 589).

syn. evolution, microphylogensis (Lincoln et al. 1985)

cf. ²evolution: macroevolution

monotypic evolution, transformation *n.*

Change of gene frequencies in populations (Mayr 1982, 400).

syn. transformation in time (Romanes 1897, 21)

cf. ²evolution: polytypic evolution

[coined by Gulick 1888 in Mayr 1982, 400]

morphogenesis, morphogeny *n.* Evolution of morphological structures (Lincoln et al. 1985).

cf. -genesis: morphogenesis

mosaic evolution, nonharmonious character transformation *n.* Evolution of different adaptive structures, traits, or other components of a phenotype at different times, or different rates, in an evolutionary sequence (Lincoln et al. 1985).

See principle: principle of mosaic evolution.

non-Darwinian evolution *n.* Genetic change owing to stochastic processes (essentially neutral mutations) with neither the environment's (directly or through selection) nor internal factors' influencing the direction of variation and evolution (Kimura 1979, 98; Mayr 1982, 361; King and Jukes 1969 and Crow and Kimura 1970 in Mayr 1982, 593).

See ³theory: non-Darwinian evolution.

cf. ³theory: neutral theory

nongenetic evolution See ²evolution: cultural evolution.

orthogenesis, aristogenesis, entelechy *n.*

Evolution continuously in one direction over a considerable time, commonly with the implication that the direction is determined by a factor internal to an organism, or, at least, not determined by natural selection (Lincoln et al. 1985).

cf. ²evolution: non-Darwinian evolution, rectilinear evolution; -genesis: orthogenesis

parallel evolution *n.*

1. Evolution of and maintenance of similar traits in two organismal lines for a significant period of time (Mayr 1982, 234) [e.g., similar adaptations of eutherian mammals in North and South America and marsupial mammals in Australia, possibly longitudinal contraction used for escape by several worm genera (Brown 1975, 14), or flight refinements in paleopterous and neopterous insects] (Kukalova-Peck 1978).

2. The independent acquisition in two, or more, related descendant species of similar derived character states evolved from a common ancestral condition (Lincoln et al. 1985), e.g., similar morphological and behavioral adaptations in African antelope species (Immelman and Beer 1989, 60).

3. "The maintenance of constant differences in the evolution of characters between two unrelated lines" (Lincoln et al. 1985).

syn. evolutionary parallelism, parallelism (Lincoln et al. 1985)

cf. ²evolution: convergent evolution, divergent evolution

phyletic evolution *n.*

1. A species' evolutionary transformation into another species (Darwin in Mayr 1963, 428; Mayr 1982, 400).
2. Evolution of a population from one state to another resulting in a single new species (Simpson 1944,

198, in Eldredge and Cracraft 1980, 262; Eldredge and Gould 1972, 87).

3. A sequence of changes that occurs more, or less, uniformly throughout a species' entire geographical range over an extended period, often regarded as a type of speciation (Lincoln et al. 1985). See ²evolution: anagenesis.

syn. anagenesis (Dobzhansky 1962, 220; Mettler et al. 1988, 267), modification in time, modification by descent (Darwin in Mayr 1963, 428), monotypic evolution (Gulik in Romanes 1897, 21), transformation, transformation in time (Romanes 1897, 21), vertical evolution *cf.* ²evolution: divergent evolution; ²extinction: pseudoevolution; speciation: phyletic speciation

polytypic evolution *n.* Evolutionary processes that occur simultaneously like species multiplication (Mayr 1982, 400).

syn. diversification (Mayr 1982, 400), transformation in space (Romanes 1897, 21)

See ²evolution: horizontal evolution.

cf. evolution: divergent evolution, monotypic evolution [coined by Gulick 1888 in Mayr 1982, 400]

punctuational evolution *n.*

1. Periodic and rapid evolution (Simpson in Boas 1984).

2. A model of evolution in which species are relatively stable and long-lived and in which new species appear during concentrated outbursts of rapid speciation, followed by differential success of certain species (Lincoln et al. 1985).

syn. macrogenesis (Mayr 1982, 75)

cf. gradualism: phyletic gradualism; hypothesis: hypothesis of punctuated equilibrium; saltation

quantum evolution *n.*

1. "The relatively rapid shift of a biotic population in disequilibrium to an equilibrium distinctly unlike an ancestral condition" [coined by Simpson 1944, 206, in Mayr 1982, 609]; the fastest kind of speciation, e.g., Bats originating from an insectivore within a few million years ..." (Mayr 1982, 609-610).

2. "Rapid and rare, but efficacious, 'all-or-nothing' transitions form one adaptive zone to another through an inadaptive phase (a process analogized with Wright's model of genetic drift)" (Simpson 1944 in Gould 1994, 6766).

3. A rapid evolutionary shift to a new adaptive zone under strong selective pressure (Lincoln et al. 1985).

syn. saltational evolution (according to some authors) *cf.* ²evolution: instantaneous evolution, phyletic evolution, saltational evolution; speciation: quantum speciation; ³theory: catastrophe theory

rectilinear evolution *n.* Continued change in one direction within a line of descent over a considerable time period, with no implication as to how this direction is maintained (Lincoln et al. 1985).

cf. ²evolution: orthogenesis

regressive evolution, regression *n.*

1. Evolution in which an organism changes back to an ancestral condition, e.g., Whales' re-evolving the streamlined form of their distant fish-like ancestors.

2. Evolution of increasing structural simplification (Lincoln et al. 1985).

3. Evolution of decreasing specialization (Lincoln et al. 1985).

cf. ²evolution: lipopalingenesis; reduction

reticulate evolution *n.* Evolution that depends on repeated intercrossing between a number of lineages that produces a network of relationships in a

series of related allopolyploid species with anastomoses in the network representing hybridization sites (Lincoln et al. 1985).

Comment: Reticulate evolution occurs in Darwin's Finches and may be a general process in the origin of species (Wiener 1994, 201).

[reticulate < Latin, diminutive for net]

retrograde evolution, backward evolution *n.*

Evolution that lengthens a biochemical pathway when a particular substrate is depleted; contrasted with "nonretrograde evolution" (Horowitz 1945 in Strickberger 1990, 141).

Comment: Retrograde evolution is believed to account for many intermediate steps in biochemical pathways that lead to the synthesis of compounds such as amino acids (Strickberger 1990, 141). A hypothetical example of retrograde evolution originally involves four substrates and one enzyme, enzyme-1. Substrate-D is a precursor of -C, -C is a precursor of -B, and -B is a precursor of -A. Enzyme-1 converts substrate-B to -A. After all -B is depleted in an organism's environment, an enzyme eventually mutates by chance and becomes enzyme-2 which converts substrate-C to -B, which enzyme-1 converts to -A. After all -C is depleted in the organism's environment, an enzyme mutates by chance and becomes enzyme-3 which converts substrate -D to -C, which enzyme-2 converts to -B.

[retrograde < Latin *retrogradus* < *retrogradi* < *retro*, backward + *gradi*, to walk]

saltational evolution, saltatory evolution, saltation *n.*

Possible evolution by major reorganization, rather than by progression through slight intermediate stages; by new features emerging by Lamarckian mechanisms; and by internal, "autogenetic" drives rather than natural selection (Mayr 1982; Futuyma 1986, 397).

See ²evolution: quantum evolution; speciation: saltational speciation.

syn. saltative evolution (Eldredge and Gould 1972, 87) *cf.* ²evolution: punctuational evolution; saltation

Comment: This is a controversial concept.

speciation See ²evolution: macroevolution.

stasigenesis *n.*

1. "All processes leading to stabilization and persistence of types and of patterns of organization from species up to phyla" [coined by Huxley (1957, 454)].
2. Persistence of a form, or group, showing little change over an extended time, irrespective of changing environmental conditions (Lincoln et al. 1985).
3. An organism's tendency to form well integrated gene pools with well-adapted phenotypic products that persist under stabilizing selection (Lincoln et al. 1985).

cf. ²evolution: anagenesis, catogenesis

tachygenesis *n.* Accelerated ontogenetic, or phylogenetic, development, e.g., omission of certain larval stages during development (Lincoln et al. 1985).

cf. ²evolution: bradygenesis

tachytely *n.*

1. A smaller distribution of evolutionary speed within the total horotelic distribution of evolutionary speed, with a distinct central tendency of larger values than the central tendency of the horotelic distribution; contrasted with bradytely and horotely (Simpson 1944 in Gould 1994, 6765).

2. Relatively fast evolution, e.g., when populations shift from one major adaptive zone to another (Lincoln et al. 1985).

See ²evolution: horotely

tandem evolution *n.* The concept that in evolution, an organism transforms from one homozygous type to another homozygous one (Mayr 1982, 429).

Comment: This concept neglects the fact that during evolution, genetic change in a species can proceed simultaneously at thousands, if not millions, of loci (Mayr 1982, 429).

transformation See ²evolution: monotypic evolution, phyletic evolution.

transpecific evolution See ²evolution: macroevolution.

zoogenesis *n.*

1. "The origin of animal life on Earth" (Lincoln et al. 1985).

syn. zoogeogenesis (Lincoln et al. 1985)

2. The evolution and development of an animal species" (Lincoln et al. 1985).

syn. zoogeny (Lincoln et al. 1985)

cf. -genesis

◆ **evolution-by-natural-selection tautology** *n.*

"The fitter genotypes are those that leave more descendants, which because of heredity, resemble the ancestors; and the genotypes that leave more descendants have greater Darwinian fitness" (Wilson 1975, 67).

Comment: This is a statement of what has already happened and does not predict which genotypes will be more fit than others in the future (Wilson 1975, 67). Thus, it does not have to be considered a tautology.

◆ **evolution, theory of** See ³theory: theory of evolution.

◆ **evolutional load** See genetic load: substitutional load.

◆ **evolutionarily stable population** See ¹population: evolutionarily-stable population.

◆ **evolutionarily stable set of genes** *n.* A gene pool that cannot be invaded by another gene (Dawkins 1977).

◆ **evolutionarily stable strategy** See strategy: evolutionarily-stable strategy.

◆ **evolutionary adaptation** See ³adaptation: ^{1,2}evolutionary adaptation.

◆ **evolutionary allometry** See ²evolution: allomorphosis.

◆ **evolutionary biology** See study of: biology: evolutionary biology.

◆ **evolutionary clock** See clock: molecular clock.

◆ **evolutionary conflict** See ³conflict: evolutionary conflict.

◆ **evolutionary conservatism** *n.* Preservation of ancestral similarity in species on diverging evolutionary pathways, due to retention of a high proportion of common ancestral alleles (Lincoln et al. 1985).

◆ **evolutionary convergence** See ²evolution: convergent evolution.

◆ **evolutionary-developmental biology** See biology: evolutionary-developmental biology.

◆ **evolutionary distance** See distance: evolutionary distance.

◆ **evolutionary diversification** See -genesis: cladogenesis.

◆ **evolutionary genetics** See study of: genetics: evolutionary genetics.

◆ **evolutionary grade** See grade: evolutionary grade.

- ♦ **evolutionary lability** *n.* The ease and speed with which particular trait categories evolve (Lincoln et al. 1985).
- ♦ **evolutionary lag, lag load** *n.*
1. A measure of how far from an adaptive peak a species finds itself and therefore of the rate of evolution this species is likely to be undergoing (Stenseth and Maynard Smith 1984, 87; Lewin 1985a).
syn. lag load (Stenseth and Maynard Smith 1984, 87; Lewin 1985a)
 2. A trait's distance from its theoretical expectation because the trait is still in the process of responding to recent natural selection (Deaner and Nunn 1999, 687).
- ♦ **evolutionary medicine** See study of: evolutionary medicine.
- ♦ **evolutionary method** See study of: systematics: evolutionary systematics.
- ♦ **evolutionary morphology** See study of: morphology: evolutionary morphology.
- ♦ **evolutionary-morphology school** *n.* A school of evolutionists that starts with a common ancestor of a group of organisms and asks questions, such as what evolutionary processes were responsible for divergence of descendants? (Mayr 1982, 468).
See study of: morphology: evolutionary morphology.
- ♦ **evolutionary novelty** *n.* An entirely new organ, structure, physiological capacity, or behavior that occurs in a group of related species (Mayr 1982, 610).
- ♦ **evolutionary pacemaker** *n.* The first trait to change in an interrelated group of traits due to evolutionary pressure (Wilson 1975, 13).
Comment: This idea extends back at least as far as Darwin's 1872 edition of *On the Origin of Species* Behavior may often be an evolutionary pacemaker that is followed by associated morphological change (Dewsbury 1978, 258).
- ♦ **evolutionary physiology** See study of: physiology: evolutionary physiology.
- ♦ **evolutionary optimum** *n.* A balance that is struck between (among) forces of evolution in a population (Wilson 1975, 131).
- ♦ **evolutionary rate** See rate: evolutionary rate.
- ♦ **evolutionary reductionism** See reductionism: evolutionary reductionism.
- ♦ **evolutionary response** See response: genetic response.
- ♦ **evolutionary species** See ²species: evolutionary species.
- ♦ **evolutionary synthesis (ES), The Modern Synthesis (MS)** *n.*
1. The unified evolutionary theory that asserts that "major evolutionary phenomena such as speciation, evolutionary trends, the origin of evolutionary novelties, and the entire systematic hierarchy could be explained in terms of the genetic theory" (Mayr 1982, 117, 119–120, 567, 569–570; Futuyma 1986, 11).
Note: A refined version of the ES is the paradigm of today. The ES markedly developed from 1936 through 1947 (Mayr 1982, 567).
 2. "The modern synthetic theory of evolution;" a reformulation of systematics, comparative morphology and physiology, paleontology, cytogenetics, ecology, and ethology in the language of early population genetics from about 1930 to 1960 (Wilson 1975, 4, 63–64).
Note: In this approach, each phenomenon is weighed for its adaptive significance and then related to the

basic principles of population genetics (Wilson 1975, 4).

3. An expanded version of Darwinism that started in the 1930s, continues at present, and is expected to continue in the future (Stebbins and Ayala 1985, 72).

Note: The ES reconciled Darwin's theory of evolution with the facts of genetics (Futuyma 1998, 24).

syn. adaptive neutrality, biological theory of evolution, the modern synthetic theory of evolution, neo-Darwinian evolution, theory of synthetic evolution (Wilson 1975, 4, 63–64), Neo-Darwinian theory, synthetic theory (Stebbins and Ayala 1985, 72); Neo-Darwinism (Gould 1994, 6765)

cf. ³theory: theory of monistic evolution

Comments: The evolutionary synthesis gathered under one theory (with population genetics at its core) the events in many subfields that researchers previously explained by special theories in each discipline (Eldredge and Gould 1972, 108). de Beer (1940) helped to integrate development; Dobzhansky (1937) classical genetics; Mayr (1942), systematics; Simpson (1944, 1953), paleontology; Stebbins (1950), systematic botany, and White (1954), cytology (all in Eldredge and Gould 1972, 108). The ES now stresses many phenomena: opportunistic, steady evolution through natural selection on variations that arise by chance and are selected in accordance with environmental demands; natural selection acting on genes, heritable units of information governing structure, development, and function of organisms; population structure's and distribution's being important in the development of new species; the biological species concept; mosaic evolution; and molecular evolution. Three main challenges to the ES are: molecular determinism, the neutral theory of evolution, and the hypothesis of punctuated equilibrium. Mayr (1993) further elucidates facets of the ES. Futuyma (1998, 26–28) explains major tenants of the evolutionary synthesis. Pigliucci (2007, 2743) suggests that the ES should unify the theory (= body of knowledge) of both genes and form of organisms as an extended evolutionary synthesis (EES).

[coined by Huxley (1942 in Mayr 1982, 567)]

- ♦ **evolutionary systematics** See study of: systematics.

- ♦ **evolutionary taxonomy** See study of: taxonomy.

- ♦ **evolutionary time** See time: evolutionary time.

- ♦ **evolutionary tree** See -gram: phylogenetic tree.

- ♦ **evolutionary trends** See -genesis: orthogenesis.

- ♦ **evolutionary vestige** See organ: relict.

- ♦ **evolutionary wisdom** See ²evolutionary adaptation (*Comments*).

- ♦ **evolutionism** *n.*

1. The theory of evolution or development (Oxford English Dictionary 1972, entries from 1869).
2. One's belief in the occurrence of organic evolution; evolutionism comprises different groups of ideas that depend on the evolutionist (Mayr 1982, 835).

cf. Darwinism

neo-Lamarckian evolutionism *n.* Evolutionism, which permeated U.S. behaviorists starting in the late 19th century, and stressed the roles of animal minds in "satisfying" environmental needs by experience, considered evolution to be an active process performed by individual efforts, and minds to be pro-

pulsive forces that yield changes that are transmitted to offspring (Gherardi 1984, 394).

♦ **evolutionist** *n.*

1. An adherent, or proponent, of organic evolution (Oxford English Dictionary 1972, entries from 1859).
2. One who advocates the theory of evolution (now known as the theory of preformation) as opposed to epigenesis (Oxford English Dictionary 1972, entry from 1875).

cf. Darwinism

♦ **macroevolutionist** *n.*

1. One who studies macroevolution, *q.v.* (Dawkins 1982, 290).
2. One who is a partisan of the idea that micro- and macroevolution are “decoupled” processes (Dawkins 1982, 290).

♦ **evolve** See ^{1,2}evolution.

♦ **exafference** See -ference: exafference.

♦ **exagamy** See -gamy: exagamy.

♦ **exaltation** See ²group: exaltation.

♦ **exanthropic** See -anthropic: exanthropic.

♦ **exaptation** See ³adaptation: ²evolutionary adaptation: exaptation.

♦ **exchange and interdependence theories** See ²theory: exchange and interdependence theories.

♦ **excision repair enzyme** See enzyme: repair enzyme: excision repair enzyme.

♦ **excitability** *n.* In living organisms: A basic property involving elicitation of arousal responses, with inherently defined characteristics, due to milieu, or behavioral-state, changes (Heymer 1977, 62).

♦ **excitation** *n.*

1. A stimulus’ affecting an organ, or tissue, so as to produce, or intensify, its characteristic activity (Oxford English Dictionary 1972, entries from 1831).
2. A stimulus’ action on an organism (Michaelis 1963).
3. An animal’s immediate, time-limited behavioral response to an external stimulus or internal-milieu change (Heymer 1977, 62).

♦ **exclusion** See competitive exclusion.

♦ **exclusive species** See ²species: exclusive species.

♦ **exclusive territory** See territory: exclusive territory.

♦ **excrement** *n.* Wastes that are expelled from an animal’s body after digestion, especially feces (Morris 1982). *adj.* excremental, excrementitious

[Latin *excrementum* < *excernere*, to discharge, excrete]

♦ **excreta** *n. pl.* Wastes that are eliminated from an animal’s body (*e.g.*, feces, sweat, or urine) (Michaelis 1963; Morris 1982).

[Latin *excrementum* < *excernere*, to discharge, excrete]

♦ **excretion** See elimination: excretion.

♦ **exendotrophic, exendotrophy** See pollination: exendotrophy.

♦ **exhibited symbiont** See symbiont: exhibited symbiont.

♦ **exhibiting symbiont** See symbiont: exhibiting symbiont.

♦ **exhaustive sampling** See sampling: exhaustive sampling.

♦ **exhibition** See need: exhibition.

♦ **existentialism** *n.*

1. A philosophical movement that stresses the active role of human will rather than reason in confronting problems posed by a hostile universe; existentialism regards human nature as consisting of decisive actions rather than an inner, or latent, disposition (Michaelis 1963).

2. A cult of nihilism and pessimism that is supposedly based on Sartre and other existentialist writers (Michaelis 1963).

3. A school of thought that maintains that each Human is at all times faced with the dilemma of making a choice of what actions to pursue when he does not have all of the information relevant to a decision (Storz 1973, 92).

♦ **exo-** *comb. f.* “Out; outside; external” (Michaelis 1963). Also before vowels, ex-.

[Greek *exo*-, *ex*- < *exō*, outside]

♦ **exobiology** See study of: biology: exobiology.

♦ **exobiont** See biont: exobiont.

♦ **exocrine gland** See gland: exocrine gland.

♦ **exocrine substance** See chemical-releasing stimulus: semiochemical: allelochemical: allomone: exocrine substance.

♦ **exogamy** See -gamy: exogamy.

♦ **exogenous** See -genous: exogenous.

♦ **exoisogamy** See -gamy: exoisogamy.

♦ **exomixis** See -mixis: exomixis.

♦ **exomorphology** See morphology: exomorphology.

♦ **exon** *n.* In Eukaryotes: A portion of a split gene (comprising DNA) that is included in the gene’s RNA transcript (heterogeneous nuclear RNA) and remains in mature messenger RNA that a cell makes from the heterogeneous nuclear RNA (Curtis 1983, 340; King and Stansfield 1985).

cf. gene; intron; nucleic acid: deoxyribonucleic acid: parasitic DNA

Comment: Archaea have introns and exons in tRNA genes (Strickberger 1990, 155).

[from expressed sequences of DNA (Curtis 1983, 338); coined by Walter Gilbert (Travis 1993)]

♦ **exon-shuffling hypothesis** See hypothesis: exon-shuffling hypothesis.

♦ **exoparasite** See parasite: ectoparasite.

♦ **exoparasitism** See parasitism: exoparasitism.

♦ **exophenotypic** See -typic: exophenotypic.

♦ **exoskeleton** *n.* In Arthropods: The hardened outer body layer that functions as a protective covering, a skeletal attachment for muscles, site for receptors, etc. (Wilson 1975, 584).

♦ **exosymbiont** See symbiont: ectosymbiont.

♦ **exosymbiosis** See symbiosis: exosymbiosis.

♦ **extropism** See -tropism: extropism.

♦ **expansion of function** *n.* An organ’s evolution of more than one function; *e.g.*, besides locomotion, fish fins can serve as supporting, or copulatory, organs (Heymer 1977, 71).

syn. extension of function (Immelmann and Beer 1989, 96)

♦ **expect** *v.t.*

1. To suppose, think (Mish, 1991).
2. To anticipate, or look forward, to the coming, or occurrence, of (Mish, 1991).
3. To consider probable or certain (Mish, 1991).
4. To consider reasonable, due, or necessary (Mish, 1991).

cf. predict

Comments: Scientists often do and should use “expect” in a nonbiased, conservative way, basically in definitions 1 and 2 without unscientific expectations and data-taking biases that would cause them to make incorrect analyses and draw false conclusions.

♦ **expected benefit** See benefit: expected benefit.

♦ **expected cost** See cost: expected cost.

♦ **expendable surplus, principle of** See principle: principle of expendable surplus.

♦ **experience** *n.*

1. A person's actually observing facts, or events, considered as a source of knowledge (Oxford English Dictionary 1972, entries from 1377).
2. A person's consciously being the subject of a state, or condition, or being affected by an event; also an instance of this phenomenon; a state, or event, viewed subjectively; an event that affects one (Oxford English Dictionary 1972, entries from 1382).
3. A person's knowledge obtained from observation or what he has undergone (Oxford English Dictionary 1972, entries from 1553).
4. An individual animal's reactions with regard to stimuli directly contacted and learned about; *e.g.*, site-orientation memory, learned behavior sequences, or stimulus-response relationships (Heymer 1977, 62).

♦ **experience deprivation** See experiment: deprivation experiment.

♦ **experiment** *n.*

1. A person's act, or operation, designed to discover, test a hypothesis, or establish, or illustrate, a truth, principle, or effect (Oxford English Dictionary 1972, entries from 1362; Michaelis 1963).
2. *v.t.* To make an experiment (Oxford English Dictionary 1972, entries from 1787).

v.i. experiment

cf. test

Comment: Researchers also perform experiments to answer questions.

climate experiment *n.* Humans' inadvertently increasing the amounts of greenhouse gases in Earth's atmosphere since the start of the Industrial Revolution (Revkin 2000, 3 October, D5).

cf. global warming; treaty: Kyoto Protocol

Comments: Many scientists propose that the climate experiment is increasing global warming (Revkin 2000, 3 October, D5). Morgan (2002, p. 1904) refers to our worldwide global change experiment" which includes our climate experiment. This experiment is evidently causing large, often negative, changes on Earth.

deprivation experiment *n.* An experiment in which an investigator rears an animal in an environment that lacks some of its usual stimuli, *e.g.*, conspecifics and particular physical stimuli (Dewsbury 1978, 159), used to determine which of an animal's capabilities develop normally, even when apparently relevant experiences are absent, and which deficits are related to which kinds of deprivation (Immelman and Beer 1989, 159).

syn. experience deprivation, isolation experiment, Kasper-Hauser experiment

cf. Kasper Hauser

double-blind experiment *n.* An experiment in which neither an interrogator nor a subject has access to correct answers to questions prior to and during testing (Gould 1982, 10).

isolation experiment See experiment: deprivation experiment.

Jasper Ridge Global Change Experiment (JRGCE) *n.* A long-term experiment, started in 1997, that is examining the response of California grassland to four components of global change: elevated atmospheric CO₂, elevated temperature, increased nitrogen deposition, and increased precipitation (Dukes 2002; Shaw et al. 2002, p. 1987).

Kasper-Hauser experiment See experiment: deprivation experiment.

manipulative experiment *n.* An experiment in which a researcher uses one, or more, treatments; attempts to make one, or more, comparisons; gives different experimental units different treatments; and randomizes, or can randomize, treatments to experimental units (Hurlbert 1984, 190).

syn. comparative experiment (Anscombe 1948 in Hurlbert 1984, 190)

cf. experiment: mensurative experiment, natural experiment

Comment: Natural experiments can answer questions that manipulative experiments cannot, and vice versa.

masking experiment *n.* A test for time sharing, *q.v.*, involving prevention of the occurrence of ongoing behavior from occurring by an experimentally controlled interruption (McFarland 1985, 466).

matching experiment *n.* An experiment in which an individual (*e.g.*, a Domestic Pigeon, dolphin, Chimpanzee, or Human): is first shown a single object (the sample) and then is shown an array of objects that includes the sample, and its correct response is choosing the sample from the array (Siegel and Honig 1970, etc. in McFarland 1985, 345).

maze experiment *n.* An experiment involving a simple maze (*e.g.*, T or Y maze), or more complicated maze (*e.g.*, three-dimensional maze), and an animal that learns the correct path at each choice point of the maze, eventually reaching a reward (*e.g.*, food) (Buchholtz 1973 and Rensch 1973 in Heymer 1977, 108).

mensurative experiment *n.* An experiment that involves a researcher's making a measurement at one, or more, points in space, or time, with space and time as the only experimental variables or treatments; that may, or may not, involve a significance test; and that usually does not involve an experimenter's imposition of some external factor(s) on experimental units (Hurlbert 1984, 189).

syn. absolute experiment (Anscombe 1948 in Hurlbert 1984, 190)

cf. experiment: manipulative experiment, natural experiment

Comment: Some workers distinguish between "measurement experiment" and "mensurative experiment;" a mensurative experiment involves one's taking "somewhat elaborate" measurements (Hurlbert 1984, 189).

Miller-Urey experiment *n.* Creation of amino acids in a laboratory from ammonia, hydrogen, methane, and water and energy form a sparking electrode (Miller and Urey 1950s in Orgel 1994, 79).

[after Stanley L. Miller and Harold C. Urey who performed the experiment]

natural experiment *n.* An experiment whose variables have been "manipulated" by natural phenomena without help from a researcher and whose result from the manipulation is interpreted by a researcher; *e.g.*, effects of similar environmental conditions on isolated groups of mammals such as American eutherians and Australian marsupials or environmental effects on prehistoric life.

Comment: Much progress in observational sciences is due to the genius of people who have discovered, critically evaluated, and compared natural experiments in fields where laboratory experiments are highly impractical or impossible (Mayr 1997, 29).

♦ **experimental design** *n.*

1. A precisely planned procedure for testing hypotheses about the relationships among studied variables, *e.g.*, the effects of independent variables (*e.g.*, learning, light periodicity, and temperature) on a dependent variable (*e.g.*, feeding) of an animal (Storz 1973, 93; Lehner 1979, 77).

Notes: The independent variables are sometimes called “treatments” whose states, or magnitudes, can be set by natural conditions or manipulation by an investigator. One’s knowing the relationship between a dependent variable and one, or more, independent variables can be useful in predicting the state, or magnitude, of the dependent variable in future studies.

2. The logical structure of an experiment (Fisher 1971, 2, in Hurlbert 1984, 188), including a specification of the nature of experimental units, the number and kinds of treatments to be imposed, the properties, or responses (of the experimental units) that will be measured, the manner in which treatments are assigned to the available experimental units, the number of experiment units (replicates) that receive each treatment, the physical arrangement of the experimental units, the temporal sequence in which treatments are applied to the different experimental units, and the measurements made on these units (Hurlbert 1984, 188).

cf. statistical test

completely-randomized block *n.* An experimental design used to compare the effects of two, or more, treatment levels of an independent variable on a dependent variable (Lehner 1979, 77).

incomplete block *n.* An experimental design that is used “when the number of subjects available for study is not large enough to measure each treatment effect for each block” (Lehner 1979, 80).

► **balanced-incomplete block** *n.* An incomplete block design in which each block “contains the same number of subjects, each treatment level occurs the same number of times, and subjects are assigned to the treatment levels so that each possible pair of treatment levels occurs together within some block an equal number of times” (Lehner 1979, 80).

► **partially balanced-incomplete block** *n.* An incomplete block design in which “some pairs of treatment levels occur together within the blocks more often than do other pairs” (Lehner 1979, 80).

Latin-square design *n.* A randomized, two-way, complete-block design, in which each treatment level is replicated only once in a given row or column (Sokal and Rohlf 1969, 362–363).

randomized block *n.* An experimental design that “attempts to control for additional sample variability (expressed in the error effect) by assigning subjects that are similar in one or more characteristics (or ways treatments are applied to them) to blocks” (Lehner 1979, 79).

sociometric matrix *n.* An experimental design often used to test one-sidedness in dyadic interactions (Lehner 1979, 115).

♦ **experimental error** See error: experimental error.

♦ **experimental hypothesis** See hypothesis: experimental hypothesis.

♦ **experimental manipulation** *n.* A scientific investigation which “... usually consists of making an event occur under known conditions where as many extraneous influences as possible are eliminated and

close observation is possible so that relationships between phenomena can be revealed” (Beveridge 1950, 20 in Lehner 1979, 59).

cf. naturalistic observation

♦ **experimental psychology** See study of: psychology: experimental psychology.

♦ **experimentation** *n.* A person’s conducting an experiment (Michaelis 1963).

♦ **experimentwise-type-I error** See error: type-I error: experimentwise-type-I error.

♦ **explanatory reductionism** See reductionism: explanatory reductionism.

♦ **explanatory variable** See variable: independent variable.

♦ **exploded lek** See ²lek: dispersed lek.

♦ **exploitably vulnerable species** See ²species: exploitably-vulnerable species.

♦ **exploitation** See competition: exploitation.

♦ **exploitation-ecosystems hypothesis** See hypothesis: exploitation-ecosystems hypothesis.

♦ **exploration** *n.*

1. A person’s examining, investigating, or scrutinizing something (Oxford English Dictionary 1972, entries from 1543, obsolete definition).

2. A person’s exploring, especially unfamiliar, or unknown, regions (Michaelis 1963).

pure exploration *n.* An animal’s learning about a new object or a strange part of its environment (Wilson 1975, 165).

Comment: An animal’s particular investigatory responses are determined by a new object’s properties (Hutt 1966 in Wilson 1975, 165).

♦ **exploratory behavior** See behavior: exploratory behavior.

♦ **exploratory drive** See drive: exploratory drive.

♦ **exploratory learning** See learning: exploratory learning.

♦ **exploratory trail** See odor trail: exploratory trail.

♦ **Explorer 66** See satellite: Cosmic Background Explorer.

♦ **explosive breeding** See breeding: communal breeding: explosive breeding.

♦ **explosive evolution, explosive radiation** See ²evolution: explosive evolution.

♦ **explosive flower** See organ: flower: exploded flower.

♦ **explosive-mating-assemblage polygyny** See mating system: polygyny: scramble-competition polygyny: explosive-mating-assemblage polygyny.

♦ **exponential growth** See growth: exponential growth.

♦ **exponential-growth phase** See phase: log-growth phase.

♦ **expression** See gene expression.

♦ **expression vector** See vector: expression vector.

♦ **expulsion reflex** See reflex: expulsion reflex.

♦ **extant** *adj.* Referring to a taxon that is still living on Earth (Lincoln et al. 1985).

See recent.

ant. extinct

cf. endangered, extirpated, threatened

♦ **extended family** See ¹family: extended family.

♦ **extended phenotype** See -type, type: phenotype: extended phenotype.

♦ **extension of function** See expansion of function.

♦ **external environment** See environment: external environment.

- ♦ **external-nontranscribed spacers (ENS)** *n.* Nontranscribed regions of ribosomal-RNA genes (Berenbaum 1996, 5).
syn. intergenic spacers (IGS), nontranslated spacers (NTS) (Berenbaum 1996, 5)
- ♦ **external stimulus, external stimulation** See ²stimulus: external stimulus.
- ♦ **external validity** See validity: external validity.
- ♦ **exteroception** See modality: chemoreception: exteroception.
- ♦ **extinct** *adj.* Referring to a taxon that is no longer living on Earth (Cooper 1984 in Norden et al. 1984, 9).
ant. extant
cf. endangered, extirpated, ²species: extinct species, threatened, type: necrotype
- ♦ **¹extinction** *n.* A dying out of an animal's response to a primary stimulus (unconditioned stimulus) because a secondary stimulus (conditioned stimulus) that it comes to associate with its response is repeated without reinforcement by the primary stimulus (Scott and Fredericson 1951, 286; Dewsbury 1978, 323); contrasted with forgetting (Immelman and Beer 1989, 97).
cf. learning: conditional learning: Pavlovian conditioning
- ♦ **²extinction** *n.*
1. The process of elimination, *e.g.*, of less fit genotypes from a population (Lincoln et al. 1985).
 2. The disappearance of all living individuals of a species, or other taxon, from a particular habitat, biota, or entire Earth (Lincoln et al. 1985).
- See ²extinction: terminal extinction.
cf. extinct
- Comments:* Extinction of a population, or taxon, is often considered to be an example of a general biological phenomenon of considerable importance in biology and paleontology. Evidently, most species that have lived on Earth are now extinct (Damuth 1992, 106). Some hypothesis related to extinction are defined under "hypothesis." Primarily due to anthropogenic causes, Earth is losing about 32,000 organism populations per day (Myers 1999, 32). About one third of U.S. species are at risk of extinction (Levy 2000, 20 May, B6). About 100,000 species may be going extinct per year (Levine, 2001, A10). Extinction of a species, *e.g.*, a smaller organism, can be very difficult to prove, and people have located populations of presumably extinct species of insects (New 2009, 26).
- ♦ **K extinction, K-extinction** *n.* The regular extinction of populations when they have reached, or exceeded, carrying capacity of their environments (Lincoln et al. 1985).
cf. ²extinction: r extinction
- ♦ **linked extinction** *n.* One, or more, other organism's going extinct due to the extinction of another organisms; *e.g.*, a keystone mutualist, *q.v.* (inferred from Buchmann and Nabhan 1996, 249).
- ♦ **mass extinction** *n.* An extinction that involves many taxa; a major extinction episode (Raven and Johnson 1989, 428).
Comments: Some of Earth's many mass extinctions occurred about 505, 438, 360, 243, and 65 Ma ago. Mass extinctions might be periodic, occurring an average of about 26 Ma (Raup and Sepkoski 1986). Benton (1995, 52) found no periodicity in mass extinctions. Seehausen et al. (1997) state that the dying off of about 200 cichlid species is probably Earth's largest "mass extinction" of contemporary vertebrates.

- ♦ **natural extinction** *n.* Extinction due to causes besides Humans; contrasted with "Human-caused extinction" (Ehrlich and Wilson 1991, 759).
- ♦ **pseudoextinction** *n.* The evolution of one species into another, with the disappearance of the ancestral species (Ehrlich and Wilson 1991, 759).
syn. ²extinction: phyletic extinction; speciation: phyletic speciation (Lincoln et al. 1985)
cf. ²extinction: terminal extinction, true extinction
- ♦ **r extinction, r-extinction** *n.* Extinction that occurs when organism colonists fail to establish themselves in a new site (Lincoln et al. 1985).
cf. ²extinction: K extinction
- ♦ **terminal extinction, extinction** *n.* The loss of an entire species without the evolution of a descendant lineage (Lincoln et al. 1985).
cf. ²extinction: phyletic extinction
- ♦ **true extinction** *n.* Extinction of a species and any species descended from it (altogether called a clade) (Ehrlich and Wilson 1991, 759).
cf. ²extinction: pseudoextinction
- ♦ **extinction curve** See curve: extinction curve.
- ♦ **extinction rate** See rate: extinction rate.
- ♦ **extirpated** *adj.* Referring to a population of a species that has been exterminated (Cooper 1984 in Norden et al. 1984, 9).
cf. endangered, extant, extinct, ²species: extirpated species, threatened
- ♦ **extirpation** *n.*
1. Removal of an animal's organ or organ part (Immelman and Beer 1989, 97).
 2. A population's elimination by either human or natural causes (Buchmann and Nabhan 1996, 245).
cf. ablation
- ♦ **extra-individual character** See character (comments).
- ♦ **extrafloral nectary** See nectary: extrafloral nectary.
- ♦ **extraocular light perception** See perception: extraocular light perception.
- ♦ **extraneous character** See character: extrinsic character.
- ♦ **extrapair copulation** See copulation: extra-pair copulation.
- ♦ **extrapyramidal system** See ²system: nervous system: extrapyramidal system.
- ♦ **extreme altruism** See altruism: extreme altruism.
- ♦ **extreme feather ruffling** See behavior: feather ruffling: extreme feather ruffling.
- ♦ **extreme holism** See holism: extreme holism.
- ♦ **extreme inbreeding** See -mixis: automixis.
- ♦ **extreme vitalism** See vitalism: extreme vitalism.
- ♦ **extrinsic character** See character: extrinsic character.
- ♦ **extrinsic-isolating mechanism** See mechanism: isolating mechanism: extrinsic-isolating mechanism.
- ♦ **extrinsic selection pressure** See selection pressure: extrinsic selection pressure.
- ♦ **exudativore** See -vore: exudativore.
- ♦ **exuviae** *n. pl.* Skins, shells, etc., cast off, or shed, by animals, often referring to arthropods (Michaelis 1963).
syn. exuvia, exuvium (not preferred synonyms, Torre-Bueno 1978)
adj. exuvial
cf. molt
[Latin < *exuere*, to cast off, undress]

♦ **eye** See ²group: eye.

♦ **eye camouflage** See camouflage: eye camouflage.

♦ **eye contact** *n.* An element of communication in which one person looks into the eyes of another which may be part of aggression, dominance, flirting, or a combination of these behaviors (Heymer 1977, 45).

♦ **eye of a needle** See effect: bottleneck effect.

♦ **eye stalk** See body part: eye stalk.

♦ **eyebrow flash** *n.* A person's quick raising of his eyebrows often followed by a smile, and being part of flirting, greeting, or both (Heymer 1977, 34).

Comments: Because eyebrow flashes have been found to have wider communicative function than first supposed, Eibl-Eibesfeldt (1972a, b in Heymer 1977, 47) proposed the less restrictive term "eyebrow raising" for

this behavior. Eyebrow flashes have different meanings in different human cultures.

[coined by Eibl-Eibesfeldt (1968 in Heymer 1977, 47)]

♦ **eyebrow raise** See eyebrow flash.

♦ **eyeless** See gene: *eyeless, pax-6* (comments).

♦ **eyespot** *n.* A pattern ranging from a simple round black spot, which scarcely contrasts with its background, through a black spot with a light contrasting ring through startlingly impressive eye markings (*e.g.*, on adults and caterpillars of some butterfly and moth species, on individuals of some fish and mantid species, and on feathers of some bird species) (Wickler 1968, 64–70).

cf. behavior: defensive behavior, deimatic behavior

Comment: Potential predators (*e.g.*, birds) are frightened by eyespots of a butterfly (Heymer 1977, 34).

♦ **eyrar** See ²group: eyrar.

♦ **eyrie** See ²group: aerie.

f

♦ **F** *n.* The ratio of two squares (= estimates of population variance) based on the information in two, or more, random samples (Hoffman 2003).

syn. *F* statistic (Hoffman 2003)

See index: fixation index.

Comment: Analysis of variance (ANOVA) tests the null hypothesis that two, or more, sample means are equal. An ANOVA calculates an *F* value. Then the ANOVA compares the calculated *F* with all possible *F*s that could occur based on the ANOVA's degrees of freedom (*df*). If found *F* is a rare one, the ANOVA's *P* (= calculated-*p*, *q.v.*) < 0.05, and the ANOVA rejects its null hypothesis.

[after Ronald A. Fisher, statistician]

♦ **F, f** See coefficient: coefficient of inbreeding; function.

♦ **FACE System** See system: Free Air CO₂ Enrichment System.

♦ **face-to-face-mating hypothesis** See hypothesis: face-to-face-mating hypothesis.

♦ **facial expression** *n.* In more derived mammals, e.g., canines, felines, many ungulate and primate species, notably *Pan troglodytes* (Chimpanzees) and Humans: Movements of facial parts that convey mood, or intention, as intraspecific communicatory signals (Heymer 1977, 116; Immelmann and Beer 1989, 98). *cf.* display and threat for other facial expressions, *Flehmen*

anger *n.* A person's facial expression that usually involves withdrawing his lips, baring his teeth, staring with his eyes, and frowning (McFarland 1985, 486).

alertness *n.* A person's facial expression that involves a relatively fixed gaze and a certain tension of facial muscles (McFarland 1985, 486).

copulation grimace *n.* In *Macaca mulatta* (Rhesus Macaques): An adult male's withdrawing his lips during copulation; contrasted with ear-flap threat, fear grimace, and open-mouth threat (Hauser 1993, 475).

disgust *n.* A person's ritualized facial expression that involves nose wrinkling, upper-lip raising, eye-screwing, and turning his face away (McFarland 1985, 486).

Comment: These components are derived from protective responses serving to exclude noxious stimuli (McFarland 1985, 486).

ear-flap threat *n.* In *Macaca mulatta* (Rhesus Macaques): A dominant individual's retracting its ears back against its head when it is attacking, or intimidating, a subordinate; contrasted with copulation grimace,

fear grimace, and open-mouth threat (Hauser 1993, 475).

fear *n.* In Humans and many other primates: A facial expression that involves wide open eyes and withdrawn lips (McFarland 1985, 486).

cf. fear

fear grimace *n.* In *Macaca mulatta* (Rhesus Macaques): A subordinate individual's withdrawing its lips when it is attacked, or intimidated, by a higher ranking group member; contrasted with copulation grimace, ear-flap threat, and open-mouth threat (Hauser 1993, 475).

flehmen See *flehmen*.

funny face *n.* In juvenile *Pan paniscus* (Bonobos) and *Pan troglodytes* (Chimpanzees): A weird facial expression aimed at no other individual in particular (Waal 1989, 197–198).

grin *n.*

1. For example, in *Macaca mulatta* (Rhesus Macaques), *Pan troglodytes* (Chimpanzees), Humans: An animal's drawing back its lips and exposing its teeth (Oxford English Dictionary 1972, entries from 1000; Waal 1989, 21), as in a snarl or a grimace of pain, rage, etc. (Michaelis 1963).

2. A person's broad smile (Michaelis 1963).

cf. facial expression: smile

joy *n.* In Humans, possibly some other primates: A facial expression that involves smiling, laughter, or both (McFarland 1985, 486).

open-mouth laughter *n.* In human infants, rarely in adults: Laughing with an open mouth and without retracted lips (McFarland 1985, 486).

open-mouth threat *n.* In *Macaca mulatta* (Rhesus Macaques): A dominant individual's slightly protruding its lips and placing them into an O-shaped configuration when it is attacking, or intimidating, a subordinate; contrasted with copulation grimace, ear-flap threat, and fear grimace (Hauser 1993, 475).

play signal *n.* An animal's facial expression that signifies its readiness for social play or serves to avoid "misunderstandings," especially during aggressive play (Immelmann and Beer 1989, 224–225).

► **play face** *n.* In many carnivore and primate species: A play signal (Immelmann and Beer 1989, 225).

pout face *n.* For example, in *Pan paniscus* (Bonobos): An animal's extending its lips while its mouth is slightly open (Waal 1989, 207–208).

relaxed-open-mouth display See display: relaxed-open-mouth display.

sadness *n.* In the Human, possibly *Pan troglodytes* (Chimpanzees): A ritualized facial expression that involves one's arched eyebrows, retracted corners of one's mouth that are turned downward, outward curling of one's lips, and tears (in intense cases) (McFarland 1985, 486).

smile, smiling *n.* A person's raising his lip corners with his mouth open or closed, with, or without vocalizing (Oxford English Dictionary 1972, entries from 1562).

cf. facial expression: grin

Comment: Smiling can be a low-intensity form of laughter and suggest pleasure, satisfaction, good humor, approval, or amity, or can be associated with mild fear, amused contempt, disdain, incredulity, etc. "Smile," "grin," "simper," and "smirk" are distinguished from one another (Michaelis 1963; McFarland 1985, 486).

surprise *n.* A person's facial expression that involves prolonged eyebrow raising, open eyes, and often an open mouth (McFarland 1985, 486).

threat face *n.* In some carnivore, cervid, and primate species: An individual's showing threat behavior with its facial expression (*e.g.*, baring teeth) (Immelmann and Beer 1989, 312); in Humans and Mandrills, exposing canine teeth and lifting lips during anger and offensiveness (Heymer 1977, 54).

threat gape, threat yawn *n.* In *Hippopotamus amphibius* (Hippopotami), some carnivore and primate species: An animal's showing a threat face that is enhanced by its opening its jaws very widely (Heymer 1977, 54; Immelmann and Beer 1989, 312).

cf. yawning

♦**facial-feature graph** See graph: facial-feature graph.

♦**facies fossil** See fossil: facies fossil.

♦**facilitation** *n.* The additive effect that multiple nerve impulses' arriving at a synapse may have in bringing about synaptic transmission (Immelmann and Beer 1989, 98).

spatial facilitation *n.* The summation of results from impulses that arrive via different nerve fibers simultaneously; these impulses are singly ineffective, but together they produce sufficient change to cause a response (Immelmann and Beer 1989, 99, 299).

temporal facilitation *n.* The summation of results from impulses that arrive close in succession via a single nerve fiber (Immelmann and Beer 1989, 99). *syn.* temporal summation (Immelmann and Beer 1989, 99, 299)

♦**facilitation** *n.*

1. The initiation or pace increase of an animal's behavior by the mere presence, or actions, of another animal that is not necessarily engaged in this behavior (Wilson 1975, 51, 595).

2. In psychology, an animal's enhancing its behavior (*e.g.*, quickening its perception or response) due to contributory internal, or external, factors, or processes, such as attention, arousal, or reinforcement (Immelmann and Beer 1989, 99).

See learning: facilitation.

cf. effect: group effect; ²facilitation: social facilitation; ¹induction

parental facilitation *n.* A parent's aid to its offspring that improves its offspring's abilities to achieve breeding status; this is not extended parental care in the usual sense, because the usual types of parental care, such as feeding young, are not involved (Brown 1987, 299).

cf. care: parental care

social facilitation *n.* An animal's taking up the behavior (*e.g.*, feeding or taking flight) of another member of its social group; this tendency can spread so that most to all members of a group show the same behavior (Immelmann and Beer 1989, 275).

cf. imitation, mood induction

►**audience-effected social facilitation** *n.* Social facilitation in which the facilitating organisms are passive spectators (Zajonc 1965 in Dewsbury 1978, 105).

►**coaction-effected social facilitation** *n.* Social facilitation wherein interacting organisms are engaged in the same behavior (Zajonc 1965 in Dewsbury 1978, 105), *e.g.*, feeding in rats and chickens or copulating in rats.

♦**facilitation** *n.* In behavior, the accelerating influence of environmental factors on behavioral development during an animal's ontogeny; distinguished from induction (Immelmann and Beer 1989, 99).

♦**facilitation** *n.* The positive effect of species-2 on species-1, without any reference to the effect of species-1 on species-2; species-2, thus, causes the facilitation of species-1 (Boucher 1992, 208).

cf. cooperation; symbiosis: mutualism; parasitism; predation

♦**fact** *n.*

1. "Something that has really occurred or is actually the case; something certainly known to be of this character; hence, a particular truth known by actual observation, or authentic testimony, as opposed to what is merely inferred, or to a conjecture or fiction; a datum of experience, as distinguished from the conclusions that may be based upon it" (Oxford English Dictionary 1972, entries from 1632).

2. The theory that researchers repeatedly confirmed and never refuted (Mayr 1997, 61).

Note: Many hypotheses in physics were replaced by "laws" which can be considered to be "facts" of nature (Mayr 1997, 62).

cf. ³theory

[Latin *factum < facere*, to do]

fact-in-itself *n.* A "fact" that does not have a logical explanation in an existing theoretical framework but is, nevertheless, "unquestioned and ignored, or accepted as a given property of the world, or simply postulated to be true" (Aristotle in Lightman and Gingerich 1992, 694).

syn. *to oti* (Aristotle), *a quia* (Middle Ages) (Lightman and Gingerich 1992, 694)

cf. phenomenon: retrorecognition phenomenon

pure fact *n.* Unbiased information; information that is not theory-laden (Mayr 1997, 25).

Comment: Some philosophers argue whether pure facts exist (Mayr 1997, 25).

reasoned fact *n.* A "fact" that has a reasonable explanation (Aristotle in Lightman and Gingerich 1992, 694).

syn. *di oti* (Aristotle), *propter quid* (Middle Ages) (Lightman and Gingerich 1992, 694)

cf. phenomenon: retrorecognition phenomenon

♦**fact-in-itself** See fact: fact-in-itself.

♦**fact memory** See memory: fact memory.

♦**factoid** *n.* Any "fact" that has no existence other than that it once appeared in print as a purported fact and has been treated as a "fact" ever since (Norman Mailer, novelist, in Hitt 1992).

[fact + oid]

♦ **factor** *n.*

1. An element, or cause, that contributes to producing a result (Michaelis 1963).
2. In mathematics, one or more quantities that, when multiplied together, produce a given quantity (Michaelis 1963).
3. In physiology, an element that is important in metabolism and nutrition; *e.g.*, an enzyme, hormone, or vitamin (Michaelis 1963). See effect: main effect.

cf. gene

density-dependent factor *n.* A factor (*e.g.*, intraspecific competition, parasitism, predation, or disease) whose influence is affected by the size of a population that it affects (Wilson 1975, 82).

syn. endogenous factor (Turchin et al. 1999, 1069)

cf. dependence: density dependence

density-independent factor *n.* A factor (*e.g.*, drought, flood, or volcanic eruption) that is not affected by the size of a population that it influences and that influences one, or more, of the following: the population's birth, death, and migration rates (Wilson 1975, 82).

syn. exogenous factor (Turchin et al. 1999, 1069)

dilution factor, mean r, r *n.* The fraction of genes in a population, or species, that is unlike that of a focal altruist, and that slows down natural selection but does not alter its direction (Hamilton 1970 in West Eberhard 1975, 5).

forkhead transcription factor (FOXO) *n.* For example, in *Culex pipiens*: A transcription factor that promotes female reproductive diapause and is normally suppressed in the presence of insulin (Jünger et al. 2003, 20; Sim and Denlinger 2008, 6777).

kappa factor *n.* A microorganism in the cytoplasm of *Paramecium* that affects its phenotypes (Preer et al. 1974 in Mayr 1982, 789).

cf. factor: sex-ratio factor, sterility factor

limiting factor *n.* Any environmental factor, or group of related factors, that exists at a suboptimal level and, thereby, prevents an organism from reaching its full biotic potential (Lincoln et al. 1985).

► **master limiting factor, master factor** *n.* The single limiting factor that prevents a population from realizing its biotic potential (Lincoln et al. 1985).

► **paired limiting factor** *n.* One of two or more limiting factors that acts synergistically to prevent a population from realizing its biotic potential (Lincoln et al. 1985).

proximate factor, proximate causation, zeitgeber *n.* An environmental factor that acts as an immediate stimulus for periodic biological activity (Lincoln et al. 1985).

See causation: proximate causation; ²stimulus: *zeitgeber*.

cf. factor: ultimate factor

sex-ratio factor *n.* Microorganisms that are passed to gametes during their formation in *Drosophila* and affect their progeny sex ratio (Mayr 1982, 789).

cf. factor: kappa factor, sterility factor

sterility factor *n.* Microorganisms that are passed to gametes during their formation and that cause sterile offspring in *Culex* mosquitoes (Mayr 1982, 789).

cf. factor: kappa factor, sex-ratio factor

sublethal factor *n.* A factor that does not cause an organism's death by its direct action, "but by possibly modifying its behavior, life cycle, physiology,

reproduction, or a combination of these attributes," and shows cumulative effects (Lincoln et al. 1985).

transcription factor *n.* A protein that regulates the activity (transcription) of a gene (Campbell et al. 1999, 402).

cf. gene: *bicoid*

Comment: Bicoid and Serendipity delta are examples of transcription factors (Campbell et al. 1999, 402).

ultimate factor *n.* An environmental factor to which the timing of a biological event is ultimately associated; ultimate causation (Lincoln et al. 1985). See causation: ultimate causation.

♦ **factor analysis** See test: statistical test: factor analysis.

♦ **facultative** *adj.*

1. Referring to an organism that can assume a particular role, or mode, of life but is not restricted to it (Lincoln et al. 1985).

2. Referring to an organism that can live, or is living, under atypical conditions (Lincoln et al. 1985).

cf. obligate

♦ **facultative anaerobe** See aerobe: anaerobe: facultative anaerobe.

♦ **facultative gamete** See gamete: facultative gamete.

♦ **facultative hyperparasitism** See parasitism: hyperparasitism: facultative hyperparasitism.

♦ **facultative learning** See learning: facultative learning.

♦ **facultative parasitism** See parasitism: facultative parasitism.

♦ **facultative parthenogenesis** See parthenogenesis: facultative parthenogenesis.

♦ **facultative polygamy** See mating system: polygamy: facultative polygamy.

♦ **facultative-schooling species** See ²species: facultative-schooling species.

♦ **facultative siblicide** See -cide: siblicide: facultative siblicide.

♦ **facultative-social parasitism** See parasitism: social parasitism: facultative-social parasitism.

♦ **facultative thermophile** See ¹-phile: thermophile: facultative thermophile.

♦ **faculty psychology** See study of: psychology: faculty psychology.

♦ **FAD, FADH₂** See enzyme: flavin-adenine dinucleotide.

♦ **fairness** See behavior: fairness.

♦ **faithful species** See ²species: exclusive species.

♦ **Falconer-style evolution** See ²evolution: Falconer-style evolution.

♦ **fall** See ²group: fall.

♦ **fall song** See animal sounds: song: subsong.

♦ **fallacy** *n.*

1. One's reasoning, argument, etc., that is contrary to the rules of logic (Oxford English Dictionary 1972, entries from 1562; Michaelis 1963).

2. One's delusive notion, an error, especially one founded on false reasoning (Oxford English Dictionary 1972, entries from 1590).

Concorde fallacy See effect: Concorde effect.

fallacy of affirming the consequent *n.* One's constructing "a particular model from a set of postulates, obtaining a result, noting that approximately the predicted result does exist in nature, and concluding thereby that the postulates are true" (Wilson 1975, 29).

Comment: “The difficulty [with this process] is that a second set of postulates, inspiring a different model, can often lead to the same result” (Wilson 1975, 29).

naturalistic fallacy *n.* One’s “supposition that what is ‘natural’ is ‘good’” (Futuyma 1986, 8); “whatever biology tells us is so is also what ought to be” (David Hume in Alexander 1987, xvi).

nominal fallacy *n.* The false concept that naming a phenomenon explains it, *e.g.*, naming a kind of instinct explains it (Dewsbury 1978, 11).

♦**false head** *n.* For example, in some membracid-insect, hairstreak-butterfly, and snake species: Coloration and morphology at the posterior end of an animal that resembles its true head (Wickler 1968, 70–77).

syn. dummy head (Wickler 1968, 71)

cf. mimicry: head mimicry

Comment: False heads might help to protect their bearers because predators might strike at them instead of true heads, inflicting no, or less significant, damage on the prey (Wickler 1968, 70–77; Robbins 1980, fig. 15).

♦**false parasitism** See parasitism: pseudoparasitism.

♦**false pheromone** See chemical-releasing substance: semiochemical: allelochemical: allomone.

♦**falsifiable hypothesis** See hypothesis: falsifiable hypothesis.

♦**falsification** *n.* One’s rejecting a false hypothesis by an appropriate experiment (inferred from Mayr 1997, 49).

Comments: Falsification is sometimes very difficult and is ill-suited for testing probabilistic hypotheses (Mayr 1997, 49–50). If one finds exceptions to a probabilistic hypothesis, it does not necessarily mean that it is false. It is very difficult, or impossible, to falsify some historical-narrative hypotheses of evolution. A single falsification of such a biological hypothesis, does not necessarily reject it, as a single falsification would do for a chemical or physical hypothesis.

cf. hypothesis: falsifiable hypothesis

♦**family** *n.* For example, in some invertebrate and fish species, almost all bird species, all mammal species: One, or both, parents and their offspring, which might be accompanied by other closely-associated kin (Wilson 1975, 584).

cf. ²group

Comment: “Two-parent family” is on a continuum with “one-parent family” in terms of the amount of care that parents give their young (Immelmann and Beer 1989, 100).

extended family *n.* A nuclear family plus other kin; contrasted with nuclear family (Brown 1987, 299).

maternal family *n.*

1. A mother and her offspring (Heymer 1977, 120).

syn. gynopaedium (Deegener 1918 in Heymer 1977, 120)

2. In some gallinaceous-bird, hummingbird, insect, fish, mammal, scorpion, spider species: A family in which only a mother cares for her young (Immelmann and Beer 1989, 100).

nuclear family *n.* A family consisting only of a mother, father, and their offspring; contrasted with extended family (Brown 1987, 299).

paternal family *n.* For example, in a labyrinth fish, painted-snipe sp., *Phalaropus* sp. (phalarope), sea-horses, stickleback fish: A family in which only a father cares for his young (Immelmann and Beer 1989, 100).

two-parent family *n.* In the majority of bird species, some fish species (including many cichlid species) and mammal species (some canid species,

Gibbons, Humans): A family in which both parents make similar investments in their young (Immelmann and Beer 1989, 100).

♦**²family** *n.* A taxon composed of closely related genera, sometimes only one genus (Immelmann and Beer 1989, 99).

♦**³family** *n.* A class, or group, of like, or related, things (Michaelis 1963).

gene family *n.* Two, or more, loci with similar nucleotide sequences, that have evolved from a common ancestral sequence (Futuyma 1986, 552).

♦**⁴family** See ²group: family.

♦**fanning** *n.* For example, in male stickleback fish, some other fish species: Rhythmic pectoral-fin movement of water over eggs (van Iersel 1953 in Heymer 1977, 66).

wing fanning *n.* Rhythmic wing movement, *e.g.*, in *Apis mellifera* (Western Honey Bees) that are cooling their hive (Heymer 1977, 66).

♦**fare** See ²group: fare.

♦**farming** See husbandry.

♦**fast ad hoc mimicry** See mimicry: *ad hoc* mimicry: fast *ad hoc* mimicry.

♦**fast-evader mimicry** See mimicry: fast-evader mimicry.

♦**fatigue** *n.*

1. Physiologically, the loss of energy, lessened activity, and decreased response to stimulation of an organism, or one of its parts, that results from excessive exertion or stimulation (Michaelis 1963).

2. Behaviorally, specific exhaustibility, *e.g.*, the reduced releasability of a behavior due to its preceding performance (Immelmann and Beer 1989, 101).

cf. learning: habituation

♦**fauna** *n. pl.*

1. Animal species in a particular location or during a stated period; distinguished from flora (Michaelis 1963).

2. A treatise on these animals (Michaelis 1963).

cf. biota; ²community: benthos; flora

Comment: Macrofauna, megafauna, meiofauna, mesofauna, and microfauna are confusing terms in need of improved definitions.

[New Latin from Latin *Fauna*, a rural goddess. Introduced by Linnaeus as a companion to flora.]

A CLASSIFICATION OF FAUNA BASED ON ANIMAL SIZE

I. megafauna, including macrofauna

II. mesofauna

III. microfauna, including meiofauna (*syn.* interstitial fauna)

avifauna *n.* The birds of an area or period (Lincoln et al. 1985).

►**resident avifauna** *n.* The avifauna that live in an area during the season of highest breeding activity (Lincoln et al. 1985).

cryptofauna *n.* Fauna of protected, or concealed, microhabitats (Lincoln et al. 1985).

cf. fauna: phytal fauna

epifauna *n.*

1. The total fauna inhabiting a sediment surface or water surface (Lincoln et al. 1985).

syn. epibenthos (Lincoln et al. 1985)

2. Organisms (characteristic of an intertidal zone) that live on the surface of a seabed, either attached, or unattached, to objects on it (Allaby 1994).

See ²community: benthos: epibenthos.

cf. fauna: infauna

ichnofauna *n.* An area's animal traces (Lincoln et al. 1985).

ichthyofauna *n.* Fish species of a particular region (Lincoln et al. 1985).

infauna See ²community: benthos: endobenthos.

interstitial fauna See fauna: meiofauna.

macrofauna *n.* Larger soil animals that one can readily remove with one's hands from a soil sample, in particular burrowing vertebrates (*e.g.*, moles or rabbits); contrasted with megafauna, meiofauna, mesofauna, and microfauna (Allaby 1994).

Note: Some researchers include larger earthworms and insects in macrofauna (Allaby 1994).

megafauna *n.*

1. Fauna large enough to be seen with unaided human eyes; contrasted with macrofauna, meiofauna, mesofauna, and microfauna (Lincoln et al. 1985; Allaby 1994).
2. "A widespread group of animals" (Lincoln et al. 1985).
3. Animals of a large uniform habitat (Lincoln et al. 1985).

meiofauna *n.*

1. Small interstitial animals that pass through a 1-mm-mesh sieve but are retained by a 0.1-mm one; contrasted with macrofauna, megafauna, mesofauna, and microfauna (Lincoln et al. 1985).
2. That part of the microfauna that inhabits algae, rock fissures, and the superficial layers of the muddy sea bottom (Allaby 1994).

syn. interstitial fauna

mesofauna *n.* Soil organisms of intermediate size; small invertebrates, characteristically annelids, arthropods, molluscs, nematodes; contrasted with macrofauna, megafauna, meiofauna, and microfauna (Allaby 1994).

Comment: Mesofauna are readily removed from soil with a Berlese funnel, Tullgren funnel, or other similar device (Allaby 1994).

microfauna *n.*

1. Fauna not visible with unaided human eyes; contrasted with macrofauna, megafauna, meiofauna, and mesofauna (Lincoln et al. 1985).

Notes: A person with normal 20/20 vision can see most kinds of tiny animals, but not many kinds of protozoa without magnification (Kingdom Protista). "Microfauna" takes on a different meaning when one places protozoa in Protista and not in Animalia.

2. "A localized group of animals" (Lincoln et al. 1985).
3. Animals of a microhabitat (Lincoln et al. 1985).

phytifauna *n.* Fauna in protected, or concealed, plant microhabitats (Lincoln et al. 1985).

cf. fauna: cryptozoa

stenohygrobia *n.* A fauna tolerant of only a narrow humidity range (Lincoln et al. 1985).

♦ **faunal dominance** See dominance (ecological): faunal dominance.

♦ **faunal region** See region: faunal region.

♦ **FCU** See unit: functional conservation unit.

♦ **fear** *n.*

1. A person's emotion of pain, or uneasiness, caused by his sense of impending danger or by the prospect

of some possible evil (Oxford English Dictionary, entries from 1155).

cf. anxiety

2. A person's solicitude, or anxiety, for a person or thing (Oxford English Dictionary, entries from 1490).

3. A person's state of apprehension that focuses on isolated and recognizable dangers; distinguished from anxiety (Erickson 1950 in DeGrazia and Rowan, pers. comm.).

4. In Animals: An emotion that is manifested in outward signs, or behavioral tendencies, of fleeing, escaping, or showing defensive behavior in a dangerous, or threatening, situation (Hinde 1970, 349; Immelmann and Beer 1989, 101).

syn. fear response (Hinde 1970, 349)

5. In Animals: A motivation that impels fleeing, escaping, or showing defensive behavior in a dangerous, or threatening, situation (Immelmann and Beer 1989, 101).

cf. anxiety; facial expression: fear; fright; response: immobility response; suffering

fear of strangers *n.* A child's fear of unfamiliar persons that peaks when he is about 8 mo old and which is often expressed by turning his head away from a stranger, avoiding eye contact, and protesting if touched (Eibl-Eibesfeldt 1972 and Hassenstein 1972 in Heymer 1977, 69).

syn. eight-months fear (Heymer 1977, 69)

♦ **fear trill** See animal sounds: fear trill.

♦ **feather ruffling** *n.* See behavior: feather ruffling.

♦ **feather stealing** See decoration stealing.

♦ **"fecal hypothesis"** See hypothesis: hypotheses regarding the origin of the Cambrian explosion: "fecal hypothesis."

♦ **feces** *Brit. faeces* *n.*

1. Animal excrement; ordure (Michaelis 1963).
2. Any foul refuse matter, or sediment (Michaelis 1963).

cf. excreta; fossil: coprolite

syn. dropping, issue, poop (colloquial) (Wright 1996, June, 59), scat (Robinson and Challinor 1995, 224), shit (obscene)

[Latin *faex, faecis*, sediment]

♦ **Fechner's law** See law: Fechner's law.

♦ **fecula** *n.* Insect excrement (Frost 1959 in Weiss 2006, 637; Torre-Bueno 1989, 269).

cf. frass, honeydew

♦ **fecundity ratio** See ratio: fecundity ratio.

♦ **feed-forward** *n.* An animal's action that results from cues that signify what condition is to be expected, rather than from just its current physiological state and feedback, *e.g.*, an animal's drinking before eating and thus "anticipating" the dehydrating effects of digestion (Immelmann and Beer 1989, 103).

♦ **feedback** *n.*

1. A system's output's influencing its input in such a way that modifies and controls its future output (Michaelis 1963; Immelmann and Beer 1989, 102).

2. Information processing in which the result of a certain system component's action serves as an initiator of new action; feedback involves cycling and information transfer (Heymer 1977, 149).

negative feedback *n.* Feedback that negates deviations from a set value; thus, it is a means of maintaining stability; *e.g.*, when a homeotherm's body temperature deviates from its normal magnitude, its body takes measures that return it to this magnitude (Immelmann and Beer 1989, 102).

positive feedback *n.* Feedback in which a system's output adds to its cause and results in a progressive increase of output; *e.g.*, local depolarization of a neuron membrane increases its permeability to sodium ions at a particular point, the consequent sodium-ion influx further depolarizes the membrane, the sodium influx further increases, etc., until limiting conditions are reached (Immelmann and Beer 1989, 102).

♦ **feedback circuit** *n.* A self-regulating system in which an actual parameter value (*Istwert*) is compared with and corrected towards a predetermined reference value (*Sollwert*) (Heymer 1977, 143).

cf. principle: reaference principle

♦ **feeder** See feeding.

♦ **feeding** *n.*

1. A person's giving, or supplying, food to another person or animal (Oxford English Dictionary 1972, verb entries from 950).

Note: "Feeding" now refers to nonhuman animals as well.

2. A person's grazing, or pasturing, Cattle, sheep, etc. (Oxford English Dictionary 1972, entries from 1382).

3. A person's consuming food; eating (Oxford English Dictionary 1972, entries from 1387).

Note: This sense is now used for nonhuman animals as well.

syn. alimentation (Lincoln et al. 1985)

n. feeder

cf. fluid recycling, foraging, guild, hawking, trophallaxis

allofeeding *n.* An animal's feeding young that are not its own (Brown 1987, 297).

Comment: This is a special case of alloparenting (Brown 1987, 297).

courtship feeding *n.* In some spider species, members of 10 insect orders (including some dancefly and scorpionfly species, a pomace-fly species), and many bird species: An animal's (usually a male's) actual, or sham, feeding of its mate during courtship (Heymer 1977, 37; Thornhill and Alcock 1983, 417–418; Lifjeld and Slagsvold 1986, 1441; Steele 1986, 1087; Immelmann and Beer 1989, 63).

syn. greeting feeding [because some kinds of birds present food only during, or after, copulation (Wickler 1969 in Heymer 1977, 37)]

cf. billing, ceremony

deposit feeding *n.* For example, in some bivalve-mollusc and polychaete-worm species: Feeding on the bottom sediments in which an individual lives (Barnes 1974, 62).

cf. feeding: suspension feeding

Comments: Deposit feeders consume the substratum in which they live and digest organic detritus away from sand grains and other inorganic substances, egesting the latter (Barnes 1994, 62). Deposit feeders ingest material directly with their mouths or first gather food with special appendages.

filter feeding *n.* For example, in many bivalve-mollusc species and some crustacean species: Feeding by straining suspended particulate organic matter from water; distinguished from suspension feeding (Barnes 1974, 63).

See feeding: suspension feeding.

syn. suspension feeding (a confusing synonym, Lincoln et al. 1985)

cf. feeding: deposit feeding

free feeding *n.* An arthropod's consuming all tissue from a leaf's margin to its mid-vein, leaving only

the larger veins uneaten; contrasted with hole feeding, margin feeding, skeletonization, and window feeding (Coulson and Witter 1984).

greeting feeding *n.* For example, in some bird species: Feeding one partner of a pair by the other when they meet after having been separated for a while (Wickler 1969 in Heymer 1977, 120).

hawking *n.* A bird's feeding while flying (Lincoln et al. 1985).

hole feeding *n.* An arthropod's consuming all tissue of part of a leaf; contrasted with free feeding, margin feeding, skeletonization, and window feeding (Coulson and Witter 1984).

kiss feeding *n.* For example, in Humans and some other anthropoid-ape species: A ritualized form of mouth-to-mouth feeding during lovemaking or bonding (Eibl-Eibesfeldt 1970, 1972, 1973 in Heymer 1977, 120).

margin feeding *n.* An arthropod's consuming all tissue of a leaf's margin; contrasted with free feeding, hole feeding, skeletonization, and window feeding (Coulson and Witter 1984).

mouth-to-mouth feeding *n.*

1. In many bird species: An individual's inserting food into a young's mouth (Heymer 1977, 120).
2. In Humans (*e.g.*, Ituri Pygmies, Papuans): A woman's inserting prechewed food into an infant's, or young domesticated animal's, mouth with her tongue (Heymer 1977, 120).

reciprocal feeding See trophallaxis.

skeletonization *n.* An arthropod's consuming all of a leaf's tissue except for many of its veins; contrasted with free feeding, hole feeding, margin feeding, and window feeding (Coulson and Witter 1984).

suspension feeding *n.* Feeding in which an animal traps, or collects (but does not filter), organisms, or detritus that are suspended in surrounding water; distinguished from filter feeding (Barnes 1974, 63).

See feeding: filter feeding.

syn. ciliary feeding (which may or may not be synonymous), filter feeding (a confusing synonym, Barnes 1994, 63)

window feeding *n.* An arthropod's consuming a layer of a leaf without making a hole through it; contrasted with free feeding, hole feeding, margin feeding, and skeletonization (Coulson and Witter 1984).

♦ **feeding aggregation** See aggregation: feeding aggregation.

♦ **feeding ceremony** See ceremony: feeding ceremony.

♦ **feeding stimulant** See chemical-releasing stimulus: feeding stimulant.

♦ **feeding territory** See territory: feeding territory.

♦ **feeding tradition** *n.* For example, in some bird and mammal species: A regional diet peculiarity that develops by young animals' learning food preferences from their mothers or both parents (Heymer 1977, 73).

♦ **fellatio** *n.* In Humans and *Pan paniscus* (Bonobos): An individual's sucking another individual's penis (Waal 1989, 204–205).

♦ **female, ♀** *n.* In bisexual or dioecious species: An egg-producing form (Lincoln et al. 1985).

cf. "caste" for different kinds of "gynes," hermaphrodite, male

Comments: In dioecious species in which males and females produce very similar gametes, the individuals that produce larger gametes can be considered to be females while those that produce smaller gametes can

be considered to be males. Workers of many social insect species are morphologically females and classified as such, although they do not lay eggs.

metafemale *n.* A female with an additional female sex chromosome (Lincoln et al. 1985).

neofemale *n.* A female that arises by sex reversal from a male (Lincoln et al. 1985).

♦ **female calling** See calling: female calling.

♦ **female care** See care: female care.

♦ **female choice, female preference** See mate choice: female mate choice.

♦ **female copying** See mate choice: female copying.

♦ **female-defense polygyny** See mating system: polygyny: female-defense polygyny.

♦ **female mate choice** See mate choice: female mate choice.

♦ **female-mate-choice hypotheses** See hypothesis: female-mate-choice hypotheses.

♦ **female mimicry** See mimicry: female mimicry.

♦ **female pattern** See female schema.

♦ **female preference** See mate choice: female mate choice.

♦ **female receptivity** See receptivity.

♦ **female schema** *n.* For example, in a dragonfly and flesh-fly species: Characteristics of an object which elicit male courtship behavior when they are present in a particular combination to a male animal (Vogel 1954, 1957, 1958; Buchholtz 1951; and Heymer 1973 in Heymer 1977, 198).

♦ **fen** See habitat: fen.

♦ **feral** *adj.*

1. Referring to an animal that is neither tame nor domesticated; wild; also, referring to an animal that became wild again after Humans tamed or domesticated it (Michaelis 1963).

Note: The descendants of domesticated animal(s) that live in the wild are also designated as feral (*e.g.*, feral ponies on Assateague Island, U.S.; feral Domestic Horses in Western U.S.).

2. Of, relating to, or typical of a wild beast; savage (Michaelis 1963).

cf. -type, type: genotype: wild type

[Late Latin <*feralis*, < Latin *fera*, wild beast]

♦ **-ference**

afference *n.* Excitation of afferent nerves conveyed from an animal's sense organs (including proprioceptors and visceral receptors) to its central nervous system (Immelmann and Beer 1989, 7).

► **exafference** *n.* Afference that results from environmental stimuli not caused by a focal animal; *e.g.*, afference caused by a cloud passing over the sun, rather than a focal animal's own movements (Immelmann and Beer 1989, 95).

► **reafference** *n.* Afference that results from stimuli caused by a focal animal's own movement and enables the animal to make compensatory movement in its orientation, *q.v.* (Immelmann and Beer 1989, 243).

cf. principle: reaffection principle; *Sollwert*

effeference *n.* Nerve impulses from an animal's central nervous system to its effectors via its efferent nerves (Heymer 1977, 58; Immelmann and Beer 1989, 7, 84).

cf. -ference: afference

♦ **fermentation** See biochemical pathway: fermentation cycle.

♦ **fertility ratio** See ratio: fertility ratio.

♦ **fertility schedule** *n.* The average number of daughters that will be produced by one female at each particular age in a population (Wilson 1975, 90).

♦ **fertilization** *n.*

1. In many organism species: A male's insemination, or fecundation, of a female (Oxford English Dictionary 1972, verb entries from 1859).

2. In many organism species: Union of the nuclei of an egg and sperm of the same species or similar species (Immelmann and Beer 1989, 103).

syn. copulation (loosely), mating (loosely), pollination (in plants)

cf. copulation, -gamy, insemination, pollination, sex *v.t.* fertilize

cross-fertilization, allogamy, allomixis, staurogamy, xenogamy *n.* In many organism species: The union of male and female gametes each from different conspecific individuals (Lincoln et al. 1985).

cf. -gamy: allogamy

plasmagynogamous fertilization *n.* Fertilization in which a zygote's cytoplasm is derived only from the female gamete that formed it (Lincoln et al. 1985).

plasmaheterogamous fertilization *n.* Fertilization in which a zygote's cytoplasm is derived unequally from the male and female gametes that formed it (Lincoln et al. 1985).

plasmaisogamous fertilization *n.* Fertilization in which a zygote's cytoplasm is derived equally from the male and female gametes that formed it (Lincoln et al. 1985).

self-fertilization, idiogamy, mychogamy *n.* In many plant species: The union of male and female gametes that are produced by the same individual organism (Lincoln et al. 1985).

♦ **fesnyng, fesynes** See ²group: fesnyng.

♦ **F horizon** See soil horizon: F horizon.

♦ **fiddling display** See display: fiddling display.

♦ **fidelity to place** See ortstreue.

♦ **field** See habitat: field.

♦ **field capacity** *n.* Water that remains in soil after excess moisture has drained freely from it (Allaby 1994).

Note: Researchers usually measure field capacity as a percentage of the weight, or volume, of oven-dried soil (Allaby 1994).

♦ **Fieldranger 6500** See instrument: Fieldranger 6500.

♦ **51 Pegasi** See star: 51 Pegasi.

♦ **fight** *n.*

1. A hostile encounter, or engagement, between opposing human forces (Oxford English Dictionary 1972, entries from 893).

2. In animals, including Humans: A combat between two, or more, individuals (Oxford English Dictionary 1972, entries from 1300).

3. A person's power, or disposition, to fight; pugnacity (Oxford English Dictionary 1972, entries from 1812).

syn. fighting

v.i., v.t. fight

damaging fight *n.* For example, in some ant species, Gray Wolves, and Humans: A fight in which animals severely harm one another, even to the point of death (Heymer 1977, 41).

syn. injurious fight (Immelmann and Beer 1989, 148)

cf. ritualized fight

Comment: Damaging fights usually occur between heterospecific individuals, *e.g.*, species competing for

- the same resource or a predator and prey. Conspecific-damaging fights usually occur in social species (Immelmann and Beer 1989, 148).
- injurious fight** See fight: damaging fight.
- mouth clashing** *n.* For example, in mouth-breeding cichlid species: Fishes' butting and striking one another with open mouths (Heymer 1977, 115).
cf. fight: mouth fight
- mouth fight, mouth pulling** *n.* For example, in a salariine-blenniid-fish: A fight involving mouthing one another; for example, in substrate-nesting cichlids that grasp each other lip to lip, wrestle, and shove each other back and forth (Heymer 1977, 115).
cf. fight: mouth clashing
- ritualized fight** *n.* For example, in Gray Wolves and Ibex: An intraspecific fight that proceeds according to set rules (*e.g.*, an animal's not attacking at a crucial time, or at all, due to perceiving certain appeasement signals from an opponent) and that usually results in no, or only minor, physical injury to combatants (Heymer 1977, 41, 100; Immelmann and Beer 1989, 256).
- ♦ **fight-intention movement** See behavior: intention movement: fight-intention movement.
- ♦ **fight-or-flight syndrome** See syndrome: fight or flight.
- ♦ **fighting coloration** See coloration: fighting coloration.
- ♦ **fighting instinct** See instinct: fighting instinct.
- ♦ F_{ij}, f_{ij} See coefficient: coefficient of consanguinity.
- ♦ **filial cannibalism** See cannibalism: filial cannibalism.
- ♦ **filial generation** See generation: filial generation.
- ♦ **filial imprinting** See learning: imprinting: filial imprinting.
- ♦ **filial ovicide** See cannibalism: filial cannibalism.
- ♦ **filial regression** See law: Galton's law of filial regression.
- ♦ **film** *n.* A motion picture (Morris 1982).
Comment: I include only a few of the thousands of films about nature.
Adaptation *n.* A 2002 American comedy-drama about *Dendrophylax lindenii* (Ghost Orchid), a screenwriter, an author, and an orchid poacher in Florida, U.S., based on the non-fiction book *The Orchid Thief* (Sony Pictures 2010).
- An Inconvenient Truth** *n.* A 2006 documentary film about global warming that is essentially a long lecture by Albert Arnold (Al) Gore, Jr., the 45th Vice President of the U.S. (Farhi 2007, 13 October, C1).
Comments: In 2007, the film won an Academy Award for best documentary. A British judge ruled that while Gore's documentary makes a strong case that human activity has contributed to global warming and that there is a sense of urgency to deal with it, the movie contained nine factual errors not supported by scientific consensus (Balz and Eilperin 2007, 13 October, A9).
- Jurassic Park** *n.* A 1990 science-fiction thriller based on a science-fiction novel about a deranged millionaire and a reckless scientist who bring ravenous dinosaurs back to life by cloning DNA from blood-sucking insects encased in amber (Crichton 1990; Morell 1992b, 1861).
- ♦ **filter feeding** See feeding: filter feeding.
- ♦ **"filtering collectors"** See ²group: functional feeding group: filtering collectors.
- ♦ **fimbricole** See -cole: fimbricole.
- ♦ **fimicole** See -cole: fimicole.
- ♦ **fin** See behavior: fin.
- ♦ **fin flicking, fin-flicking behavior** See display: fin flicking.
- ♦ **final common path** *n.* The same motor neurons and muscles that are affected by different impulses that arise from any of many sources of reception (Sherrington 1906 in Immelmann and Beer 1989, 104).
- ♦ **final instar** See instar: last instar.
- ♦ **fine-grained environment** See environment: fine grained environment.
- ♦ **fine-grained species** See ²species: fine-grained species.
- ♦ **fine-grained variation** See variation: fine-grained variation.
- ♦ **fine-particulate-organic matter** See particulate-organic matter: fine-particulate-organic matter.
- ♦ **fine-structure map** See map: genetic map.
- ♦ **firefly-flash-synchronization hypothesis** See hypothesis: firefly-flash-synchronization hypothesis.
- ♦ **first Darwinian revolution** See revolution: first Darwinian revolution.
- ♦ **first instar, first larval instar** See instar: first instar.
- ♦ **first law of thermodynamics** See law: laws of thermodynamics: first law of thermodynamics.
- ♦ **first order** See order: first order.
- ♦ **first-order Markoff chain** See chain: Markoff chain.
- ♦ **first-order stream** See stream: first-order stream.
- ♦ **Fisher's-exact test, Fisher's-exact-probability test** See statistical test: Fisher's-exact test.
- ♦ **Fisher's fundamental theorem** See ³theory: Fisher's fundamental theorem.
- ♦ **Fisher's theory of 1:1 sex ratios** See ³theory: Fisher's theory of 1:1 sex ratios.
- ♦ **fission** *n.* Spontaneous division of a cell, or organism, into new cells or organisms, especially as a mode of reproduction (Michaelis 1963).
See swarming: fission.
syn. cell division (Michaelis 1963)
Comments: Agametic reproduction by fission has evolved numerous times in Annelida, *q.v.* (Bely 1999, 243). Almost all fissiparous annelids whose regenerative abilities have been investigated fully are capable of regenerating both anteriorly and posteriorly. One fissiparous annelid *Paranais litoralis* (Oligochaeta: Naididae) has lost the capacity for full anterior regeneration. It routinely produces its four anterior segments during each round of fission, yet this species is incapable of producing these same segments by anterior regeneration.
[Latin *fissio*, *-onis* < *fussus*, past participle of *findere*, to split]
- architomical fission** *n.* In Nemerteans and Sponges: Fission "in which a large parental individual proliferates vegetatively into a number of smaller progeny" (Bell 1984, 600).
- binary fission** *n.* In Prokaryotes: A kind of cell division in which a parent cell splits transversely into approximately equal sized daughter cells, each of which receives a copy of a single parental chromosome (King and Stansfield 1985; Campbell 1990, G-2).
cf. mitosis
- paratomical fission** *n.* In Actiniarians, Aelosomatid and Naiad Oligochaetes, Hydras, and Planarians: Fission "in which the two products are similar in size and both require only a small amount of growth

and differentiation to regain the actively reproducing adult state" (Bell 1984, 600).

♦ **fission-fusion group** See ²group: fission-fusion group.

♦ **fission hypothesis** See hypothesis: Moon-origin hypotheses: fission hypothesis.

♦ **fitness** *Comments:* Because of the many kinds of fitness, one general, broad definition of fitness as it relates to all kinds of fitness is not appropriate. Fitness can be defined as genetic or nongenetic and from the vantage points of memes, genes, individual organisms, or particular groups of organisms. The vast literature on fitness is confusing because authors frequently call whatever fitness they are discussing simply "fitness" without informative adjectives, and some fitness terms that some authors synonymize have very different meanings to other authors.

SOME CLASSIFICATIONS OF FITNESS^a

- I. General classification
 - A. genetic fitness (*syn.* Darwinian fitness)
 - B. nongenetic fitness (*syn.* cultural fitness)
- II. Classification by type of genetic "group"
 - A. Below the individual-organism level
 - 1. single-gene fitness
 - 2. gene-group fitness
 - B. Individual-organism level
 - 1. direct fitness
 - 2. inclusive fitness
 - 3. indirect fitness
 - C. Above the individual-organism level
 - 1. mated-pair fitness
 - 2. family-group fitness
 - 3. deme fitness
 - 4. population fitness, etc.
- III. Classification by kind of relative
 - A. cousin fitness
 - B. grandchild fitness (granddaughter fitness, grandson fitness), etc.
 - C. grandparent fitness (grandfather fitness, grandmother fitness)
 - D. nephew fitness, niece fitness
 - E. offspring fitness (daughter fitness, hermaphrodite fitness, son fitness)
 - F. parent fitness (father fitness, mother fitness)

^a These classifications are only some of many that can be made based on the many definitions of the different kinds of fitness.

adaptive value See fitness: genetic fitness.

classical fitness See fitness (def. 2, 4); fitness: genetic fitness.

classical-individual fitness See fitness (def. 2).

classical-personal fitness See fitness (def. 4).

cultural fitness See fitness: nongenetic fitness.

Darwinian fitness See fitness (def. 2, 4); fitness: genetic fitness.

direct fitness See fitness (def. 2, 4).

fitness[1] See fitness: See fitness (def. 1).

fitness[2] See fitness: genetic fitness.

fitness[3] See fitness (def. 4).

fitness *n.*

1. An animal's capacity to survive and reproduce (Spencer 1864, Wallace 1866, Darwin 1866 in Dawkins 1982, 181).

syn. classical fitness (Brown 1987, 299), fitness[1] (Dawkins 1982), classical individual fitness, individual fitness (Brown 1987, 299), personal fitness
Notes: In certain contexts, "fitness" refers to some individuals' having better survivorship traits than others, e.g., harder teeth, keener eyes (Spencer 1864, Wallace 1866, Darwin 1866 in Dawkins 1982, 181). This definition of fitness is not precisely synonymous with "reproductive success." The 19th-century idea of fitness as an animal's being favored physically in its "struggle for existence" is markedly different from some more recent statistical concepts of fitness (Immelmann and Beer 1989, 106). Generally speaking, fitness refers to an organism's state of good physical condition; good health (Michaelis 1963).

2. The number of offspring reaching adulthood that an individual organism leaves in the next generation in the absence of chance effects (Williams 1966 in West Eberhard 1975, 2).

See fitness: individual fitness.

syn. classical fitness (West Eberhard 1975, 6); Darwinian fitness (Haldane 1932); direct fitness (Brown 1975); individual fitness; personal fitness (West Eberhard 1975, 6)

3. The probability that a lineage will continue for a very long time, such as 10^8 generations, and will be contributed to by such "biotic" factors (Williams 1966) as "genetic flexibility" (Thoday 1953 in Dawkins 1982, 193).

Note: Some of Thoday's basic ideas have been recently recast in Cooper's (1984) interpretation of fitness as "expected time to extinction" (Beatty 1992, 119).

4. The genes, relative to conspecifics, that an individual organism contributes to its next generation, measured in different ways, which vary in accuracy, including number of a male's matings, number of eggs in a female (fecundity), number of eggs a female lays (fecundity), number of eggs that hatch or number of live births (fertility), and number of an individual's offspring that live to maturity.

syn. classical fitness, classical-personal fitness, personal fitness (Wilson 1975), direct fitness (Brown 1975, Brown and Brown 1981 in Dawkins 1982), fitness[3] (Dawkins 1982), genetic fitness (Dewsbury 1978, 43)

Notes: This is a commonly used concept of fitness. An individual's fitness is related to different factors including its health, feeding efficiency, resource availability, and survival time (Dawkins 1982, 183). Different fitness measurements suggest an individual's actual, or potential, reproductive success, which is very difficult to measure under field conditions. In the long run, it is an individual's relative contribution to the gene pool of its next generation and future generations that represents the "bottom line" of this individual's fitness (Dewsbury 1978, 295).

5. A verbal trick to make it possible to discuss natural selection at the level of the individual organism instead of at the level of the gene (Dawkins 1982, 179).

Note: Dawkins (1982, 179) contends that "fitness" is a confusing term with many different meanings, and that this term probably should not be used (Dawkins 1982, 179).

6. A hypothetical quantity that tends to be maximized by natural selection (Dawkins 1982, 182).

Note: Dawkins (1982, 182), who opposes many concepts represented by the term “fitness,” argues that this definition makes “survival of the fittest” into a tautology.

7. “A measure of the ability of genetic material to perpetuate itself in the course of evolution” (McFarland 1985, 78).

Note: McFarland (1985) uses fitness in reference to long-term reproductive success throughout his book.

cf. fitness: genetic fitness, inclusive fitness, indirect fitness

Comments: “Fitness’ is perhaps the most contentious concept in evolutionary biology” (Paul 1992, 113). Darwin (1959) used “fit” and its forms to refer to adapted and suitable characters; he used “fitness” once (Paul 1992, 113). Despite Dawkin’s (1982) analyses, many biologists consider “fitness” to be a useful concept as indicated in def. 4. “The precise meaning of ‘fitness’ has yet to be settled, in spite of the fact — or perhaps because of the fact — that the term is so central to evolutionary thought” (Beatty 1992, 115). [from “survival of the fittest” Spencer (1864 in Dawkins 1982, 179); a synonym for “natural selection” (Paul 1992, 113). One can also think about fitness in terms of how an organism “fits” into its environment (Lewontin 2000, 43)]

genetic fitness *n.*

1. The relative increase, or decrease, of a particular gene in the gene pool of the next generation of a population (Fisher 1930, Haldane 1957 in Mayr 1982, 588); contrasted with nongenetic fitness.
2. W, a measure of the relative frequency of a genotype, usually a single locus (Falconer 1960 in Dawkins 1982, 182).

syn. fitness, fitness[2] (Dawkins 1982)

Notes: $W = 1 - s$, where “s” is the coefficient of selection against this genotype; the “1” is an arbitrary fitness value of the more common, or most common, allele at the locus in question; and “W” can be regarded as the number of offspring, relative to the arbitrary value of 1, that the average individual of a certain genotype produces that live up to their reproductive ages (Falconer 1960 in Dawkins 1982, 182).

3. “A measure of the rate at which allele or linkage-group frequencies change within a gene pool through time” (Wittenberger 1981, 614).

syn. adaptive value, selective value, Darwinian fitness (Wittenberger 1981)

See fitness (def. 4).

cf. fitness (def. 7)

inclusive fitness *n.* “The animal’s production of adult offspring ... stripped of all components ... due to the individual’s social environment, leaving the fitness he would express if not exposed to any of the harms or benefits of the environment ... and augmented by certain fractions of the quantities of the harm and benefit, the individual himself causes to the fitnesses of his neighbours. The fractions in question are simply the coefficients of relationship ...” (Hamilton 1964a, 14).

syn. neighbor-modulated fitness (Hamilton 1964a, b), personal fitness (not a good synonym as indicated in Orlove 1975, 1979 in Dawkins, 1982)

Comments: Primary literature and textbooks are confusing in their implied and explicit definitions of “inclusive fitness.” Different authors (Hamilton 1964a;

West Eberhard 1975; Grafen 1982, 1984) in defining “inclusive fitness” use “a focal organism’s (helper’s) number of offspring” with different combinations of the following characteristics: (1) plus any increase, or decrease, in offspring equivalents due to this focal animal’s helping them; (2) plus the number of the focal organism’s offspring equivalents present, or not present, due to help, or hindrance, from any relatives involved with the helper; (3) plus all offspring equivalents present due to its relatives’ reproducing whether, or not, the focal organism had anything to do with these offspring equivalents being produced; (4) minus the number of the focal organism’s offspring equivalents present, or not present, due to help, or hindrance, from any relatives involved with the helper. These authors’ papers should be consulted for further information. The concept of inclusive fitness is now so generally accepted by biologists that it is implied in most uses of fitness, regardless of whether it differs from classical fitness in the case in point (C. K. Starr, pers. comm.).

[coined by W. D. Hamilton (1964a, b)]

indirect fitness *n.* “The component of inclusive fitness that arises from [a focal organism’s] effects on nondescendent kin and other nondescendent co-gene-carriers” [coined by Brown 1978 in Brown 1987, 302)].

cf. selection: indirect selection, kin selection

Comment: Brown (1987, 302–304) discusses the confusion regarding the concepts represented by the terms indirect fitness, indirect selection, kin selection, and kinship component.

individual fitness *n.*

1. “The (average) net contribution of an individual of a particular genotype to the next generation” (Keller 1992, 120).
2. “The geometric rate of increase of a particular genotype” in a population (Keller 1992, 120). See fitness (def. 2).

Comment: There is a chronic confusion in evolutionary literature regarding these two definitions (Keller 1992, 120).

kinship component See fitness: indirect fitness.

neighbor-modulated fitness See fitness: inclusive fitness.

nongenetic fitness *n.* In animals with culture: An animal’s perpetuation of its memes; contrasted with genetic fitness.

syn. cultural fitness

personal fitness See fitness (def. 1, 2, 4); fitness: inclusive fitness.

♦ **selective value**

See fitness: genetic fitness.

♦ **fitness topography** See gram: fitness topography.

♦ **fittest** *n.* Referring to animals that survive in their natural environments (Dawkins 1982, 181); animals of a group with high fitness, *q.v.*

See survival of the fittest.

Comment: Using “fittest” to refer to more than one animal of a group can be considered poor English; “fitter” seems preferable.

♦ **fixation** *n.* “The complete prevalence of one gene form (allele), resulting in the complete exclusion of another (Wilson 1975, 584).

random fixation *n.* Fixation due to chance loss of an allele’s homologous allele in a population (Lincoln et al. 1985).

- ♦ **fixation index, *F*** See index: fixation index.
 - ♦ **fixed-action pattern** See action pattern: fixed-action pattern.
 - ♦ **fixed effect** See effect: main effect: fixed effect.
 - ♦ **fixed factor** See effect: main effect: fixed effect.
 - ♦ **fixed-interval reinforcement schedule** See reinforcement schedule: fixed-interval reinforcement schedule.
 - ♦ **fixed-ratio reinforcement schedule** See reinforcement schedule: fixed-ratio reinforcement schedule.
 - ♦ **fixed-reaction behavior** See behavior: fixed-reaction behavior.
 - ♦ **fixed territory** See territory: territory.
 - ♦ **flagship species** See ²species: flagship species.
 - ♦ **flashbulb memory** See memory: flashbulb memory.
 - ♦ **flash coloration** See coloration: flash coloration.
 - ♦ **flash communication** See communication: flash communication.
 - ♦ **flavin-adenine dinucleotide** See enzyme: flavin-adenine dinucleotide.
 - ♦ **flehmens, Flehmen** *n.*
 1. In males of many ungulate species, felid species, and some insectivore and primate species: An individual's extending his neck, closing his nasal openings, and curling his upper lip (lip curling, exposing his upper incisors and possibly gum ridge), especially in his reproductive season after licking a female's urine or vulva, or smelling a female (Schneider 1930 in Heymer 1977, 68; Immelmann and Beer 1989, 107).
syn. lip curl (Immelmann and Beer 1989, 107)
cf. facial expression, organ: Jacobson's organ
Notes: This behavior appears to be more important in facilitating a male's perception of the odor more than being a courtship display (Dewsbury 1978, 76). Flehmen appears to be a ram's olfactory mechanism for confirming the reproductive state of a ewe (Bland and Jubilan 1987, 735).
 2. In the Asian Elephant: A female's touching a liquid sample with her trunk tip and moving it and a bit of the liquid to the ducts in the roof of her mouth that lead to her vomeronasal organ (Schulte and Rasmussen 1999, 1269, illustration).

[German *Flehmen*]
 - ♦ **Flemming's aphorism** *n.* *Omnis nucleus e nucleo* (the nucleus of a fertilized egg cell — a zygote — never disappears, and there is complete continuity between it and all nuclei of the organism into which it develops) (Mayr 1982, 666, 678).
Comment: By 1880, every cytological investigation confirmed this aphorism (Flemming in Mayr 1982, 666, 678).
 - ♦ **fleurs-du-mâle syndrome** See syndrome: fleurs-du-mâle syndrome.
 - ♦ **flexibility** See plasticity: phenotypic plasticity: flexibility.
 - ♦ **flick** See ²group: flick.
 - ♦ **flight** *n.*
 1. In the majority of insect species, most bird species, bats: An individual's act, or manner, of flying (Oxford English Dictionary 1972, entries from 900).
 2. In Falcons: An individual's pursuit of game; also the pursued quarry (Oxford English Dictionary 1972, entries from 1530).
 3. In many insect and bird species: A migration or issuing forth of bodies (Oxford English Dictionary 1972, entries from 1823).
 - 4. In animals: An individual's fleeing, or running away, from danger; hasty departure or retreat (Oxford English Dictionary 1972, entries from 1200).
cf. behavior: escape behavior
 - 5. *v.i.* For example, in Wild Fowl: To migrate, or move in flights (Oxford English Dictionary 1972, entries from 1604).
cf. locomotion
See ²group: flight.
- courtship flight** *n.* Flight during which a bird sings, as in *Alauda arvensis* (Skylarks) and some nighthawk spp., or makes noise with its wings as in *Columba livia* (Rock Dove), or tail feathers as in snipe (Immelmann and Beer 1989, 63).
syn. song flight (Immelmann and Beer 1989, 63)
cf. flight: nuptial flight
Comment: This is a misleading term because most so-called "courtship flights" are not part of mating initiation, but serve as territory advertisements. Better terms for this behavior are "advertisement flight," "territorial flight," and "display flight." "Courtship flight" should be reserved for the few bird species whose song flights are used solely for courtship, including some heron species, and many hummingbird species (Immelmann and Beer 1989, 63).
- **individual courtship flight** *n.* In some firefly species: Flight during which solitary males signal to females with light flashes (Immelmann and Beer 1989, 64–65).
- nuptial flight** *n.* In many social-insect species: The mating flight of the winged reproductive females and males of a colony (Wilson 1975, 435, 590).
syn. marriage flight (Wheeler 1930, 9), mating flight
cf. flight: courtship flight
Comment: Reproductives' copulations may occur in flight or after landing depending on species (Immelmann and Beer 1989, 204).
[Latin *nuptialis* < *nuptus*, past participle of *nubere*, to marry]
- orientation flight** *n.* For example, in some digger-wasp and sand-wasp species and *Apis mellifera* (Western Honey Bees): An individual's flying about and learning the landmarks of its environment (Tinbergen 1932, Baerends 1941, Frisch 1965 in Heymer 1977, 126–127).
- song flight** See flight: courtship flight.
- territorial flight** See flight: courtship flight.
- ♦ **flight behavior** See behavior: flight behavior.
- ♦ **flight companion** See companion: flight companion.
- ♦ **flight distance** See distance: flight distance.
- ♦ **flight-intention movement** See behavior: intention-movement: flight-intention movement.
- ♦ **flight year** See unit of measure: year: flight year.
- ♦ **Fligner-Policello test** See statistical test: multiple-comparisons test: planned-multiple-comparisons procedure: Fligner-Policello test.
- ♦ **fling** See ²group: fling.
- ♦ **floater** *n.*
 1. For example, in some bee species, *Acinonyx jubatus* (Cheetahs) and *Melospiza melodia* (Song Sparrows): An individual animal that is "unable to claim a territory and hence forced to wander through less suitable surrounding areas" (Wilson 1975, 271, 584; Barrows 1983, 808; Arcese 1987, 773; Caro 1989, 54).
syn. nonresident, nonterritorial animal (Caro 1989)
 2. A nonbreeding animal that is a potential breeder and not bound to a particular territory (Brown 1987, 299).

cf. ¹population: floater population; territory: floating territory; resident; territory holder

♦ **floater population** See population: floater population.

♦ **floating territory** See territory: floating territory.

♦ **flock** See ²group: flock.

♦ **flora** *n.*

1. The plant species of, and usually peculiar to, a particular region or period; distinguished from fauna (Michaelis 1963).

2. A treatise on these plants (Michaelis 1963).

cf. ²community: *Metasequoia Flora*

[New Latin from Latin *Flora*, goddess of flowers]

ichnoflora *n.* An area's traces of extinct plants (Lincoln et al. 1985).

microflora *n.* Fungi and microbial colonies (Hoekstra et al. 1995, 248).

cf. phage: microphytophage

♦ **Flora and Fauna Guarantee Act 1988** See law: Flora and Fauna Guarantee Act 1988.

♦ **floral color change** *n.* A natural color change in a part of a flower (Müller 1877 and others in Weiss 1991, 227).

Comments: Flowers in at least 74 diverse angiosperm families undergo dramatic, often localized, color changes (Weiss 1991, 227; 229, illustrations). In many studied plants, floral color change directs pollinators to flowers with nectar and pollen. Many varieties of *Lantana camara* (Lantana) show floral color change, including *Lantana* 'Sonja', whose yellow flowers turn pink (fig. 17).

♦ **floral display** See display: floral display.

♦ **floral mimicry** See mimicry: floral mimicry.

♦ **floral mutualism** See mimicry: floral mimicry: nondeceptive floral mimicry.

♦ **floral nectary** See nectary: floral nectary.

♦ **floral reward** See reward: floral reward.

♦ **floral visitor** *n.* An animal that visits a flower where it finds food, a mate, a resting place, shelter, or a combination of these things (Buchmann and Nabhan 1996, 246).

Comment: A particular floral visitor may, or may not, be a pollinator.

♦ **flope** See ²group: flole.

♦ **flower** See organ: flower.

♦ **flower constancy** *n.*

1. In many bee species: A forager's restricting its visits to a single plant species, or morph within a species, during one foraging bout or a longer period (Plateau 1901, etc., in Waser 1986, 594).

2. In many bees species: A forager's tendency to use the same flower species as a food source, especially a pollen source, on any one foraging trip or during a longer period (Michener 1974, 372).

adj. flower constant

♦ **fluctuating asymmetry** *n.* Asymmetry of the two sides of bilateral characters (e.g., ears, feet, fins, hands, or wings) for which the signed differences between the two sides have a population mean of zero and are normally distributed (Van Valen 1962 in Thornhill et al. 1995, 1602).

Comments: Because the two sides of such characters are not controlled by different genes, some researchers think that fluctuating asymmetry represents imprecise expression of underlying developmental design because of developmental perturbations (Thornhill et al. 1995, 1602). Reduced fluctuating asymmetry is associated with male mating success in, e.g., some

Drosophila species, *Hirundo rustica* (Barn Swallow), non-human primates, and scorpionflies.

♦ **fluffing** See behavior: feather ruffling: fluffing.

♦ **fluid recycling** *n.* In many skipper-butterfly species: An adult's extending its proboscis under its thorax and imbibing fluid that it excreted from its abdomen (Atkins 1989, 103).

♦ **flurry** See ²group: flurry.

♦ **flush** See ²group: flush.

♦ **flutter** See ²group: flutter.

♦ **fluviology** See study of: fluviology.

♦ **fly along a mating path** See patrol.

♦ **flying-fish hypothesis of wing origin** See hypothesis: hypothesis of the origin of insect wings: flying-fish hypothesis of wing origin.

♦ **flying-squirrel hypothesis of insect wing origin** See hypothesis: hypotheses of the origin of insect wings: paranotal hypothesis of insect wing origin.

♦ **FMGP** See program: Fungal Mitochondrial Genome Project.

♦ **focal-animal sampling** See sampling technique.

♦ **fold** See ²group: fold.

♦ **folicaulicole** See -cole: folicaulicole.

♦ **folicole** See -cole: folicole.

♦ **folivore** See -vore: folivore.

♦ **follicle-stimulating hormone** See hormone: follicle-stimulating hormone.

♦ **follower** *n.* In many ungulate species, including *Connochaetes* spp. (Gnus), Goats, Sheep, and *Rupicapra rupicapra* (Chamois): A precocial young that, from its birth onwards, tends to follow its mother (or a substitute moving object) and stay near her (Immelmann and Beer 1989, 108).

cf. hider; period: lying-out period

Comment: "Follower" is on a continuum with "hider" (Immelmann and Beer 1989, 108).

♦ **following behavior, following response** See behavior: following behavior.

♦ **following-response imprinting** See learning: imprinting: filial imprinting.

♦ **F₁** See generation: filial generation.

♦ **food** *n.*

1. Matter that a person eats, drinks, or absorbs and uses for his maintenance and growth (Oxford English Dictionary 1972, entries from 1000).

syn. aliment, nourishment, nutrient, provisions (Oxford English Dictionary 1972)

2. Matter that a plant absorbs from the Earth and air (Oxford English Dictionary 1972, entries from 1759).

syn. nutriment (Oxford English Dictionary 1972)

3. A person's nourishment consumed in more, or less, solid form vs. liquid form: food and drink (Oxford English Dictionary 1972, entries from 1610).

Comment: Definitions 1 and 3 now refer to many species of nonhuman animals as well.

♦ **caecotroph** *n.* In Lagomorphs, a prosimian species, and Rodents: Material that is higher in raw protein than feces, arises from an animal's caecum, and is eaten by the animal that produces it (Harder 1949, Frank et al. 1951, and Hladik et al. 1971 in Heymer 1977, 49).

cf. -troph-: caecotroph

♦ **pap** *n.* In *Phascolarctos cinereus* (Koalas): A green fecal fluid that is eaten by a young individual and is composed of partly digested eucalyptus leaves and produced by its mother (Lee and Martin 1990, 41).

♦ **proctodeal food** *n.* In Kalotermitid and Rhinotermitid Termites: Food originating from the hindgut

that is exchanged in trophallaxis; this food is emitted from the anus and is different from ordinary feces because it contains symbiotic flagellates and is more watery (Wilson 1975, 207).

cf. food: stomodeal food
[Greek *proktos*, rectum]

stomodeal food *n.* Food exchanged in trophallaxis originating in the salivary glands and crop in Kalotermitid and Rhinotermitid Termites (Wilson 1975, 207).

cf. food: proctodeal food

Comment: This food is the principal source of nutrient for the royal pair and larvae (Wilson 1975, 207).

♦ **food begging** *n.* In many animal species: One individual's soliciting food from a conspecific; *e.g.*, a young's soliciting food from its parents (in many animal species); a courtship partner's soliciting food from its mate during courtship feeding (in some bird species); an adult's soliciting food from another adult that is not its mate during food sharing (*e.g.*, in the African Wild Dog and Western Honey Bee) (Heymer 1977, 72; Immelmann and Beer 1989, 109).

syn. food solicitation, solicitation (C. K. Starr, pers. comm.)

v.t. food beg

cf. feeding: courtship feeding, greeting feeding

♦ **food call** See animal sounds: call: food call.

♦ **food chain** See chain: food chain.

♦ **food-deception mimicry** See mimicry: floral mimicry: food-deception mimicry.

♦ **food dispenser** *n.* A device used in a Skinner box that automatically gives out a particular amount of food following a particular performance by an animal in the box (Heymer 1977, 73).

♦ **food hiding** *n.* For example, in Chipmunks, Ravens, and Squirrels: An individual's concealing its gathered food in certain places (Eibl-Eibesfeldt 1951, Gwinner 1962 in Heymer 1977, 73).

See hoarding: food hoarding

cf. behavior: caching; food storage; hoarding: food hoarding

♦ **food hoarding** See hoarding: food hoarding.

♦ **food imprinting** See learning: imprinting: food imprinting.

♦ **food mimicry** See mimicry: food mimicry.

♦ **food pilfering** See parasitism: cleptoparasitism.

♦ **food provisioning** See provisioning: food provisioning.

♦ **food-related patrolling** See patrol.

♦ **food-source mimicry** See mimicry: floral mimicry: deceptive floral mimicry.

♦ **food storage** See hoarding: food hoarding.

♦ **food web** *n.* The complete set of food links among species in a community (Wilson 1975, 584).

See -gram: food web.

cf. food chain

♦ **fool's gold** See mineral: iron pyrite.

♦ **foot preference** See handedness.

♦ **footdrumming** See animal sounds: drumming: footdrumming.

♦ **footedness** See handedness.

♦ **footprint substance** See chemical-releasing stimulus: semiochemical: pheromone.

♦ **forager** *n.* An organism that practices foraging (*q.v.*), *e.g.*, a feeding animal or a social-insect worker that brings food to its nest.

cf. predator

Bayesian forager *n.* A forager that assesses resource-patch quality by using information on the distribution of resources among patches (McNamara and Houston 1980 in Valone 1991, 569).

cruising forager See predator (table).

intensive forager See predator (table).

prescient forager *n.* A forager that assesses resource-patch quality by using information obtained through its modalities and remembering patches that have temporally predictable qualities (Valone and Brown 1989 in Valone 1991, 569).

♦ **foraging, foraging behavior** See behavior: foraging.

♦ **forbicole** See -cole: forbicole.

♦ **forbivore** See -vore: forbivore.

♦ **forced copulation** See copulation: forced copulation.

♦ **forebrain** See organ: brain: forebrain.

♦ **forehead-brooding** See brooding: forehead-brooding.

♦ **forehead gland** See gland: forehead gland.

♦ **foreplay** See play: foreplay.

♦ **forensic psychology** See study of: psychology: forensic psychology.

♦ **forest** See ²community: forest; fossil: petrified forest; habit: forest.

♦ **forkhead transcription factor** See factor: forkhead transcription factor.

♦ **forgotten Pollinators Campaign** See project: Forgotten Pollinators Campaign.

♦ **form** *n.* A shallow depression dug by a hare that serves as a camouflage blind from which it monitors its surroundings (Stutz 1987).

♦ **form analysis** See analysis: form analysis.

♦ **form constancy** *n.* An animal's always performing a behavior in a rigidly stereotyped manner (Immelmann and Beer 1989, 111).

cf. pattern: fixed-action pattern, stereotypy.

♦ **form species** See ²species: form species.

♦ **formation** *n.* A body of rock strata that consists of a certain lithologic type or combination of types (Bates and Jackson 1984).

Comments: A formation is the fundamental lithostratigraphic unit (Bates and Jackson 1984). Some formations are combined into groups and divided into members. For much information on evolution, formations, fossils, etc., see the Web site of the Museum of Paleontology, University of California, Berkeley, www.ucmp.berkeley.edu/index.html.

Akilia Island Rocks *n.* A banded-iron formation from Akilia Island, Western Greenland, that is > 3,800 Ma old and has tiny bits of elemental carbon in Apatite that may be remains of early life on Earth (Mojzsis et al. 1996 in Holland 1997, 38).

cf. life

Comments: This formation has very low $\delta^{13}\text{C}$ values which are typical of organic matter produced by methanotrophs (Holland 1997, 38). Akilia Island Rocks have the oldest possible remains of life known.

Isua Rocks *n.* A banded-iron formation from Isua, Western Greenland that is 3,800 Ma old and has carbonaceous residues that may be remains of early life on Earth (Schidlowski et al. 1979 in Holland 1997, 38).

Comments: The Isua Rocks may have originated by chemical precipitation in marine basins, and their quartz layers may have initially been chert that precipitated from seawater (Stanley 1989, 251). The Isua

Rocks have $\delta^{13}\text{C}$ values that characterize present-day organisms.

Warrawoona Rocks *n.* A formation of sedimentary rocks in Northwestern Australia that are 3,450 Ma old and contain carbonaceous material that might be remains of early life on Earth (Schopf 1993 in Holland 1997, 38).

syn. Warrawoona Formation (Strickberger 1996, 167, illustration)

♦ **formicarium, formicary** See nest: formicarium.

♦ **formic acid** See toxin: formic acid.

♦ **forward mutation** See $^4\text{mutation}$: forward mutation.

♦ **FOSB** See gene: *FOSB*.

♦ **fossil** *n.*

1. Any curious object, either organic or nonorganic, dug from the earth (obsolete definition) (Trowbridge 1962; Olson 1973, 649).

Note: This early definition included relics of ancient civilizations (Mayr 1985, 9).

2. The preserved remains of an organism dating before historical time; *e.g.*, an altered original soft part, altered original hard part, an unaltered hard part, or an unaltered soft part (Trowbridge 1962; Curtis 1983, 1095).

syn. necrotype (Lincoln et al. 1985)

Note: This definition dates from the 16th century (Olson 1973, 649). Coal, petroleum, some graphite deposits, and some limestone deposits are technically fossils, but are left out of the concept of "fossil" by some researchers. Fossilized sharks' teeth, including those of *Carcharodon megalodon* (Great White Shark), are collectors' favorites (fig. 18, specimens from Calvert Cliffs, U.S.).

A CLASSIFICATION OF FOSSILS^a

- I. abiotic fossils
 - A. astronomical fossil, including "faint hotspots"
 - B. geological fossil, including ripple marks, sea beds, seashores
- II. biotic fossils
 - A. amber
 - B. characteristic fossil (*syn.* diagnostic fossil; index fossil, not preferred)
 - C. coprolite
 - D. facies fossil
 - E. guide fossil
 - F. index fossil (*syn.* characteristic fossil, not preferred)
 - G. microfossil
 - H. molecular fossil
 - I. mummy
 - J. organism body remains
 - K. stromatolite fossil
 - L. trace fossil (*syn.* ichnofossil, Lebensspur, trace, vestigifossil)
 - 1. boring
 - 2. caste
 - 3. ichnite (*syn.* ichnolite), including ornithichnite
 - 4. gastrolith (*syn.* gastric mill stone, stomach stone)
 - 5. mold
 - 6. scolite
 - 7. trail

^a "Living fossils," "pseudofossils," and "subfossils," defined below, are not true fossils

3. The trace of an organism's existence (*e.g.*, a boring, a cast, a coprolite, an ichnofossil, a gastrolith, a mold, a track, or a trail) (Michaelis 1963; Lapidus 1987).

4. Any preserved remains, or trace, of an organism from before the Holocene Epoch, which started from 10,000 through 12,000 yr ago, depending on the researcher (inferred from Mayr 1985, 9).

5. One of certain inorganic objects, or physical features, that record natural activities or phenomena of past geological times (*e.g.*, solidified ripple marks) (Michaelis 1963).

6. *adj.* Referring to extinction or age (*e.g.*, a fossil fern, fossil rain prints, fossil hail prints) (Lapidus 1987).

7. Referring to a geological form that has become covered or changed: a fossil feature (Lapidus 1987).

See Appendix 1 for entries on particular fossils.

cf. -type: necrotype; stromatolite
[Latin *fossilis*, dug up; *fodere*, to dig]

amber *n.* Fossilized tree resin that has become stable due to loss of its volatile constituents, oxidation, and polymerization during lengthy burial in the ground (Frondel 1973, 717).

Note: Amber is a general name for a group of very heterogeneous resins from different plant species (Frondel 1973, 717). Amber is white ("bone amber") through yellow, reddish yellow, red, and brownish yellow, or rarely bluish; brittle; easily electrified by friction; hard; and translucent.

cf. copal

Comments: Amber, which often contains fossils (bacteria through vertebrates), is used as jewelry and for pharmaceutical purposes. The natural embalming features of amber are due to inert dehydration, encapsulation of organic material by flowing resin (of some plant species including the legume tree *Hymenaea protera*), and bactericidal action of terpenes, according to Desalle et al. (1992, 1936), but the exact process of fossil preservation in amber is considered to be an enigma (Fischman 1993, 656). Amberization preserves fine features of organisms, even molecules such as DNA. Desalle et al. (1992) sequenced DNA from 18s and 16s ribosomal DNA genes of a 30-Ma-old termite fossil in Dominican amber.

Amber sites include the Bavarian Alps, Germany (Triassic, 225 Ma); Indonesia, Jamaica, Mexico (Chiapas), Morocco (Atlas Mountains), Philippines, and Alberta, Canada (Cretaceous, 80–70 Ma); Danish, Polish, and Russian Baltic Coasts (Eocene and Oligocene, 60–40 Ma); Alaska, New Jersey, and Taimyr Peninsula, Siberia (Cretaceous); Lebanon (Cretaceous, 135–120 Ma); and Dominican Republic (Oligocene, 40–25 Ma); New Zealand (Miocene, 20 Ma) (Poinar and Poinar 1994; Grimaldi 1996, illustrations).

Behavior is sometimes preserved in amber; *e.g.*, an animals' struggling while caught in the sap that became amber, an ant's struggling while in a spider web, and a spider's attacking a termite (Poinar and Poinar 1994, illustrations, unnumbered central pages), as well as a queen ant's carrying prey, a scale insect (Poinar and Poinar 1994, 180, illustration).

The plant that produced Baltic amber is unknown (Poinar and Poinar 1994, 4).

See fossil: succinate.

[Old French *ambre* < Arabic *anbar*; ambergris]

cast *n.* Material (which is often hardened) that is inside a mold of a regular fossil or a trace fossil (based on Bates and Jackson 1984).

syn. mold (Morris 1982)

cf. mold

Comments: Cast material may be one or more minerals, loose sediment material(s) such as clay and sand, or both. Fossils are sometimes in casts.

characteristic fossil *n.* A fossil species, or genus, that is often found in a particular stratigraphic unit or time unit; contrasted with guide fossil and index fossil (Bates and Jackson 1984).

See fossil: index fossil.

syn. diagnostic fossil, index fossil (not preferred) (Bates and Jackson 1984)

Comment: A characteristic fossil is either confined to a particular unit or is particularly abundant in it (Bates and Jackson 1984).

coprolite *n.* Fossilized fecal material (Lincoln et al. 1985; Wright 1996, illustrations).

Comment: Early coprolites (probably from arthropods) occur in rocks from the Upper Silurian (412 Ma) and Lower Devonian (390 Ma) (Edwards et al. 1995).

diagnostic fossil See fossil: characteristic fossil.

Ediacaran fossils *n.* Precambrian fossils of several metazoan species from the Ediacara Hills, Australia; Newfoundland; White Sea Region of the former U.S.S.R., and other places (Gerhart and Kirschner 1997, 15; exhibit, U.S. Museum of Natural History, 2002).

Comments: Ediacaran fossils are about 580 Ma old and comprise several species with many different body forms (Gerhart and Kirschner 1997, 15). Ediacaran fossils include possible-arthropod, echinoderm, jellyfish, marine alga, sea-pen, and segmented-worm species. Researchers continue the spirited debate as to whether the large, flat Ediacaran fossils are the precursors of modern metazoans or whether they represent alternative experiments in eukaryotic multicellularity toward the main metazoan line. Ediacaran trace fossils (tracks) might represent bilateral triploblastic animals.

[After the Ediacara Hills (*q.v.*), Southern Australia]

facies fossil *n.* A fossil that characterizes the environment that prevailed in a particular area of sedimentation, *e.g.*, a coral species (Mayr 1985, 11).

gastrolith *n.* A highly polished, rounded stone believed to have been a part of the digestive system of certain extinct reptiles, such as plesiosaurs (Lapidus 1987).

syn. gastric mill stone (Norman 1985, 78), stomach stone (Lapidus 1987)

Comment: Gastroliths aid in grinding food in an animal's stomach (Lapidus 1987).

guide fossil *n.*

1. A fossil taxon that has actual, potential, or supposed value in identifying the stratum's age in which it is found or in indicating the conditions under which it lived; contrasted with characteristic fossil and index fossil (Bates and Jackson 1984).

2. A fossil taxon used especially as a guide for correlating local strata (Bates and Jackson 1984).

ichnite, ichnolite *n.* A fossilized animal track or footprint (Michaelis 1963).

cf. fossil: trace fossil

[Greek *ichnos*, footprint]

ichnofossil See fossil: trace fossil.

index fossil *n.* A fossil used to identify and date the stratum in which it occurs; contrasted with characteristic fossil and guide fossil (Bates and Jackson 1984).

See fossil: characteristic fossil.

syn. characteristic fossil (not preferred) (Bates and Jackson 1984), index fossil (Burns 1991, 25, not preferred)

Comments: Index fossils are usually genera, not species (Bates and Jackson 1984). An index fossil has morphologic distinctiveness; a relatively broad, even worldwide, occurrence; and a short span of geological time, and therefore, a narrow, or restricted stratigraphic range. The better index fossils include swimming, or floating, organisms that evolved rapidly and were distributed widely, *e.g.*, ammonites and graptolites. Some researchers use the brachiopod *Costispirifer arenosus* as a guide fossil for the Oriskany Sandstone in West Virginia, U.S., but this is not a preferred guide fossil (Burns 1991, 25).

Lebensspur See fossil: trace fossil.

living fossil *n.*

1. A relict organism from an ancient group of organisms, *e.g.*, a lungfish [coined by Charles R. Darwin (1859 in Thomson 1991, 71)].

2. A species that has persisted to the present with little, or no, change over a long period of geological time (Lincoln et al. 1985).

Note: Some people consider a genus, that has persisted to the present with little, or no, change over a long period of geological time, to be a "living fossil" also.

3. "The living representative of an ancient group of organisms that is expected to be extinct (it may for a long time have been thought to be extinct) but isn't" (Thomson 1991, 71).

Note: "Living fossil" connotes one, or more, of these characters: rare, or at least uncommon; a restricted geographical range; a member of a taxon formerly widely distributed in time and space as indicated by the fossil record; and very ancestral in comparison to other organism groups, even closely related ones (Thomson 1991, 71–72).

Comments: Scientists debate about the meaning of "living fossil" (Thomson 1991, 71–72). Many biologists do not like this term. It sounds like an oxymoron. A living organism cannot be a fossil; however, a living species can be represented by fossils. Researchers have called the following "living fossils": *Amia calva* (Bowfin, a fish), *Atractosteus* spp. (Gars), *Didelphis virginianum* (Virginia Opossum), *Latimeria chalumnae* (Coelacanth), *Lepidosiren paradoxa* (South American lungfish), *Lepisosteus* spp. (Sturgeons), *Limulus polyphemus* (Horseshoe Crab), *Metasequoia glyptostroboides* (Dawn Redwood), *Neoceratodus forsteri* (Australian Lungfish), *Polyodon* sp. (Mississippi Paddlefish), and *Protopterus* spp. (African Lungfish) (Thomson 1991, 71–75). Xiphosurida, which contains *Limulus polyphemus*, is represented by Silurian fossils about 425 Ma old, but this species has no fossil record and its genus is known from the Miocene (Gould and Eldredge 1993, 224). Some extant genera have lived for millions of years with little apparent change: *Lingula* (Brachiopoda), 400 Ma ago; *Metasequoia* (Coniferophyta), ca. 70 Ma (Stewart and Rothwell, 1993, 432–433). About 20 mollusc species that lived in the North American Miocene appear to be "living fossils" Clark et al. (1904).

microfossil *n.* A fossil of a unicellular organism, *e.g.*, a dinoflagellate, foraminiferan, or nanoplankton (Kerr 1997, 28 February, 1265).

mold *n.*

1. "A hollow form or matrix for shaping a fluid or plastic substance" (Morris 1982).
2. Something that is made, or shaped, in a mold (Morris 1982).
3. An impression, or cavity, made in surrounding earth or rock material by the exterior of a fossil, interior of a fossil, or both, or another organic structure that is too young to be a fossil (based on Bates and Jackson 1984).

cf. caste

molecular fossil *n.*

1. A modern biomolecule whose parts appear to be frozen in time, thus preserving remnants of ancient events that forged early living molecules [coined by Alan Weiner and Nancy Maizels in Gibbons 1992c, 31].
2. An ancient molecule found in a rock that is a remnant of an organism, *e.g.*, a molecule of carbon from a plant from the Carboniferous Period (Gerhart and Kirschner 1997, 11).

cf. molecule: sterane

mummy *n.* A desiccated, prehistoric mammal corpse preserved in northern permafrost (Guthrie 1990, 22).

See mummy.

Comments: There are many prehistoric mummies (= fossils) (Guthrie 1990).

ornithichnite *n.* A fossilized bird track or footprint (Lincoln et al. 1985).

petrified forest *n.*

1. A group of fossil trunks of an *Araucarioxylon*-type tree (in Petrified Forest National Park, eastern Arizona, U.S.) that date to at least 220 Ma ago (Wilford 1995, C1, illustration; National Park Service 2001).

Notes: Many of the trees have traces of what appear to be bee nests and wasp cocoons (Wilford 1995, C1). The oldest known bee (*q.v.*) body fossil is 80 Ma old and the oldest known wasp body fossil is 116 Ma old.

2. The Petrified Forest of Lesvos; a group of fossil trunks of several tree species (on Lesvos Island Greece) that date from the late Oligocene through the middle Miocene Epochs about 20–15 Ma ago (Velizelos and Zouros 2001, illustrations).

pseudofossil *n.* An object that looks like a true biotic fossil but is not such a fossil (Mayr 1985, 11).

Comment: Abiotic chemical factors, mechanical factors, physical factors, or a combination of these factors produce pseudofossils (Mayr 1985, 11).

scolite *n.* A fossilized worm burrow (Lincoln et al. 1985).

♦ **succinate**

- n.* Baltic amber (Frondel 1992, 717).

See fossil: amber.

[after succinic acid obtained by dry distillation of this amber, D. A. M. Mackay, pers. comm.]

stromatolite fossil *n.* A banded dome of sediment produced by bacteria that is strikingly similar to ones constructed by bacterial mats today (Campbell 1987, 512–513).

Comments: Stromatolite fossils from western Australia and southern Africa are dated at 3.5 Ga old and are the oldest direct evidence of early life. Many of them may have formed before the evolutionary appearance of grazing animals (Stanley 1989, 96). John Grotzinger and Daniel Rothman reported that abiotic processes can produce formations that resemble stromatolites (Anonymous 1997, February, 20, illustration).

subfossil *n.* An organism's remains, or trace, from the Holocene Epoch (which started *ca.* from 10,000 through 12,000 yr ago and continues into the present); a "post-Pleistocene fossil" (Lincoln et al. 1985).

trace See fossil: trace fossil.

trace fossil *n.* A prehistoric sedimentary structure that resulted from an animal's behavior (*e.g.*, a bore hole of predatory marine snail, dinosaur track, rodent burrow, spider web, termite's nest, and worm tube in petrified wood or shale) or preserved feces (= coprolite) or stomach contents (Lincoln et al. 1985; Immelmann and Beer 1989, 111–112).

syn. ichnofossil, *Lebensspur*, trace, vestigofossil (Lincoln et al. 1985)

vestigofossil See fossil: trace fossil.

fossil feature *n.* A geological form that has become covered or changed (Lapidus 1987).

♦ **fossil sea** *n.* An ancient sea bed (Lapidus 1987).

♦ **fossilorial** See -orial: fossilorial.

♦ **fostering** *n.* A person's bringing up a child, often a foster child, with parental care (Oxford English Dictionary 1972, entries from 1205).

Comment: "Fostering" now refers to nonhuman animals as well.

cross-fostering *n.*

1. An experimental method for controlling for subtle environmental factors that affect observed differences among strains of a species; in mice, this method involves switching newborn litters of pups at birth of two strains differing in adult behavior so that foster mothers rear the pups (Dewsbury 1978, 113).

2. Nonparental rearing of young in humanly contrived situations; thus, brood parasitism and adoption are excluded (Immelmann and Beer 1989, 112).

syn. foster rearing (Immelmann and Beer 1989, 112)

cf. adoption; parasitism: brood parasitism

interspecific fostering *n.* Rearing young animals by heterospecific adults (Immelmann and Beer 1989, 112).

syn. cross-species rearing, cross-fostering (Immelmann and Beer 1989, 112)

► **hand-rearing** *n.* A person's rearing a young heterospecific animal (Immelmann and Beer 1989, 112).

♦ **foundation species** See ²species: ecosystem-engineer species.

♦ **"found-p"** See p: "found-p."

♦ **founder effect** See effect: founder effect.

♦ **foundling stage** See stage: founding stage.

♦ **foundress queen** See caste: queen: foundress queen.

♦ **four whys of animal behavior** See Tinbergian research programme.

♦ **Fourier analysis** See method: Fourier analysis.

♦ **FOXO** See factor: transcription factor: forkhead transcription factor.

♦ **FPOM** See particulate-organic matter: fine-particulate-organic matter.

♦ **frass** *n.*

1. Solid larval insect excrement; contrasted with urine (Craighead 1923 and Frost 1958 in Weiss 2006, 637; Torre-Bueno 1989, 285).

Note: Researchers commonly use this definition for frass (Weiss 2006, 637, who uses frass and fecula interchangeably).

2. Plant fragments made by a wood-boring insect, usually mixed with excrement (Torre-Bueno 1989, 285).

3. Uneaten food fragments cast aside by an insect's mandibles plus its excrement (Craighead 1923 and Frost 1958 in Weiss 2006, 637).

cf. *fecula, honeydew*

syn. *ejecta, excrement, excreta, dejecta, dejections, dung, feces, ordure, rejectamenta* (Weiss 2006, 637)

Comments: Depending on the species, insects use their frass as a building material, chemically informative material, defensive product, fertilizer, and nutrient (Weiss 2006). From the human standpoint, insect frass is an allergen, carrier of pathogens, means of identifying its producer, and source of medicine depending on the insect species. Insect excrement in the form of honeydew can be a major ingredient of honey and food of other organisms.

[German < *fressen*, to devour]

♦ **fraternal polyandry** See mating system: polyandry.

♦ **fraternal twin** *n.* See twin: fraternal twin.

♦ **fratricide** See -cide: fratricide.

♦ **Fraser-Darling effect, Fraser-Darling law** See effect: Fraser-Darling effect.

♦ **Free Air CO₂ Enrichment System** See system: Free Air CO₂ Enrichment System.

♦ **free-cell-formation theory** See ³theory: free cell-formation theory.

♦ **free earlobe** See character: attached earlobe.

♦ **free-running period** See period: natural period.

♦ **"freedom-from-deleterious-mutations hypothesis"** See hypothesis: hypotheses of the evolution and maintenance of sex: "freedom-from-deleterious-mutations hypothesis."

♦ **freehold** See territory.

♦ **French kiss** See kiss: French kiss.

♦ **frequency** *n.*

1. The number of times something occurs within a particular extent of time, a particular group, etc. (Michaelis 1963).

2. The number of times something occurs in relation to its total number of possible occurrences (Michaelis 1963).

cf. abundance, rarity

A CLASSIFICATION OF FREQUENCY IN INCREASING OCCURRENCE

- I. very infrequent (*syn.* rare)
- II. infrequent (*syn.* occasional, sporadic, somewhat common)
- III. frequent (*syn.* common)
- IV. very frequent (*syn.* abundant)

almost certain *n.* An event that occurs from 95 through 99% of the time (inferred from Mosteller et al. in Kolata 1986).

rare *n.* An event that occurs less than once out of a thousand times, depending on the kind of event (Mapes in Kolata 1986).

See frequency (table).

cf. rarity

relative frequency *n.*

1. A measure of the occurrence of a species, usually expressed as a percentage, calculated as the ratio of the frequency of a given species to the sum of the frequencies of all species present (Lincoln et al. 1985).

2. The number of times an event occurs in *x* trials, divided by the number of trials (*n*) (Lincoln et al. 1985).

very likely *n.* An event that occurs 90% of the time (inferred from Mosteller et al. in Kolata 1986).

♦ **frequency curve** See curve: frequency curve.

♦ **frequency-dependent selection** See selection: frequency-dependent selection.

♦ **frequency-dependent-sexual selection** See selection: frequency-dependent-sexual selection.

♦ **frequency distribution** See distribution: frequency distribution.

♦ **frequency modulation** See modulation: frequency modulation.

♦ **frequent worker** See caste: worker: frequent worker.

♦ **fresh-water marsh** See habitat: marsh: fresh-water marsh.

♦ **friend** *n.*

1. A person joined to another in "mutual benevolence and intimacy," not usually applied to relatives or lovers (Oxford English Dictionary 1972, entries from 1018).

2. A person who wishes another person, or a cause, well; a sympathizer, favorer, patron, supporter (Oxford English Dictionary 1972, entries from 1205).

3. A person who is on good terms with another, not hostile, or at variance; one who is on the same side in warfare, politics, etc. (Oxford English Dictionary 1972, entries from 1000).

4. In Olive Baboons: A conspecific that an animal is frequently near and with which it frequently engages in grooming; friends can be mothers and adolescent sons, older females and older males, adolescent males and females, or older females and young adult males (Smuts 1987, 39).

♦ **fright** *n.*

1. A person's sudden fear, violent terror, alarm; an instance of this (Oxford English Dictionary 1972, entries from 825).

2. An individual animal's feeling of being threatened accompanied with its "alertness and acumen" (Tembrock 1961 in Heymer 1977, 72).

v.t. fright (poetic, to frighten)

cf. fear

Comment: Unlike "fear," "fright" is object-oriented; i.e., it occurs only in response to tangible danger, and it probably does not result in physiological arousal such as fear-induced defecation and urination (Tembrock 1961 in Heymer 1977, 72).

♦ **fright call** See animal sounds: call: fright call.

♦ **fright molt** See molt: fright molt.

♦ **frith** See ²group: frith.

♦ **frigofuge** *n.* An organism that is intolerant of cold (Lincoln et al. 1985).

adj. frigofugous

♦ **frigophile** See ¹-phile: frigophile.

♦ **frogger** See ²group: frogger.

♦ **frost** *n.* Temperature cold enough to freeze a particular object (Michaelis 1963).

killing frost *n.*

1. A sharp temperature drop that severely damages and kills a plant (Allaby 1994).

2. A sharp temperature drop that prevents reproduction of an annual, biennial, or ephemeral plant (Allaby 1994).

♦ **frost bottom** *n.* A glacier-made depression up to 30 ft deep in the ground in New England, U.S., which is

warmer during the day and colder during the night than surrounding areas (Dean 2000, 12 September, D2).

Comment: A frost bottom on Martha's Vineyard can have frost throughout the year (Dean 2000, 12 September, D2). Frost bottoms harbor rare moth species.

♦ **F_{RT}** See index: fixation index; F_{RT}.

♦ **fructicole** See -cole: fruticole.

♦ **frugivore** See -vore: frugivore.

♦ **fruit** *n., pl. fruit, fruits*

1. In Angiosperms: A ripened ovary, or ovaries, together with accessory parts, normally containing seeds and occurring in a large variety of forms (Morris 1982).

2. In nonangiospermous plants: A fertile, often spore-bearing, structure (Morris 1982).

Comments: There are many kinds of fruits including accessory fruit, achenes, aggregate fruit, berries, capsules, drupes, follicles, legumes, loments, nuts, pomes, pyxides (singular pyxis), samaras, and schizocarps (Lawrence 1951, 759–760). Many kinds of organisms consume fruits (pers. obs.).

[Middle English < Old French < Latin *frutus* < past participle of *frui*, to enjoy]

♦ **fruitless** See gene: fruitless.

♦ **frustration** *n.* Failure of an animal's goal-directed behavior to realize its objective through obstruction, or absence, of a requisite condition (Heymer 1977, 70; Immelmann and Beer 1989, 113).

cf. hypothesis: aggression-frustration hypothesis

Comment: Frustration may include an animal's "emotional state" due to its not reaching its goal (Heymer 1977, 70; Immelmann and Beer 1989, 113).

♦ **frustration-induced aggression** See aggression: frustration-induced aggression.

♦ **fruticole** See -cole: fruticole.

♦ **fry** See animal names: fry; ²group: fry.

♦ **F_{SR}** See index: fixation index: F_{SR}.

♦ **F_{ST}** See index: fixation index: F_{ST}.

♦ **F statistic** See index: fixation index.

♦ **F₃** See generation: filial generation (comments).

♦ **F₂** See generation: filial generation (comments).

♦ **fucivore** See -vore: fucivore.

♦ **fugitive species** See ²species: fugitive species.

♦ **fulguration** See essentialism.

♦ **full charge** *n.* The ultimate aggressive act of an African Elephant directed only at dangerous predators including Humans (Wilson 1975, 495).

♦ **full-phylogenetic tree** See -gram: full-phylogenetic tree.

♦ **full sister** See sister: full sister.

♦ **¹function** *n.*

1. Anything's activity that is proper to it; the mode of action by which something fulfills its purpose; contrasted with structure (Oxford English Dictionary 1972, entries from 1590).

Note: Function was first used with regard to animals, then plants.

2. Evolutionary advantage of a trait (Hailman 1967 in Hailman 1976, 184).

syn. adaptive significance (Dewsbury 1999, 193), ecological adaptiveness (Dewsbury 1978, 6), proximate function, ultimate function (Immelmann and Beer 1989, 114). These are all confusing synonyms of function. Dewsbury (1999, 193) suggests that "function" should no longer be used to mean adaptive significance, and if it must be used, one should use the term "adaptive function."

cf. program: Tinbergian research programme; structure

proximate function of behavior *n.* The immediate effects, or consequences, of an animal's behavior; distinguished from ultimate function of behavior, *q.v.* (Immelmann and Beer 1989, 236), *e.g.*, a male bee's charging after another conspecific male and driving the intruder from his territory.

ultimate function of behavior *n.* The effects of an animal's behavior on its survivorship and reproduction (genetic fitness); distinguished from proximate function of behavior, *q.v.* (Immelmann and Beer 1989, 236); *e.g.*, a male bee's increasing his genetic fitness by maintaining a territory where he obtains food and mates.

♦ **²function (F, f)** *n.* In mathematics, a quantity whose value is dependent on the value of some other quantity (Michaelis 1963).

cost function *n.* An organism's long-term optimization, *e.g.*, energy intake per life time (McFarland and Houston 1981 in Dawkins 1986, 31).

cf. ³theory: optimality theory, utility

goal function *n.* An organism's short-term optimization, *e.g.*, energy intake per unit time (McFarland and Houston 1981 in Dawkins 1986, 31).

cf. ³theory: optimality theory; utility

utility function *n.* In economics, a consistent set of values (Tierney 1983).

♦ **functional conservation unit** See unit: functional conservation unit.

♦ **functional cycle** See cycle: functional cycle.

♦ **functional-feeding group** See ²group: functional-feeding group.

♦ **functional fixedness** *n.* An animal's inability to solve an insight problem because it cannot perceive an unusual function for an object (Storz 1973, 103).

♦ **functional group** See guild.

♦ **functional monogyny** See -gyny: monogyny: functional monogyny.

♦ **functional morphology** See morphology: functional morphology.

♦ **functional play** See play: functional play.

♦ **functional psychology** See study of: psychology: functional psychology.

♦ **functional response** See response: functional response.

♦ **functional song** See animal sounds: song: functional song.

♦ **functional system** See cycle: functional cycle.

♦ **functionalism** *n.*

1. The ideas that natural selection for an adaptation results in a function of an organism, and form (structure) is a manifestation (materialization) of this function (Geoffroy; Russell 1916, 77, in Mayr, 1982, 463); function determines structure (Mayr 1982, 463).

Note: Functionalists include Cuvier, Darwin, and Lamarck (Mayr 1982, 463; Gould 1986, 18).

2. A framework of thinking in which parts of the whole perform functions and these functions represent "biological significance," and within a historical framework lead to the notion of "purpose" (Hughes and Lambert 1984, 787).

See study of: psychology: functionalism.

Comments: Consequently functionalism represents the view that structures result from "need" (D. M. Lambert, pers. comm.). Gould (1986, 27) suggests that an adequate theory of evolution must meld certain aspects of both functionalism and structuralism. Lambert and Hughes (1988) argue that there is a conceptual and

keyword schism within evolutionary biology, and that these represent incommensurable viewpoints.

♦ **fundamental law of biogenesis** See law: biogenic law.

♦ **fundamental niche** See niche (def. 7).

♦ ***fundamentum divisionis*** See character.

♦ **funeral pheromone** See chemical-releasing stimulus: semiochemical: pheromone: funeral pheromone.

♦ **Fungal Mitochondrial Genome Project** See program: Fungal Mitochondrial Genome Project.

♦ **fungicide** See -cide: pesticide: fungicide.

♦ **fungicole** See -cole: fungicole.

♦ **fungivore** See -vore: fungivore.

♦ **funny face** See facial expression: funny face.

♦ **fusion-fission group** See ²group: fission-fusion group.

♦ ***Futterparasitismus*** See parasitism: social parasitism: trophic parasitism.

♦ **fuzzy number** See number: fuzzy number.

♦ **fynbos** See ²community: fynbos.

g

- ♦ **g** See intelligence: general-cognitive ability.
- ♦ **Ga** See unit of measure: Ga.
- ♦ **Gadgil-Bossert model** See ⁴model: Gadgil-Bossert model.
- ♦ **gaggle** See ²group: gaggle.
- ♦ **Gaia hypothesis** See hypothesis: Gaia hypothesis.
- ♦ **galactic black hole** See black hole: galactic black hole.
- ♦ **Galápagos Islands** See place: Galápagos Islands.
- ♦ **gall** *n.* A tumorous plant growth caused by an associated organism, including some bacterium, round-worm, insect, and some mite species (Kritcher and Morrison 1988, 252; Horst 1990).
Comments: Many plant species bear galls, often more than one kind. In insects, some aphid, beetle, fly, moth, thrips, and wasp species cause galls. About 800 species (mostly wasp species) produce oak galls (Walker 1990, 201). The gall-producing organisms usually live inside their galls where they obtain food and have protection from enemies.
- ♦ **gallicole** See -cole: gallicole.
- ♦ **galliphage, gallivore** See -phage: galliphage.
- ♦ **Galton's law of ancestral inheritance** See law: Galton's law of ancestral inheritance.
- ♦ **Galton's law of filial regression** See law: Galton's law of filial regression.
- ♦ **galvanotaxis** See taxis: galvanotaxis.
- ♦ **gam** See ²group: gam.
- ♦ **gamma hydroxybutyrate** See drug: gamma hydroxybutyrate.
- ♦ **game** *n.* An interaction between, or among, organisms that relates to the promotion of their fitnesses (Maynard Smith 1982, 2).
syn. contest (Maynard Smith 1982, 2)
See ²group: game
- asymmetric game** *n.* For example, in *Pararge aegeria* (Speckled-wood Butterflies): A game in which “there is a difference in ‘role’ between the contestants, of a kind which enables either of them to adopt a strategy ‘in role 1, do A; in role 2, do B;’” contrasted with symmetric game (Davies 1978; Maynard Smith 1982, 204).
syn. asymmetric contest (Maynard Smith 1982, 204)
- prisoner’s-dilemma game** *n.* A game in which two partners in crime are arrested, are separately interrogated by police, and given a particular “deal” with regard to confession of a suspected crime (Rosenberger 1992, 24–25).
Comments: This game involves reciprocal altruism (*q.v.*) (Rosenberg 1992, 24–25). The “deal” is if neither prisoner confesses, both will be imprisoned for 2 yr;

SOME KINDS OF GAMES

-
- I. Classification with regard to the number of players
 - A. pairwise game
 - B. individual game versus conspecific-group game
 - II. Classification with regard to capabilities of players
 - A. asymmetric game
 - B. symmetric game
 - III. Classification with regard to game rules
 - A. hawk-dove game
 - B. hawk-dove-assessor game
 - C. hawk-dove-bourgeois game
 - D. life-history-strategy game
 - E. prisoner’s-dilemma game (one-shot game, reiterating game)
 - F. retaliator game
 - G. rock-scissors-paper game
 - H. territory game
 - I. tit-for-tat game
 - J. war-of-attrition game
-

if one prisoner confesses and the other is mute, the confessor spends 1 yr in jail, and the non-confessor spends 10 yr in jail. If both confess, each will be imprisoned for 5 yr. The situation is a dilemma because the dominant strategy for each partner leads to an outcome that is less desirable than another attainable one. Under certain circumstances, the optimal strategy of an individual in a prisoner’s dilemma is the game tit-for-tat (Axelrod and Hamilton 1981).

symmetric game *n.* A game in which there is no difference in “role” between the contestants; contrasted with asymmetric game (Maynard Smith 1982, 204).

tit-for-tat game *n.* A prisoner’s dilemma game in which the two players cooperate in the first round, and then in each subsequent round, a player does that which the other player did in the last round (Rosenberger 1992, 24–25).

Comments: Robert Axelrod performed a computer simulation that pitted players that used different strategies in the prisoner’s dilemma game against each other (Rosenberg 1992, 24–25). He eliminated the players that used strategies that gave very low payoffs every five turns. After many turns, all remaining players used the tit-for-tat game strategy. This strategy is altruistic because the players expect cooperation. If one player doesn’t cooperate, the other can retaliate. The tit-for-tat game strategy can become the evolutionary-stable strategy (*q.v.*).

ultimatum game *n.* A game that involves an anonymous proposer, an anonymous responder, and a windfall sum of money (Jensen et al. 2007b, 109). *Comments:* In this game, the proposer decides whether to divide money with the responder. If the responder accepts the offer, both players receive the proposed division. If the responder does not accept the offer, neither player gets money. The canonical economic model of pure self-interest predicts that the proposer should offer the smallest share possible, and the responder should accept any nonzero offer. Actual human behavior deviates from this prediction suggesting that a responder is sensitive to unfairness and punishes a proposer that makes an inequitable offer by rejecting it at a cost to himself. The proposer knows this and makes a strategic offer that the responder is less likely to refuse. This is the most widely recognized test for sensitivity to fairness.

♦**game theory** See ³theory: game theory.

♦**gamergate** See caste: worker: gamergate.

♦**gamete** *n.* A mature, usually haploid, sexual reproductive cell that fuses with another gamete of the opposite sex and forms a zygote which is usually diploid (Vines 1886 in the Oxford English Dictionary 1972; Lincoln et al. 1985).

Comment: Most animal species have two kinds of gametes: motile sperm and nonmotile eggs; at fertilization, a sperm and an egg fuse to form a zygote (Immelman and Beer 1989, 116).

[New Latin *gameta* < Greek *gametē*, wife, or *gamelēs*, husband]

agamete *n.*

1. A mature reproductive cell that does not fuse with another to form a zygote; a noncopulating germ cell (Bell 1982, 501; Lincoln et al. 1985).
2. A haploid propagule that has the capacity for syngamy, but develops without it (Bell 1982, 501). *syn.* aryspore (Bell 1982, 501)

aplanogamete *n.* A gamete without cilia (Vines 1886 in the Oxford English Dictionary 1972); “a non-motile gamete” (Lincoln et al. 1985).

cf. gamete: zoogamete

anisogamete See gamete: heterogamete.

egg *n.*

1. A female gamete (Michaelis 1963). *syn.* egg cell, ovum, *pl.* ova (Michaelis 1963); gynogamete (Lincoln et al. 1985)
2. An unfertilized egg cell (Lincoln et al. 1985).
3. An unfertilized fish egg, a fish embryo, or both (Blumer 1982, 3). *cf.* animal names: spawn, female, gamete: macrogamete

Comment: An egg can also be a fertilized female gamete, e.g., a bird embryo, and is surrounded by nutrient material with a protective covering (Morris 1982) or a fertilized invertebrate egg that has not yet hatched.

facultative gamete *n.* “A motile spore (zoospore) that can function as a gamete” (Lincoln et al. 1985).

gynogamete See gamete: egg.

heterogamete *n.*

1. A gamete that is produced by the heterogametic sex (Lincoln et al. 1985).
2. A gamete that belongs to one of two distinguishable types (Lincoln et al. 1985). *syn.* anisogamete (Lincoln et al. 1985) *cf.* gamete: homogamete

homogamete *n.* A gamete, of only one distinguishable type, produced by the homogametic sex; contrasted with heterogamete (Lincoln et al. 1985).

macrogamete *n.* The larger of two anisogametes, often called an ovum or female gamete; contrasted with microgamete (Lincoln et al. 1985). *syn.* megagamete (Lincoln et al. 1985)

megagamete See gamete: macrogamete.

microgamete *n.* The smaller of two anisogametes, often called a sperm or male gamete; contrasted with macrogamete (Lincoln et al. 1985).

obligate gamete *n.* A gamete that cannot develop parthenogenetically (Lincoln et al. 1985).

oosphere *n.* A female gamete before it is fertilized (Lincoln et al. 1985).

oospore *n.* A fertilized female gamete (Lincoln et al. 1985).

ovum *n.* *pl.* **ova** See gamete: egg.

parthenogamete *n.* A gamete that can develop parthenogenetically (Lincoln et al. 1985).

planogamete See gamete: zoogamete.

planont *n.* A motile gamete, spore, or zygote (Lincoln et al. 1985). *syn.* planospore (Lincoln et al. 1985)

progamete *n.* A cell that gives rise directly to gametes, either by a single division or intracellular metamorphosis (Lincoln et al. 1985).

sperm *n.* A male gamete (Lincoln et al. 1985).

syn. spermatogamete, spermatosome, spermatozoid, spermatozoid, spermatozoon, sperm cell, spermium *cf.* ejaculate, gamete: microgamete, male [Greek *sperma*, seed]

► **apyrene sperm** *n.* A sperm that lacks a genome (Sivinski 1984, 92).

► **eupyrene sperm** *n.* A sperm with a complete haploid genome (Sivinski 1984, 92).

► **kamikaze sperm** *n.* A human aberrant sperm that may sacrifice itself as a protection of normal sperm during fertilization (Baker and Bellis 1988, 938; 1989, 867; Small 1989, 544).

► **oligopyrene sperm** *n.* A sperm with only part of its usual chromosomal complement (Sivinski 1984, 92).

► **outlaw sperm** *n.* A sperm that competes in a way that lowers the effectiveness of an ejaculate as a whole (Sivinski 1984, 108).

► **worker sperm** *n.* An apyrene sperm that aids its ejaculate mates but cannot fertilize an egg (Sivinski 1984, 108).

syngamete See zygote.

zoogamete, zoozygogamete, planogamete *n.* A gamete with cilia (Vines 1886 in the Oxford English Dictionary 1972); a motile gamete (Lincoln et al. 1985). *cf.* gamete: aplanogamete

♦**gamete selection** See selection: gamete selection.

♦**-gametic**

heterogametic, digametic *adj.* Referring to an organism that has two kinds of gametes, one producing males and the other producing females; contrasted with homogametic (Lincoln et al. 1985).

homogametic *adj.* Referring to an organism that has only one kind of gamete; contrasted with heterogametic (Lincoln et al. 1985).

♦**gametic disequilibrium** See linkage disequilibrium.

♦**gametic meiosis** See meiosis: gametic meiosis.

- ♦ **gametic number** *n.* The number of chromosomes in a gamete's nucleus, which is usually half the somatic chromosome number of a particular species (Lincoln et al. 1985).
- ♦ **gametic pool** *n.* The total potential gamete production of any particular generation of a sexually reproducing population (Lincoln et al. 1985).
- ♦ **gameto-** *comb. f.* Gamete (Michaelis 1963). [Greek *gametes*, husband < *gamos*, marriage]
- ♦ **gametogamy** See -gamy: syngamy.
- ♦ **gametogenesis** See -genesis: gametogenesis.
- ♦ **gametogenic** See -genic: gametogenic.
- ♦ **gametogeny** See -geny: gametogeny.
- ♦ **gametotoky** See parthenogenesis: amphitoky.
- ♦ **gametophyte** *n.* In plants with haploid and diploid generations, the haploid phase (1N) which produces diploid gametophytes (2N) (Curtis 1983, 424).
- ♦ **gamety** *comb. f.*
cf. gameto-
- diagamety, heterogamety** *n.* An organism's having two kinds of gametes, one producing male and the other producing female offspring (Lincoln et al. 1985).
- heterogamety** See sex determination: heterogamety.
- homogamety** *n.* An organism's production of only one kind of gamete from its homogametic sex (Lincoln et al. 1985).
See sex determination: homogamety.
- pseudoanisogamety** *n.* The occurrence of different sized gametes whose sizes are not correlated with their genders (Bell 1982, 511).
- sex diagamety** *n.* The capacity of an individual of an organism's heterogametic sex to produce male- and female-determining gametes through a sex-chromosome mechanism (Lincoln et al. 1985).
- sex monogamety** *n.* A hermaphrodite's, parthenogenetic individual's, or population's producing gametes of only one kind with regard to sex determination (Lincoln et al. 1985).
- sex polygamety, sex plurigamety** *n.* An individual organism's "producing gametes of many different types with regard to sex determination through the mechanism of polyfactorial sex determination" (Lincoln et al. 1985).
- ♦ **gamic** *adj.* "Fertilized" (Lincoln et al. 1985).
See -gamous, -gamy.
- ♦ **γ-diversity** See diversity: γ-diversity.
- ♦ **γ-diversity index** See index: species-diversity index: γ-diversity index.
- ♦ **gamma karyology** See study of: karyology: gamma karyology.
- ♦ **gamma link** See link: gamma link.
- ♦ **gamma taxonomy** See taxonomy: gamma taxonomy.
- ♦ **gamodeme** See -deme: gamodeme.
- ♦ **gamogenesis** See -genesis: gamogenesis.
- ♦ **gamogenic, gamogonic** See -genetic: gamogenic.
- ♦ **gamontogamy** See -gamy: gamontogamy.
- ♦ **gamophase** See -plont: haplont.
- ♦ **gamophobia** See -phobia: gamophobia.
- ♦ **gamosematic** *adj.* Referring to coloration, markings, or behavior that assists members of a pair in locating each other (Lincoln et al. 1985).
- ♦ **gamotropism** See -tropism: gamotropism.
- ♦ **-gamous** *comb. form* See -gamy.

ephydrogamous *adj.* Referring to a plant species that has, or is pollinated by, water-borne pollen that is transported at the water surface (Lincoln et al. 1985).

cf. -gamous: hyphydrogamous

hercogamous, herkogamous *adj.* Referring to a flower whose stamens and stigma are positioned in a way that prevents self-pollination by a stamen's touching the stigma (Lincoln et al. 1985).

n. hercogamy, herkogamy

Comment: *Lilium philadelphicum* (Wood Lily) is hercogamous, but it also appears that an individual's own pollen cannot fertilize its ovules (Barrows 1979).

hyphydrogamous, hyphydromic, hypohydromic *adj.* Referring to a plant species that has water-borne pollen that is transported below the water surface (Lincoln et al. 1985).

cf. -gamous: ephydromic

monogamous *adj.* Referring to a population, or species, that has a monogamous mating system (Lincoln et al. 1985).

See mating system: monogamy.

polygamous *n.* Referring to a plant species with hermaphroditic and unisexual flowers on the same, or on different, individuals, e.g., *Ampelopsis brevipedunculata* (Porcelainberry) (Fernald 1950, 1580).

progamous *adj.* Referring to a phenomenon that occurs, or exists, before fertilization (Lincoln et al. 1985).

♦ **-gamy** *comb. f.* "Marriage, fertilization, sexual union" (Lincoln et al. 1985).

adj. -gamic, -gamous

cf. fertilization, mating system, pollination

[Greek *gamos*, marriage]

adelphogamy See mating: sib mating.

allautogamy See -gamy: autoallogamy.

alloamy *n.* Fertilization of an ovule(s) of one flower with pollen from another conspecific flower (Faegri and van der Pijl 1979, 24).

cf. breeding; outbreeding; fertilization: cross-fertilization; -gamy: autogamy, gneisiogamy; pollination: cross-pollination

► **geitonogamy** *n.* Allogamy that involves two flowers from the same plant (Faegri and van der Pijl 1979, 24).

► **xenogamy** *n.* Allogamy that involves two flowers from different conspecific plants (Faegri and van der Pijl 1979, 24).

syn. gneisiogamy (q.v.)

amphigamy *n.* Cross-fertilization; the fusion of male and female gametes (Lincoln et al. 1985).

androgamy *n.* Impregnation of a male gamete by a female gamete (Lincoln et al. 1985).

anisogamy *n.*

1. The condition in which a female sex cell (ovum) is larger than a male sex cell (sperm) (Wilson 1975, 316, 578).

Note: Anisogamy, not isogamy, is the rule in organisms (Wilson 1975, 316, 578).

2. "A sexual system in which fusion takes place at fertilization between a large (female) and a small (male) gamete" (Dawkins 1982, 284).

See -gamy: heterogamy, isogamy.

anisohologamy *n.* Fusion of hologametic gametes that are not quite identical in some respect (Lincoln et al. 1985).

anisomerogamy See -gamy: anisogamy.

apogamy See parthenogenesis: apomixis.

► **euaphogamy, diploid apogamy** *n.* Development of a diploid sporophyte from one, or more, cells of a gametophyte without gamete fusion (Lincoln et al. 1985).

► **parthenopogamy, obligate apogamy, diploid parthenogenesis, somatic parthenogenesis** *n.* Parthenogenesis of diploid individuals in which meiosis has been suppressed so that neither chromosome reduction nor any corresponding phenomenon occurs (Lincoln et al. 1985). *cf.* parthenogenesis

► **obligate apogamy** See -gamy: apogamy: parthenopogamy.

apolegamy *n.* Selected breeding (Lincoln et al. 1985).

autoallogamy, allautogamy, autallogamy, autallogamy, homodichogamy *n.* The condition in which some individuals of a species are adapted to cross-fertilization and others to self-fertilization (Lincoln et al. 1985).

autogamy *n.*

1. Self-fertilization or self-pollination (Lincoln et al. 1985).

syn. orthogamy (Lincoln et al. 1985)

Note: Within a single plant, there may be interfloral autogamy in which pollen from a flower fertilizes its ovule(s), and intrafloral autogamy in which pollen from one flower fertilizes the ovule(s) of another flower.

2. Fusion of two reproductive nuclei within a single cell from one parent (Lincoln et al. 1985).
3. "Reproduction in which a single cell undergoes reduction division producing two autogametes which subsequently fuse" (Lincoln et al. 1985).
4. For example, in some protistans: The division of micronuclei to produce eight, or more, nuclei of which two fuse and give rise to a new macronucleus (Lincoln et al. 1985).

See -mixis: automixis.

► **paedogamous autogamy** *n.* Autogamy (def. 2) in which only nuclei, not cytoplasm, are involved in zygote formation (Lincoln et al. 1985).

caryogamy See -gamy: karyogamy.

chasmogamy *n.* A flower's pollination and fertilization which occurs after its opening (e.g., in many species of flowering plants); contrasted with cleistogamy, *q.v.* (King and Stansfield 1985).

[Latin, *chasma* < Greek *khasma*, gap, opening + *gamy*]

cleistogamy *n.*

1. A flower's pollination and fertilization without its opening (e.g., in some *Impatiens* spp., *Viola* spp., some Pansy cultivars); contrasted with chasmogamy, *q.v.* (Fernald 1950, 1572).
2. A plant's condition of having small, closed, self-fertilizing flowers, usually in addition to regular ones (Michaelis 1964).
3. A flower's pollination and fertilization before it opens (e.g., in *Spergularia marina*, Caryophyllaceae) (Usher 1966).

syn. clistogamy

Comment: Cleistogamous flowers are usually on, or near, the ground (Lawrence 1951, 744).

[Greek *kleisto*, closed < *kleinein*, to close + *gamy*]

cytogamy *n.*

1. Fusion of two cells (Lincoln et al. 1985).
2. Fusion of both male nuclei of one of two conjugating organisms with the other's female nucleus; double autogamy (Lincoln et al. 1985).

cytoplasmonic androgamy *n.* A male gamete's being fertilized by the cytoplasm of a female gamete (Lincoln et al. 1985).

cytoplasmonic gynogamy *n.* A female gamete's apparently being fertilized by the cytoplasm of a male gamete (Lincoln et al. 1985).

diamesogamy *n.* "Fertilization through an external agency" (Lincoln et al. 1985).

dichogamy *n.* Maturation of male and female reproductive organs at different times in a flower, or hermaphroditic organism, that prevents self-fertilization; contrasted with homogamy (Faegri and van der Pijl 1979, 27; Lincoln et al. 1985).

syn. heteracme (Lincoln et al. 1985)

diecdichogamy *n.* Maturation of male flowers first in some plants and female flowers first in other plants in a population of dichogamic plants (Lincoln et al. 1985).

dioeciopolygamy *n.* Both unisexual and hermaphrodite individual's being present in the same species (Lincoln et al. 1985).

ditopogamy See -gamy: heterogamy.

double autogamy See -gamy: cytogamy.

ecodichogamy *n.* The condition in which individuals of a dioecious species have different maturation times (given as the adjective "ecodichogamic" in Lincoln et al. 1985).

endogamy See breeding: inbreeding; mating: assortative mating.

endokaryogamy See -gamy: endogamy.

epigamy *n.* In Polychaete worms: Modification of an asexual individual (atoke) into a sexual one (epitoke) without any intervening reproductive process; contrasted with schizogamy (Bell 1982, 505).

exogamy See breeding: outbreeding; mating: disassortative mating.

exoisogamy *n.* The condition in which an isogamete undergoes fusion only with an isogamete from a different brood (Lincoln et al. 1985).

gametogamy See -gamy: syngamy.

gamontogamy *n.* "Aggregations or union of gamonts (organisms)" (Margulis et al. 1985, 73).

See -gamy: hologamy.

geitonogamy See -gamy: allogamy: geitonogamy.

gneisiogamy, intraspecific zygosis *n.* Cross-fertilization between two conspecific individuals (Lincoln et al. 1985).

cf. -gamy: allogamy

gymnogamy *n.* Fertilization (Lincoln et al. 1985).

hemigamy, semigamy *n.* Activation of an ovum by a male nucleus with fusion (Lincoln et al. 1985).

herkogamy *n.* The spatial separation of anthers and stigma(s) in a single flower (Faegri and van der Pijl 1979, 27).

heterodichogamy *n.* For example, in some maple species: The phenomenon in which all male flowers of a plant finish anthesis before female ones open, or vice versa (Faegri and van der Pijl 1979, 26).

heterogamy *n.*

1. A species' having two kinds of gametes, one kind producing males and the other producing females; contrasted with homogamy (Lincoln et al. 1985). *cf.* -gametic: homogamic

2. The union of gametes of different shape, size, or behavior (heterogametes) (Lincoln et al. 1985).

syn. anisogamy, ditopogamy (Lincoln et al. 1985)

cf. -gamy: anisomerogamy, isogamy

3. For example, in some cecidomyiid midges and aphids: "Alternation of two sexual generations, one syngamic and the other parthenogenetic" (Thornhill and Alcock 1983, 35; Lincoln et al. 1985).

syn. heterogamy (Lincoln et al. 1985). See parthenogenesis: heterogamy.
adj. heterogametic

hologamy, gamontogamy, macrogamy *n.* A mode of protistan reproduction involving gametes similar in size to vegetative cells (Lincoln et al. 1985). See -gamy: gamontogamy.

homiogamay, homoioGamay *n.* Union of two gametes of the same sex (Lincoln et al. 1985).

homodichogamy See -gamy: autoallogamy.

homogamy *n.*

1. The condition of having only one kind of gamete (Lincoln et al. 1985).
2. A flower's simultaneously having its own mature pollen and a receptive stigma; contrasted with dichogamy, heterogamy (Faegri and van der Pijl 1979, 27).

syn. autogamy (Faegri and van der Pijl 1979, 27)

See breeding: inbreeding; mating: assortative mating.
adj. homogametic

homoioGamay See -gamy: homiogamy.

hylogamy *n.* The fusion of a haploid nucleus with a diploid one (Lincoln et al. 1985).

hyperanisogamy *n.* An organism's having large, active female gametes (Lincoln et al. 1985).

idiogamy See fertilization: self-fertilization.

isogamy *n.* In a few species of sexually reproducing organisms: "The condition in which the male and female sex cells are the same size" (Wilson 1975, 316, 587), and not differentiated into sperm and ova (Wittenberger 1981, 617); contrasted with anisogamy.

syn. zygogamy

karyallogamy *n.* Reproduction involving the fusion of two morphologically identical gametes (Lincoln et al. 1985).

karyogamy, caryogamy, karyapsis *n.* Fusion of gametic nuclei (Lincoln et al. 1985).

macrogamy See -gamy: hologamy.

merogamy, microgamay, merogony, merogeny *n.* Protistan reproduction involving gametes that are smaller than vegetative cells and are produced by multiple fission; contrasted with hologamy (Lincoln et al. 1985).

metagamy *n.* Reproduction involving cycles that alternate between sexual and asexual phases (Lincoln et al. 1985).

microgamay See -gamy: merogamy; isolation: reproductive isolation.

misogamy See isolation: reproductive isolation.

mychogamy See fertilization: self-fertilization.

neogamy *n.* "Precocious syngamy" (Lincoln et al. 1985).

nothogamy See -gamy: heteromorphic xenogamy.

orthogamy See -gamy: autogamy.

pangamy, panmixis *n.* "Unrestricted random mating" (Lincoln et al. 1985).

See -mixis: panmixis.

paragamy *n.* Zygote nucleus formation by fusion within a syncytium (Lincoln et al. 1985).

parthenogamy See parthenogenesis: automictic parthenogenesis.

parthenokaryogamy, parthenocaryogamy *n.* "The fusion of two female haploid nuclei" (Lincoln et al. 1985).

pedogamy, paedogamy *n.*

1. Zygote formation by fusion of two gametes produced by one individual organism (Lincoln et al. 1985).
2. A form of automixis (Lincoln et al. 1985).

perittogamy *n.* Random cytoplasmic fusion between a gametophyte's undifferentiated cells without nuclear fusion (Lincoln et al. 1985).

phytogamy *n.* Plant cross-fertilization (Lincoln et al. 1985).

plasmagynogamy *n.* Fertilization in which a zygote's cytoplasm is derived from only a female gamete (Lincoln et al. 1985).

plasmaisogamy *n.* Fertilization in which a zygote's cytoplasm is derived equally from both a male and female gamete (Lincoln et al. 1985).

plasmogamy, plasmatogamy *n.* Cytoplasm fusion of two, or more, cells without nuclear fusion (Lincoln et al. 1985).

plastogamy *n.* Cytoplasm fusion of unicellular organisms to form a plasmodium without nuclear fusion (Lincoln et al. 1985).

protogamy *n.* Fusion of gametes producing a binucleate zygote (Lincoln et al. 1985).

pseudogamy, gynogenesis, pseudomixis, somatogamy *n.* Egg activation by a male gamete that degenerates without its nucleus fusing with that of the egg (Lincoln et al. 1985).

schizogamy *n.* In polychaete worms: Creation of sexual individuals by fission; contrasted with epigamy (Bell 1982, 512).

semigamy See -gamy: hemigamy.

somatogamy See -gamy: pseudogamy.

staurogamy See fertilization: cross-fertilization.

syngamy *n.*

1. The final step in fertilization in which the nuclei of sex cells (gametes) meet and fuse forming a zygote (Wilson 1975, 596).
2. Contact or fusion of gametes (cells or nuclei) (Margulis et al. 1985, 73).

syn. fertilization (Bell 1982, 513), gametogamy, sexual reproduction (Lincoln et al. 1985)

cf. -gamy: neogamy

xenautogamy *n.* A species' condition in which cross-fertilization normally occurs, but self-fertilization is possible (Lincoln et al. 1985).

xenogamy See fertilization: cross-fertilization; -gamy: allogamy: xenogamy.

zoidiogamy *n.* Fertilization by motile male gametes (Lincoln et al. 1985).

zoogamy *n.*

1. An animal's reproducing sexually (Lincoln et al. 1985).
2. A plant species' having mobile gametes (Lincoln et al. 1985).

zygogamy See -gamy: isogamy.

♦ **gang** See ²group: gang.

♦ **gap genes** See gene: segmentation genes (comment).

♦ **gaping** *n.*

1. A person's opening his mouth; yawning (Oxford English Dictionary 1972, entries from 1660).
cf. yawning
2. An individual bird's holding its bill widely open, upward in young birds and toward parents in older birds (Tinbergen and Kuenen 1939 in Heymer 1977, 166).

- v. gape
- ◆ **gargle call** See animal sounds: call: gargle call.
 - ◆ **gas-chromatography-mass-spectrometric-analytical method** See method: gas-chromatography-mass-spectrometric-analytical method.
 - ◆ **gaster** *n.* The “terminal major body part behind the “waist” of ants and other hymenopterans” (Wilson 1975, 585).
syn. metasoma (Wilson 1975, 585)
 - ◆ **gastric-brooding** See brooding: stomach-brooding.
 - ◆ **Gause's axiom, Gause's hypothesis, Gause's law, Gause's principle, Gause's rule, Gause's exclusion principle, Gause-Volterra principle** See principle: Gause's principle.
 - ◆ **Gaussian distribution** See distribution: normal distribution.
 - ◆ **gecker** See animal sounds: gecker.
 - ◆ **geitonogamy** See -gamy: allogamy: geitonogamy; pollination: self-pollination.
 - ◆ **gel electrophoresis** See method: electrophoresis: gel electrophoresis.
 - ◆ **Gelber-Jensen controversy** *n.* A debate regarding whether *Paramecium aurelia* showed modified behavior due to learning or environmental modification in Gelber's investigation (Gelber 1952, etc. in Dewsbury 1978, 343).
 - ◆ **gelicole** See -cole: gelicole.
 - ◆ **geminate species, law of** See law: Jordan's law.
 - ◆ **gemmule** *n.* A hypothetical small hereditary particle that carries information from all parts of an organism's body into its germ cells (Darwin 1868; Dawkins 1982, 287).
Comment: This is a discredited concept (Dawkins 1982, 287).
 - ◆ **GenBank** See database: GenBank.
 - ◆ **gender** *n., pl. genders*
 1. In grammar, a class, kind, sort; in biology, also a genus as opposed to a species (an obsolete definition, Oxford English Dictionary 1972, entries from 1384).
 2. In grammar, each of two or three grammatical kinds (depending on the language) corresponding more, or less, to sex or absence of sex in denoted objects; the distinction of words into genders (Oxford English Dictionary 1972, entries from 1387).
 3. Informally, the condition of being of a female or male sex; sex; (Oxford English Dictionary 1972, entries from 1387; Pickett 2000); “sex classification: a humorous use” (Michaelis 1963).
 4. In biology, a set of conspecific individual organisms, or gametes, that are incapable of fertilizing one another, *e.g.*, males or females in gonochores, or microgametes, or macrogametes in anisogametic amphimictics (Bell 1982, 506).
 5. In anthropology, sexual identity, especially in relation to culture or society (Pickett 2000).
 6. Females or males taken as a group (Pickett 2000).
syn. sex (an erroneous *syn.* for gender; D. A. M. Mackay, pers. comm.).

Comments: Traditionally, people used “gender” primarily to refer to grammatical categories of feminine, masculine, and neuter (Pickett 2000). More recently, many people use “gender” to refer to sex-based categories. Many anthropologists use “gender” to refer to cultural, or social, categories, and “sex” to refer to biological categories. Many people do not make this useful distinction when they use “gender” (Pickett 2000). The Oxford English Dictionary (1972) and Pickett (2000)

provide more information on the definitions and use of “gender” and related terms including gender bender, gendered, gender gap, gendering, genderize, genderlect, genderless, gender-neutral, and gender-specific. [Middle English *gendre* < Old French *kind*, *gender* < Latin *genius*, *gener-*]

- ◆ **gene** *n.*
 1. A unit of heredity; an “element” (Mendel 1866 in Mayr 1982, 736).
 2. An elementary unit of inheritance; pangen (*q.v.*) [Darwin's “pangen” renamed “gene” by Wilhelm Johannsen (1909 in Mayr 1982, 736)].
 3. Wilhelm Johannsen's concept of gene: A kind of accounting or calculating unit (*Rechnungseinheit*); not a material, morphologically characterized structure in the sense of Darwin's gemmules or Weismann's biophores; a kind of force (Mayr 1982, 736).
Note: Johannsen coined “gene” as a term to be free of any hypothesis about its nature or how it functioned (Maienschein 1992, 123).
 4. “Any hereditary information for which there is a favorable or unfavorable selection bias equal to several or many times its rate of endogenous change” (Williams 1966, 25 in Dawkins 1982, 287); any portion of chromosomal material that potentially lasts for enough generations to serve as a unit of natural selection (Dawkins 1977).
 5. A heritable unit of information governing structure, development, and function of an organism (Stebbins and Ayala 1985, 72).
 6. A hereditary unit that, in the classical sense, occupies a specific position (locus) within an organism's genome or chromosome; has one, or more, specific effects upon the organism's phenotype; can mutate to various allelic forms; and recombines with other such units (King and Stansfield 1985).
syn. cistron (for a gene that specifies for the formation of a particular polypeptide chain); factor; genetic material; idioplasm (Nägeli in Mayr 1982, 958); inheritance factor
 7. Commonly, a shorthand metaphorical term that indicates that one conspecific organism has a genetic makeup that is related to its showing a particular character (*e.g.*, protein, biochemical pathway, organelle, organ, or behavior) and that another conspecific organism does not have such a genetic makeup (McFarland 1985, 100; Dawkins 1986, 47).
 8. A DNA sequence that is transcribed as a single unit and encodes a functional RNA molecule or one set of closely related polypeptide chains (protein isoforms) (Alberts et al. 1989, 486, 592).
Notes: This gene definition was formulated after the discovery of alternative gene splicing. This definition seems appropriate for wide use.
cf. gene patent, mutation, nucleic acid: deoxyribonucleic acid, regulon

Comments: In this book, I italicize formal gene names and write the proteins that genes encode in Roman letters. Other publications either italicize or do not italicize gene names. “The concept of gene continues to undergo considerable revision and even fragmentation” (Maienschein 1992, 127). Kitcher (1992) discusses what a gene is physically and concludes that a “gene is anything a competent biologist chooses to call a gene” and that evolutionary biology can do without a precise definition of gene. “Gene” in the definitions below refers to different gene definitions. I usually have not

A CLASSIFICATION OF GENES^a

- | | |
|---|---|
| I. behavior genes | BB. segmentation gene (= segment-polarity gene) |
| A. altruism gene | CC. <i>sonic hedgehog</i> |
| B. <i>FOS B</i> (= good-mother gene) | DD. suppressor gene |
| C. <i>fruitless</i> | EE. <i>unt</i> |
| D. homosexuality gene | III. disease-related gene, including <i>BRCA1</i> |
| E. novelty-seeking gene | IV. miscellaneous genes |
| II. developmental genes (including body-character genes, body-plan genes, and regulatory genes) | A. cheap gene |
| A. <i>age-1</i> | B. cistron |
| B. bicoid | C. clock gene |
| C. <i>Brachyury</i> | D. duplicate gene |
| D. <i>chico</i> | E. house-keeping gene |
| E. clock gene | F. I.Q. gene |
| F. cistron | G. linked genes |
| G. complementary gene | H. major-histocompatibility-complex genes |
| I. <i>distal-less (dll)</i> | I. modifier gene |
| J. egg-polarity gene | J. mimic gene |
| K. epistatic gene (= masking gene) | K. mutable gene |
| L. <i>eyeless</i> | L. muton |
| M. homeotic gene | M. operator gene |
| N. homeotic <i>Hox</i> gene | N. ortholog |

| AA. polygene | AA. supergene |
| | BB. synthetic lethal |

^a Many genes overlap in their characteristics and functions, and therefore could be placed in more than one category. Only a few of the thousands of genes are in this table.

tried to indicate which definition(s) is relevant to “gene” below because the authors of the definitions usually do not stipulate this information. A few of the thousands of known genes are defined below.

Some gene names suggest that one gene, alone, is responsible for a particular trait (e.g., homosexuality gene, I.Q. gene, or novelty-seeking gene). These are metaphorical names because more than one gene are involved in producing these traits (Gould 1999, 13 September, 62). Databases with much information on genes include FlyBase, Genbank, Genome Database, Mouse Genome Database, and The Interactive Fly (defined in Appendix 4). A *Drosophila* gene may have a preferred name, one or more synonymous names, and a symbol. For example, the synonyms of the *CrebB-17A* gene are *dCREB2* and *CREB*, and its symbol is *dCrb2* (Brody 1996).

Researchers have sequenced the genomes of over 180 species of Archaea (including *Methanococcus janaschii*), Bacteria (including *Mycobacterium leprae*, Leprosy Bacterium; *Rickettsia typhi*, Murine Typhus Bacterium; *Yersinia pestis*, Black Plague Bacterium), Eukarya (including *Apis mellifera*, Western Honey Bee; *Arabidopsis thaliana*, Mouse-ear Cress, a dicot forb; *Ashbya gossypii*, fungus; *Caenorhabditis elegans*, round worm; *Drosophila melanogaster*, pomace fly; *Gallus gallus*, Domestic Chicken; *Homo sapiens sapiens*, Modern Human; *Mus musculus*, House Mouse; *Oryza sativa*, Rice, a grass; *Populus trichocarpa*, Black

Cottonwood, a tree; *Rattus norvegicus*, Norway Rat; *Saccharomyces cerevisiae*, and Baker’s Yeast) (Culliton and Winstead 2010).

[gene < pangen < gemmule (Mayr 1982, 704; Brosius and Gould 1992, 10706)]

abdominal A (*abd-A*)

n. A *Hox* gene found in arthropods (Carroll 2000, 28). *Comments:* *abdominal A* and *Ubx* are *Hox* genes that diverged from a single gene in the common ancestor of Annelida and Arthropoda (Carroll 2000, 28). They are found in Arthropoda, but not Annelida. In Arthropoda, they are coexpressed and determine transitions in appendage morphology along anterior-posterior axis of arthropod bodies.

age-1 *n.* A gene that increases life span of *Caenorhabditis elegans* (Johnson 1990, 908).

Comment: *age-1* increases life span by a mean of 65% and is the first known gene that shortens life in its normal form (Johnson 1990, 908).

aggression gene *n.* A gene for monoamine oxidase-A that possibly underlies the aggressive and sometimes violent behavior displayed in certain male Humans (Brunner et al. in Morell 1993b, 1722).

Comment: Monoamine oxidase-A helps break down several neurotransmitters that might, if their concentrations build up abnormally, cause a person to respond excessively, and at times even violently, to stress (Morell 1993b).

allele See allele.

allogene See allele; recessive allele.

altruistic gene *n.* A metaphor of a group of genes that underlie altruism (Wilson 1975, 3).

antimorph *n.* A gene that produces the opposite effect of a wild-type gene (Lincoln et al. 1985).

behavior gene *n.* A metaphor for a gene group (a genetic makeup) that underlies a particular behavior, e.g., a “gene” for sibling care or a “gene” for a dove strategy (McFarland 1985, 100; Dawkins 1986, 47).

Comment: Genes control many behaviors including movements of paramecia, singing of crickets, human retardation due to phenylketonuria, and mouse maze learning (Dawkins 1986, 51–55).

bicoid *n.* A maternally-transcribed, homeobox-containing, egg-polarity gene (*q.v.*) in *Drosophila* nurse cells, that produces Bicoid (a protein) that is one of several morphogens involved in egg-axis specification and that specifies a fly’s anterior end (Campbell et al. 1999, 399, 402, 404).

Comments: *Bicoid* organizes anterior development in *Drosophila*. Its mRNA remains localized at the anterior tip of an oocyte and later in early embryonic stages. Maternal *bicoid* transcription is regulated by the maternal transcription factor *Serendipity delta*. *Bicoid* mRNA translation is inhibited in the posterior by the protein Nanos (Payre 1994 and Gavis 1995 in Brody 2000).

[*bicoid*, two-tailed, referring to the duplicate posterior structures produced when an egg lacks Bicoid protein]

BRCA1 *n.* A gene, located on human chromosome 17, that is associated with cancer (Campbell et al. 1999, 224).

Comment: Cancer tumors lack one of the two copies of *BRCA1* found in normal cells (Campbell et al. 1999, 224).

buffering gene See gene: polygene.

Ced genes See death: apoptosis (comment).

cheap gene *n.* A hypothetical kind of gene that arises from a repeat sequence that was not subject to natural selection (Zuckerkandl et al. 1989, 506).

chico *n.* In *Drosophila melanogaster*: A gene that affects fly size (Mitchell 1999, 8 July, 115).

Comment: Flies with mutations in *chico* are about half the size of normal ones (Mitchell 1999, 8 July, 115). [Spanish *chico*, small boy]

cistron *n.*

1. A segment of DNA with the property that the phenotype of a double mutation within the segment differs according to whether the mutations occur in the *cis*, or *trans*, arrangement (Benzer 1957 in Kitcher 1992, 129).

Note: Thus, “cistron” has “a precise definition in terms of a specific experimental test” (Dawkins 1982, 285).

2. “The gene of function; the functional unit of inheritance” (Mayr 1982, 806, 957).

3. The length of a chromosome responsible for the encoding of one complete, mature tRNA, rRNA, or polypeptide chain; a cistron can include regions that precede and follow the coding region (leader and trailer), introns, and exons (King and Stansfield 1985).

syn. gene (Dawkins 1982), structural gene

cf. gene: muton, recon

[Benzer (1957 in Mayr 1982, 806) coined “cistron” from the *cis-trans* difference in gene position effects.]

clock gene *n.* In *Drosophila melanogaster*: A gene that enables an individual to maintain a circadian

rhythm at different environmental temperatures (Sawyer et al. 1997, 2117).

complementary genes, complementary factors *n.* Two, or more, nonallelic factors that are collectively required to produce a single phenotypic trait (Lincoln et al. 1985).

syn. reciprocal genes (Lincoln et al. 1985)

CREB *n.* A gene that functions as a kind of master switch of dozens of other genes that function to convert recent experience into long-term memory (Hall 1998, 28).

syn. CREB switch (Tim Tully in Hall 1998, 26), *CrebB-17A* (the preferred name for this gene when it is in *Drosophila*, Brody 1996)

Comments: This gene makes the enzyme CREB (cAMP response-element-binding protein) which switches on other genes after it binds with an animal’s DNA (Hall 1998, 31). Blocking the action of *CREB* stops long-term memory in *Aplysia californica* and *Drosophila* (Hall 1998, 32). Mice, deprived of the *CREB* gene by genetic engineering, showed normal learning and short-term memory, but not long-term memory (Alcino Silva in Hall 1998, 32). Genetically engineered *Drosophila* with a huge excess of the activator protein from the *CREB* gene memorized tasks after only one training session, and researchers dubbed these flies “smart flies” (Tulley et al. in Hall 1998, 33). Further, CREBs are in many body cells besides neurons and might play roles in circadian rhythms, drug addiction, and hormone metabolism (Jerry Yin in Hall 1998, 33).

[cAMP response-element-binding protein]

distal-less (dll) *n.* A regulatory gene that helps generate both arthropod and mammal legs (Erwin et al. 1997, 135).

syn. *brista (Ba)* (Brody 2000)

duplicate gene *n.* One of a set of genes each of which has an identical but noncumulative effect (Lincoln et al. 1985).

egg-polarity genes *n.* Maternal-effect genes (*q.v.*) that control the orientation (= polarity) of an egg and later stages of *Drosophila melanogaster* (Campbell et al. 1999, 399).

epistatic gene *n.* A gene that inhibits the expression of another gene (hypostatic gene) (King and Stansfield 1985).

syn. masking gene (King and Stansfield 1985)

eyeless *n.* In *Drosophila*: A gene that encodes the development of an eye (Mestel 1996, July, 110).

See gene: *pax-6* (comments).

Comment: Mestel (1996, July, 110) includes a photograph of an eyeless fruit fly and fruit flies with several other eye conditions.

FOSB *n.* A kind of immediate-early gene that triggers female and male mice to care for their young (Associated Press 1996, 27 June, A2).

syn. good-mother gene (Associated Press 1996, 27 June, A2)

Comments: A mother mouse without a *FOSB* gene ignores her young and lets them die (Associated Press 1996, 27 June, A2). *FOSB* is probably a regulatory gene that turns on other genes in response to outside cues, probably the sight and smell of baby mice. The function of the human *FOSB* gene is not yet known. In Humans, a group of genes and external environmental conditions probably influence a complex behavior such as nurturing (E. Kandel in Anonymous 1996, 26 July, A21).

fruitless *n.* A gene that coordinates all sexual behavior of *Drosophila melanogaster* (Weiss 1996, 16 December, A2).

syn. fruity (Weiss 1996, 16 December, A2)

Comments: Scientists found evidence for this gene in 1963 (Weiss 1996, 16 December, A2) and isolated it in 1996. This is an enormous gene, about 70 times larger than the average fruit-fly gene, and is active in just 500 of the fly's 100,000 brain cells. It apparently serves as a "master switch" of other genes that together control a fly's sexual behavior. This gene resembles no known human gene in its DNA structure.

[fruitless, referring to having no offspring, a name change from "fruity," 1960s U.S. slang for homosexual (Weiss 1996, 16 December, A2)]

ORFX *n.* A gene in *Solanum lycopersicum* (Tomato) that controls fruit size (Frary et al. 2000, 85).

Comments: ORFX is expressed early in floral development, controls carpel cell number, and has a sequence suggesting similarity to the human oncogene c-H-ras p21(Frary et al. 2000, 85).

gap genes See gene: segmentation genes (comment).

"gene for a behavior" See gene: behavior gene.

good-mother gene See gene: fosB.

homeobox gene (Hox gene) *n.* In some animal species, a homeobox-containing gene (Duboule et al. in Nash 1995, 31 July, 56).

syn. homeo-gene (Rieger et al. 1991, 252), homeobox-containing gene (Alberts et al. 1989, 937–938)

cf. gene: homeobox-containing gene, homeobox, ²mutation: homeotic mutation

Comments: Some writers refer to both particular "homeotic-homeobox genes" and "nonhomeotic-homeobox genes" as simply homeobox genes (*Hox* genes), and this can confuse readers who are not familiar with the functions of the genes in question. There are about 20 families of *Hox* genes. Many different classes of regulatory genes share similar homeoboxes. Most *Hox* genes are associated with development, which suggests that they had a very early evolutionary role in development (Campbell et al. 1999, 404). Clades likely evolved new *Hox* genes that influenced the development of increasingly complex animal body plans (Alberts et al. 1989, 937–938). In *Drosophila*, the *Hox* gene *enchaired* controls segment polarity; in frogs, a *Hox* gene controls "posteriority;" and in Humans, a *Hox* gene turns on genes for antibody formation. The same *Hox* genes specify the anterior-posterior body axis of developing *Drosophila* and mammals. Many *Hox* genes each encode a sequence of about 60 amino acids, are evolutionarily conserved in many kinds of animals, are key regulators of embryonic development, and likely helped to generate the enormous diversity of present-day organisms (Marx 1992, 401). Not all *Hox* genes are homeotic genes (Campbell et al. 1999, 404).

homeotic gene *n.* A gene that causes homeosis when the gene is mutated (*q.v.*); a master regulatory gene that is responsible for the control and formation of part of an animal's body (Dye 2002, 74).

cf. gene: homeotic mutant gene, ²mutation: homeotic mutation

Comments: Researchers discovered homeotic genes in *Drosophila* when mutants of these genes produced extra sets of wings, extra or missing body segments, and legs (instead of antennae) growing from heads (Campbell 1990, 391; Campbell et al. 1999, 404).

Homeotic genes specify the identity and sequence of body segments among other things. These genes are master control genes that are important in development and evolution (Dye 2002, 74). Duplication and mutation of homeotic genes resulted in diversification of respective body segments. Homeotic-gene products control batteries of other genes. For example, the homeotic gene *eyeless* (*ey*) apparently can switch on eye development which involves more than 2,400 other genes. Homeotic genes and other developmental genes contain homeoboxes, and these genes encode transcription factors. *Drosophila* homeogenes contain homeoboxes, each with a 180-nucleotide sequence. [homeotic, after the fact that mutations in genes in question caused *Drosophila* segments to become similar to one another through homeosis, *q.v.* (Gerhard and Krischner 1997, 314)]

homeotic-homeobox gene *n.* A homeobox gene (*Hox* gene) that directly controls the identity of an animal's body parts (Campbell et al. 1999, 404).

cf. gene: nonhomeotic-homeobox gene

Comments: *Hox* genes are "master architects" of development. Non-homeotic *Hox* genes and homeotic *Hox* genes are not independent agents but members of vast genetic networks that connect hundreds, perhaps thousands, of other genes (Nash 1995, 31 July, 57). About 38 of the some 50,000 through 100,000 genes in derived vertebrates are *Hox* genes (Nash 1995, 31 July, 56).

homeotic mutant gene *n.* A gene that produces homeosis (Rieger et al. 1991, 252).

cf. gene: homeotic gene

homeotic-selector gene *n.* One of a group of genes that regulates the identity of an animal's body region (Dye 2002, 74).

Comment: Mutation of a homeotic-selector gene causes the transformaton of one body region into the form of another (Dye 2002, 74).

homosexuality gene *n.* A gene (in the Xq28 of DNA on the X-chromosome) that is possibly the basis for some instances of male homosexuality in Humans (Pool 1993, 292; Hamer et al. 1993).

Comment: Homosexuality is likely to be affected by a group of genes.

house-keeping gene *n.* A gene that is active in all cell types (Rieger et al. 1991).

syn. housekeeping gene (Rieger et al. 1991)

Comments: House-keeping genes include those that function in DNA recombination, repair, and replication and produce molecular chaperones (Koonin and Galperin 1997, 760). House-keeping genes produce rare through moderately abundant mRNAs, as opposed to tissue-specifically expressed genes. Cells regulate housekeeping genes primarily at the level of mRNA maturation, stability, or both (Rieger et al. 1991).

Hox cluster *n.* A group of homeobox genes (*q.v.*) that specifies the developmental fate of a region of a complex organism (Erwin et al. 1997, 133; illustration, 136).

Comments: Erwin et al. (1997) describe the evolution of *Hox* clusters from a cnidarian ancestor through mammals. There is one gene in the *Hox* cluster of sponges and eight in arthropods. Mammals have four *Hox* clusters, with a total of 38 genes, derived from an ancestral one.

Hox gene See gene: homeotic-homeobox gene.

hybrid-sterility gene *n.* A gene that causes a hybrid to be sterile or die in its development (inferred from Presgraves et al. 2003, 715).

Comment: There are four known hybrid-sterility genes (Presgraves et al. 2003, 715). One such gene is *Nup96* from *Drosophila simulans*. That gene codes for the protein Nup96 which is not compatible with an unknown interacting factor(s) encoded by the X chromosome of *D. melanogaster* in male hybrids of those two species. The changes in the *Nup56* of *D. simulans* evidently evolved due to natural selection.

hypostatic gene *n.* A gene that is inhibited by another (epistatic gene) (King and Stansfield 1985).

I.Q. gene *n.* A metaphor for a group of genes that influence the learning ability, or I.Q. (*q.v.*) of an animal (*e.g.*, lab mouse or Human) (Lemonick 1999, 13 September, 56).

Comment: "Intelligence is an array of largely independent and socially defined mental attributes, not a measure of a single something, secreted by one gene measurable as one number and capable of arranging Human diversity into one line ordered by relative mental worth" (Gould 1999, 13 September, 62).

Indy *n.* In *Drosophila melanogaster*, a gene that nearly doubles an individual's mean life span (which is 37 days) without being accompanied by a decline in fertility or physical activity (Rogina et al., 2000, 231).

cf. gene: *methuselab*

Comments: *Indy* has five independent P-element insertional mutations and its product is most closely related to a mammalian sodium dicarboxylate cotransporter — a membrane protein that transports Krebs cycle intermediates. The insertional mutations may create a metabolic state that mimics caloric restriction which extends life span. Humans also have *Indy* genes. FlyBase (2010) lists the symbol for this gene as *Dmel\Indy* and the name for this gene as I'm not dead yet.

[*Indy* < I'm not dead yet, after a Monty Python movie in which one man is ready to carry away another man whom he thought was dead from bubonic plague and who protests "but, I'm not dead yet" (coined by Rogina et al., 2000, 231)]

key gene See gene: oligogene.

Lcyc *n.* A gene whose mutant (in this case silencing due to methylation) causes radial symmetry in the normally bilaterally symmetric flowers of the hemiparasite *Linaria vulgaris* (Butter-and-eggs, Toadflax) (Cubas et al. 1999, 157–158, illustration).

Comments: *Lcyc* is a homolog of the *cycloidea* gene which controls dorsoventral asymmetry in flowers of *Antirrhinum*, Snapdragon (Cubas et al. 1999, 157, illustration).

[*Lcyc* from *Linaria cycloidea*-like gene]

Lim1 *n.* An organizer gene that determines whether or not a mouse embryo develops a head (Oliwenstein 1996, January, 34, photograph).

linked genes *n. pl.* Two, or more, genes that tend to be inherited together in a genetic cross (Campbell et al. 1999, 263).

Comments: Linked genes are on the same chromosome (Campbell et al. 1999, 263).

major gene See gene: oligogene.

major-histocompatibility-complex genes (MHC genes) *n.* A gene group that varies widely among Humans, *Mus musculus* (laboratory mice), and the Three-spined Stickleback, encodes for cell-surface

proteins (= the MHC molecules) that present peptides derived from pathogens in an animal's body to T cells, a crucial step in immune response to pathogens, and encodes individual odors (Claus Wedekind in Richardson 1996, 26; Bakker and Zbinden 2001, 262).

cf. chemical-releasing stimulus: semiochemical: human-male pheromone

syn. MCH-alleles (Milinski 1997, 164)

Comments: For example, the displayed peptides help an immune system identify cells that have been invaded by a virus or other pathogen (Richardson 1996, 26). Some MHC genes in Humans have several hundred alleles (Bakker and Zbinden 2001, 262). Female laboratory mice prefer to mate with males whose MHC alleles are dissimilar to theirs, and female Three-spined Sticklebacks prefer to mate with males with greater MHC allele diversity compared to those with lesser MHC allele diversity (Reusch et al. 2001, 300). This mate selection by the Sticklebacks may be a way that natural selection maintains high MHC allele diversity in natural populations. Such mate selection might be ubiquitous in Vertebrates.

masking gene See gene: epistatic gene.

master gene *n.* A gene that acts as a master switch that triggers the development of part of an organism's body, *e.g.*, a *Drosophila*'s eye (Campbell et al. 1999, 388).

maternal-effect genes *n.* Genes in an unfertilized egg of *Drosophila melanogaster* that encode cytoplasmic determinants, *q.v.* (Campbell et al. 1999, 399).

methuselab (mth) *n.* A gene of *Drosophila melanogaster* that increases life span by 35% (Rogina et al., 2000, 231).

cf. gene: *Indy*

mimic *n.* A gene that has similar phenotypic effects as another gene that is not its allele (Lincoln et al. 1985).

cf. genocopy

mobile genetic element See transposable element.

modifier gene *n.*

- "A gene whose phenotypic effect is to modify the effect of another gene" (Dawkins 1982, 290).
- "A gene that modifies the phenotypic expression of a nonallelic gene" (King and Stansfield 1985).

syn. modifier, modifying factor, specific modifier (Lincoln et al. 1985)

Comments: "Many (and perhaps most) genes modify the effects of many (and perhaps most) other genes" (Dawkins 1982, 290). Modifier genes readily respond to natural selection and provide populations with flexibility to respond to sudden environmental changes (Mayr 1982, 791). Strickberger (1990, 173) considers a gene to be a modifier gene when its effects on another gene can be measured quantitatively. Some modifier genes have their own phenotypic effects (Rieger et al. 1991). Modifier genes are classified as enhancers (= intensifiers, extension genes) and reducers (= restriction genes).

multigene See gene: polygene.

mutable gene *n.* An unstable gene that mutates spontaneously with relatively high frequency during an organism's development (Lincoln et al. 1985).

muton *n.*

- "The minimum unit of mutational change;" distinguished from cistron and recon (Dawkins 1982, 290).
- "The mutational site within a gene" (Lincoln et al. 1985).

3. The smallest unit (a single nucleotide) that, when modified, changes an organism's genetic code (King and Stansfield 1985).

[Benzer (1957) coined this term which is not widely used (Mayr 1982, 805)]

myoD *n.* A master regulatory gene that produces the protein MyoD, a muscle-specific transcription factor (Campbell et al. 1999, 395).

Comments: MyoD is a regulatory protein that binds to specific control elements in DNA and stimulates the transcription of genes that encode secondary muscle-specific transcription factors (Campbell et al. 1999, 395). These factors activate muscle-protein genes.

novelty-seeking gene *n.* A metaphor for a group of genes that underlie an animal's searching for novel experiences (Allen 1998, 24).

syn. novelty gene (Allen 1998, 24)

Comments: Three follow-up studies failed to find a novelty-seeking gene (Allen 1998, 24). According to geneticist David Dox, if there is a novelty-seeking gene, its contribution to human personality is likely to be small. The novelty-seeking gene is also related to a propensity for heroin addiction (Gould 1999, 13 September, 62).

oligogene, key gene, major gene, switch gene *n.* "A gene with a major obvious phenotypic effect" (Lincoln et al. 1985), *e.g.*, on a kind of behavior. See gene: switch gene.

operator gene *n.* The gene within an operon that is responsible for switching on, or off, the operon in which it resides (King and Stansfield 1985).

syn. regulator gene (Lincoln et al. 1985, a confusing synonym)

cf. gene: regulatory gene

organ-identity gene *n.* One of a group of homeotic genes that determines the type of structure (*e.g.*, petal or stamen) that will grow from a flower meristem (Campbell et al. 1999, 408).

cf. gene: homeotic gene

Comment: Organ-identity genes do not contain homeoboxes (Campbell et al. 1999, 408).

ortholog *n.* A gene that is related to another particular gene by vertical descent; contrasted with paralog (Koonin and Galperin 1997, 759).

cf. logous: orthologous

syn. orthologue (Theissen 2002, 741)

Comment: Orthologs typically retain the same function in the course of evolution, whereas paralogs acquire novel, but usually mechanistically-related functions (Koonin and Galperin 1997, 759)

outlaw gene *n.* A gene that is favored by selection at its own locus, in spite of its deleterious effects on an organism's other genes, *e.g.*, a gene involved in meiotic drive, *q.v.* (Dawkins 1982, 291).

syn. outlaw concept (Dawkins 1982, 291)

"nonhomeotic-homeobox gene" *n.* A homeobox gene (Hox gene) that does not directly control the identity of an animal's body parts (Campbell et al. 1999, 404).

cf. gene: homeotic-homeobox gene

pair-rule genes See gene: segmentation genes (comment).

paralog *n.* A gene that is related to another particular gene by gene duplication; contrasted with ortholog (Koonin and Galperin 1997, 759).

syn. parologue (Theissen 2002, 741)

cf. logous: paralogous

pax-6 *n.* A regulatory gene at the top of a gene cascade that produces eyes in rodents (Erwin et al. 1997, 135).

Comments: pax-6 produces the transcription factor Pax-6 which is associated with eye development in both insects and vertebrates (Gerhart and Kirschner 1997, 32). Pax-6 is expressed in all of the components of developing vertebrate camera eyes and in the optic primordia and other structures in *Drosophila* compound eyes. "Eyeless" mutants in *Drosophila* show partial through complete loss of compound eyes. The mutation "small-eye" (in mice and rats) occurs in an individual animal heterozygous for a mutation in pax-6. "Aniridia" is a human heterozygous congenital abnormality of pax-6 and is characterized by a reduction in eye size and absence of an iris. Ectopic expression of eyeless causes morphologically normal compound eyes to form on antennae, legs, thoraxes, and wings.

plastogene *n.* "A hereditary factor contained within a plastid" (Lincoln et al. 1985).

pleiotropic gene (PLEYE o TRO pick) *n.* A gene that has more than one, seemingly unrelated, phenotypic effects (Lincoln et al. 1985).

cf. gene: polygene; pleiotropy
[Greek *pleiōn*, more]

polygene *n.*

1. One of an integrated group of independent genes that collectively control the expression of a character or trait (Lincoln et al. 1985).

syn. multigene, multiple factors (Lincoln et al. 1985), quantitative-trait locus (Strickberger 2000, 219)

2. A gene that controls quantitative characters (Lincoln et al. 1985).

cf. gene: pleiotropic gene; gene locus: quantitative-trait locus

Comment: "Polygene" is synonymous with "quantitative-trait locus" when the locus has only one polygene. Polygenes vary widely in the magnitudes of their effects on organisms (Tanksley 1993, 217).

protogene See allele: dominant allele.

pseudogene *n.*

1. A DNA region that closely resembles the DNA sequence of a gene, but is nonfunctional due to nucleotide additions and deletions that prevent normal transcription, translation, or both (King and Stansfield 1985; Kimura 1985, 46).

2. A defective copy of a gene that lacks introns and is rarely, if ever, expressed (Nowak 1994b).

syn. dead gene (Kimura 1985, 46)

cf. allele: silent allele

Comment: Molecular evolution occurs quickly in pseudogenes because mutations in those genes are neutral (*i.e.*, witness no natural selection) (Kimura 1985, 43).

reciprocal genes See gene: complementary genes.

recognition gene *n.* A gene that promotes combining of zooids into colonies, *e.g.*, in a tunicate species (Burnet 1971 in Wilson 1975, 386).

recon *n.* The smallest genetic unit that can experience recombination, as determined by cross-over location, which is an adjacent pair of nucleotides in *cis* position (King and Stansfield 1985).

cf. gene: cistrone, muton

[Benzer (1957) coined "recon," which is not widely used (Mayr 1982, 805).]

regulator gene See gene: operator gene, regulatory gene.

regulatory gene *n.*

1. A gene whose primary function is to control the synthesis rate of products of other distant genes (King and Stansfield 1985).
- syn.* regulator gene (King and Stansfield 1985)
2. A gene whose product regulates gene expression via transcription initiation or termination (Jacob and Monod 1961 in Rieger et al. 1991).
3. A gene that directs RNA synthesis which can directly control gene expression (Rieger et al. 1991).

cf. ²mutation: regulatory mutation

Comments: Regulatory genes are found in both prokaryotes and eukaryotes (Rieger et al. 1991). In eukaryotes, they also control the timing and tissue specificity of the expression of other genes; some control only the structural gene that they are linked to (*cis*-regulation), and others appear to produce diffusible effector molecules that result in *trans* regulation. Regulatory genes may be more important in the evolution of new adaptations than structural-gene changes. Many different classes of regulatory genes have homeoboxes (*q.v.*) (Erwin et al. 1997, 133).

reporter gene *n.* A promoterless gene that a researcher fuses with a second gene of interest and whose expression he uses as an indication of transcription activity in the second gene (Rieger et al. 1991).

segmentation genes *n.* Genes that direct the formation of segments in a *Drosophila* embryo whose major axes are defined (Campbell et al. 1999, 402).

Comments: Segmentation genes include gap genes (which map out the basic subdivisions along an embryo's anterior-posterior axis), pair-rule genes (which define the modular pattern in terms of pairs of segments), and segment-polarity genes (which set the anterior-posterior axis of each segment). Mutations in gap genes cause "gaps" in a *Drosophila*'s segmentation (Campbell et al. 1999, 402–403).

segment-polarity genes See gene: segmentation genes (comment).

segregation distorter *n.* "A gene whose phenotypic effect is to influence meiosis so that the gene has a greater than 50 percent chance of ending up in a successful gamete" (Dawkins 1982, 293).

syn. segregation-distorting allele (Dawkins 1982, 293)

self-sterility gene *n.* In monoecious plants: A gene that prevents self-fertilization by controlling the rate of pollen-tube growth down a style (Lincoln et al. 1985).

selfish gene *n.* A gene that "does what it can," through acting on individual organisms that carry it, to make more copies of itself (Dawkins 1976, 95).

cf. nucleic acid: deoxyribonucleic acid: selfish DNA

Comments: This term is used by Dawkins (1976) in the context that genes, not individual organisms, are the main units of natural selection. The idea of a selfish gene is not universally accepted (Gould 1981, 13).

sex-conditioned gene, sex-influenced gene *n.*

A gene whose expression is modified by the sex of the individual organism bearing it (Lincoln et al. 1985).

sex-linked gene *n.* A gene on a sex chromosome (Lincoln et al. 1985).

sex-limited gene *n.* A gene that is not necessarily carried on a sex chromosome, but it is expressed phenotypically in only one sex (Dawkins 1982, 294).

sonic hedgehog *n.* A gene, found in vertebrates, that participates in the formation of brains, hearts, lungs, skeletons, and many other body parts, and is

active in embryos as hair follicles arise (Travis 1999, 30 October).

[after Sonic the Hedgehog, a popular, combative video-game hero (Travis 1999, 30 October)]

specific modifier See gene: modifier gene.

split gene *n.* In some animal viruses, Archaeabacteria, and Eukaryotes: A gene with introns between exons (King and Stansfield 1985; Strickberger 1990, 155).

Comments: Split genes were discovered in 1977 by Phillip Sharp and Richard Roberts, who won the Nobel Prize in 1993 for their discovery (Travis 1993). Before this discovery geneticists firmly believed that genes were uninterrupted pieces of DNA.

structural gene See gene: cistron.

sublethal gene See ²mutation: subvital mutation.

supergene *n.* A group of tightly linked genes that are usually transmitted as a single unit (Lincoln et al. 1985).

suppressor gene *n.* A gene that stops phenotypic expression of a gene at a different locus (Lincoln et al. 1985).

switch gene *n.* A gene that activates a group of other genes, *e.g.*, a gene that determines which wing pattern of a mimetic butterfly will occur in an individual (Mayr 1982, 41).

See gene: oligogene.

synthetic lethal *n.* A gene, or chromosome, that conveys superior fitness in some combinations but is lethal in combination with other combinations of chromosomes (Mayr 1982, 580).

Comment: Dobzhansky's research revealed synthetic lethals, and this "spelled the end of the faith in constant fitness values of genes" (Mayr 1982, 580).

transposon See transposable genetic element: transposon.

ultrabithorax (Ubx) *n.* A *Hox* gene found in Arthropods (Carroll 2000, 28).

See gene (*abdominal A*, comments).

wnt

n. A gene that codes for a protein used in cell signaling (Travis 1999, 20 February).

Comments: The *wnt* gene family has 16 genes in Vertebrates (McMahon et al. 1978 and Sasson et al. 1978 in Travis 1999, 20 February). In *Mus musculus* (House Mouse), the gene *Wnt-7a* alters the very early steps in the development of reproductive tissues and is active in the reproductive tract of adults. The Interactive Fly (*q.v.*) lists three *wnt* genes for *Drosophila* (Brody 2000).

XIST *n.* A gene, found only on a Barr-body chromosome, that produces a "specific transcript" which is an RNA that may initiate X-chromosome inactivation (Campbell et al. 1999, 271).

cf. chromosome: Barr body

[X-inactive specific transcript]

♦**gene action** *n.* The interaction (*e.g.*, dominance or epistasis) of two alleles at a genetic locus that affects an individual's phenotype (Tanksley 1993, 220).

♦**gene cloning** See cloning: gene cloning.

♦**gene complex** *n.*

1. Two, or more genes, that have a similar function and are sometimes closely adjacent on the same chromosome (Mayr 1982, 804).

2. An organism's entire system of interacting genetic factors (Lincoln et al. 1985).

♦**gene-conservation guild** See guild.

♦**gene conversion** See ³theory: transmutation.

♦ **gene dosage** *n.* The number of alleles present in a given genotype that is dependent upon its ploidy state (Lincoln et al. 1985).

♦ **gene expression** *n.* The transcription of mRNA (*q.v.*) for a gene and its structural genes and its subsequent translation into a functional protein (Rudin 1997, 159).

syn. expression (Lee and Lee 2000, 171)

Comments: In multicellular organisms, variable gene expression in different somatic tissues underlies an organism's development, growth, and differentiation (Rudin 1997, 159). Also a cell, or an entire organism, regulates its metabolism through variable gene expression.

♦ **gene family** See ³family: gene family.

♦ **gene fitness** See fitness: genetic fitness.

♦ **gene flow** *n.*

1. Exchange of genes between different conspecific populations caused by migrants, and commonly resulting in simultaneous changes in gene frequencies at many loci in the recipient gene pool (Wilson 1975, 66, 585; King and Stansfield 1985).

Note: Gene flow that occurs between populations, artificially bred strains, and especially species, is called "hybridization" (Wilson 1975; King and Stansfield 1985).

2. Genes' spreading through a gene pool due to organisms' dispersal and mating patterns occurring within, between, or among populations (Wittenberger 1981, 615).

syn. migration (Lincoln et al. 1985)

cf. hybridization, migration

Comments: Depending on the circumstance, gene flow may constrain evolution by preventing a population's adaptation to local conditions or promote evolution by spreading new genes, gene combinations, or both from one part of a species range into another part (Slatkin 1987, 787). Both direct methods and indirect methods measure gene flow. Researchers measure the force of gene flow in larger populations as the fraction of individuals in the population that are immigrants (often denoted by *m*).

island-model migration *n.* "Gene flow by periodic migration between groups of semi-isolated populations" (Lincoln et al. 1985).

cf. gene flow: river-model migration

river-model migration *n.* "Gene flow by migration along a linear series of subpopulations" (Lincoln et al. 1985).

cf. gene flow: island-model migration

♦ **gene gun** See instrument: gene gun.

♦ **gene imprinting** *n.* The phenomenon that some genes function properly only when they are donated to an offspring by its father, and other genes function properly only when they are donated by its mother (Hoffman 1991, 1250).

cf. learning: imprinting

♦ **gene locus** *n., pl. gene loci* The specific location on a chromosome where a gene resides (King and Stansfield 1985).

syn. locus (King and Stansfield 1985)

quantitative-trait locus (QTL) *n.* The specific location on a chromosome where a gene(s) that influences a quantitative character (*q.v.*) resides (Bradshaw et al. 1995, 762; Hartl and Clark 1997, 467).

syn. polygene (*q.v.*) (used when a QTL has only one gene locus) (Futuyma 1998, 409).

Comments: "QTL" is both a singular and plural term according to Tanksley (1993, 218), but Futuyma (1998, 409) uses "QTLs" as a plural. It is often difficult to determine if a QTL has more than one gene. Researchers have detected QTLs that affect many characters including fruit mass, fruit pH, growth, and leaflet shape in tomatoes; grain yield, leaf length, and height in Maize; seed weight in Cowpeas and Mung Beans; epilepsy in mice; and hypertension in rats (Tanksley 1993, 218).

major-quantitative-trait locus, major QTL *n.*

A QTL that explains $\geq 25\%$ of phenotypic variance explained (PVE) (Kim and Rieseberg 1999, 972).

Comments: Ligule shape, speckled internodes, and total height of the sunflower *Helianthus debilis* ssp. *cucumerifolius* appeared to be affected by one, or more, major QTL (Kim and Rieseberg 1999, 972).

morphological quantitative-trait locus, morphological QTL *n.* A QTL (*q.v.*) that codes for a morphological trait (*q.v.*).

Comments: This term is both singular and plural.

quantitative-trait-locus mapping, QTL mapping *n.* A method used to determine the number of quantitative-trait loci that contribute to quantitative variation in a character (Futuyma 1998, 410).

Comments: In QTL mapping a researcher distinguishes each of a number of chromosomes, or chromosome regions, by a marker (perhaps a mutation) (Futuyma 1998, 410). He assesses the phenotypic effect of each marked region by recombining it into an otherwise uniform genetic background.

♦ **gene machine, survival machine** *n.* Metaphorically, an individual organism used by its genes to replicate themselves (Dawkins 1976, 47).

cf. vehicle

♦ **gene map** See map: genetic map.

♦ **gene mutation** See ²mutation: gene mutation.

♦ **gene patent** *n.* A patent for a Human-made version of a gene of any organism (Gillis 2000, 30 December, A14).

Comments: Companies had over 200 gene patents in 1999 (Gillis 2000, 30 December, A14). Biotechnological companies are flooding patent offices with tens of thousands of applications, fueling an international debate. Such companies believe that they require the funds from gene patents to pay for the development of treatments for genetic diseases. Some academic researchers, medical ethicists, and patient groups argue that private ownership of genes is likely to slow down, not accelerate, progress in finding treatments. In 1980, the U.S. Supreme Court ruled that a living organism, a bacterium genetically modified by General Electric Company, to break down petroleum, could be patented in the case *Diamond v. Chakrabarty*. This case did not directly tackle the patentability of genes, but attorneys reasoned that if whole organisms could be patentable, their inert pieces would be also, assuming those pieces could be shown to be useful, a fundamental requirement of patent law. Courts endorsed this view. Biotechnology researchers perform the difficult tasks of identifying the useful parts of a gene and stringing them together into one continuous stretch of DNA. Therefore a researcher uses complex techniques to manipulate nature in the service of human goals. A person may patent such a human-made version of a gene. Regarding the gene for the human disease *pseudoxanthoma elasticum* (PXE), a researcher and patient group filed a patent as co-applicants, in an attempt to make the gene broadly available for research and testing.

- ♦ **gene pool** See pool: gene pool.
- ♦ **gene selfishness** *n.* A fundamental concept of biology: genes are programmed in ways that enable them to survive and reproduce their own kind (Dawkins 1977).
cf. gene: selfish gene
Comment: This concept is controversial.
- ♦ **gene splicing** See technology: recombinant-DNA technology.
- ♦ **gene substitution** *n.* Replacement of one allele by a mutant allele in a population (Lincoln et al. 1985).
- ♦ **geneogenesis** See parthenogenesis.
- ♦ **genealogy** *n.* "An ancestor-descendant lineage" (Lincoln et al. 1985).
syn. geneology (Lincoln et al. 1985; an erroneous spelling, D. A. M. Mackay, pers. comm.)
See study of: genealogy.
- ♦ **genecology** See study of: ecology: genecology.
- ♦ **geneogenous** See -genous: geneogenous.
- ♦ **geneology** See genealogy.
- ♦ **genepistasis** *n.* One form's developing further than another related form (Lincoln et al. 1985).
- ♦ **general adaptation** See ³adaptation: ²evolutionary adaptation.
- ♦ **general-adaptation syndrome** See syndrome: general-adaptation syndrome.
- ♦ **general-cognitive ability** See intelligence: general-cognitive ability.
- ♦ **general drive** See drive: general drive.
- ♦ **general-emergency reaction** See reaction: general-emergency reaction.
- ♦ **general physics** See study of: physics: general physics.
- ♦ **generalist, generalist species** See ²species: generalist.
- ♦ **generalized** *adj.* Referring to an individual animal, population, or species that eats more than a few species of other organisms as food.
cf. specialized; -topic: stenotopic; ²species: generalist
- ♦ **generalization** See stimulus generalization.
- ♦ **generation** *n.* All the individuals produced within a single life cycle of a species (Lincoln et al. 1985).
Comment: "Generation" is sometimes misused to refer to offspring from a single brood-rearing cycle, e.g., in social wasps. The term "brood cohort," or "brood cycle," is preferred for these offspring (C. K. Starr, pers. comm.).
- backcross generation** *n.* Any generation (offspring) that results from the crossing of an offspring with one of its parents or individual with a genotype like one of its parents or an offspring with its grandparent, great grandparent, etc. (Rieger et al. 1991).
Comments: The first backcross generation (= B₁) is the generation that results from the cross of an offspring with one of its parents (Rieger et al. 1991). The second backcross generation (= B₂) is the generation that results from the crossing of a B₁ individual with the same parent used to produce the B₁ generation. The third backcross generation (= B₃) is the generation that results from the crossing of a B₂ individual with the same parent used to produce the B₁ generation, and so forth for higher backcross generations. Kim and Rieseberg (1999, 966) also use BC₁, BC₂, etc. for backcross generations.
- filial generation** *n.* Any generation (offspring) that follows a parental generation (Bateson and Saunders 1902 in Rieger et al. 1991).

Comments: The first filial generation (= F₁) is the generation that results from the cross of the parental individuals. The second filial generation (= F₂) is the generation that results from the crossing, selfing, or both, of the F₁. The third filial generation is the progeny of the F₃.

- ♦ **Generation of Diversity (GOD)** *n.* Production of genetically changed organisms by genetic engineers and other researchers (Weiner 1994, 274).
Comment: GOD is increasing the rate of evolution in many organism lines, and its potential effects are little understood (Weiner 1994, 274).
- ♦ **generation time** See time: generation time.
- ♦ **generational mutualism** See symbiosis: mutualism: generational mutualism.
- ♦ **generative parthenogenesis** See parthenogenesis: generative parthenogenesis.
- ♦ **generator potential** See potential: generator potential.
- ♦ **genesiology** See study of: genesiology.
- ♦ **-genesis** *comb. f.* Development, descent, genesis, evolution, origin, formation (Michaelis 1963; Lincoln et al. 1985).
 - n.* -geny
 - adj.* -genetic
 - [Greek *genēsis*, origin]
- abiogenesis** *n.*
 1. An organism's hypothetical origination, or evolution, from inanimate matter, without the action of living parents (Huxley 1870 in the Oxford English Dictionary 1972; Mayr 1982, 582, 959).
 2. The concept that life can arise spontaneously from nonliving matter by natural processes without the intervention of supernatural powers (Lincoln et al. 1985).

syn. archebiosis, archegensis, archigenesis, archigony, autogenesis, diagenesis, heterogenesis, nomogenesis, spontaneous generation, xenogenesis (Lincoln et al. 1985)

cf. -genesis: biogenesis, nomogenesis, xenogenesis

Comments: Spontaneous generation's happening during human history as a regular form of reproduction was refuted by Spallanzani and Redi (Mayr 1982, 258). Before then it was a widely accepted idea. Many biologists believe that life on Earth originated by spontaneous generation although it seems unlikely to occur today on Earth.

[coined by Huxley (1870)]
- amphigenesis** *n.* Fusion of two dissimilar gametes; sexual development (Lincoln et al. 1985).
- anagenesis** *n.* Regeneration of tissues (Lincoln et al. 1985). See ²evolution: anagenesis.
- androgenesis** *n.* See -genesis: patrogenesis.
- anorthogenesis** *n.* "Changes in direction of evolution based on preadaptation" (Lincoln et al. 1985).
- anthogenesis** *n.* Production of male and female offspring by asexual forms (Lincoln et al. 1985).
- anthropogenesis** *n.* The descent of Humans; origin (phylogeny) and development (ontogeny) of Humans (Lincoln et al. 1985).
- archeogenesis, archigenesis** See -genesis: abiogenesis.
- aristogenesis** See ²evolution: orthogenesis.
- autogenesis** *n.* Reproduction, or origin, within a given system or individual (Lincoln et al. 1985).
See -genesis: abiogenesis.
- syn.* autogeny, autogony (Lincoln et al. 1985)

behavioral ontogenesis, behavioral ontogeny See -genesis: ontogenesis: ethogenesis.

biogenesis *n.*

1. Living matter always arises from the agency of preexisting living matter (Huxley 1870 in Oxford English Dictionary 1972). [coined by Huxley (1870) as the hypothesis of biogenesis]
2. The phenomenon in which many kinds of animals show ancestral traits in their embryonic development that are present in their ancestors' adult stages (Rensch 1954 in Immelmann and Beer 1989, 244), or in closely related (often less derived) species (Immelmann and Beer 1989, 244). See law: biogenic law.

Note: "Behavioral biogenesis" occurs in some songbird species (Immelmann and Beer 1989, 244).

3. The principle that all living organisms have arisen from previously existing living organisms (Lincoln et al. 1985).

cf. -genesis: abiogenesis; law: biogenic law

► **neobiogenesis** *n.* The hypothesis that life originated repeatedly from inorganic substrates (Lincoln et al. 1985).

► **probiogenesis** *n.* "The origin of life" (Lincoln et al. 1985).

► **symbiogenesis** *n.* The merger of different kinds of life forms into a new species [coined by biologist Konstantin S. Merehkovsky 1909 in Margulis and Sagan 2001, 40].

Comments: Many nucleated living things probably evolved by symbiogenesis (Margulis and Sagan 2001, 41). Humans and many other animal species have two genomes of once independent organisms, plants have three such genomes, and species of reef-building corals (*Animalia: Cnidaria*) and *Mixotricha paradoxa* (*Protista*) have five such genomes.

blastogenesis *n.* "Asexual reproduction by budding or gemmation" (Lincoln et al. 1985).

cf. parthenogenesis

bradygenesis See ²evolution: bradygenesis.

cacogenesis, kakogenesis *n.* An organism's inability to hybridize (Lincoln et al. 1985).

catagenesis See ²evolution: catagenesis.

cenogenesis *n.* The unequal development of different organs in the same organism during its ontogeny; contrasted with palingenesis (Haeckel 1875 in Gould 1992, 160).

See ²evolution: coenogenesis.

Comments: Haeckel considered cenogenesis to be a "bad" ontogenetic phenomenon because it did not support his biogenetic law (Gould 1992, 160). He called it *Fälschungsgeschichte* (falsified history), and divided it into (1) juvenile adaptation (the interpolation of new features into early ontogenetic stages for their own immediate evolutionary utility), and (2) changes in time and placement of one organ relative to others in the same body. Category 2 has two sub-categories: heterotopy and ²heterochrony.

cladogenesis See coenogenesis; ²evolution: cladogenesis.

coenogenesis See ²evolution: coenogenesis.

cytogenesis *n.* "Cell production and development" (Lincoln et al. 1985).

deuterogenesis *n.* The second phase of embryonic development after gastrulation (Lincoln et al. 1985).

cf. -genesis: protogenesis

diagenesis *n.*

1. The regular alternation of sexual and asexual generations of an organism (Lincoln et al. 1985). *syn.* metagenesis, heterogenesis (Lincoln et al. 1985)
2. A mutant's appearance in a population (Lincoln et al. 1985).

See -genesis: abiogenesis.

cf. ²evolution

diplogenesis *n.*

1. "An abnormal duplication of a structure" (Lincoln et al. 1985).
2. The postulated changes in germ plasm that accompany modifications attributed to use and disuse of body organs and structures (Lincoln et al. 1985).

dysgenesis *n.* The condition of infertility between hybrids that are themselves cross-fertile with parental stocks (Lincoln et al. 1985).

adj. dysgenetic

ectogenesis *n.*

1. Variation generation by extrinsic factors (Lincoln et al. 1985).
2. Development of an embryo in vitro (Lincoln et al. 1985).

epigenesis, epigenetics *n.*

1. An embryo's development (ontogenesis) from undifferentiated cells into organs that are not themselves present at conception (Oxford English Dictionary 1972, entries from 1807; Mayr 1982, 106, 958; Strickberger 1990, 12).

Note: Early biologists believed this differentiation of undifferentiated tissues occurred due to mystical, nonphysical forces (Strickberger 1990, 12).

2. The process in which development of each small stage in an organism's growth and differentiation from a zygote to mature adult arises from a preceding stage through the joint action of its genetic and environmental determinants; thus, an organism's phenotype, genotype, and environment "work in dynamic conjunction and progressive sequence" (Immelmann and Beer 1989, 89).

cf. -genesis: biogenesis, ontogenesis; ³theory: encasement theory

Comment: "Epigenesis" contrasts with "preformationism" (*syn.* encasement theory, *q.v.*), which views an organism as prepackaged in miniature or in coded information in its zygote (thus, as a "blueprint," rather than a "recipe") (Dawkins 1982, 286).

embryogenesis *n.* Development of an embryo.

ethogenesis *n.*

1. A person's development and maturation of innate behavior during post embryonic and early-childhood development (Heymer 1977, 64).

2. An individual animal's behavioral development as it grows (Immelmann and Beer 1989, 206).

syn. behavioral ontogeny (Immelmann and Beer 1989, 206), behavioral ontogenesis, ontogenesis of behavior

gametogenesis *n.* "The specialized series of cellular divisions that leads to the production of sex cells (gametes)" (Wilson 1975, 585).

syn. gametogeny (Lincoln et al. 1985)

gamogenesis *n.*

1. Formation of gametes (Lincoln et al. 1985).
2. Reproduction by union of gametes (Lincoln et al. 1985).

adj. -genetic

cf. gamogenetic

geneagenesis See parthenogenesis.

- gonogenesis** *n.* Formation of germ cells by meiotic division (Lincoln et al. 1985).
- gynogenesis** See parthenogenesis: gynogenesis.
- haematogenesis, haemopoiesis** *n.* “The process of blood formation” (Lincoln et al. 1985).
- haplogensis** See ²evolution: haplogensis.
- heterogenesis** See -genesis: diagenesis.
- heteroparthenogenesis** See parthenogenesis: heteroparthenogenesis.
- histogenesis** *n.*
1. Tissue formation and development (Craig 1847 in Oxford English Dictionary 1972).
syn. histogeny (Oxford English Dictionary 1972)
 2. Reorganization of body tissue during metamorphosis (Lincoln et al. 1985).
- hologenesis** See ²evolution: hologenesis.
- homogenesis, homogeny** *n.* An organism’s having a succession of morphologically similar generations, not alternation of generations (Lincoln et al. 1985).
cf. -genesis: heterogenesis, hypogenesis
- hybridogenesis** See parthenogenesis: hybridogenesis.
- hypogenesis** *n.* An organism’s development without alternation of generations (Lincoln et al. 1985).
- kakogenesis** See -genesis: cacogenesis.
- katogenesis** See ²evolution: catogenesis.
- lipogenesis** See ²evolution: lipogenesis.
- lipopalingenesis** See ²evolution: lipopalingenesis.
- macrogenesis** See speciation: saltational speciation.
- macrophylogenesis** See ²evolution: macroevolution.
- megagametogenesis** *n.* Development of megagametes (Lincoln et al. 1985).
- metagenesis** See -genesis: diagenesis.
- microgametogenesis** *n.* Development of microgametes (Lincoln et al. 1985).
- monogenesis, unigenesis** *n.* The development of an organism from a single cell (Lincoln et al. 1985). See parthenogenesis: asexual reproduction.
- morphogenesis** *n.*
1. The total process of embryological development and growth (Lincoln et al. 1985).
 2. The physical processes that give shape to an organism and its various parts (Campbell et al. 1999, 389).
- See ²evolution.
- neobiogenesis** See -genesis: biogenesis.
- nomogenesis** See hypothesis: nomogenesis.
- ontogenesis, ontogeny** *n.* An individual organism’s growth and development from an egg, or other cell, to maturity; contrasted with phylogeny (Oxford English Dictionary 1972, entries from 1875).
cf. law: biogenetic law; phylogeny; prochronism
Comment: Some workers include senescence and death in “ontogenesis” (Immelman and Beer 1989, 206). “Ontogenesis” includes whatever changes environment and habit may impose on an organism during this process (Bateson 1979, 242). According to the doctrine of the extended phenotype, “ontogenesis” includes “the ‘development’ of extracorporeal adaptations, for example artifacts like beaver dams” (Dawkins 1982, 291). [coined by Haeckel (1866 in Heymer 1977, 64)]
- ontogenesis of behavior** See -genesis: ethogenesis.
- oogenesis, female gametogenesis, ovogenesis** *n.* “The formation, development, and maturation of female gametes (ova)” (Lincoln et al. 1985).

- organogenesis** *n.* Organ formation during an organism’s development (Lincoln et al. 1985).
- orogenesis, orogeny** *n.* The process of mountain formation (Lincoln et al. 1985).
- orthogenesis** *n.*
1. The assertion that a “nonphysical (perhaps even nonmaterial) force” drives the living world upward toward ever greater perfection (Mayr 1982, 50, 361, 883).
Note: This is one of the autogenetic theories, *q.v.* (Lamarck, Osborn, Teilhard de Chardin in Mayr 1982, 50, 361, 883).
 2. The notion that once evolution has begun to proceed in a certain direction, it tends to continue in this direction due to its own momentum (Bell 1982, 510).
syn. Cartesian transformations, evolutionary trends, trends
cf. -genesis: anorthogenesis; ²evolution; ²evolution: orthogenesis, nomogenesis; progress
- ovogenesis** See -genesis: oogenesis.
- paedogenesis, pedogenesis** *n.* In some beetle and gall-midge species: Parthenogenetic reproduction by a larva or pupa (Gould 1976, 24; Thornhill and Alcock 1983, 35; Borror et al. 1989, 3, 57, 538). See ²heterochrony: progenesis.
cf. ²heterochrony: neoteny, merostasis
syn. progenesis (a confusing synonym)
[New Latin < Greek *pais*, *paidos*, child + GENESIS]
- palaeogenesis** See neoteny.
- palingenesis** *n.*
1. The equal and coordinated acceleration of organ development in the same organism; contrasted with cenogenesis, *q.v.* (Haeckel 1875 in Gould 1992, 160).
Note: Haeckel considered palingenesis to be a “good” ontogenetic phenomenon, which he called *Auszugsgeschichte* (epitomized history) because it supported his biogenetic law (Gould 1992, 160).
 2. Development of individual organisms already pre-formed within eggs (Lincoln et al. 1985).
 3. The true repetition, or recapitulation, of past phylogenetic states in ontogeny of an organism’s descendants (Lincoln et al. 1985).
cf. law: biogenetic law; ³theory: theory of preformation
- pangenesis** See ³theory: theory of pangenesis.
- paragenesis** *n.* “Reproduction induced by a cross between a parent and an otherwise sterile hybrid” (Lincoln et al. 1985).
- parthenogenesis** See parthenogenesis in the Ps.
- pathogenesis** *n.* The course, or development, of a disease (Lincoln et al. 1985).
- patrogenesis, androgenesis, male parthenogenesis** *n.* Parthenogenetic development of an organism from an enucleated egg following fusion with a normal male gamete (Lincoln et al. 1985). See parthenogenesis: androgenesis.
- pedogenesis** See -genesis: paedogenesis.
- perigenesis** *n.* Theoretically, somatic cells are modified by their environment and the activity of organs containing them, and these changes are passed as wave motions to sex cells and influence the course of an organism’s heredity (Lincoln et al. 1985).
- phenogenesis** *n.* Development of genetically determined phenotypic characters or traits (Lincoln et al. 1985).
- phylogenesis** See phylogeny: phylogenesis.
- physiogenesis** *n.*

1. "Origin and development of physiological processes" (Lincoln et al. 1985).
2. "Cellular differentiation during ontogeny" (Lincoln et al. 1985).

phytogenesis *n.*

1. "Origin of plants on Earth" (Lincoln et al. 1985). *syn.* phytogeogenesis (Lincoln et al. 1985)
2. "Evolution and development of a plant species" (Lincoln et al. 1985). *syn.* phylogeny (Lincoln et al. 1985)

probiogenesis See -genesis: biogenesis.**progenesis** See -genesis: paedogenesis; ²heterochrony: progenesis.**proterogenesis** See hypothesis: proterogenesis.**protogenesis** *n.*

1. "Early embryonic development to gastrulation" (Lincoln et al. 1985).
2. "Reproduction by budding" (Lincoln et al. 1985)

cf. -genesis: deutero genesis**psychogenesis** *n.* The origin and development of social instincts and behavior (Lincoln et al. 1985).*adj.* psychogenetic**saturation mutagenesis** *n.* A procedure that is used to make many mutations in a study animal species (e.g., fruit flies or Zebra Fish), involving treating the animal with a chemical mutagen and searching for embryos that develop abnormally three generations later (Kahn 1994, 904).*Comment:* Saturation mutagenesis was pioneered by Christiane Nüsslein-Volhard and Eric Wieschaus (Kahn 1994, 904).**schizogenesis** *n.* "Reproduction by multiple fission" (Lincoln et al. 1985).*adj.* schizogenetic**sociogenesis** *n.* For example, in Ants: The collective processes and patterns that lead to a colony's development during its life cycle (Hölldobler and Wilson 1990, 643).**somatogenesis** *n.* "The development of somatic structure" (Lincoln et al. 1985).**spermatogenesis** *n.* Sperm formation (Lincoln et al. 1985).**spermiogenesis, spermiohistogenesis, spermateleosis, spermoteleosis** *n.* The transformation of a spermatid into a spermatozoon (Lincoln et al. 1985).**spermogenesis** See -genesis: spermatogenesis.**stasigenesis** See ²evolution: stasigenesis.**strophogenesis** *n.* The evolution of alternation of generations in an organism that previously passed through a succession of similar generations (Lincoln et al. 1985).**syngensis** *n.* "Sexual reproduction" (Lincoln et al. 1985).See ²evolution: coenogenesis.**tachygenesis** See ²evolution: tachygenesis.**trophogenesis** *n.* For example, in *Apis mellifera* (Western Honey Bees) and some ant species: Different caste traits' originating from differential feeding of immatures as opposed to genetic control of castes and blastogenesis (Hölldobler and Wilson 1990, 644).**tychoparthenogenesis** See parthenogenesis: tychoparthenogenesis.**typogenesis** *n.* A period of explosive evolution in which new forms are produced rapidly (Lincoln et al. 1985).*cf.* typolysis; -stasis: typostasis**unigenesis** See -genesis: monogenesis.**xenogenesis** *n.* "Any unusual method of reproduction" (Lincoln et al. 1985).

See -genesis: abiogenesis.

zoogenesis See ²evolution: zoogenesis.**zylogenesis** *n.* "Reproduction during which male and female nuclei fuse" (Lincoln et al. 1985).**♦genet** *n.* A unit, or group, derived by asexual reproduction from a single original zygote, such as a seedling or a clone (Lincoln et al. 1985).*cf.* ortet, ramet**♦-genetic** *comb.f.**cf.* ^{1,2}genetic**caenogenetic** *adj.*

1. Referring to an organism of recent origin (Lincoln et al. 1985).

2. Referring to transitory adaptations developed in an organism's early ontogenetic stages (Lincoln et al. 1985).

digenetic *adj.* Referring to a symbiont that requires two different hosts during its life cycle (Lincoln et al. 1985).*cf.* -genetic: monogenetic, trigenetic**gamogenetic, gamogenic, gamogonic, sexual** *adj.* Referring to an organism produced from a union of gametes (Lincoln et al. 1985).*cf.* -genesis: gamogenesis**gynogenetic** *adj.* For example, in some lizard and chalcidoïd-wasp species, a mantid species, and aphids: Referring to a strain of females that produces other females without fertilization (Wilson 1975, 286).*cf.* parthenogenetic**heterogenetic, heterogen** *adj.* Referring to organisms that are derived from different ancestral stocks (Lincoln et al. 1985).*cf.* -genetic: homogenetic**homogenetic, homogene** *adj.* Referring to organisms that have a common origin or ancestral stock (Lincoln et al. 1985).*cf.* -genetic: heterogenetic**karyogenetic** *adj.* Referring to a trait that is "heritable, not subjected to direct environmental influences" (Lincoln et al. 1985).**monogenetic** *adj.*

1. Referring to a symbiont's having only one host throughout its life cycle (Lincoln et al. 1985).

cf. -genetic: digenetic, trigenetic

2. Referring to an asexually reproducing organism or asexual reproduction (Lincoln et al. 1985).

syn. monogenous (Lincoln et al. 1985)**palingenetic, ancestral** *adj.* Referring to a trait that is remote or of ancient origin (Lincoln et al. 1985).*cf.* ancestral, derived**morphogenetic** *adj.* "Pertaining to the development of anatomical structures during the growth of an organism" (Wilson 1975, 589).**paragenetic** *adj.* Referring to a chromosomal change that affects a gene's expression rather than its constitution, such as a position effect (Lincoln et al. 1985).**phylogenetic** *adj.* Referring to evolutionary relationships within and between organism groups (Lincoln et al. 1985).**psychogenetic** See -genesis: psychogenesis.**trigenetic** *adj.* Referring to a symbiont that requires three different hosts during its life cycle (Lincoln et al. 1985).*cf.* -genetic: digenetic, monogenetic

♦ **¹genetic** *adj.*

1. Of, referring to, or based on genetics (Michaelis 1963).
2. Of, referring to, or produced by genes (Michaelis 1963).
3. Innate (Lorenz 1932, 1937 in Dawkins 1986, 57).

Note: Dawkins (1986) discusses why “innate” should not be used synonymously with “genetic” or “inherited.” *cf.* developmentally fixed, innate, instinct, learning

♦ **²genetic** *adj.* Of, or referring to, the origin, generation, or development of something (Michaelis 1963).♦ **genetic architecture** *n.* The arrangement and possible linkages of genes, introns, and other parts of DNA in an organism’s chromosome(s) and gene effects on other genes including dominance and epistasis (inferred from Kim and Rieseberg 1999, 965).

Comments: “Genetic architecture” can refer to an organism’s entire genome, or just part of it, e.g., the genetic architecture of a morphological character or sterility barrier (Kim and Rieseberg 1999, 966).

♦ **genetic assimilation** *n.* “Reinforcement, by alternation in genetic material, of phenotypic modifications which themselves had no genetic basis” (Lincoln et al. 1985).

cf. effect: Baldwin-Waddington effect

♦ **genetic background** *n.* The part of an organism’s genotype other than a gene, or genes, under consideration (Lincoln et al. 1985).♦ **genetic-behavioral-polymorphism hypothesis** See hypothesis: population-limiting hypotheses: polymorphic-behavior hypothesis.♦ **genetic-benefit polyandry** See mating system: polyandry: genetic-benefit polyandry.♦ **genetic canalization** See canalization: genetic canalization.♦ **genetic code** *n.* The sequence of nucleotide base pairs on an organism’s DNA polynucleotide chain that encodes its genetic information (Lincoln et al. 1985).♦ **genetic damages** *n. pl.* Physical alterations in the structural regularity of DNA such as breaks, depurinations, depyrimidinations, cross-links, thymine dimers, and modified bases (Bernstein et al. 1985, 1278).

Note: Damages usually interfere with replication and transcription, and damages are neither replicated nor inherited (Bernstein et al. 1985, 1278).

♦ **genetic death** *n.*

1. Selective elimination of a genotype carrying mutant alleles that reduce fitness (Lincoln et al. 1985). *syn.* genetic extinction (Lincoln et al. 1985)
2. An individual organism’s being unable to reproduce (Lincoln et al. 1985).

cf. genetic load

♦ **genetic determinism of behavior** *n.* The opinion that a Human’s basic behavior is genetically determined and should not be changed by cultural means (Mayr 1982, 598).

Comment: “E. O. Wilson and other sociobiologists have been accused of preaching the genetic determinism of behavior. This does not represent their views accurately. All they have said, and one can argue about the validity of this claim, is that much of man’s social behavior has a genetic component” (Mayr 1982, 598).

♦ **genetic disharmony** *n.* Incompatibility between parental genes manifested in progeny (Lincoln et al. 1985).♦ **genetic distance** See distance: genetic distance.♦ **genetic dominance** See dominance (genetic).♦ **genetic drift** See drift: genetic drift.♦ **genetic engineering** *n.*

1. Human experimental manipulation of the genetic composition of an organism or cell (Lincoln et al. 1985). *syn.* algeny

2. Human manipulation of genes for practical purposes (Campbell et al. 1999, 364).

♦ **genetic epistemology** See developmental-genetic conception of ethical behavior.♦ **genetic equilibrium** See law: Hardy-Weinberg law.♦ **genetic equivalence** *n.* The phenomenon that nearly all cells of an organism have the same genes (Campbell et al. 1999, 392).♦ **genetic equivalence of all chromosomes, theory of** See ³theory: theory of genetic equivalence of all chromosomes.♦ **genetic extinction** See genetic death.♦ **genetic factor** See gene.♦ **genetic fitness** See fitness: genetic fitness.♦ **genetic heritability** See ²heritability (comments).♦ **genetic homeostasis** See homeostasis: genetic homeostasis.♦ **genetic-linkage map** See map: genetic map.♦ **genetic load** *n.*

1. Human genes that are deleterious to our welfare (Muller 1950 in Crow 1992, 132).

[after Our load of mutations, a 1950 paper by Muller (Crow 1992, 132)]

2. All fitness-reducing genes in any population including those that are maintained by mutation or by other mechanisms (Dobzhansky 1950 in Crow 1992, 132).

Note: A load is the consequence of normal genetic variability; the less favorable genes and genotypes constitute a load (Crow 1992, 132).

3. The reduction in fitness of a gene locus, chromosome, individual organism, deme, population, or species due to genetic polymorphism (Wilson 1975, 71). *Note:* Genetic loads are static; they refer to a population at equilibrium for the load-determining forces (Crow 1992, 135).

4. “The average loss of genetic fitness (*q.v.*) in an entire population due to the presence of individuals less fit than others” (Wilson 1975, 585).

5. The average number of lethal equivalents (potential genetic deaths) per individual in a population, viewed as the accumulated depression of fitness from a theoretical optimum, caused by deleterious genes, and composed of mutational, segregational, and substitutional load (Lincoln et al. 1985).

Comments: Genetic load can be precisely defined mathematically (Crow 1992, 132). Any factor that leads to variability in fitness can create a genetic load (Crow 1992, 134).

syn. load (Crow 1992, 132)

♦ **balanced load** See genetic load: segregational load.♦ **cumulative-substantial load** See cost: cost of selection.♦ **drift load** *n.* Genetic load caused by random gene-frequency drift in small populations (Crow 1992, 134).♦ **dysmetric load** *n.*

1. Genetic load caused from a mismatch between genes and their environment (Crow 1992, 132).

2. Genetic load caused by less than optimum allocation of different genotypes to appropriate environments (Crow 1992, 134).

♦ **hidden load** *n.* Genetic load caused by a gene(s) whose effect is not manifest (e.g., a recessive gene

whose effect is concealed by heterozygosity with a favorable dominant) but might be expressed at a later time or brought out by special techniques such as inbreeding (Crow 1992, 132).

lag load See ²evolutionary lag.

incompatibility load *n.* Genetic load caused by mother-fetus incompatibility (Crow 1992, 134).

meiotic-drive load *n.* Genetic load caused by deleterious genes maintained by meiotic, or gametic, advantage (Crow 1992, 134).

mutational load *n.* Genetic load caused by deleterious mutations in an organism's genome (Haldane 1937 in Crow 1992, 132; Bernstein et al. 1985, 1279). *syn.* mutation load (Crow 1992, 132)

Comment: Haldane regarded mutational load as the price a species paid for the privilege of evolution; without mutation there would be no evolution (Crow 1992, 133).

recombinational load *n.*

1. The loss in an organism's fitness caused by gene randomization from outcrossing (Bernstein et al. 1985, 1280).
2. The genetic load caused by breakup of favorably linked epistatic gene combinations (Crow 1992, 134).

See cost: cost of recombination.

syn. cost of recombination

cf. genetic load

segregational load *n.* Genetic load due to a particular gene's being favored in a heterozygous, but not homozygous, condition (Lincoln et al. 1985; Crow 1992, 132).

syn. balanced load [after the balance between mutation and natural selection, Dobzhansky (1955 in Crow 1992, 132)], cost of natural selection (not a preferred synonym, Haldane 1957 in Crow 1992, 135), segregation load (Crow 1992, 134)

Comment: The segregation load is the price a species pays for Mendelian inheritance; an asexual population has no segregation load (Crow 1992, 134).

substitutional load, transitional load *n.*

Genetic load due to one allele's being replaced by another during evolutionary change (Lincoln et al. 1985).

Comment: Substitutional load is the expression of the cost of selection, *q.v.*, as a kind of genetic load (Ridley 1996, 160).

total load *n.* Hidden plus expressed genetic loads (Morton et al. 1956 in Crow 1992, 132).

transitional load See genetic load: substitutional load.

♦ **genetic map, genetic linkage map** See map: genetic map.

♦ **genetic material** See gene.

♦ **genetic mosaic** See chimera: genetic mosaic.

♦ **genetic polymorphism** See -morphism: polymorphism: genetic polymorphism.

♦ **genetic program** See program: genetic program.

♦ **genetic psychology** See study of: psychology: genetic psychology.

♦ **genetic recombination** See recombination. *dele-*te: genetic recombination.

♦ **genetic response** See response: genetic response.

♦ **genetic revolution** See revolution: genetic revolution.

♦ **genetic segregation** *n.* The separation of alleles from one another and their distribution to different cells, usually at meiosis (= meiotic genetic segregation)

and sometimes as a consequence of mitotic crossing over at mitosis (= mitotic segregation) (Bateson and Saunders 1902 in Rieger et al. 1991).

syn. segregation (Rieger et al. 1991)

cf. law: Mendel's laws

Comment: One can observe genetic segregation only in genotypes with heterozygous pairs of alleles (Rieger et al. 1991).

transgressive segregation *n.* The primary mechanism by which the extreme, or novel, adaptations observed in new hybrid ecotypes, or species, are thought to arise (Kim and Rieseberg 1999, 975).

♦ **genetic selection** See selection: genetic selection.

♦ **genetic species concept** See ²species.

♦ **genetic surgery** *n.* A therapeutic alteration of the genotype of a specific tissue to cure a disease (Williams and Nesse 1991, 13).

♦ **genetic swamping** *n.* An influx of genes (= gene flow) from a nearby population(s) adapted to other circumstances than the population receiving the genes (Wilson 1975, 34).

♦ **genetic system** See ¹system: genetic system.

♦ **genetic transcription** See transcription.

♦ **genetic translation** See translation.

♦ **genetic variance** See variance: genetic variance.

♦ **genetical theory** See altruism.

♦ **genetics** *n. pl.* An organism's inherited traits (Michaelis 1963).

See study of: genetics; -type: genotype.

♦ **-genic** *comb. f.* Related to generation or production; producing, produced by (Michaelis 1963; Lincoln et al. 1985).

n. -geny

atiogenic, aitiogenous, aitionomic, aitionomous, paratonic *adj.* Referring to an individual organism's movement, or reaction, induced by an external stimulus (Lincoln et al. 1985).

See paratonic.

allelogetic, allelogenous *adj.* Referring to an organism that produces offspring in broods that are entirely of one sex (Lincoln et al. 1985).

cf. -genic: amphogenic, arrhenogenic, monogenic, thelygenic

amphogenic *adj.*

1. Referring to an organism that produces sons and daughters, usually in approximately equal numbers (Bell 1982, 501; Lincoln et al. 1985).

cf. allelogetic, arrhenogenic

2. Referring to cecidomyiids (flies) that produce both thelytokous female larvae and sexual male larvae (Bell 1982, 501).

cf. genic: arrhenogenic, monogenic, thelygenic anthropogenic

adj. Referring to something caused, or produced, by humans (Lincoln et al. 1985).

aristogenic See -genic: eugenic.

arrhenogenic *adj.* Referring to an organism that has offspring that are entirely, or predominantly, male (Lincoln et al. 1985).

cf. genic: amphogenic, monogenic, thelygenic; parthenogenesis: arrhenotoky

audiogenic *adj.* Referring to an organism's response that results from an auditory stimulus, *e.g.*, audiogenic seizures (Dewsbury 1978, 117).

cacogenic See -genic: dysgenic.

carcinogenic *adj.* Cancer producing.

cryptogenic *adj.*

1. Referring to a fossil species of unknown, or obscure, phylogenetic descent from species occurring in earlier geological formations (Lincoln et al. 1985).
 2. "Of indeterminate descent" (Lincoln et al. 1985).
cf. phanerogenic
- digenic** *adj.* Referring to traits controlled by the integrated action of two genes (Lincoln et al. 1985).
syn. digenous
cf. -genic: monogenic, oligogenic, polygenic, trigenic
- diphygenic** *adj.* Referring to an organism that has two types of development (Lincoln et al. 1985).
- dysgenic** *adj.* Referring to, or having, the capacity for decreasing the fitness of a race or breed (Lincoln et al. 1985).
syn. cacogenic, kakogenic (Lincoln et al. 1985)
cf. -genic: eugenic
- eugenic, aristogenic** *adj.* Referring to, or having, the capacity for increasing the fitness of a race or breed (Lincoln et al. 1985).
cf. -genic: dysgenic
- gametogenic** *adj.* Referring to a variation that arises from spontaneous changes in a gametic chromosome (Lincoln et al. 1985)
- gamogenetic** See -genetic: gamogenetic.
- heterogenic** *adj.* Referring to a population, or gamete, that contains more than one allele at a given locus (Lincoln et al. 1985).
- hysterogenic** *adj.* Referring to a structure, or trait, that appears late in an organism's development (Lincoln et al. 1985).
- intragenic** *adj.* Referring to something within the same gene (Lincoln et al. 1985).
- intergenic** *adj.* Referring to a mutation that involves more than one gene (Lincoln et al. 1985).
- isogenic** *adj.* Referring to individuals that have the same set of genes (Lincoln et al. 1985).
syn. isogeneic, homozygous, syngeneic, sygenic
cf. allogenic
- kakogenic** See -genic: dysgenic.
- monogenic** *adj.*
 1. Referring to traits controlled by a single gene (Lincoln et al. 1985).
syn. monofactorial, unifactorial (Lincoln et al. 1985)
cf. -genic: digenic, oligogenic, polygenic, trigenic
 2. Referring to an organism that produces only sons or only daughters (Lincoln et al. 1985).
n. monogamy
cf. -genic: allelopathic, amphogenic, arrhenogenic, thelygenic
- multigenic** See -genic: polygenic.
- nectogenic** *adj.* Referring to something derived from nekton (Lincoln et al. 1985).
- nosogenic, pathogenic** *adj.* Referring to a disease-producing, or pathogenic, agent. (Lincoln et al. 1985).
- oligogenic** *adj.* Referring to traits controlled by only a few genes (Lincoln et al. 1985).
cf. -genic: digenic, monogenic, polygenic, trigenic
- oncogenic** *adj.* Referring to a tumor-causing agent (Lincoln et al. 1985).
- ornithogenic** *adj.* Referring to sediments that are rich in bird droppings (Lincoln et al. 1985).
- pathogenic** See -genic: nosogenic.
- phanerogenic** *adj.*
 1. Referring to a fossil species that has an established phylogeny from species occurring in earlier geological formations (Lincoln et al. 1985).

2. Referring to a biological phenomenon of known descent (Lincoln et al. 1985).
cf. -genic: cryptogenic
- photogenic** *adj.* Referring to a light-producing agent (Lincoln et al. 1985).
See bioluminescent.
- phytogenic** *adj.* Arising from, or caused by, plants (Lincoln et al. 1985).
- polygenic** *adj.* Referring to traits controlled by the integrated action of multiple independent genes (Lincoln et al. 1985).
syn. polygenetic, multigenic, polyergistic, polyfactorial
cf. -genic: digenic, monogenic, trigenic
- protogenetic** *adj.* Referring to structures that persist from an organism's very early developmental stages (Lincoln et al. 1985).
- psychogenic** *adj.*
 1. Referring to something caused by mental activity (Lincoln et al. 1985).
 2. Referring to something originating in a mind (Lincoln et al. 1985).
- saprogenic, saprogenous** *adj.* Something's causing, or something caused by, the decay of organic matter (Lincoln et al. 1985).
n. saprogen
- syngenic** See -genic: isogenic.
- thelygenic** *adj.*
 1. Referring to isopod crustaceans that produce only daughters (Bell 1982, 513).
 2. Referring to an organism that has offspring that are entirely, or predominantly, female (Lincoln et al. 1985).
syn. thelyogenous (Lincoln et al. 1985)
cf. -genic: allelopathic, amphogenic, arrhenogenic, monogenic; -genous: gynogenous
- trigenic** *adj.* Referring to traits controlled by the integrated action of three genes (Lincoln et al. 1985).
cf. -genic: monogenic, digenic, oligogenic, polygenic
- zoogenetic, zoogenous** *adj.* Referring to something produced by, or associated with, the activity of animals (Lincoln et al. 1985).
cf. -morphic: zoomorphic; -morphism: zoomorphism
- ♦ **genic** *adj.* Referring to, characteristic of, or produced by one, or more, genes (Michaelis 1963).
- ♦ **genic balance** *n.* The sum of the combined effects of all of an organism's genes that interact to produce a given phenotypic trait (Lincoln et al. 1985).
- ♦ **genic selection** See selection: genetic selection.
- ♦ **genital display, genital presentation** See display: genital display.
- ♦ **genital gland** See gland: genital gland.
- ♦ **genital pouch** See organ: copulatory organ: bursa copulatrix.
- ♦ **genital touching** *n.*
 1. In some tribes of New Guinean Humans: One's touching a person's scrotum with an upward movement as part of a greeting (Eibl-Eibesfeldt 1977 in Waal 1989, 79).
 2. In *Pan troglodytes* (Chimpanzees): One male's fingering another's scrotum at moments of mild tension (Waal 1989, 79).
syn. ball bouncing (colloquial) (Waal 1989, 79)
- ♦ **genitalic-recognition hypothesis** See hypothesis: hypothesis of divergent evolution of animal genitalia: genitalic-recognition hypothesis.
- ♦ **genito-genital rubbing (GG-rubbing)** *n.* In *Pan paniscus* (Bonobos): Two females' holding their

bellies together and facing close together and rubbing their genital swellings together with rapid sideways movements (Waal 1989, 201–202).

♦ **genocline** See cline: genocline.

♦ **genocopy** *n.* The phenotypic expression of one gene that resembles that of another (nonallelic) gene (Lincoln et al. 1985).

♦ **genodeme** See deme: genodeme.

♦ **genoecodeme** See deme: genoecodeme.

♦ **geologic range** See ¹range: geologic range.

♦ **genome** *n.*

1. An organism's complete genetic constitution (Wilson 1975, 585).

syn. total genetic complement (Stebbins and Ayala 1985, 73)

2. "The complete set of genetic materials carried by an organism in its primary sex cell" (Wittenberger 1981, 616).

Note: Viruses have from 1,300 through 20,000 nucleotide pairs; bacteria, 4 million; fungi, 10 through 20 million; most animals and plants, several billion; a few groups of higher plants, salamanders, and some primitive fishes, 10^{10} ; certain species of amoeba and Psilophyta (plant phylum), 10^{12} (Stebbins and Ayala 1985, 73).

3. The minimum set of nonhomologous chromosomes required for a cell's proper functioning (Lincoln et al. 1985).

4. A particular species' basic (monoploid) set of chromosomes (Lincoln et al. 1985).

syn. gametic chromosome number, genom (Lincoln et al. 1985)

cf. gene

ancestral-mitochondrial genome *n.* A mitochondrial genome that has retained clear vestiges of its eubacterial ancestry; contrasted with derived-mitochondrial genome (Gray et al. 1998, 1477).

Comments: The contrast between ancestral and derived mitochondrial genomes is not always clear and sharp in some taxa (Gray et al. 1998, 1477). The protozoan *Reclinomonas americana* has a prototypical ancestral-mitochondrial genome, with its 69,034 base pairs of mtDNA (<http://megasun.bch.umontreal.ca/ogmp/projects/ramer/ramer.html>).

derived-mitochondrial genome *n.* A mitochondrial genome that radically departs from an ancestral one, having little or no evidence of retained ancestral traits, and usually being reduced in overall size; contrasted with ancestral-mitochondrial genome (Gray et al. 1998, 1477).

Comments: Animal and most fungal mtDNAs, apicomplexa such as *Plasmodium* sp., and the highly atypical mtDNAs of green algae, are derived-mitochondrial genomes (Gray et al. 1998, 1477).

mitochondrial genome *n.* All of the genes in a mitochondrion (Gray et al. 1998, 1478).

Comment: Phylogenetic evidence that is derived from both SSU rRNA and protein data and gene arrangements support the hypothesis that all mitochondrial genomes descended from a single protochlorial ancestor (Gray et al. 1998, 1478).

♦ **genome blotting** See method: Southern blotting.

♦ **genome library** See library: genomic library.

♦ **genomic bank** See library: genomic library.

♦ **genomic library** *n.* A set of thousands of DNA segments that are from a genome and are each carried by a plasmid or phage (Campbell 1990, 402–403, G-10).

♦ **genomics** See study of: genomics.

♦ **genomorph** See -morph: genomorph.

♦ **genonomy** See study of: systematics: biosystematics.

♦ **genophenes** See -type, type: phenotype.

♦ **genophyletic** *adj.* Referring to a group of taxa that are inferred to have greater genotypic similarity to one another than to members of any other groups (Lincoln et al. 1985).

n. genophly

♦ **genospecies** See ²species: genospecies.

♦ **genotype** See -type, type: genotype.

♦ **genotypic adaptation** See ³adaptation: ^{1,2}evolutionary adaptation.

♦ **genotypic distance** *n.* A measure of the disparity between two genotypes in terms of the probability that two individuals differ with respect to a gene at a particular locus (Lincoln et al. 1985).

♦ **genotypic sex determination** See sex determination.

♦ **genotypic sterility** *n.* Hybrid sterility resulting from an imbalance in its zygote's genotype (Lincoln et al. 1985).

♦ **-genous** *suffix of adjectives*

1. Generating; yielding (Michaelis 1963).

2. Produced, or generated, by (Michaelis 1963). [*gen-*(that which is produced < French *-gène* < Greek *-γένες*) + -ous]

allogenous *adj.* Referring to one species' genetic change produced from its incorporation of another species' genes and that leads to phyletic evolution in a lineage (Mayr 1963, 429).

cf. -genous: autogenous

anautogenous, nonautogenous *adj.* Referring to a female insect that must feed before she can produce mature eggs (Lincoln et al. 1985).

cf. genous: anautogenous

androgenous *adj.* Pertaining to an organism that produces only sons (Lincoln et al. 1985).

cf. -genous: gynogenous

autogenous *adj.*

1. Referring to genetic change (mutation, recombination, selection, etc.) that leads to phyletic evolution in a lineage (Mayr 1963, 429).

cf. -genous: allogenous

2. Referring to a female insect whose eggs mature although she does not feed (Lincoln et al. 1985).

cf. -genous: anautogenous

biogenous *adj.* Living on, or in, other organisms (Lincoln et al. 1985).

syn. parasitic, symbiotic (Lincoln et al. 1985)

carpogenous *adj.* Growing on, or in, fruit (Lincoln et al. 1985).

coenogenous, cenogenous *adj.* Referring to an animal that produces offspring oviparously during one season and ovoviparously during another season of a year (Lincoln et al. 1985).

digenous See -genetic: digenetic; sexual: bisexual.

ectogenous, ectogenesis, ectogenic *adj.* Arising, or originating, outside an organism or system (Lincoln et al. 1985).

cf. -genous: endogenous

endogenous, endogenetic *adj.*

1. Referring to something that arises, or originates, within an organism or system (Lincoln et al. 1985), e.g., behavioral causation, or control, that is located, or originates, within an animal's body; "endogenous" does not necessarily imply a genetic basis of a factor (Immelmann and Beer 1989, 87).

2. Referring to something that grows inside something else (Lincoln et al. 1985).
syn. autochthonous, intrinsic (a psychological synonym, Immelmann and Beer 1989, 87)
cf. ectogenous, exogenous, rhythm: endogenous rhythm
- entomogenous** *adj.* Living in, or on, insects (Lincoln et al. 1985).
- epigenous** *adj.* Referring to an organism that grows, or develops, on a surface (Lincoln et al. 1985).
cf. epiphyte; zoon: epizoon
- exogenous** *adj.*
1. Referring to something that originates outside an organism or system (Lincoln et al. 1985).
 2. Referring to something that is due to, or triggered by, external environmental factors (Lincoln et al. 1985).
syn. allochthonous, ectogenous, xenogenous (Lincoln et al. 1985)
cf. -genous: endogenous
- geneogenous** *adj.*
1. Referring to a character that is present when an organism is born (Lincoln et al. 1985).
syn. congenital
 2. Referring to an organism's condition that has resulted from an embryonic aberration (Lincoln et al. 1985).
- gynogenous** *adj.* Referring to an organism that produces only daughters (Lincoln et al. 1985).
cf. -genic: thelygenic; -genous: androgenous
- homogenous** *adj.* Referring to organisms that are more, or less, similar owing to descent from a common stock (Lincoln et al. 1985).
- hypogenous** *adj.* Referring to an organism that lives, or grows, underneath an object or on its lower surface (Lincoln et al. 1985).
- monogenous** See -genetic: monogenetic.
- necrogenous** *adj.*
1. Referring to an organism that grows on, or inhabits, dead bodies (Lincoln et al. 1985).
 2. Referring to organisms, or other factors, that promote decay (Lincoln et al. 1985).
- nonautogenous** See -genous: anautogenous.
- psammogenous** *adj.*
1. Referring to an agent that produces sand (Lincoln et al. 1985).
 2. Referring to an agent that forms sandy soils (Lincoln et al. 1985).
- rhexigenous, rhexogenous** *adj.* Produced as a result of breakage or rupture (Lincoln et al. 1985).
- saxigenous** See -cole: saxicole.
- xenogenous** See -genous: exogenous.
- ♦ **genovariation** See ²mutation: gene mutation.
- ♦ **gens, gentes** See group: gens.
- ♦ **genuine synapomorphy** See character: homologous synapomorphy.
- ♦ **-geny** *comb.f.* Mode of production of; generation, or development, of (Michaelis 1963).
adj. -genic, genous
[French *-génie* < Latin *-genia* < Greek *-geneia* < *gen-*, stem of *gignesthai*, to become]
- cyclogeny** See -morphosis: cyclomorphosis.
- digeny** See sexual reproduction.
- endodyogeny** *n.* A rare type of sexual reproduction shown by some protists in which two daugh-

ter cells develop within a single parent cell that is destroyed in the process (Lincoln et al. 1985).

endopolygeny, endopolygony *n.* Formation of many daughter cells, each surrounded by her own membrane within a mother cell (Lincoln et al. 1985).

gametogeny See -genesis: gametogenesis.

gynecogeny See parthenogenesis.

herpetogeny *n.* "The history of colonization and evolution in establishment of modern amphibian and reptile faunas" (Lincoln et al. 1985).

histogeny See -genesis: histogenesis.

ontogeny See -genesis: ontogenesis.

thelygeny *n.* An organism's producing offspring that are entirely, or predominantly, female (Lincoln et al. 1985).

cf. -genic: allelogetic, amphogenic, arrhenogenic, monogenic

♦ **geo-** *comb.f.* "Earth; ground; soil" (Michaelis 1963).

♦ **geoaesthesia** See perception: graviperception.

♦ **geobenthos** See ²community: benthos: geobenthos.

♦ **geobiology** See study of: biology: geobiology.

♦ **geobiont** See biont: geobiont.

♦ **geobios** See -bios: geobios.

♦ **geobiotic** See -biotic: geobiotic.

♦ **geobotany** See study of: geography: biogeography: phytogeography.

♦ **geochronology** See study of: geochronology.

♦ **geochronometry** See -metry: geochronometry.

♦ **geochrony** See study of: geochronology.

♦ **geocline** See -cline: geocline.

♦ **geocole** See -cole: geocole.

♦ **geocosmology** See study of: geocosmology.

♦ **geodyte** See -cole: terricole.

♦ **geoecology** See study of: geology: geoecology.

♦ **Geoffroyism** See inheritance of acquired characters: hypothesis: Geoffroyism.

♦ **geographic barrier** *n.*

1. A large landmark, such as a mountain, chain of mountains, or body of water, that isolates populations of a species, or different species, from one another (Mayr 1982, 601).

Note: Geographic barriers are important factors that promote allopatric speciation (Mayr 1982, 601).

2. "Any geographical feature that prevents gene flow between populations" (Lincoln et al. 1985).
syn. geographical barrier (Lincoln et al. 1985)

♦ **geographic-character gradient** See cline.

♦ **geographic race** See ²species: subspecies.

♦ **geographic speciation** See speciation: geographic speciation.

♦ **geographic variation** See variation: geographic variation.

♦ **geographical barrier** See geographic barrier.

♦ **geographical ecology** See study of: ecology: geographical ecology.

♦ **geographical equivalents, syngeographs** *n.*

Two, or more, taxa that occupy the same geographical area and have patterns of distribution that are nearly congruent (Lincoln et al. 1985).
See isolation: geographical isolation.

♦ **geographical-isolating mechanism** See mechanism: isolating mechanism: geographical-isolating mechanism.

♦ **geographical isolation, geographic isolation** See isolation: geographic isolation.

♦ **geographical race** See variety.

♦ **geographical speciation** See speciation: allopatric speciation.

- ♦ **geography** See study of: geography.
- ♦ **geologic range** See ²range: geologic range.
- ♦ **geological chronology** See study of: geochronology.
- ♦ **geological province** *n.* "A large region characterized by similar geologic history and development" (Bates and Jackson 1984).
Comment: A few of Earth's many current geological provinces are defined below.
- Appalachian Plateau Province** *n.* The broad western part of the Appalachian Mountains (*q.v.*, def. 1), extending from the St. Lawrence River southward through northwestern Alabama and west into central Ohio (Stanley 1989, 214, illustration; Schmidt 1994, 4, illustration).
Comments: The Cumberland Mountains in the Appalachian-Plateau Province are in Pennsylvania, Maryland, West Virginia, Kentucky, Tennessee, and Alabama. Duncan and Foote (1975, inside cover) divide this Province into the Cumberland Plateau and the Interior Low Plateau. This Province is composed of gently deformed sedimentary rocks (Stanley 1989, 214, illustration) uplifted after the Appalachian Mountains (def. 2) were greatly eroded.
[*Cumberland Mountains, possibly after Cumberland County, England*]
- Blue Ridge Province** *n.* An eastern portion of the Appalachian Mountains (*q.v.*, def. 1) extending from New England through northern Georgia, which includes the Green Mountains of New England and the Great Smoky Mountains (Stanley 1989; 214, illustration; 217).
Comments: Duncan and Foote (1975, cover illustration) show the Blue Ridge Provinces extending into Central Alabama. Some geographers use "Blue Ridge" only for a conspicuous chain of large hills in Virginia (Stanley 1989, 217, illustration). The Blue-Ridge Province consists primarily of a band of crystalline rocks of the Precambrian basement that moved upward along faults during the formation of the Appalachian system about 600 Ma ago (Stanley 1989, 217)
syn. Blue Ridge Mountains (Michaelis 1963)
[after the blueish appearance of these mountains on some days from a distance (Stewart and Borovac 1994)]
- Coastal Plain Province** *n.* Relatively low, flat land that borders the Atlantic Ocean and Gulf of Mexico, extends from New York through southern Texas, and includes parts of New York, Pennsylvania, New Jersey, Delaware, Maryland, Virginia, the Carolinas, Georgia, Alabama, Tennessee, Kentucky, Missouri, Arkansas, and Texas, and all of Florida, Mississippi, and Louisiana (Stanley 1989, 214, illustration).
Comment: This Province is primarily composed of unmetamorphosed Cenozoic and Mesozoic rocks, predominantly sedimentary ones that originated from the old Appalachian Mountains (def. 2) (Stanley 1989, 214, illustration).
- Piedmont Province** *n.* The usually hilly region of the Appalachian Mountains (*q.v.*, def. 1) mostly between the Coastal Plain Province and Blue Ridge Province, extending from the St. Lawrence River through northcentral Alabama (Michaelis 1963; (Stanley 1989, 214, 223, illustrations).
Comments: The Piedmont is about 80,000 mi² (Michaelis 1963). It is primarily composed of metamorphosed paleozoic rocks which are highly deformed and intruded by scattered igneous plutons

(Stanley 1989, 214, illustration). Blocks of crustal rock that were welded to the North American craton during orogenic events that produced the Appalachians formed many segments of the Piedmont (Stanley 1989, 216).

Ridge-and-Valley Province *n.* The region of the Appalachian Mountains (*q.v.*, def. 1) that is primarily southeast of the Cumberland-Plateau Province, and extends from the St. Lawrence River through central Alabama, and is characterized by many subparallel ridges and valleys (Duncan and Foote 1975, inside cover; Bates and Jackson 1984; "Valley and Ridge Province" in Stanley 1989, 214, illustration).

Comments: The Ridge-and-Valley Province is primarily composed of sedimentary rocks of a fold-and-thrust belt which has elegant rock folding caused by the collision of North America and Africa (Stanley 1989, 214, illustration). This folding caused mountains and reached its maximum during the late Permian or early Triassic, approximately 230 through 240 Ma ago (Brezinski 1989, 6). A narrow band of this Province extends from the St. Lawrence River through New York and into eastern Pennsylvania.

[after the many subparallel ridges and valleys of this province (Stanley 1989, 215)]

♦ **Geological Site of Specific Scientific Interest (Geological SSSI)** See place: Geological Site of Specific Scientific Interest.

♦ **geological stratum** *n.* A layer of rocks with diagnostic characteristics including particular fossil species.

See "fossil site" for many of the strata with fossils.

♦ **geological time** *n.* Time intervals from the Earth's origin (4.6 Ga ago) through the present.

Comments: The times of the intervals vary among published references. Strickberger (1996) lists two eons, six eras, periods, and epochs. I define only two of many periods below.

Devonian Period *n.* The time interval from about 408 through 363 Ma ago (Stanley 1993, 270).

abbrev. D, Dev. (Flessa et al. 1975, 74, 76)

Comments: During the Devonian Period, sea level was generally low worldwide and climate was generally warm (Stanley 1993, 270). The first ammonoids and insects appeared in the Early Devonian. Land plants were up to about 1 m tall in the early Devonian (Speer 2001). Many new species of jawed fishes evolved during the early and mid-Devonian. The first amphibians, large trees, seed plants, and tall forests appeared and a mass extinction that destroyed the tabulate-strome-coral-reef communities occurred in the late Devonian. The Rhynie Chert in Scotland contains fossils of Zosterophyllophytes and Trimerophytes, the two major lines of vascular plants. The oldest known vascular plants in the Northern Hemisphere are from the Devonian. The early tree *Archaeopteris* appeared in this Period.

[Devonian, after Devon, United Kingdom, where people found fossils of Devonian age]

Silurian Period *n.* The time interval from about 439 through 408 Ma ago (Stanley 1993, 270).

abbrev. S, Sil. (Flessa et al. 1975, 74, 76)

Comments: Researchers do not all report the same time interval for the Silurian Period. Some researchers divide it into early and late or early, middle, and late. The Llandoverian and Wenlockian Epochs occur in the early Silurian, and the Ludlowian and Pridolian Epochs occur in the late Silurian (Speer 2001). Earth's

general climate was relatively stabilized, ending the previous pattern of large erratic climate fluctuations. Large glacial formations melted, and this resulted in a significant rise in sea level. Many new species of marine organisms (including jawless fish) evolved after the late Ordovician mass extinction. The first ancestors of centipedes and spiders, fresh-water fish, and reef-building corals appeared, and the first vascular land plants may have appeared (Stanley 1993, 270). The first jawed fishes appeared in the late Silurian. Some researchers suspect that the first land plants appeared in the late Ordovician, but no one has found fossils that support this idea.

[Silurian, after Silures, an ancient Celtic Tribe that lived in the region which is now the United Kingdom]

- ♦ **geology** See study of: geology.
- ♦ **geometric isomer** See isomer: enantiomer.
- ♦ **geonemy** See study of: geography: biogeography.
- ♦ **geoperception** See graviperception.
- ♦ **geophagie** See -phage: geophagie.
- ♦ **geophile** See -phile: geophile.
- ♦ **geosmin** See molecule: geosmin.
- ♦ **geosere** See ²community: geosere; ²succession: geosere.
- ♦ **geotaxis** See taxis: geotaxis.
- ♦ **geotectic geology** See study of: geology: structural geology.
- ♦ **geotropism** See -tropism: geotropism.
- ♦ **geoxene** See -xene: geoxene.
- ♦ **geratology** See study of: geratology.
- ♦ **germ cell** See cell: germ cell.
- ♦ **germ-line** *n.* The part of an organism that “is potentially immortal in the form of reproductive copies: The genetic contents of gametes and of cells that give rise to gametes” (Dawkins 1982, 287).
- cf.* soma
- ♦ **germ-line replicator** See replicator (comment).
- ♦ **germ-line theory** See ³theory: germ-plasm theory.
- ♦ **germ plasma** *n.* The genetic material within a cell (Mayr 1982, 670).
- syn.* idioplasm (Nägeli 1884 in Mayr 1982, 670, 958), gonoplasm, *stirp* (Galton 1876 in Mayr 1982, 696) [A. Weismann coined “germplasm” in 1883 (Mayr 1982, 670).]
- ♦ **germ-plasm theory** See ³theory: germ-plasm theory.
- ♦ **germinal** *adj.* Referring to, or something’s influencing, germ cells (Lincoln et al. 1985).
- ♦ **germule** *n.* “A unit of colonization or migration” (Lincoln et al. 1985).
- ♦ **gerontic, gerontal** *adj.* Referring to later stages of phylogeny or ontogeny (Lincoln et al. 1985).
- ♦ **gerontology** See study of: gerontology.
- ♦ **gerontophagy** See -phagy: gerontophagy.
- ♦ **gerontomorphosis** See -morphosis: gerontomorphosis.
- ♦ **gerontophage** See -phage: gerontophage.
- ♦ **gestalt, Gestalt** *n., pl. gestalts, Gestalten*
 1. A shape, configuration, or structure that a person perceives as a specific whole, or unity, that one cannot express simply in terms of its parts; *e.g.*, a melody as distinguished from its individual notes (Oxford English Dictionary 1989, entries from 1890).
 2. A functional configuration, or synthesis, of separate elements of emotion, experience, sign stimuli, etc. (Tinbergen 1951, 78) that constitutes more than the mechanical sum of their parts (Michaelis 1963).

3. A pattern of biological phenomena in which the properties of a functional whole differ from those predicted from the sum of its component parts (Lincoln et al. 1985).

syn. holism (Lincoln et al. 1985)

cf. holism; perception: gestalt perception; reductionism [German *Gestalt* form, shape]

♦ **gestalt model** See ⁴model: gestalt model.

♦ **gestalt odor** See odor: gestalt odor.

♦ **gestalt perception** See perception: gestalt perception.

♦ **gestalt psychology** See study of: psychology.

♦ **gestation** *n.* The duration of development of an embryo within a viviparous animal’s uterus, from conception to birth (Lincoln et al. 1985).

v.t. gestate.

♦ **gesture** *n.*

1. A person’s manner of carrying his body; bearing; carriage; deportment (Oxford English Dictionary 1972, entries from 1410).
2. A person’s manner of placing his body; position; posture; attitude (Oxford English Dictionary 1972, entries from 1533).
3. A person’s movement of his body, or limbs, as an expression of feeling (Oxford English Dictionary 1972, entries from 1545).
4. A person’s movement of his body or any part of it; now in the strict meaning of a movement that expresses thought or feeling (Oxford English Dictionary 1972, entries from 1551).
5. An individual animal’s expressive movement, or body posture, that involves its torso, extremities, and appendages, *e.g.*, tail (Immelmann and Beer 1989, 120).

cf. display, facial expression.

Comment: In Humans who are hearing and speech impaired, gestures can become conventionalized into a gesture language (Drever 1974).

♦ **gesture of embarrassment** *n.* Partial covering of one’s face in persons who are mildly embarrassed, which occurs in all human cultures (Heymer 1977, 189).

♦ **GHB** See drug: gamma hydroxybutyrate.

♦ **gibberellins** See hormone: gibberellins.

♦ **gift** See nuptial gift.

♦ **Giftsterzeln** *n.* In *Apis mellifera* (Western Honey Bees): A guard’s raising her abdomen, exposing her sting, releasing an alarm pheromone, and fanning her wings which aids in pheromone dissemination (Maschwitz 1964 in Heymer 1977, 78).

[German]

♦ **gigantism** *n.* An organism’s being much larger than normal, or exhibiting excessive growth, often associated with polyploidy (Oxford English Dictionary 1972, entry from 1885; Lincoln et al. 1985).

adj. gigantic

cf. nanism

♦ **Gilbertian mimicry** See mimicry: Gilbertian mimicry.

♦ **gill-brooding** See brooding: gill-brooding.

♦ **gill-cover hypothesis of insect wing origin** See hypothesis: hypotheses of the origin of insect wings: gill-cover hypothesis of insect wing origin.

♦ **gilt** See animal names: gilt.

♦ **glade** See habitat: glade.

♦ **gland** *n.*

1. In many animal species: An organ that is composed of nucleated cells, is from simple through complex

in structure, and removes certain constituents from blood for body use or ejection (Oxford English Dictionary 1972, entries from Ray 1692).

2. In many plant species: A secreting cell, or group of cells, on the surface of a structure (Oxford English Dictionary 1972, entries from Martyn 1785).
3. In many animal species: An organ that is composed of modified epithelial cells and produces one, or more, secretions discharged outside of itself (Michaelis 1963; Curtis 1983, 1096).

Note: This definition seems appropriate for wide use.

4. In many animal species: A gland-like structure, *e.g.*, lymph gland (Michaelis 1963).

cf. chemical-releasing stimulus: semiochemical; hormone

Comments: Animal glands (*e.g.*, adrenals, spleen, thymus, and thyroid) have no ducts and hence are called “ductless glands” or “apocrine glands.” Glands are named from their body position (*e.g.*, cervical or iliac) or for their discoverers (*e.g.*, Dufour’s gland). Barnes (1974) describes many kinds of glands found in invertebrates. Some of the many kinds of glands are defined below. [Greek *glans*, *glandis*, acorn]

adrenal gland *n.* In Vertebrates: An endocrine gland that produces aldosterone, cortisol, and other steroid hormones in its cortex and adrenaline and noradrenaline in its medulla (Curtis 1983, 1086).

anal gland *n.* For example, in *Canis familiaris* (Domestic Dogs), *Canis lupus* (Gray Wolves), Dolichoderine Ants, *Oryctolagus cuniculus* (European Rabbits), and *Petaurus breviceps* (Phalangers): A gland near an animal’s anus that produces a territory-marking pheromone (Wilson 1975, 205, 231, 509).

antebrachial gland *n.* For example, in male *Lemur catta* (Ring-tailed Lemurs): A forearm gland that produces an odorous substance used in stink fights, *q.v.* (Wilson 1975, 531).

cf. gland: brachial gland

apocrine gland *n.* In Humans: A gland found especially under arms, on breasts, and in genital regions, that produces chemicals fed on by lipophilic diphtheroid bacteria that transform the chemicals into human-perspiration odor (Curtis 1983, 805; Booth 1990).

syn. apocrine-sweat gland (Curtis 1983, 805), human-scent gland (Booth 1990)

cf. odor: human-underarm odor

Comment: Human pubic and axillary hair may function to retain and amplify human odors (Curtis 1983, 805).

appeasement gland *n.* In *Atemeles pubicollis* (a beetle): A gland near an individual’s abdominal tip that produces a material that seems to calm ants that feed on it (Hölldobler 1967–1971 in Wilson 1975, 375).

brachial gland *n.* In male *Lemur catta* (Ring-tailed Lemurs): A gland high on the chest that produces an odorous substance (Wilson 1975, 531).

cloacal gland *n., pl. cloacae* For example, in *Amietophryne superciliaris* (African Giant Toads), most reptile species, and many bird species: A male’s, or female’s, gland that is brought together with one of the opposite sex during mating in a cloacal kiss, *q.v.* (Dewsbury 1978, 77; Curtis 1983, 840).

syn. cloaca (Curtis 1983, 840)

Comment: Depending on the species, a cloaca is an exit chamber from an animal’s digestive system and the exit for an animal’s reproductive and urinary systems (Curtis 1983, 1091).

[Latin *cloaca*, sewer]

Dufour’s gland *n.* In female Hymenoptera: An abdominal gland that produces different substances with markedly different functions depending on the species; *e.g.*, a sex pheromone in the ant *Xenomyrmex floridanus*; offensive and defensive chemicals, alarm pheromone, and a propaganda substance in the ants *Formica pergandei* and *F. subintegra*; a nest lining in some sweat-bee species; and a polyethylene used in lining brood cells in *Colletes thoracicus* (Polyester Bee) (Dufour 1835, Wheeler 1910, Talbot and Kennedy 1940 in Wilson 1975, 370; Regnier and Wilson 1971, 269; Hölldobler 1971b in Wilson 1975, 141; Hefetz et al. 1979; Barrows et al. 1986).

syn. sebiferous gland, silk gland (Dufour 1835), alkaline gland (Carlet 1884, 1890), *glande appendiculaire*, *glande de Dufour*, basic gland (Bordas 1894, Semichon 1906)

Comment: Carlet (1884, 1890) states that Dufour used the names “sebiferous gland” and “silk gland” for the gland we now call “Dufour’s gland.”

[after Léon Jean Marie Dufour (1780–1865) French M.D. and naturalist]

endocrine gland *n.* An often ductless gland that synthesizes, stores, or secretes hormones, or a combination of these activities; *e.g.*, adrenal, pituitary, and sex glands; contrasted with exocrine gland (Wilson 1975, 583; Immelmann and Beer 1989, 86).

[Greek *endon*, within + *krinein*, to separate]

exocrine gland *n.* A gland that secretes to the outside of an animal’s body or into its alimentary tract, *e.g.*, salivary and sweat glands; contrasted with endocrine gland (Curtis 1983, 1094).

Comment: Exocrine glands are the most common sources of pheromones (Wilson 1975, 584).

[Greek *ex*, out of + *krinein*, to separate]

forehead gland *n.* For example, in *Odocoileus hemionus columbianus* (Black-tailed Deer): A pheromone-producing gland in an individual’s forehead (Müller-Schwarze 1971 in Wilson 1975, 233).

genital gland *n.* In *Canis lupus* (Gray Wolves): A gland in the genital region that appears to produce a pheromone (Wilson 1975, 509).

gland of construction *n.* In many (perhaps all) paper-making wasps: A gland in a worker’s head that produces a fluid that apparently acts as the adhesive in preparation of nest carton from fibers and water (Evans and West Eberhard 1970, 166).

honeydew gland *n.* For example, in *Anatole rossi* (Ross’ Metalmark Butterflies): One of a pair of glands on the posterior part of a caterpillar that produces a sweet substance used by ants (Ross 1985).

cf. honeydew

hypopharyngeal gland *n.* In *Apis mellifera* (Western Honey Bees): A gland that secretes royal jelly and brood food that workers feed to queens and larvae (Free 1961 in Wilson 1975, 207).

hypophysis See gland: pituitary gland.

hypothalamus See organ: hypothalamus.

interdigital gland *n.* For example, in *Connochaetes taurinus* (Blue Wildebeest) and *Odocoileus hemionus columbianus* (Black-tailed Deer): A pheromone-producing gland found between toes that deposits odor directly on the ground (Müller-Schwarze 1971 in Wilson 1975, 234, 491).

interrenal gland *n.* In some fish species: A gland that produces corticosteroids (Wilson 1975, 289).

intersegmental gland *n.* In *Apis mellifera* (Western Honey Bees): An abdominal gland that secretes wax (Wilson 1975, 430).

Koschevnikov's gland *n.* In nest queens of *Apis mellifera* (Western Honey Bees): A gland at the base of a queen's sting that produces a volatile attractant that is one of three pheromones causing workers to tend to queens (Wilson 1975, 203, 212).

mandibular gland *n.* In hive queens of *Apis mellifera* (Western Honey Bees): A gland that produces trans-9-keto-2-decenoic acid, an odor which prevents workers from constructing queen cells in which new queens would be reared (Wilson 1975, 216).

mental gland *n.* In males of most salamander species: A gland on an individual's chin that produces a courtship pheromone (Houck and Reagan 1990, 729). *syn.* courtship pheromone (Houck and Reagan 1990, 729)

[Latin *mentum*, chin]

metanotal gland *n.* For example, in Oecanthine Grasshoppers: A gland on the metanotum of a male that produces a secretion eaten by a female during, or after, copulation (Boake 1984, 696).

metapleural gland *n.* In some ant species: A gland that produces antibiotic substances (phenylacetic acid and other biocidal secretions) used for protection against fungi and bacteria (Wilson 1975, 211, 422).

metatarsal gland *n.* For example, in *Odocoileus hemionus columbianus* (Black-tailed Deer): A pheromone gland found on hind legs that transmits airborne scents (Müller-Schwarze 1971 in Wilson 1975, 234).

Nasanov gland *n.* In workers of *Apis mellifera* (Western Honey Bees): A gland that produces a pheromone consisting of a mixture of citral, geranic acid, geraniol, and nerolic acid (Frisch and Rösch 1926 and Butler and Calam 1969 in Wilson 1975).

Comment: This pheromone attracts and assembles workers at a food source or at a queen during swarming (Velthuis and van Es 1964 and Mautz et al. 1972 in Wilson 1975, 212).

oral-scent gland *n.* In *Spermophilus columbianus* (Columbian Ground Squirrels): A gland in the oral angle of an individual that produces a scent that appears to enable adults to tell familiar from unfamiliar individuals, as well as recognize conspecifics as individuals (Harris and Murie 1982, 140).

pituitary gland *n.* In vertebrates: An endocrine gland that hangs from the floor of an animal's brain stem and produces hormones that affect an animal's body directly and regulate activity of other endocrine glands (adrenal cortex, gonads, and thyroid) (Curtis 1983, 1103; Immelmann and Beer 1989, 221).

syn. hypophysis (Immelmann and Beer 1989, 221) *Comment:* The anterior lobe of a pituitary produces tropic hormones, growth hormone, and prolactin (Curtis 1983, 1103).

[Latin *pituita*, phlegm]

► **neurohypophysis** *n.* The posterior part of a pituitary gland which stores and releases oxytocin and antidiuretic hormone (ADH) produced by the hypothalamus (Curtis 1983, 1103).

postcornual-skin gland *n.* For example, in the *Rupicapra rupicapra* (Chamois): One of a pair of glands located directly behind horns, which is most developed during rutting (Heymer 1977, 48).

precaudal gland *n.* In the Wolf: A gland that appears to produce pheromones (Wilson 1975, 509).

sternal gland *n.* In Termites: A gland that produces trail pheromone (Wilson 1975, 231).

tarsal organ *n.* For example, in *Odocoileus hemionus columbianus* (Black-tailed Deer): A pheromone-producing gland that produces individual odors (Müller-Schwarze 1969 in Wilson 1975, 205).

temporal gland *n.* In Elephants: A gland located between ears and eyes that secretes a viscous, strong smelling liquid especially when an individual is excited or under stress (Wilson 1975, 495).

♦ **glandotrophic hormones, glandotropic hormone** See hormone: glandotrophic hormones.

♦ **glial cell** See cell: glial cell.

♦ **global-positioning system** See system: global-positioning system.

♦ **global warming** *n.* An increase in the average yearly temperature of Earth's lower atmosphere due to greenhouse gases produced as by-products of human activities (Allaby 1994).

cf. experiment: climate experiment; treaty: Kyoto Protocol

Comments: Nonanthropogenic global warming and cooling have occurred many times during Earth's history. At present, Earth seems to be in a warming phase with an accompanying sea-level rise (Rensberger 1993, 1 June, A1; Stevens 1995, 23 May, C4; Sawyer and Lee 1995, 25 October, A3). Worldwide average temperature increased about 1.1°F over the last 100 yr (Suplee 2000, 21 February, A13). The majority of researchers now agree that some of the current global warming (def. 1) is caused by human activities, such as burning fossil fuels (Stevens 2000, 27 February, D1; Landler 2007, 11 October, A10). Global warming models disagree regarding the exact amount of global warming that we can expect and the details of how global warming will affect our planet. The amount of greenhouse gases may double in the 21st century causing an increase of global temperature of 3–8°F and increased weather fluctuations. Possible changes in global warming in the U.S. include increased risks of floods, mass migrations of some species, severe droughts, and widespread erosion of coastal zones (Suplee 2000, 12 June, A3). An increase in minimum daily temperature, associated with global warming, is also correlated with earlier plant flowering in spring in the U.S. (Abu-Asab et al. 2001, 597). Many Websites discuss global warming including the EPA Global Warming Site, www.epa.gov/globalwarming/home.htm; NASA's Global Change Master Directory, <http://gcmd.gsfc.nasa.gov>; and the Sierra Club Global Warming and Energy Program, www.toowarm.com. Organisms such as European damselflies and dragonflies (Odonata) are shifting their ranges, perhaps in response to global warming (New 2009, 109).

♦ **global-warming potential** See unit of measure: global-warming potential.

♦ **Gloger's law, Gloger's rule** See law: Gloger's rule.

♦ **glossary** *n.* A dictionary of foreign terms, obscure terms, or technical terms or a combination of these terms of a field or work (Michaelis 1963).

Comment: There are scores of online biological glossaries many of which can be found via Glossarist (<http://www.glossarist.com>/February 20, 2008). I list a few of the online glossaries below.

- [< Latin *glossa*, a difficult word (in a text) < Greek *glossa*, foreign word; originally, tongue]
- Glossary of Plant Terminology** <http://aquat1.ifas.ufl.edu/glossary.html> (20 February 2008)
- Glossary of Ordination-Related Terms** <http://ordination.okstate.edu/glossary.htm> (20 February 2008)
- Tree of Life Glossary** <http://www.googlesearch.com/u/TreeofLife?q=glossary&sa=Search> (20 February 2008)
- UCMP Glossary** *n.* A large online science glossary divided into nine main subjects.
<http://www.ucmp.berkeley.edu/glossary/glossary.html> (20 February 2008)
- ♦ **glucagon-like factor-1** See hormone: glucagon-like factor-1.
- ♦ **gluttony principle** See principle: gluttony principle.
- ♦ **glycolysis** See biochemical pathway: glycolysis cycle.
- ♦ **glycolytic pathway** See biochemical pathway: glycolytic pathway.
- ♦ **gneiss** See rock: gneiss.
- ♦ **gnesiogamy** See -gamy: gnesiogamy.
- ♦ **goal expectation** *n.* An animal's striving for an expected thing, *e.g.*, a Rhesus Macaque's refusing a lettuce leaf after seeing a banana that it might receive instead of the leaf (Heymer 1977, 205).
- ♦ **goal function** See ²function: goal function.
- ♦ **goal orientation** See taxis: telotaxis.
- ♦ **GOBASE** See database: Organelle Genome Database.
- ♦ **GOD** See Generation of Diversity.
- ♦ **Goldschmidt's-speciation hypothesis** See hypothesis: Goldschmidt's-speciation hypothesis.
- ♦ **gonad** *n.* In multicellular-animal species: A gamete-producing organ; ovary or testis (Curtis 1983, 836).
cf. ovariole
- ♦ **gonadectomy** See castration.
- ♦ **gonadotropic hormone, gonadotropin** See hormone: gonadotropic hormone.
- ♦ **gonadotropin-releasing hormone (GNRH)** See hormone: gonadotropin-releasing hormone, GNRH.
- ♦ **gono-, gon-** *comb. f.* Generation, offspring, semen, procreative, sexual, etc. (Oxford English Dictionary 1972; Michaelis 1963).
[*Greek gonos*, seed]
- ♦ **gonochorism** *n.*
- Fusion of male and female gametes produced from separate unisexual individuals (Lincoln et al. 1985).
syn. sexual reproduction (Lincoln et al. 1985)
 - The history, or development, of sex differentiation (Lincoln et al. 1985).
 - A species' having individuals of separate sexes (Lincoln et al. 1985).
syn. dioecism, dioecy, diecism, unisexuality (Lincoln et al. 1985)
cf. sexual: unisexual
 - Male and female individuals' being present in the same population (Lincoln et al. 1985).
syn. bisexuality (Lincoln et al. 1985)
cf. hermaphroditism
adj. gonochoric, gonochoristic
- ♦ **gonogenesis** See -genesis: gonogenesis.
- ♦ **gonopodium** See organ: copulatory organ: gonopodium.
- ♦ **good-genes hypothesis, good-genes model** See hypothesis: good-gene hypothesis.
- ♦ **good-mother gene** See gene: fosB.
- ♦ **Google Earth** See program: Google Earth.

- ♦ **goosery** See ²group: goosery.
- ♦ **G-protein-linked receptor** See ²receptor: G-protein-linked receptor.
- ♦ **G-protein-linked-receptor protein** See molecule: G-protein-linked-receptor protein.
- ♦ **GPS** See instrument: global-positioning system.
- ♦ **Graafian follicle** See egg follicle.
- ♦ **-grade** *comb. f.*
- "Progressing or moving: *retrograde*" (Michaelis 1963).
 - Walking in a specified manner (Michaelis 1963).
cf. locomotion
[Latin *-grandus* < *grandi*, to walk]
- digitigrade** *n.* An animal that locomotes with digits of its foot, but not its entire sole, in contact with its substrate (*e.g.*, a cat or dog) (Michaelis 1963; Eisenberg 1981; 506).
adj. digitigrade
- palmigrade** See -grade: plantigrade.
- pinnigrade** *n.* An animal that locomotes utilizing flippers as paddles (*e.g.*, a dolphin or seal) (Lincoln et al. 1985).
adj. pinnigrade
- plantigrade** *n.* An animal that locomotes with the entire soles of its feet (or palms of its hands) in contact with its substrate (*e.g.*, a bear or Human) (Michaelis 1963; Eisenberg 1981, 508).
syn. palmigrade (Lincoln et al. 1985)
adj. plantigrade
- saltigrade** *n.* An animal that locomotes by leaping or hopping (*e.g.*, a grasshopper or kangaroo) (Lincoln et al. 1985).
adj. saltigrade
- syringograde** *n.* An animal that locomotes by propelling itself with a jet of water (*e.g.*, a dragonfly larvae or squid) (Lincoln et al. 1985).
adj. syringograde
- unguligrade** *n.* An animal that walks, or runs, on hooves or the modified tips of one, or more, of its digits (*e.g.*, an antelope or a deer) (Lincoln et al. 1985).
adj. unguligrade
- ♦ **grade, evolutionary grade** *n.*
- A group of animals whose members are presumed to have arisen from the same common ancestor at about the same time; a higher grade is separated from a lower one by a certain "advance in differentiation of structure".
[coined by Lankester 1877 in Oxford English Dictionary 1972]
 - A distinct stage in a series of stages in morphological, physiological, or behavioral traits that an organism may pass through during its evolution (Lankester 1909 and others in Mayr 1982, 234, Wilson 1975, 25).
Note: A principal characteristic of macroevolution "is the relative rapidity with which shifts into new adaptive zones occur When a phyletic line enters a new adaptive zone, ..., it undergoes at first a very rapid morphological reorganization until it has reached a new level of adaptation. Once it has achieved this new *grade*, it can radiate into all sorts of minor niches without any major modifications of its basic structure" (Bather 1927 and Huxley 1958 in Mayr 1982, 614).
 - "The evolutionary level of development in a particular structure, physiological process, or behavior occupied by a species or group of species" (Wilson 1975, 584).

Note: “Evolutionary grade is distinguished from the phylogeny of a group, which is the relationship of species by descent” (Wilson 1975, 584).

4. “A delimitable unit of anagenetic advance or biological improvement” (Lincoln et al. 1985).

cf. clade

intergrade *n.* An individual in an intergradation zone (Lincoln et al. 1985).

- ♦ **graded potential, graded response** See response: graded response.

- ♦ **graded signal** See signal: analog signal.

- ♦ **gradient hypothesis** See hypothesis: gradient hypothesis.

- ♦ **gradual-change hypothesis** See hypothesis: hypotheses of species richness: gradual-change hypothesis.

- ♦ **gradualism** *n.* The belief that the Earth’s geological changes were and are gradual (Baker 1978 and Alvarez et al. 1980 in May 1982, 377–378).

Comments: Buffon, Lamarck, Leibniz, and most of Darwin’s so-called forerunners believed in gradualism. However, their upholding gradualism became more difficult after the discovery of the frequency of stratigraphic breaks. Both Lyell, and later Darwin, were aware of the fact that earthquakes and volcanic eruptions could produce rather drastic effects, but they were smaller by several orders of magnitude than the catastrophes postulated by some geologists. Modern geological research indicates that certain events in the Earth’s past history qualify as catastrophes (Baker 1978 and Alvarez et al. 1980 in May 1982, 377–378).

phytic gradualism *n.*

1. A paleontological conception of evolution with these tenets: new species arise by transformation of an ancestral population into modified descendants; the transformation is slow and even and involves large numbers of conspecifics, usually an entire ancestral population; and transformation occurs over all, or a large part of, the ancestral species’ geographic range (Eldredge and Gould 1972, 89).
2. “The doctrine that [organic] evolutionary change is gradual and does not go in jumps” (Dawkins 1982, 288).

syn. gradualism (Rhodes 1983, 269)

cf. ²evolution: anagenesis, quantum evolution, saltational evolution; hypothesis: hypothesis of punctuated equilibrium; selection: species selection; speciation: allopatric speciation

Comments: “All sane Darwinians are gradualists in the extreme sense that they do not believe in the *de novo* creation of very complex and therefore statistically improbable new adaptations like eyes. This is surely what Darwin understood by the aphorism ‘Nature does not make leaps.’ But within the spectre of gradualism in this sense, there is room for disagreement about whether evolutionary change occurs smoothly or in small jerks punctuating long periods of *stasis*. It is this that is the subject of the modern controversy, and it does not remotely bear, one way or the other, on the validity of Darwinism” (Dawkins 1982, 288).

- ♦ **graft chimera, graft hybrid** See chimera: graft chimera.

- ♦ **grail number** See number: grail number.

- ♦ **grain** *n.* The spatial pattern of a resource with respect to size and spacing of its patches (Wittenberger 1981, 616).

Comment: Coarse-grained resources are widely dispersed and patchy. Fine-grained resources are more uniformly distributed (Wittenberger 1981, 616).

- ♦ **grallatorial** See -orial: grallatorial.

- ♦ **-gram** *comb. f.* “Something written or drawn” (Michaelis 1963).

cf. curve, graph

[Greek *gramma*, letter, writing]

bar diagram See graph: bar graph.

behavior-chain diagram *n.* A graph of interactions between two, or more, organisms (Lehner 1979, 118–120).

syn. behavior-reaction chain (Evans and Matthews 1976, fig. 2)

cf. graph: kinematic graph

biogram *n.* The behaviors and rules by which an organism increases its Darwinian fitness (Count 1958, Tiger and Fox 1971 in Wilson 1975, 548).

cladogram *n.* (CLADE o gram)

1. “A branching diagram that shows how species split and form new species” (Simpson 1961; Mayr 1969; Wilson 1975, 26).
2. “A phylogenetic tree that depicts only the splitting of species and groups of species through evolutionary time” (Wilson 1975, 580).
3. A hypothetical tree that orders organisms according to nested sets of novelties; consequently, the organisms are ordered as well into nested sets — hypothesized monophyletic taxa (Eldredge and Cracraft 1980).
4. A branching diagram constructed by cladistic methods (Futuyma 1998, 95).

Note: Cladograms can represent different entities including nucleic acids sequences, molecules, subspecies, species, and higher taxa.

cf. -gram: dendrogram, phenogram, phylogenetic tree; study of: systematics: cladistic systematics

Comments: Cladistics, initiated by Willi Hennig, utilizes cladograms (Futuyma 1998, 94). Researchers use cladograms as suggestions of evolutionary changes within in investigated entities.

See Lincoln et al. (1985) for more definitions.

[Greek *clados*, branch, stem, twig; *gramma*, letter, writing]

dendrogram *n.*

1. “A diagram showing evolutionary change in a biological trait, including the branching of the trait into different forms due to the multiplication of the species possessing it” (a more narrow definition than def. 2, Wilson 1975, 582).
2. “A tree-like diagram of relationship” (Mayr 1982, 957) or resemblance (a Lincoln et al. 1985).

syn. tree (Vigilant et al. 1991, 1505)

Comment: Biological dendograms include cladograms, phenograms, and phylogenograms which are often working hypotheses of relationship.
[Greek *dendros*, tree, stem, twig; *gramma*, letter, writing]

distance-Wagner tree *n.* A cladogram that shows the differences in characters among taxa as differences in branch distances (Shaffer et al. 1991, 289).

cf. -gram: Wagner tree

electroencephalogram (EEG) *n.* A recording of an animal’s brain electrical activity (Michaelis 1963; Immelmann and Beer 1989, 20).

electroretinogram (ERG) *n.* A recording of an animal’s retinal light-frequency sensitivity (Lall et al. 1980, 561).

Comment: For example, regarding some firefly species, an ERG is a graph of the log relative quantal sensitivity versus light wavelength (nm) (Lall et al. 1980, 561).

engram, memory trace *n.* A hypothetical physical manifestation of learning within an animal's central nervous system (Dewsbury 1978, 338).

Comment: The physiologist Karl Lashley spent several decades in the 20th century looking for engrams in Humans (Campbell 1996, 1022). Because partial damage to one area of a person's cerebral cortex does not destroy individual memories, Lashley ultimately concluded that there is no highly localized memory trace in a person's nervous system; rather, one of his memories seems to be stored within a certain association area of his cortex with some redundancy.

ethogram *n.* "A complete inventory of the behaviour patterns of a species" (Tinbergen 1951, 6).

syn. action system (Jennings 1906 in Heymer 1977, 64), behavioral catalog, behavioral repertoire catalog (Fagen 1978, 26), behavioral repertory, repertoire (Lehner 1979, 49)

cf. repertoire

Comments: Different authors give different definitions of "ethogram" (and terms listed here as synonyms), and some of the definitions are contradictory (Brown 1975, 2; Dewsbury 1978, 20; Lehner 1979, 49; Lincoln et al. 1985). Workers might reduce confusion by using "ethogram" and "partial ethogram" only with the meanings given in this book instead of the many synonyms of debatable meanings and the same synonyms for both "partial ethogram" and "ethogram."

► **partial ethogram** *n.* Part of an ethogram.

syn. behavioral catalog (Fagen 1978, 26), catalog, ethogram (Lehner 1979, 49)

Comment: It is very difficult to compile an ethogram, rather than a partial ethogram, for a species because it takes a long time to see rare behaviors and many behaviors are variable with regard to complexity.

evolutionary tree See -gram: phylogenetic tree.

fitness topography *n.* A plot of evolutionary fitness with regard to the frequencies of two alleles of an organism that are not necessarily on the same chromosome (Lewontin 2000, 86, illustration).

Comment: Fitness topographies often show peaks and valleys, and sometimes saddles.

food web *n.* A diagram that indicates which organisms are the consumers and which are consumed (Wilson 1975, 584).

cf. chain: food chain

full-phylogenetic tree *n.* A dendrogram that "contains the information of the cladogram, plus some measure of the amount of divergence between the branches, plotted against a time scale" (Wilson 1965).

histogram See graph: histogram.

idiogram See -gram: karyogram.

karyogram *n.* A photographic representation of a cell's karyotype (chromosome complement) (Lincoln et al. 1985).

syn. idiogram, karyotype

kingram *n.* A graphical technique used to evaluate decision rules and corresponding maximum efficiencies in different animal recognition systems (Getz 1981 in Wilson 1987, 11).

nomogram, nomograph *n.* A graph of numerical relations; especially, one that has graduated scales for three interrelated variables, arranged in a straight

line that joins values of two of the variables and cuts the scale of the third variable at its related value (Michaelis 1963).

phenogram *n.* A dendrogram (def. 2) of overall similarity among species, generated by a numerical algorithm that uses as many traits of the species as possible (Michener and Sokal 1957 in Futuyma 1998, 92).

Comments: The developers of phenograms wanted to produce unbiased taxonomic trees based on quantitative data, and indicated that phenograms were definitely not designed to show evolutionary relationships (Sokal and Sneath 1973 in Quicke 1993, 3). Nonetheless researchers did use phenograms for inferring about phylogeny (Futuyma 1998, 94).

cf. study of: systematics: phenetic systematics [Greek *pheno* < *phaino*, appear, shine; *gramma*, letter, writing]

phylogenetic tree *n.*

1. A hypothetical taxonomic tree, more detailed than a cladogram, that specifies actual series of ancestral and descendant taxa (Eldredge and Cracraft 1980).

2. A dendrogram (def. 2) representing inferred lines of descent (Lincoln et al. 1985).

syn. evolutionary tree, phyletic tree, phylogeny (Oxford English Dictionary 1972, entries from 1870; Wilson 1975, 591), phylogram (Mayr 1982, 233)

Comment: The procedures for making phylogenetic trees have dramatically increased in complexity in the 1980s–2000s, as shown in an example in Mueller et al. (1998, 2036) which uses molecular techniques and computer programs.

rooted-phylogenetic tree *n.* A phylogenetic tree that has a base that represents the ancestor of the organisms in the tree (Niesbach-Klösgen et al. 1987, 219).

Comment: Construction of a rooted phylogenetic tree requires information concerning the time scale of evolution (Niesbach-Klösgen et al. 1987, 219).

rootless-phylogenetic tree *n.* A phylogenetic tree that does not have a base that represents the ancestor of the organisms in the tree (Niesbach-Klösgen et al. 1987, 219).

syn. undirected tree (Mayr and Ashlock 1991, 292)

scatter plot, scatter diagram *n.* A graph of sets of paired, or multiple, points made to indicate the general nature of the relationship between two, or more, variables (Lincoln et al. 1985).

sociogram *n.*

1. A complete description of the social behavior of a particular species (Wilson 1975, 16, 595).

2. A graph of social relationships, or interaction frequencies, in an animal group (Immelmann and Beer 1989, 280).

cf. -gram: ethogram

sonogram, sonogram, sound spectrogram *n.*

A graph of an animal's vocalizations, showing their amplitudes, frequencies, and sound pressures (Heymer 1977, 99, Lincoln et al. 1985).

undirected tree See -gram: unrooted tree.

vibrogram *n.* A graph of robber-fly wing-beat frequency versus time (Lavigne and Holland 1969, 13).

Wagner tree *n.* A dendrogram based on the Wagner algorithm (Kluge and Farris 1969 in Wiley 1981, 176).

cf. -gram: distance-Wagner tree

♦ **graminicole** See -cole: graminicole.

- ♦ **graminivore** See -vore: graminivore.
- ♦ **graminology** See study of: graminology.
- ♦ **granite** See rock: granite.
- ♦ **granivore** See -vore: granivore.
- ♦ **graph** *comb. f.* “That which writes, portrays, or records” (Oxford English Dictionary 1972). [French *-graphe* < Latin *-graphus* < Greek *-graphos* < *graphein*, to write]
- autoradiograph** *n.* A sheet of x-ray film that is exposed by radioactive chemicals (Campbell et al. 1999, 369). *Comment:* Autoradiographs are used in DNA fingerprinting and other methods that seek to identify particular molecules (Campbell et al. 1999, 369).
- Sonagraph®** *n.* The brand name of a kind of sound spectrograph (Immelman and Beer 1989, 284).
- sound spectrograph, sonograph** *n.* A machine that produces sonograms, *q.v.* (Lehner 1979, 174–180; Immelman and Beer 1989, 284).
- stenograph** *n.* A machine that can be used to record behavior of two animals simultaneously (Lehner 1979, 161).
- ♦ **graph** *n.* A diagram that represents variations in the relationship between two, or more, factors by means of a series of connected bars, curves, lines, points, and so forth (Michaelis 1963). *cf.* curve, -gram
- bar graph** *n.* A graph of counts of something versus categories, *e.g.*, the number of people versus five different religions (Sokal and Rohlf 1969, 21, illustration, 29). *syn.* bar chart (Upton and Cook 2006, 28), bar diagram (Sokal and Rohlf 1969, 29) *Comments:* The counts are bars of equal width along an x axis, and sides of bars do not touch (Sokal and Rohlf 1969, 29). People used diagrams that resemble bar graphs in the 14th century. Kinds of bar graphs include compound bar graphs, line graphs, and multiple bar graphs (Upton and Cook 2006, 28).
- **line graph** *n.* A bar graph with lines instead of bars (Upton and Cook 2006, 28).
- histogram** *n.* A graph of counts of something versus a continuous (= nondiscrete) variable represented as class intervals (Sokal and Rohlf 1969, 25, illustration, 29). *cf.* graph: bar graph *Comments:* The width of a bar along the abscissa represents that of a class interval, and the sides of bars touch each other to show that the actual class limits are contiguous (except for the left side of the leftmost bar and the right side of the rightmost bar). The midpoint of an interval corresponds to a class mark. Examples of histograms are: mean number of leaves on a group of mangroves versus time (3-day intervals from June through October) and number of people versus height in 1-cm intervals. Data used in a histogram may also be correctly presented as a frequency polygon. Karl Pearson introduced the term “histogram” in his lectures before 1895 (Upton and Cook 2006, 195).
- behavior-chain diagram** See -gram: behavior-chain diagram.
- “facial-feature graph”** *n.* A type of graph devised by H. Chernoff that encodes data in human facial features that help a viewer to detect data patterns, groupings, and correlations (Levine 1990, 457).
- frequency polygon** *n.* A graph, of counts of something versus a continuous variable represented as class intervals, which is made up of the lines that connect the dots of y versus x when $y > 0$ (Sokal and Rohlf 1969, 30, illustration). *Comment:* The data of a frequency polygon may also be correctly presented as a histogram.
- hydrograph** *n.*
1. A graph on which a water course's water flow is plotted against time (Allaby 1994).
 2. A graph on which the elevation of groundwater in a borehole above a particular datum point is plotted against time (Allaby 1994). *Comment:* Peaks on the hydrograph indicate times of high water level (USDA Forest Service, 1993).
- kinematic graph** *n.* A graph that represents a temporal, or sequential, ordering of behavior states (Sustare 1978, 278). *syn.* behavior-sequence diagram *cf.* graph: behavior-chain diagram
- line graph** See bar graph: line graph.
- rose diagram** *n.* A circular histogram that displays directional data and their frequency in each class (Allaby 1994). *cf.* wind rose
- spindle diagram** *n.* A graph with geological time on its ordinate and that shows the number of focal taxa during geological time as a group of centered, stacked, horizontal bars, each bar being the number of taxa that are known from a time interval (Labandeira and Sepkoski 1993, 311, figure 2).
- wind rose** *n.* A rose diagram that represents the relative frequencies of different wind directions and wind speeds at a climatic station over a time interval (Adams et al. 1994, 19, illustration; Allaby 1994). *cf.* rose diagram
- ♦ **-graphy** *comb. f.*
1. Denoting a style of writing, drawing, or graphic representation (Oxford English Dictionary 1972).
 2. Denoting a descriptive science (Oxford English Dictionary 1972).
- [Greek *graphein*, to write]
- ecography** *n.* “Descriptive ecology” (Lincoln et al. 1985). See study of: ecology.
- entomography** *n.* Description of an insect or its life history (Lincoln et al. 1985).
- onomatography** *n.* The correct writing of plant or animal names (Lincoln et al. 1985).
- orthography** *n.* “The spelling of words” (Lincoln et al. 1985).
- paleontography, palaeontography** *n.* “The systematic description of fossil taxa” (Lincoln et al. 1985).
- phytography** *n.* “Descriptive botany” (Lincoln et al. 1985). *cf.* study of: botany
- phytotopography** See study of: phytogeography: phytotopography.
- ♦ **grasp reflex, grasping reflex** See reflex: grasp reflex.
- ♦ **grass bald** See habitat: grass bald.
- ♦ **grass pulling** See behavior: displacement behavior: grass pulling.
- ♦ **graveolent** *adj.* Possessing a strong, or offensive, odor (Lincoln et al. 1985).
- ♦ **gravid** *n.*
1. In Mammals including Humans: A female's being pregnant; heavy with young (Oxford English Dictionary 1972, entries from 1597).

2. In nonmammalian animals: Referring to an individual that carries eggs, or young, internally (Lincoln et al. 1985).

syn. berried, ovigerous (Lincoln et al. 1985), pregnant (in less precise modern writing)
cf. pregnancy

Note: Definition 2 is usually used today.

♦ **graviperception, geoesthesia, geoperception** *n.* Gravity perception (Lincoln et al. 1985).

♦ **gravity pollination** See pollination: gravity pollination.

♦ **gray matter** See organ: brain: gray matter.

♦ **grazers** See ²group: functional feeding group: scrapers.

♦ **grazing** *n.* An animal's feeding on algae, herbage, or phytoplankton, by consuming whole food plants or cropping entire surface growth of herbage (Lincoln et al. 1985).

v.t., v.i. graze

cf. feeding, predator

♦ **great bevy** See ²group: great bevy.

♦ **great chain of being** See *scala naturae*.

♦ **green-beard effect** See hypothesis: green-beard effect.

♦ **green development** *n.* A trend in home building that includes greater environmental concern by including better building energy management, preservation of wildlife habitats, transportation solutions, waste-water recycling, and wetlands protection (Lehman, 1991, E1).

♦ **greenhouse effect** See effect: greenhouse effect.

♦ **greenhouse gas** See molecule: greenhouse gas.

♦ **greeting, greeting behavior** *n.*

1. A person's approaching, or addressing, another with expressions of goodwill, or courtesy, upon meeting; a person's offering in speech, or writing, to another person his own, or another person's friendly, or polite, regard (Oxford English Dictionary 1972, entries from 1000).

2. A person's receiving, or meeting, another person with welcome (Oxford English Dictionary 1972, entries from 1605).

See greeting: notifying.

Comment: "Greeting" now refers to nonhuman animals as well.

♦ **arrow greeting** *n.* For example, in certain Amazonian Indians: An aggressive greeting in which the Indians fire a barrage of arrows just in front of a visitor (Eibl-Eibesfeldt 1970 in Heymer 1977, 128).

♦ **contact greeting** *n.* Any greeting in which bodily contact occurs; e.g., kissing (Eibl-Eibesfeldt 1970), hand shaking, and nose rubbing in Humans; mutual rubbing against one another in some mammals; billing in some birds; and nasal-anal, naso-genital, or naso-nasal greetings in some mammals (Heymer 1977, 102).

♦ **notifying** *n.* In *Papio hamadryas* (Hamadryas Baboons): A type of male-male greeting behavior characterized by a sequence of approach-retreat patterns used by one, or both males; swinging-gait locomotion; and no physical contact when the animals come close to each other during an interaction (Kummer 1968; etc. in Colmenares 1991, 49).

syn. greeting (Colmenares 1991, 49)

Comments: In the context of male rivalry over females, notifying might be a negotiation strategy whereby harem possessors and their rivals can assess a situation, influence each other's roles in their relationship, and eventually resolve a conflict without resorting to fighting. "Notifying" originally referred to

the behavior's presumed function of a male's signaling the direction of a foraging march (Colmenares 1991, 49).

♦ **threat greeting** *n.* For example, in *Equus ferus caballus* (Domestic Horses), Humans, and *Leucophaeus atricilla* (Laughing Gulls): Greeting behavior that contains some elements of threat, e.g., aggressive facial expression of an *Equus ferus caballus* (Domestic Horse) combined with erected ears, which is a nonaggressive position (Heymer 1977, 54).

♦ **greeting ceremony** See ceremony: greeting ceremony.

♦ **greeting etiquette** *n.* Human greeting responses that often contain components of symbolic submission (such as repeated bowing, lifting a hat and showing a bare head, falling to knees or to the ground in front of rulers or royalty), and may include present giving (Heymer 1977, 80–81).

Comment: Greeting etiquette may establish, or maintain, bonds and appease aggression (Heymer 1977, 80–81).

♦ **greeting feeding** See feeding: greeting feeding.

♦ **gregarious** *adj.*

1. In classes, or species, of animals: Referring to individuals that live in conspecific groups (Oxford English Dictionary 1972, entries from 1668).

2. Referring to a person who is "inclined to associate with others, fond of company" (Oxford English Dictionary 1972, entries from 1789).

3. Referring to plants that grow in open groups (Oxford English Dictionary 1972, entries from 1829).

4. Of, or pertaining to, a group of persons; characteristic, or affecting, persons gathered in crowds (Oxford English Dictionary 1972, entries from 1833).

5. Referring to a parasitic-wasp species whose females lay more than one egg into, or on, a host individual (Hooker and Barrows 1992).

cf. ²group: swarm

♦ **subgregarious** *adj.* Referring to organisms that form loose aggregations or groups (Lincoln et al. 1985).

♦ **gregarious disposition** See drive: bonding drive.

♦ **grin** See facial expression: grin.

♦ **grind** See ²group: grind.

♦ **Grinnell's axiom** See principle: Gause's principle.

♦ **grip** *n.* A person's tight, or strained, hand grasp upon an object (Oxford English Dictionary 1972, entries from 1148).

♦ **power grip** *n.* In Primates, including Humans: An individual's strong grasping with its hand (Wilson 1975, 516).

♦ **precision grip** *n.* In Primates: An individual's grasping an object using some amount of separate control in its index finger and thumb, permitting its fine manipulation of food particles and grooming its fur (Wilson 1975, 516).

Comment: Humans have the most refined precision grip of all primates (Wilson 1975, 516).

♦ **grist** See ²group: grist.

♦ **grooming** *n.*

1. A person's carrying, feeding, and generally attending to an *Equus ferus caballus* (Domestic Horse) (Oxford English Dictionary 1972, entries from 1809).

2. A person's tending, or attending, to something carefully; giving a neat, tidy, or smart appearance to something (Oxford English Dictionary 1972, entries from 1843).

3. An individual animal's cleaning itself of foreign matter and parasites; including a bird's nibbling its feathers with its bill; an insect's brushing, mouthing, and scraping its body parts; and a mammal's nibble-grooming its fur with its teeth and licking it with its tongue and scratching with its hind legs, rolling in dust, rubbing against objects, and washing.

v.i., v.t. groom

cf. behavior: comfort behavior; displacement behavior; sham preening; ²movement: abdominal-up-and-down movement

Comments: Among primates, grooming serves in both communication and pelage hygiene (Dewsbury 1978, 59). In Humans, grooming can have a calming effect. Bird grooming is usually called "preening." Preening can involve carding, cleaning, combing, and smoothing feathers; dressing feathers with oil-gland secretions; head rubbing; rehooking detached barbules; and scratching (Immelmann and Beer 1989, 230). Figure 19 shows a young *Pelecanus occidentalis* (Brown Pelican) preening its shoulder feathers in the Baltimore Zoo, U.S.

allogrooming *n.* An animal's grooming a conspecific animal (Wilson 1975, 208, 578).

cf. grooming: autogrooming

Comment: "Allopreening" is usually used for birds.

autogrooming *n.* An animal's grooming its own body (Lincoln et al. 1985).

cf. grooming: allogrooming

direct scratching (under the wing) *n.* In many bird species: An individual's raising its leg up without moving its wing and then scratching its head (Heymer 1977, 194).

cf. grooming: scratching over the wing

habit preening *n.* In some duck species: A ritualized preening movement common in courting individual's involving, *e.g.*, an individual's tilting up its enlarged and brightly colored feathers (*e.g.*, in Mandarin Ducks) or an individual's pointing its bill to its bright speculum (Immelmann and Beer 1989, 126).

Lausen *n.* In Primates: An individual's searching for lice with its hands (Heymer 1977, 104).

cf. grooming: grooming talk

Comment: "Lausen" indicates a groomer's familiarity with a groomee may strengthen social bonds and may calm groomees (*e.g.*, in Humans) (Heymer 1977, 104). [German]

nibble-cleaning, nibble-preening *n.* In Birds: Grooming with a bill (Meischner 1959; Petzold 1964 in Heymer 1977, 104).

ritualized grooming *n.* A grooming movement, or movements, that an animal uses for communication (McFarland 1985, 392).

cf. behavior: ritualized behavior; ritualization

scratching over the wing *n.* In a few bird species: A bird's raising its ipsilateral leg over and above its dropped wing and scratching its head (Heinroth 1930, Wickler 1970 in Heymer 1977, 87).

cf. grooming: direct scratching

self-grooming See grooming: autogrooming.

social grooming *n.* Allogrooming and allopreening (Immelmann and Beer 1989, 275).

♦**grooming dance** See dance: bee dance: shaking dance.

♦**grooming talk, small talk** *n.* A conversation in which substantive exchange of information does not occur, but contains social information (*e.g.*, that a partner is interested in the other person and ready to listen

and answer) and may function in group bonding (Morris 1968 in Heymer 1977, 197).

cf. grooming: Lausen

♦**gross cheater** See cheater: gross cheater.

♦**gross-primary productivity, gross-primary production** See ²production: gross-primary productivity.

♦**ground litter** See litter.

♦**ground ozone** See molecule: ozone.

♦**ground pecking** *n.* For example, in some gallinaceous-bird species: Pecking at the ground that functions in agonistic behavior, cocks' holding their groups of hens together, and hens' stimulating their chicks, causing their chicks to follow them (Schenkel 1956, 1958; Wickler 1969; Feekes 1972 in Heymer 1977, 46).

♦**¹group** *n.* A set of taxa, *e.g.*, Protostomia or Deuterostomia.

♦**²group** *n.*

1. A number of persons, or things, that form a unity because they have a common relationship; a number of such items classed together because they have a certain degree of similarity (Oxford English Dictionary 1972, entries from 1809).

2. A set of conspecific organisms that remain together for any period while interacting with one another to a much greater degree than with other conspecific organisms; no specific information regarding the organization of the set is implied (Kummer 1971 in Immelmann and Beer 1989, 122; Wilson 1975, 8–9).

Note: Specific group terms, many that denote particular information about a group, are used for different types of animals; I list many below. Some of the animal groups listed below are further defined under alphabetical listings. Hierarchy of groups may occur as in *Papio hamadryas* (Hamadryas Baboons): "one-male unit," "two-male team," "band," and "troop" (Kummer, 1968).

3. In *Papio anubis* (Anubus Baboons): The basic unit of society; an assembly of females, offspring, and multiple males (Wilson 1975, 534).

4. A set of related species, *e.g.*, a genus (Wilson 1975, 585).

See taxon.

cf. biota, -coenosis, community, chorus, fauna, flora, harem, jordanon, ²lek, one-male group, -paedium, social group, ²society, ²species, warren

aerie, brood, eyry, eyrie, nest *n.* A group of birds of prey, ravens, or children (Sparkes 1975).

aggregation *n.*

1. A temporary group of conspecific, or heterospecific, organisms that forms, for nonsocial reasons, in response to environmental factors (*e.g.*, a group of insects or tree frogs around a light at night) (Dice 1952, 266; Dewsbury 1978, 92).

Note: Aggregating individuals do not cooperate and may even be in strong competition with one another (Dice 1952, 266).

2. In some fish species: A group of fish that occurs incidentally, not as a result of "biosocial attraction" (Breder 1967 in Partridge 1982, 298).

cf. ²group: school

3. A group of conspecific organisms, comprising more than just a mated pair or a family, gathered in the same place but not internally organized or engaged in cooperative behavior;" distinguished from a true society, *q.v.* (Wilson 1975, 8, 577).

Notes: Some insect species, *e.g.*, *Aphis nerii* (Oleander Aphid, fig. 6) and *Oncopeltis fasciatus*

AN ECOLOGICAL AND POPULATION-BIOLOGY CLASSIFICATION OF ANIMAL GROUPS^a

- biota (flora and fauna)
- biome
- community
- species
 - geographical race (= subspecies)
 - metapopulation
 - population
 - deme
 - colony
 - troop
 - family
 - pair
 - individual

^a These categories do not refer to all species.

A TAXONOMIC CLASSIFICATION OF PLANTS AT THE SPECIES AND LOWER LEVELS^a

- species
- subspecies (*syn.* geographical race, variety)
- variety (*syn.* genetic variant, microgeographic race, nongenetic variant, subspecies, *varietas*, *varietas*)
- subvariety (*syn.* *subvaritas*)
 - form (*syn.* form, *forma*, race, variety)
 - clone

^a Lawrence (1951), Munson (1981). Different authors (in Munson 1981) proposed different classificational schemes for taxa between the species and clone levels; none of which is widely accepted.

(Large Milkweed Bug, fig. 7) form feeding aggregations of different aged individuals. The nonnative *A. nerii* are feeding on inflorescences and leaves of the native *Asclepias syriaca* (Common Milkweed), and the native *O. fasciatus* are feeding on a follicle of this species in Eastern U.S. Both aggregations contain early-instar individuals through adults.

4. A society, or group, of conspecific organisms that have a social structure and consist of repeated members or modular units, but with a low level of coordination, integration, genotypic relatedness, or a combination of these attributes (Lincoln et al. 1985).
5. A group of nests of conspecific bees of a social, or nonsocial, species.

syn. nest aggregation

See ²group: pseudosocial group.

Note: Members of some of these species may attract one another with aggregation pheromones.

syn. subsocial grouping (Immelmann and Beer 1989, 8)

See ²society: modular society: modular discontinuous society.

cf. ²group: colony, pseudosocial group; ¹population; school; ²society: discontinuous modular society

amphoterosynthesmia *n.* A swarm of both sexes of an animal species gathered for reproductive purposes (Deegener 1918 in Wilson 1975, 16).

anonymous group See ²society: open society.

assemblage *n.* A group of species in the same taxon that live in the same location at the same time (*i.e.*, live in the same community); contrasted with

ensemble, ²community, guild, local guild, and taxon in the Venn diagram of Fauth et al. (1996, 283).

association *n.*

1. A large assemblage of organisms in a particular area, with one, or two, dominant species (Lincoln et al. 1985).
2. Living together by conspecific, or heterospecific, organisms (Immelmann and Beer 1989, 21). See association.

► **kormogene association** *n.* An organism colony in which different individuals are morphologically attached to each other without organic connection (Lincoln et al. 1985).

aviary *n.* A group of birds in an aviary (Sparkes 1975).

bachelor group *n.* For example, in *Papio anubis* (Anubus Baboons), and *Vicugna vicugna* (Vicuña): A social unit comprising reproductively mature males without territories (Wilson 1975, 490, 534).

band *n.*

1. A social group of any kind of social mobile animals, composed of two, or more, individuals; “a social group of indefinite composition” (Dice 1952, 266).
2. A group of social animals (*e.g.*, a band of Coatis or Humans) (Wilson 1975, 456, 579).
3. In *Papio hamadryas* (Hamadryas Baboons): A group of a few one-male units (Wilson 1975, 534). See ²group: troop; hierarchy: central hierarchy.
4. A group of clans of Pygmies (Humans) (Heymer 1977, 99).

baren, barren *n.* A pack, or herd, of *Equus xmu-lus* (Mules) (Sparkes 1975).

[Middle English *berynge*, bearing (Lipton 1968, 53); or from barren, referring to the Mule’s not being capable of reproducing (Sparkes 1975)]

battery *n.* A group of birds housed together to encourage egg laying (Sparkes 1975).

bellowing *n.* A group of Bullfinches (Sparkes 1975).

bew *n.* A flock of Partridges (Sparkes 1975).

syn. bow, flock (Sparkes 1975)

bevy *n.* A group of things; *e.g.*, six head of *Capreolus capreolus* (Roe Deer) or swans; a bevy of larks, *Oryctolagus cuniculus* (European Rabbits), Otter, Quail, ladies, or beauties (attractive human females) (Sparkes 1975; Choate 1985, 13).

cf. ²group: company, covey, flight, flock, great bevy, middle bevy

bike *n.* A nest of wild bees, a swarm, or crowd, of people; *e.g.*, a bike of ants, hornets, or wasps (Sparkes 1975).

syn. swarm

bite *n.* A group of mites (Sparkes 1975).

bloat *n.* A group of *Hippopotamus amphibius* (Hip-popotami) (Sparkes 1975).

bouquet *n.* A group of pheasants (Sparkes 1975).

[from the appearance of a bouquet (Lipton 1968, 9)]

bow *n.* A herd of *Bos primigenius* (Domestic Cattle); the Domestic Cattle on a farm (Sparkes 1975).

brace, cast *n.* A pair of usually hunted animals; *e.g.*, a brace of bucks, ducks, foxes, Greyhounds, hares, hounds, rarely Humans, partridges, pheasants, pike, or trout (Sparkes 1975).

brood *n.*

1. The offspring of an animal that hatch, or are born alive, contemporaneously (Oxford English Dictionary 1972, entries from 1000).

syn. hatch (Oxford English Dictionary 1972)

subgenus
superspecies
species ^b (pl. species)
geographical race (<i>syn.</i> race, subspecies)

^a Boudreax (1979, 83, 141); Lincoln et al. (1985, 279); Borror et al. (1989, 147).

^b This is a major taxonomic division. Categories designated as “group,” which I have not included in this table, are used at different levels between divisions in this hierarchy. Some researchers are arguing for abolishing Linnaean categories, which they consider to be arbitrary and even nonsensical and overtly misleading (Minelli 1996).

2. “Any young animals that are being cared for by adults;” in social insects in particular, the immature members of a colony collectively, including eggs, larvae, and pupae (Wilson 1975, 579).

Note: In the strict sense, eggs and pupae are not members of a society, but they are, nevertheless, referred to as part of a brood (Wilson 1975, 579).

3. A group of young animals all from the same parents or same mother; *e.g.*, a brood of eagles, eggs, *Gallus gallus* (Domestic Chickens), grouse, hawks, hens, or kittens (Sparkes 1975).

syn. aerie, breed, fry (Sparkes 1975)

4. A group of 13-yr Cicadas, or 17-yr Cicadas, that emerge in the same year and tend to be geographically contiguous (Williams and Simon 1995, 269).

Notes: Marlatt (1898 in Williams and Simon 1995, 269) designated Brood I as the brood that emerged in 1893, Brood II, 1984, etc. Broods I–XVII occur in 17-yr Cicadas, and Broods XVIII–XXX occur in 13-yr Cicadas. Some of the 30 broods are not documented, are poorly documented, or went extinct.

cf. 2group: aerie, clutch, covey, eye, eyrar, fall

building See ²group: rookery.

bunch *n.* A group of conspecific animals that are close together (*e.g.*, a bunch of Domestic Cattle, ducks, waterfowl, or Widgeon) (Sparkes 1975).

bury *n.* A group of rabbits (Sparkes 1975).

busyness *n.* A group of ferrets (Sparkes 1975).

cast See ²group: brace.

cavalry *n.* A group of Domestic Horses or horsemen (Sparkes 1975).

centeneer *n.* A large number of organisms that have a common parentage (Sparkes 1975).

cete *n.* An assemblage or company; a group of badgers (Sparkes 1975).

charm *n.* A group of *Spinus tristis* (American Goldfinches) (Sparkes 1975).

chirm *n.* A group of finches (Sparkes 1975).

[from chirm, din, or chatter (Sparkes 1975)]

chorus *n.* A group of calling frogs, toads, or some insect species (Wilson 1975, 443, 580; Brush and Narins, 1989, 33).

cf. animal sounds: song: chorus, communal song

► **wood choir** *n.* A bird chorus (Sparkes 1975).

citadel *n.* A group of mole burrows at different levels that are connected by vertical shafts (Sparkes 1975).

¹clan *n.*

1. A group of persons who claim descent from a common ancestor and associate together; tribe (Oxford English Dictionary 1972, entries from circa 1425); a small, usually exogamous, group of several families that traces its origin from a common ancestor (Dice 1952, 272; Heymer 1977, 99).
 2. In Pygmies (Humans): One of several groups, each with an elder head, within a band (Heymer 1977, 99).
- cf.* group
3. For example, in *Crocuta crocuta* (Spotted Hyenas) and *Loxodonta africana* (African Elephants): A large social complex which is coextensive with a local population (Wilson 1975, 494; van Lawick-Goodall in Heymer 1977, 99).

See ²group: clan.

²clan, clique, sept, society *n.*

1. A group of social animals of common descent; *e.g.*, as a clan of *Crocuta crocuta* (Spotted Hyenas), *Loxodonta africana* (African Elephants), or Humans (Sparkes 1975).
2. A collection of animals, plants, or lifeless things (Sparkes 1975).

See clan.

cf. ²group: zoo

clatter See ²group: clatter.

cloud *n.* A large number things; *e.g.*, a cloud of flies, gnats, grasshoppers, locusts, seafowl, or *Sturnus vulgaris* (European Starlings) (Sparkes 1975).

clowder *n.* A group (kendle or kindle) of *Felis catus* (Domestic Cats) (Sparkes 1975).

[possibly the same word as “clutter” (Lipton 1968, 53)]

clump, group, thicket *n.* An unshaped mass; a heap; *e.g.*, a clump of plants, reeds, or trees (Sparkes 1975).

cluster *n.* A number of like things that are growing together; a number of similar things that are collected together; *e.g.*, a cluster of bees, grapes, islands, nuts, or spiders (Sparkes 1975).

clutch *n.*

1. The number of progeny (eggs or live births) produced by a female at one time (Wilson 1975, 581; Lincoln et al. 1985; Hooker and Barrows, 1989, 460). *syn.* clutch size, litter size
2. A number of *Gallus gallus* (Domestic Chickens) (Choate 1985, 13).
3. A group of young of animals, *e.g.*, some wasp species (Hooker and Barrows, 1989, 460).
4. *v.t.* “To hatch (chickens)” (Oxford English Dictionary 1972, entry from 1774).

[cletch < *clock* to hatch < Old Norse *klekja*, hatch]

clutter, clatter *n.* A confused collection of something (Sparkes 1975).

Comment: Some usages are clutter of cats or spiders (Sparkes 1975).

colony *n.*

1. A human settlement in a new country that remains subject to, or connected with, its parent state (Oxford English Dictionary 1972, entries from 1548).
2. An aggregate of individual organisms that forms a physiologically connected structure, *e.g.*, compound ascidians or coral polyps (Oxford English Dictionary 1972, entries from 1872); in social animals, a group of individuals that are highly integrated by physical union of their bodies, by

division into specialized zooids or castes, or both (Wilson 1975, 8, 383, 456, 472, 581); *e.g.*, tightly integrated masses of bryozoans, siphonophores, sponges, other “colonial” invertebrates, or societies of social insects.

Note: In social insects, a “colony” should be distinguished from a “nest” (Michener 1974, 372).

3. An aggregation of conspecific individuals that has a more, or less, permanent location in its ecological community (Dice 1952, 266); almost any group of organisms, especially if they are fixed in one locality (Wilson 1975); *e.g.*, a group of sedentary spiders, a group of nesting birds, or a cluster of rodents living in dens; no implication about group cohesion is made in this term (Immelmann and Beer 1989, 48).

cf. ²group: association: kormogene association

4. Mature female bees that work in a nest plus actively cared-for immatures (Michener 1974, 372).

5. In some bee species: A group of two, or more, nest-making, or nest-tending, adult females (Michener 1988b).

cf. ²group: aggregation, hive, nest; ²society: continuous modular society.

[Latin *colonia* < *colonus*, farmer]

►breeding colony *n.* For example, in herons,

Sturnus vulgaris (European Starlings), waxbills, and weaver finches: A nesting concentration of communally breeding individuals (Immelmann and Beer 1989, 35).

cf. ²group: heronry, rookery

- mixed colony** *n.* A group of two, or more, social-insect species whose broods are placed together and tended communally (Wilson 1975, 354).

►supercolony *n.*

1. In some ant species: “A uniclonal population, in which workers move freely from one nest to another, so that the entire population is a single colony” (Hölldobler and Wilson 1990, 643).

2. In Fire Ants: A group of workers with more than one egg-laying queen (as “super colony” in Scott 1996, 26).

syn. multiple-queen colony, polygene colony (Scott 1996, 26)

Comment: Fire Ant supercolonies occur in parts of Texas where an acre can support over 250 mounds (= ant hills), compared to areas with single-queen colonies which have up to about 50 mounds per acre (Norvell 1996, 26).

community module *n.* A small number of intimately interacting species whose interactions a researcher can understand and reasonably isolate from much of the rest of the community in which they occur (Hochberg et al. 1996 in New 2009, 47).

Comment: For example, a community module is a focal insect species, its sole food plant, host-specific parasites and parasitoids, monophagous predator, and the plant’s pollinator (New 2009, 48).

company, assembly, bevy *n.* A fellowship, band, or retinue; *e.g.*, a company of moles, parrots, or Widgeon (Sparkes 1975).

congregation *n.* A group of things; *e.g.*, *Corvus frugilegus* (Rooks), Humans, or plovers (Sparkes 1975; Choate 1985, 13).

cortège See ²group: parade.

coterie *n.*

1. In *Cynomys* spp. (Prairie Dogs): The basic society unit, consisting of a small group of individuals

(often as many as two males and five females with their offspring) that occupies communal burrows (King 1955 in Wilson 1975, 139, 472, 581).

Note: More than two coteries comprise a "ward," *q.v.*

2. An animal social group that defends a common territory against members of other coteries (King 1955, 54; Lincoln et al. 1985).
3. A group of people that meet familiarly, usually for social or literary purposes (Sparkes 1975).

syn. clique, set (Sparkes 1975)

cf. ²group: colony, town

[French earlier, an organization of tenants holding land from the same lord < *citier*, cotter < *cote*, hut]

covert *n.* A flock of birds, *e.g.*, coots (Sparkes 1975).

syn. covey (Sparkes 1975).

covey *n.*

1. A flock of bobwhites (quail) or partridges (Michaelis 1963) or Ptarmigans (Sparkes 1975).
2. A brood, or hatch, of birds (Sparkes 1975).

syn. bevy, company, covert (Sparkes 1975)

3. A sport term for a foraging flock of bobwhites, partridges, or pheasants (Choate 1985, 13).

[Middle English *cove*, *covy* < Latin *cubare*, to be lying down (Lipton 1968, 27)]

cowardess *n.* A group of curs (mongrel Domestic Dogs) (Lipton 1968).

[from an observer's viewpoint (Lipton 1968)]

crash *n.* A group of rhinoceroses (Sparkes 1975).

See ²group: stubbornness.

creaght, booly, bow *n.* A herd of *Bos primigenius* (Domestic Cattle) that is driven from place to place for pasturing (Sparkes 1975).

creche, crèche *n.*

1. A public nursery for human infants (Oxford English Dictionary 1972, entries from 1882).
2. In some bird species: A group of young of more than one pair of parents, tended by one or more adults, usually fewer than one parent from each family (Wilson 1975, 504; Sparks 1975; Immelmann and Beer 1989, 64).

3. In precocial birds with young that can forage for themselves, *e.g.*, Eider Ducks: A gathering of young that adults guide and defend against predators (Immelmann and Beer 1989, 64).
4. In altricial birds, *e.g.*, *Aptenodytes forsteri* (Emperor Penguins), flamingos, and some gull species: An assemblage of young, that have left their nests or brood places, are cared for by a few adults at a time or are left by themselves for short periods, and are periodically fed by their parents (Immelmann and Beer 1989, 64).

syn. crèche (erroneous word, D. A. M. Mackay, pers. comm.), nursery group
cf. ²group, kindergarten

Comment: Young *Panthera leo* (Lions) may form creche-like groups (Wilson 1975, 504).
[French *crèche*, crib, cradle]

crown group See clade: crown group.

cultivar *n.*

1. A horticultural variety of a plant or flower (Michaelis 1963).

2. An assemblage of cultivated individuals that are distinguished by any character (*e.g.*, chemical, cytological, morphological, or physiological), significant for the purpose of agriculture, forestry, or horticulture and that when reproduced (asexually

or sexually) retain their distinguishing characters (Gilmer 1969 in Munson 1981, 2).

3. A plant variety produced and maintained by cultivation (Lincoln et al. 1985).

syn. cultigen, cultivaritas (Lincoln et al. 1985)

abbr. CV (Lincoln et al. 1985), cv.

Comments: A cultivar name is capitalized and placed inside single quotes: *Calluna vulgaris* 'Flore Pleno,' *Cyclamen persicum* 'giganteum' 'All Sorts Mixed,' *Rudbeckia fulgida* 'Goldsturm.' Cultivar names derive from scientific names, nonscientific names, persons' names, and newly invented words. Cultivars can be difficult to identify because their written descriptions are lacking or ambiguous; the same name is used for different clones; different names are used for the same clone; cultivars are distinguished by their fragrance or hardiness, or a combination of these phenomena (Munson 1981, 1). Jeffrey (1968 in Munson 1981, 2) indicates that according to the International Code of Nomenclature for Cultivated Plants, a cultivar is a unit whose division is not permitted. Munson (1981) provides a key to many cultivars of heaths and heathers. People protect some new plant cultivars with plant-variety-protection certificates (Adams 1996, 12). Researchers use plant characters including genetic fingerprinting, as developed by P. B. Cregan, to ascertain whether a new variety is distinct enough from others to warrant such a certificate.

[cultivated + variety]

dairy *n.* A group of milking Cows (*Bos primigenius*) (Sparkes 1975).

deceit, desert *n.* A flock of lapwing (Sparkes 1975).

[from an observer's viewpoint, Lipton 1968, 9]

decent *n.* A group of woodpeckers (Sparkes 1975).

den *n.* Animals in a den or lair; *e.g.*, a den of foxes or some snake species (Sparkes 1975).

desert See ²group: deceit.

diphyletic group *n.* A group that is derived from two distinct ancestral lineages; one that is comprised of descendants of two different ancestors (given as the adjective diphyletic, Lincoln et al. 1985).

n. diphyle

dissimulation *n.* A flock of birds (Sparkes 1975).

doggery *n.* A group of dogs (Sparkes 1975).

dole, duele *n.* A company of doves (Sparkes 1975).

[French *deuil*, mourning, from doves "mournful" calls (Lipton 1968, 36)]

dout *n.* A group of wild cats (Sparkes 1975).

down *n.* A group hares or sheep (Sparkes 1975).

doylt *n.* A group of swine (*Sus scrofa domestica*) (Sparkes 1975).

drave *n.* A haul, or shoal, of fish (Sparkes 1975).

dray *n.* A group of squirrels (Sparkes 1975).

[Middle English *dray*, squirrel nest (Lipton 1968, 52)]

drift, drive, creaght *n.* A group of animals that are driven or move along in a body; *e.g.*, a drift of bees, birds, *Bos primigenius* (Domestic Cattle), *Martes pennanti* (Fishers), *Ovis aries* (Domestic Sheep) or Swans (Sparkes 1975).

drove, concourse, drift, flock, mulada *n.* A group of *Bos primigenius* (Domestic Cattle), or other animals, that are driven in a body; a crowd of people that moves in one direction (Sparkes 1975).

Comment: Some usages are drove of bullocks, *Equus africanus asinus* (Asses or Donkeys), sheep, hares, oxen, or *Sus scrofa domestica* (Domestic Pigs, Swine) (Sparkes 1975).

dryft *n.* A herd of tame Swine (Sparkes 1975).

dule See ²group: dole.

ensemble *n.* A group of species in the same taxon that live in the same location at the same time (*i.e.*, live in the same community) and are in the same guild (*i.e.*, a group of species that exploit the same class of environmental resources in a similar way); *e.g.*, the ensemble of seed-eating insects in the Mojave desert; contrasted with assemblage, ²community, guild, local guild, and taxon in the Venn diagram of Fauth et al. (1996, 283).

erst *n.* A group of bees (Sparkes 1975).

escargatoire *n.* A nursery of snails (Sparkes 1975). [French *escargot*, snail]

exaltation *n.* A flock of larks (Sparkes 1975). [from an observer's viewpoint (Lipton 1968, 9)]

eye, nye *n.* A brood of pheasants or other animals (Sparkes 1975).

eyrar *n.* A brood of swans (Sparkes 1975).

eyrie See ²group: aerie.

fall, brood, cast, clutch *n.* A brood of *Oris aries* (lambs), spawn, or *Marmota monax* (Groundhogs) (Sparkes 1975).

cf. ²group: spawn

family See ^{1,2,3}family; ²group: family (table).

fare *n.* A group of animals, *e.g.*, a fare of *Sus scrofa domestica* (Domestic Pigs) (litter) or a fare of flies (swarm) (Sparkes 1975).

fesnyng, fesynes *n.* A pack of ferrets; a 15th-century word (Sparkes 1975).

fission-fusion group *n.* In Spider Monkeys, some other more-derived-primate species: A casual social group that changes in size due to joining and leaving of smaller groups of conspecific animals (Kummer 1971 in Wilson 1975, 137, 522).

syn. fusion-fission group (Wilson 1975, 137)

flick *n.* A group of Hares or Rabbits (Sparkes 1975).

flight, bevy, covey, skein *n.* A group of things that pass through the air together; *e.g.*, a flight of birds (young birds that have taken flight together), cormorants, doves, dunbirds, dunlin, goshawks, larks, plover, rails, rock doves, storks, swallows, or widow (Sparkes 1975).

fling *n.* A flock of sandpipers, *e.g.*, *Calidris alpina* (Dunlin) (Sparkes 1975).

Comment: Another usage is fling of Oxbirds (Sparkes 1975).

flock *n.*

1. A group of conspecific animals that feed and travel together, especially birds, goats, and sheep (Oxford English Dictionary 1972, entries from 1299).

Note: This is the most frequently used term for a group of birds (Choate 1985, 13).

2. A number of domestic animals, especially *Capra aegagrus hircus* (Domestic Goats) and *Ovis aries* (Domestic Sheep), tended by one, or more, persons (Oxford English Dictionary 1972, entries from 1300).

3. A company of birds or mammals, including people; *e.g.*, a flock of auks (at sea), birds, bitterns, bustards, camels, coots, cranes, elephants, fish, geese, lice, *Panthera leo* (Lions), parrots, seals, sheep, or swifts (Sparkes 1975).

syn. bevy, bew, bow, canaille, covy, deceit, dissimulation, drove, exaltation, fling, gaggle, herd, hurtle, line, loft, lute, meinie, meiny, mob, murder, murmuration, raft, rafter, screech, scry, skein, sord, swarm, tiding, trace, trip, volery, wing (Sparkes 1975)

Comment: Many flock “synonyms” are explained in more detail under ²group.

flete *n.* A herd of *Bos primigenius* (Domestic Cattle); a shoal of fish (Sparkes 1975).

flurry *n.* A fluttering group of things, *e.g.* a group of birds that flutter around before they set out or when they settle down on a lake or marsh (Sparkes 1975).

flush *n.* A flock of startled birds, *e.g.*, *Anas platyrhynchos* (Mallards) (Sparkes 1975).

fluther, smuth, stuck *n.* A group of jellyfish (Sparkes 1975).

cf. ²group: smack

fold *n.* A flock that is enclosed within a fence or shelter, *e.g.*, a fold of *Ovis aries* (Domestic Sheep) (Sparkes 1975).

form *n.*

1. In Plants, the lowest taxonomic rank in classification right below subvariety (Lincoln et al. 1985).

syn. morph (Lincoln et al. 1985), forma, *forma* (Lawrence 1957, 55)

2. In Plants, any minor variant or recognizable subset of a population or species based on characteristics of corollas, fruit, habitat, or other things (Lawrence 1957, 55).

3. In Plants, any sporadic variant, irrespective of its morphological variation or constancy, with the significant criterion that this variant has no geographic discontinuity (Lawrence 1957, 55).

syn. race, variety (of many botanists, Lawrence 1957, 55)

forma See ²group: form.

frith *n.* Woods; wooded country (Sparkes 1975).

cf. ²community: xylium

froggery *n.* “A gathering of frogs” (Sparkes 1975).

fry *n.*

1. The young, or hatched brood, of a fish (Sparkes 1975).

2. The young, or brood, of animals such as Bees (eggs, larvae, and pupae), Eels (spawn), and Oysters (young) (Sparkes 1975).

cf. ²group: spawn

functional-feeding group *n.* A group of insect species that performs a particular kind of feeding (Cummins and Merritt in Merritt and Cummins 1984, 63).

cf. feeding, guild

Comments: Cummins and Merritt (in Merritt and Cummins 1984, 63) consider a functional-feeding group to be analogous to “guild,” defined as a group of organisms that use a particular resource class. Aquatic insects in functional-feeding groups are usually omnivores because they often ingest algae (including diatoms), bacteria, fungi, microarthropods, and protozoans with their plant food (Merritt and Cummins 1984, 61). Cummins and Merritt (in Merritt and Cummins 1984) indicate which insect orders have dominant representatives in different functional-feeding groups.

► **“animal piercers”** *n.* A functional-feeding group of aquatic insects whose species puncture and suck fluids from animals; contrasted with “plant piercers” and “predators” (Cummins and Merritt in Merritt and Cummins 1984, 63).

Comments: Animal piercers include Backswimmers, Broad-shouldered Water-striders, Creeping Water Bugs, Giant Water Bugs, Pigmy Backswimmers, Riffle Bugs, Water-boatmen, Water-measurers (= Marsh-treaders), Water-treaders, Waterscorpions,

- Water-striders, and Velvet Water Bugs (Borror et al. 1989). These animals can also be categorized as “predators” in the broad sense of this word.
- **“dead-plant shredders”** *n.* A functional-feeding group of aquatic insects whose species consume dead-plant material that they shred before eating; contrasted with “live-plant shredders” (Cummins and Merritt in Merritt and Cummins 1984, 63).
- Comments:* “Dead-plant shredders” include chewers of coarse particulate organic material and gougers that consume wood (Cummins and Merritt in Merritt and Cummins 1984, 61). This group includes many crane-fly, mayfly, and stonefly species and is important in recycling a large amount of plant material that falls and washes into bodies of water. Dead-plant shredders are saprophages.
- **“filtering collectors,” suspension feeders** *n.* A functional-feeding group of aquatic insects whose species obtain food by filtering it from water; contrasted with gathering collectors (Cummins and Merritt in Merritt and Cummins 1984, 63).
- Comment:* “Filtering collectors” consume fine-particulate-organic material (Cummins and Merritt in Merritt and Cummins 1984, 61). This group includes net-making caddisfly species.
- **gathering collectors, deposit feeders** *n.* A functional-feeding group of aquatic insects whose species obtain food from loose surface films and sediments; contrasted with “filtering collectors” (Cummins and Merritt in Merritt and Cummins 1984, 63).
- syn.* collectors-gatherers (Harper and Stewart in Merritt and Cummins 1984, 226; Harrahy et al. 1994, 517)
- Comment:* Gathering collectors consume fine-particulate-organic material in loose surface films and sediments (Cummins and Merritt in Merritt and Cummins 1984, 61).
- **“live-plant shredders”** *n.* A functional-feeding group of aquatic insects whose species consume living plants whose parts they shred before eating; contrasted with “dead-plant shredders” (Cummins and Merritt in Merritt and Cummins 1984, 63).
- Comment:* “Live-plant shredders” include “chewers” and “miners” (Cummins and Merritt in Merritt and Cummins 1984, 61). This group includes Nymphuline Pyralid Moths (Borror et al. 1989), and plant parasites and predators in the broad senses of these terms.
- **“plant piercers”** *n.* A functional-feeding group of aquatic insects whose species puncture and suck fluids from plants; contrasted with “animal piercers” (Cummins and Merritt in Merritt and Cummins 1984, 63).
- **parasites** *n.* A functional-feeding group of aquatic parasitic insects (Cummins and Merritt in Merritt and Cummins 1984, 61).
- cf.* parasite
- Comment:* This group includes some species of mymarid chalcidoid wasps (Borror et al. 1989, 712).
- **predators, engagers** *n.* A functional-feeding group of aquatic insects whose species attack prey and ingest their parts or entire bodies; contrasted with animal piercers (Cummins and Merritt in Merritt and Cummins 1984, 61–63).
- cf.* predator
- Comments:* Predators includes larvae of Crawling Water Beetles, Damselflies, Dragonflies, Phantom Midges, Water Scavenger Beetles, and Whirligig Beetles; larvae of some caddisfly, crane-fly,

and mosquito species; and adults and larvae of Predaceous Diving Beetles and Trout Stream Beetles (Borror et al. 1989). “Animal piercers” that kill their hosts by sucking out their fluids are predators in the broad sense of this term.

- **scrapers, grazers** *n.* A functional-feeding group of aquatic insects whose species obtain food by scraping it off other objects (Cummins and Merritt in Merritt and Cummins 1984, 63).

Comment: Scrapers consume periphyton (attached algae and associated organisms) (Cummins and Merritt in Merritt and Cummins 1984, 61).

- functional group** *n.* A component of an organic molecule that is commonly involved in a chemical reaction (Campbell et al. 1999, 53).

Comment: A functional group can be an attachment to a molecule that replaces a hydrogen atom or, in some cases, an attachment that includes part of the molecule’s carbon skeleton (Campbell et al. 1999, 53).

- **amino group** *n.* A nitrogen atom bonded by two hydrogen atoms and to the carbon skeleton of a molecule ($-NH_2$) (Campbell et al. 1999, 55).

Comment: An organic compound with an amino group is called an “amine.” (Campbell et al. 1999, 55).

- **carbonyl group** *n.* A carbon atom joined to an oxygen atom by a double bond ($C=O$) (Campbell et al. 1999, 53).

Comments: A molecule with a carbonyl group at the end of a molecule’s carbon skeleton is an “aldehyde” (Campbell et al. 1999, 53). A molecule with a carbonyl group in another position is a “ketone.”

- **carboxyl group** *n.* An oxygen atom that is double-bonded to a carbon atom and a hydroxyl group ($-COOH$) (Campbell et al. 1999, 54).

Comment: Compounds with carboxyl groups are called “carboxylic acids” (*syn.* organic acids) (Campbell et al. 1999, 55).

- **hydroxyl group** *n.* A hydrogen atom that is bonded to an oxygen atom which is in turn bonded to a molecule’s carbon skeleton ($-OH$ or $HO-$); contrasted with hydroxide ion (OH^-) (Campbell et al. 1999, 53).

Comments: An organic compound with a hydroxyl group is called an “alcohol” or “phenol” (Campbell et al. 1999, 53). Alcohols and sugars (which have hydroxyl groups) are usually very soluble in water (D. A. M. Mackay, pers. comm.).

- **phosphate group** *n.* An anion formed by dissociation of the inorganic acid phosphoric acid (H_3PO_4) (Campbell et al. 1999, 55).

Comment: Phosphate groups have different functions within cells, including transferring energy between organic molecules (Campbell et al. 1999, 55).

- **sulphydryl group** *n.* A sulfur atom bonded to a hydrogen atom ($-SH$) (*syn.* mercaptan) (Campbell et al. 1999, 55).

Comments: An organic compound with a sulphydryl group is called a “thiol” (Campbell et al. 1999, 55). Sulphydryl groups interact and can help stabilize the intricate structure of many proteins including keratin (D. A. M. Mackay, pers. comm.).

- gaggle** *n.* A flock of geese (Sparkes 1975).

[echoic word based on goose vocalizations]

- gam** *n.* A herd, or school, of porpoises or whales; whaling ships in company (Sparkes 1975).

[from “gam,” an exchange of crews via whaleboats when two whale boats encounter each other, which

reminded sailors of playful sporting of whales (Lipton 1968, 34)

game *n.* A group of animals raised and kept for sport or pleasure; *e.g.*, a game of *Cervus elaphus* (Red Deer), *Oryctolagus cuniculus* (European Rabbits), or some bee and swan species (Sparkes 1975).

gang *n.* A full set of things, including some animals; *e.g.*, a gang of *Canis familiaris* (Domestic Dogs), Elk, or Humans (Sparkes 1975).

gens *n., pl. gentes*

1. In *Cuculus canorus* (European Cuckoos): A group of females within a population that lay their eggs primarily in the nests of a single host species whose eggs theirs mimic (Wilson 1975, 585).

2. “A species group” (Lincoln et al. 1985).

3. “A distinct evolutionary lineage” (Lincoln et al. 1985).

goosery *n.* A group of geese (Sparkes 1975).

great bevy *n.* Twelve head of *Capreolus capreolus* (Roe Deer) (Sparkes 1975).

grind *n.* A school of blackfish or *Hyperodon* sp. (bottlenose whale) (Sparkes 1975).

grist *n.* A lot of things such as bees or flies (Sparkes 1975).

grove, bosquet *n.* A small group of trees or something similar (Sparkes 1975).

cf. ²community: grove.

gulp *n.* A group of cormorants or swallows (Lipton 1968; Sparkes 1975).

haras, harras *n.* A group of breeding mares or wild horses (Lipton 1968; Sparkes 1975).

[Latin *hara*, pigsty, hence any enclosure for animals (Lipton 1968, 56)]

hatch *n.* A group of young oviparous animals.

head *n.*

1. A single animal, *e.g.*, a head of *Bos primigenius* (Domestic Cattle) (Michaelis 1963).

2. A collection of animals; an indefinite number; *e.g.*, a head of pheasants, *Bos primigenius* (Domestic Cattle), or hungry *Canis lupus* (Gray Wolves) (Sparkes 1975).

herd *n.* An assemblage of animals, usually large ones; *e.g.*, a herd of *Alces alces* (Moose), bison, *Bos primigenius* (Domestic Cattle), buffalo, camels, caribous, cranes, curlew, deer, elephants, *Equus africanus asinus* (Donkeys), *Giraffa camelopardalis* (Giraffes), goats, ibex, oxen, parasites, ponies, porpoises, *Rupicapra rupicapra* (Chamois), seals, *Sus scrofa domestica* (Domestic Pigs), whales, or wrens (Sparkes 1975).

syn. baren, bow, creaght, dryft, flock, flote, mob, pace, rangale, rabble, sounder, zeal (of Zebras) (Sparkes 1975)

cf. ²group: little herd

Comment: Many synonyms of herd are explained in more detail under “group.”

herony *n.* A place where herons congregate and breed (Michaelis 1963).

hive *n.* A group of some bee or oyster species (Sparkes 1975).

cf. bike, hive

Comment: Some biologists prefer to use “hive” to mean a bee nest and “colony” to mean the bees themselves as discussed under ²colony.

hoggery *n.* A group of *Sus scrofa domestica* (Domestic Pigs) (Sparkes 1975).

holophyletic group See ²group: monophyletic group (def. 2).

horde, gang, troop *n.* A large group of some gnat, other insect, or urchin species; or Wolves (Sparkes 1975).

host *n.* A large number of things such as daffodils, sparrows, or Humans (Sparkes 1975). See host under H in this book.

hover *n.* A group of trout waiting for food; a group of crows (Sparkes 1975).

huddle *n.* A group of things crowded together; *e.g.*, a huddle of *Odobenus rosmarus* (Walruses), puppies, or Humans (Sparkes 1975).

hurtle *n.* A flock of Sheep (Sparkes 1975).

huske *n.* A down, or group, of hares (Sparkes 1975).

individualized group *n.* In some bird and mammal species: A group whose members recognize each other as individuals (Immellmann and Beer 1989, 122).

cf. recognition: individual recognition; ²society: open society

ingratitudo *n.* A group of children (Sparkes 1975).

Imperium Naturae *n.* The three kingdoms animals, minerals, and plants (Linnaeus in Minelli 1996: 1993).

intrusion *n.* A group of cockroaches (Lipton 1968).

jug, covey *n.* A group of partridge, quail, or roosting grouse (Sparkes 1975). [from jug, to nestle or collect in a covey, therefore the covey itself (Sparkes 1975)]

juvenile group *n.* For example, in some stink-bug and lepidopteran species: Young that remain together after hatching (Heymer 1977, 97).

syn. sympaedium (Deegener 1918 in Heymer 1977)

kennel, crew, gang *n.* A pack of *Canis familiaris* (Domestic Dogs), Humans, or other animals (Sparkes 1975).

kindergarten *n.* In many ungulate species with lying out periods: A gathering of young animals (Immellmann and Beer 1989, 64).

cf. ²group: creche

kindle, kendle, kindling, kyndyll *n.* A litter or brood; *e.g.*, a kindle of hares, kittens, leverets, or rabbits (Sparkes 1975).

kingdom *n.*

1. A taxonomic group between superkingdom and subkingdom.

See group above (see ²group: table).

2. One of Earth’s six large plant communities (Boroughs 1999, May–June, 17)

Comments: These kingdoms include the Antarctic Kingdom, Australasian Kingdom, Boreal Kingdom, Cape Floral Kingdom (*syn.* fynbos, *q.v.*), Neotropical Kingdom, and Paleotropical Kingdom (Boroughs 1999, May–June, 17).

kip *n.*

1. A set, or bundle, of hides (Sparkes 1975).
2. Young or small beasts, *e.g.*, a kip of calves or lambs (Sparkes 1975).

knob *n.* A group of Pochard or Widgeons (on water) (Sparkes 1975).

knot *n.* A small cluster, or group, of things; *e.g.*, a knot of Humans, islands, mountains, palm trees, stars, toads, or young snakes (Sparkes 1975). [from the appearance of a knot (Lipton 1968, 9)]

labor Brit. labour *n.* A group of moles; a 15th-century term (Sparkes 1975).

laughter *n.* A clutch of eggs (Sparkes 1975).

leafag *n.* A group of leaves (Sparkes 1975).

syn. foliage (Sparkes 1975)

- leap** *n.* A group of *Panthera pardus* (Leopards) (Lipton 1968).
[after Leopard leaping behavior (Lipton 1968)]
- lease** *n.* A group of three, *e.g.*, a leas of fish or hares (Sparkes 1975).
cf. ²group: leash
- leash, lece** *n.* A sporting term for a group of three; a brace and a half; a tierce; *e.g.*, a leash of bucks, deer, foxes, Greyhounds, hares, hawks, hounds, partridges, snipe, teal, or trout (Sparkes 1975).
- legion** *n.* A large group of things, *e.g.*, a legion of whelps (Sparkes 1975).
- lepe** *n.* A group of *Panthera pardus* (Leopards) (Sparkes 1975).
- line, string** *n.* A series, or rank, of things, usually of the same kinds; *e.g.*, a line of geese (flock), ponies, or people (Sparkes 1975).
- lineage group** *n.* A group of species allied by common descent (Wilson 1975, 588).
- linkage group** *n.* A group of genes associated to a greater, or lesser, extent by linkage; the maximum number of linkage groups in a cell is equal to the number of its chromosomes (Lincoln et al. 1985).
- litter** *n.* The young of a viviparous vertebrate that are born at about the same time; *e.g.*, a litter of kittens, piglets, or puppies (Sparkes 1975).
- little herd** *n.* Twenty deer (Sparkes 1975).
- lodge** *n.*
1. A group animals that live close together, *e.g.*, a lodge of *Castor canadensis* (North American Beavers) or Otters (Sparkes 1975).
 2. A family unit of four or six people (Sparkes 1975).
- loft** *n.* A flock of *Columba livia* (Rock Doves) (Sparkes 1975).
- lot, back, break, sort** *n.* A group of things; *e.g.*, a lot of *Bos primigenius* (Domestic Cattle) or Humans (Sparkes 1975).
- lute** *n.* A flock of *Anas platyrhynchos* (Mallards) (Sparkes 1975).
- mating group** *n.* A group of haploid, or diploid, individuals having genetic, or environmental, characteristics that favor mating within the group at the expense of mating outside the group (Lincoln et al. 1985).
- matriarchy** *n.* For example, in Elephants: A social group led by a female; contrasted with patriarchy, *q.v.* (Wilson 1975, 491).
[a form of matriarchy after patriarchy, Latin *mātr(i)*, *māter*, mother + *archein*, to rule]
- meiny, meinie** *n.* A large group; *e.g.*, a meinie of brooks, oxen, pilgrims, plants, sheep, or sparrows (Sparkes 1975).
syn. flock, retinue, train (Sparkes 1975)
- menagerie** *n.* A collection of wild, or foreign, animals; an aviary (Sparkes 1975).
- meute, meuse, mews** *n.* A pack of hounds (Sparkes 1975).
cf. ²group: mews
- mews** *n.* A group of molting hawks or fattening capons or hens (Sparkes 1975).
cf. ²group: meute.
- middle bevy** *n.* Ten *Capreolus capreolus* (Roe Deer) or 40 deer in general (Sparkes 1975).
cf. ²group: bevy.
- migration** *n.* A group of organisms that moves from one place to another; *e.g.*, a migration of birds,

butterflies, locusts, or mammals (including Humans) (Sparkes 1975).

mixed group *n.* In some fish, bird, and mammal species: A group composed of more than one species that usually lead similar lives (Heymer 1977, 29; Immelmann and Beer 1989, 187).
syn. mixed-species group (Immelmann and Beer 1989, 122)

mob, canaille, flock, herd *n.* A collection of things, *e.g.*, a mob of ducks, horses, kangaroos, sheep, wallabies, whales, or Humans (Sparkes 1975).

monophyletic group *n.*

1. A group of taxa that are derived from one, or more, lineages from one immediately ancestral taxon of the same, or lower, rank [derived from Simpson's (1961, 124) definition of monophyly in Sober (1992, 203)].
Note: This is an evolutionary-taxonomist definition of monophyletic group. Reptilia is a monophyletic group based on this definition (Sober, 1992, 205). Problems with this definition have caused many evolutionary taxonomists to abandon it (Wiley 1981, 256).

2. "A group of species descended from a single ('stem') species, and which includes all species descended from this stem species" (Hennig 1966, 73 in Wiley 1981, 83, and Sober, 1992, 203).

Note: This is a cladist definition of monophyletic group. Reptilia is not a monophyletic group based on this definition (Sober, 1992, 205).

syn. holophyletic group (Ashlock 1971 in Sober, 1992, 207; Lincoln et al. 1985; not a frequently used synonym, C. K. Starr, pers. comm.)

3. "A group of species in which every species is more closely related to every other species than to any species that is classified outside the group" (Hennig 1966 in Wiley 1981, 84).

4. "A group whose most recent common ancestor is cladistically a member of the group" (Ashlock 1971 in Wiley 1981, 84).

5. A group into which one places all species, or species groups, that are assumed to be descendants of a single hypothetical ancestral species, that is, a complete sister-group system (Nelson 1971 in Wiley 1981, 84).

6. "A group that includes a common ancestor and all of its descendants" (Farris 1974 in Wiley 1981, 84).

7. "A group with unique and unreversed group membership characters; an algorithm definition" (Farris 1974 in Wiley 1981, 84).

8. An assemblage of organisms that are related by descent from a common ancestor (Lincoln et al. 1985).

syn. natural group (Lincoln et al. 1985)

cf. ²group: paraphyletic group, phyletic group, polyphyletic group, sister group

Comments: Wiley (1981) and Sober (1992) give more details regarding how to distinguish between the cladists' and evolutionary taxonomists' definitions of monophyletic group. Ashlock (1971) has classified both "paraphyletic group" and "monophyletic group" (*sensu* Hennig = Ashlock's holophyletic group) as kinds of monophyletic groups; others have objected to this classification (Wiley 1981, 258). Wiley (1981) gives other definitions of "monophyletic group." ["monophyly" coined by Haeckel (1866 in Wiley 1981, 85)]

mores, mune *n.* Groups of organisms that have similar ecological requirements and behavioral attributes (Lincoln et al. 1985).

cf. ²species: ecospecies

mulada See ²group: drove.

multimale group *n.* In many baboon and macaque species: A group composed of several sexually mature males that live with sexually mature females and young of all ages (Immelman and Beer 1989, 195).

cf. harem

murder *n.* A flock of crows (Sparkes 1975).

[from a human observer's viewpoint (Lipton 1968, 9)]

murmuration *n.* In falconry, a flock (of *Sturnus vulgaris*, European Starlings) (Oxford English Dictionary 1972, entries from 1470; Choate 1985, 13). [echoic word < French *murmurer* < Latin *murmureare*, to murmur]

muster *n.* A number of things that are assembled on a particular occasion; *e.g.*, a muster of peacocks, storks, or troops or other people (Sparkes 1975).

syn. levy (Sparkes 1975)

mutation *n.* A group of molting birds; a mutation of thrushes (Sparkes 1975).

cf. mutation under M in this book.

mute *n.* "A pack of hounds" (Sparkes 1975).

natural group See ²group: monophyletic group.

nest *n.*

1. A number of animals that occupy the same nest or habitation (Oxford English Dictionary 1972, entries from 1470); *e.g.*, a nest of bees, birds, caterpillars, chickens, crocodiles, dormice, hedgehogs, kittens, mice, rabbits, toads, wasps, or vipers (Sparkes 1975).

2. "An accumulation of similar things," *e.g.*, a nest of hummocks or low bushes (Sparkes 1975).

syn. aerie, brood, bike, colony, swarm (Oxford English Dictionary 1972; Sparkes 1975)

cf. ²group: aerie, brood, bike, colony, hive, swarm

v.i., v.t. nest

[from the habitat (nest) of the animals involved (Lipton 1968, 9)]

nide, bike, nye *n.* A nest, or brood, of young birds; *e.g.*, a nide of eggs, geese, or pheasants (Sparkes 1975).

cf. ²group: bike

nursery group See ²group: creche.

obstinacy *n.* A group of buffaloes (Sparkes 1975).

[from a human observer's viewpoint (Lipton 1968, 9)]

open-anonymous group See ²society: open society: anonymous group.

ostentation *n.* A group of peacocks (Sparkes 1975).

out-group *n.* A species, or a higher monophyletic taxon, that is examined in the course of a phylogenetic study to determine which of two homologous characters may be inferred to be apomorphic (Wiley 1981, 7).

syn. out group (Shaffer et al. 1991, 286)

Comments: One to several out-groups may be examined in a study. The most critical out-group comparisons involve the sister group of the taxon studied (Wiley 1981, 7).

pace, herd *n.* A herd of *Equus africanus asinus* (Donkeys) (Sparkes 1975).

[Latin *passus*, step, stride (Lipton 1968, 34)]

pack *n.* A group of animals; *e.g.*, a pack of *Canis familiaris* (Domestic Dogs), *Canis lupus* (Gray Wolves), grouse, hounds, *Mustela erminea* (Stoats), perch, or weasels (Sparkes 1975).

syn. baren, crew, fesnyng, fesynes, gang, kennel, mute, rabble, singular (Sparkes 1975)

Comment: Many synonyms of "pack" are explained in more detail under ²group.

paddling *n.* A group of ducks (Sparkes 1975).

parade, cortège, procession, walk *n.* A procession of animals, *e.g.*, a parade of elephants or Humans (Sparkes 1975).

paraphyletic group *n.*

1. "A group of species that has no ancestor in common only with them and thus no point of origin in time only to them in the true course of phylogeny" (Hennig 1966 in Wiley 1981, 84).

2. "A group based on symplesiomorphous characteristics" (Hennig 1966 in Wiley 1981, 84).

3. "A group that does not contain all of the descendants of the most recent common ancestor" (Ashlock 1971 in Wiley 1981, 84).

4. "An incomplete sister-group system lacking one species or one monophyletic species group" (Nelson 1971 in Wiley 1981, 84).

5. "A group that includes a common ancestor and some but not all of its descendants" (Farris 1974 in Wey 1981, 84).

6. "A group with unique but reversed group membership characters" (Farris 1974 in Wiley 1981, 84).

cf. ²group: monophyletic group, phyletic group, polyphyletic group

parcel *n.* A small group of animals; *e.g.*, a parcel of crows, *Gallus gallus* (Domestic Chickens), horses, Humans, penguins, or sheep (Sparkes 1975).

parliament *n.* A group of owls or fowls (Sparkes 1975).

party *n.*

1. A group of animals; *e.g.*, a party of birds, jays, or people (Sparkes 1975).

2. A group of people that travel together (Sparkes 1975).

patriarchy *n.* For example, in the *Vicugna vicugna* (Vicuña): A social group led by a male (Wilson 1975, 490).

cf. ²group: matriarchy

[Greek *patriarchia*, office of a patriarch < Old French *patriarche* < Latin *patriarcha* < Greek *patriarchēs*, head of a family, *patria*, family, clan + *archein*, to rule]

peck *n.* A large group of bees (Sparkes 1975).

peep *n.* A brood of *Gallus gallus* (Domestic Chickens) (Sparkes 1975).

perversum confusum *n.* A unisexual aggregation of heterospecific individuals during their breeding season (Lincoln et al. 1985).

phalanx *n.*

1. A compact group of animals prepared for attack, defense, or both, *e.g.*, a phalanx of lawyers or troops (Sparkes 1975).

2. A group of things drawn together in a common purpose, *e.g.*, a phalanx of migrating storks (Sparkes 1975).

phyletic group *n.* "A group of species related to one another through common descent" (Wilson 1975, 591).

cf. ²group: holophyletic group, natural group, paraphyletic group, polyphyletic group

pinnacles of social evolution *pl. n.* Four animal groups: the more derived colonial invertebrates, the more derived social insects, the more derived social vertebrates, and Humans (Wilson 1975, 379).

plague, swarm *n.* A swarm of *Locusta* sp. (locusts) (Lipton 1968, 22).

[from a human observer's viewpoint]

cf. ²group: swarm

pleophyletic group See ²group: polyphyletic group.

plump *n.* A compact body of animals or other things; *e.g.*, ducks, Humans, moorhens, seals, trees, whales, or wildfowl (Sparkes 1975).

pod *n.*

1. A school of fish whose bodies touch (Breder 1959 in Wilson 1975, 439, 591).
2. A small group of birds or mammals; *e.g.*, a pod of birds (*e.g.*, coots), *Merlangius merlangus* (Whiting), otters, porpoises, seals, or whales (Sparkes 1975).
cf. ²group: turmoil
[from peas in a pod, a sailor's term (Lipton 1968, 33)]

polyphyletic group *n.*

1. A group of descendants minus their ancestor (inferred from Hennig 1966 by Wiley 1981, 84); a group of taxa derived from two, or more, distinct ancestral lineages (Lincoln et al. 1985).
syn. pleophyletic group (inferred from Lincoln et al. 1985 who synonymize pleophyletic and polyphyletic)
2. "A group based on convergent similarity" (Hennig 1966 in Wiley 1981, 84); a group based on convergence rather than common ancestry (Lincoln et al. 1985).
3. A group of descendants minus their most recent common ancestor (Ashlock 1971 in Wiley 1981, 84).
4. "An incomplete sister-group system lacking two species or monophyletic species groups that together do not form a single monophyletic group" (Nelson 1971 in Wiley 1981, 84).
5. "A group in which the most recent common ancestor is assigned to some other group and not the group itself" (Farris 1974 in Wiley 1981, 84).
6. "A group whose membership characters are not uniquely derived" (Farris 1974 in Wiley 1981, 84).
cf. ²group: monophyletic group, paraphyletic group, phyletic group

population See ¹population, ²population.

pride *n.* A group of animals, *e.g.*, a pride of peacocks or *Panthera leo* (Lions) (Sparkes 1975).

procession See ²group: parade.

pseudosocial group, aggregation *n.* A group of animals that gather "by accident" due to individual animals' seeking the same kind of place (Immelmann and Beer 1989, 122).

cf. ²group: aggregation

psittosis *n.* A group of parrots (Sparkes 1975).

Comment: This is a modern pun (Sparkes 1975).

puddling *n.* A group of *Anas platyrhynchos* (Mallards) (Sparkes 1975).

quartet *n.*

1. A set of four human singers, or players, who make music (render a quartet); a set of four persons (Oxford English Dictionary 1972, entries from 1814).
2. For example, in *Hyla* frogs: A group of four calling individuals that alternate calls (Wilson 1975, 443).
cf. ²group: duet, trio, chorus

rabbitry *n.* A group of hutches of tame rabbits (Sparkes 1975).

rabble, mob, swarm *n.* A pack, string, or swarm of animals; *e.g.*, a rabble of bees, butterflies, flies (including gnats), or other insects (Sparkes 1975).

raft *n.*

1. A large group of things that are grouped indiscriminately, *e.g.*, a raft of Humans (Sparkes 1975).
2. "A dense flock of swimming birds," *e.g.*, a raft of auks (at sea) (Sparkes 1975) or ducks (Choate 1985, 13).

rafter *n.* A group of *Meleagris gallopavo* (Turkeys) (Sparkes 1975).

rag, rake *n.* A group of colts (Sparkes 1975).

rake *n.* A group of colts or *Equus xmulus* (Mules) (Sparkes 1975).

ramage *n.* A group of branches (Sparkes 1975).

ramification *n.* A tree's branches (Sparkes 1975).

rangale *n.* A herd of deer (Sparkes 1975).

range *n.* A series of things, a role; line; or file; *e.g.*, a range of beehives (Sparkes 1975).

richness *n.* A group of martins (birds) (Lipton 1968). [from a human observer's viewpoint (Lipton 1968, 9)]

rookery *n.*

1. A rook colony or breeding place; a group of *Corvus frugilegus* (Rooks) (Sparkes 1975).
- syn.* building (Sparkes 1975)

2. A breeding place, or large colony, of seabirds or marine mammals; *e.g.*, a rookery of albatrosses, *Corvus frugilegus* (Rooks), herons, penguins, or seals (Sparkes 1975).
cf. ²group: colony

roost *n.* A group of fowl that roost together (Sparkes 1975).

rout, route *n.* A company, throng, or troop; *e.g.*, a rout of *Canis lupus* (Gray Wolves) or snails (Sparkes 1975). [Old French *route*, troop, throng (Lipton 1968, 55)]

run *n.* A group of migrating aquatic animals; *e.g.*, a run of fish, salmon, or whales (Sparkes 1975).

rush *n.* A group of animals that moves forward with great speed, *e.g.*, a rush of dunbirds (Sparkes 1975).

safe *n.* A group of ducks (Sparkes 1975).

See ²group: sord.

sawt *n.* A group of *Panthera leo* (Lions) (Sparkes 1975). [French leap]

school *n.* A group of individuals, many to all typically in the same life stage, that swim together in an organized fashion (Wilson 1975, 594); *e.g.*, a school of dolphins, fish, gulls, herrings, *Hippopotamus amphibius* (Hippopotami), pheasants, porpoises, or whales (Sparkes 1975). *v.i.* school

cf. ²group: aggregation

Comment: Shaw (1970 in Partridge 1982) and Partridge (1982, 298) review more than a dozen attempts to define "school," scientifically. This is very difficult because of the great variability in the kinds of schools. [Middle English, *sceald*, shallow; "school" comes from an erroneous transcription of shoal (Lipton 1968, 9, 23)]

► **dense school** *n.* A school of poisoned fish of some species that is more tightly grouped than usual (Geiger et al. 1985, 11; R. A. Drummond, pers. comm.).

Comment: In a dense school, fish can appear "stacked" with all school members facing the same direction (Geiger et al. 1985, 11; R. A. Drummond, pers. comm.).

► **loose school** *n.* A fish school that is less tightly grouped than usual, *e.g.*, a group of poisoned fish compared to a control group (Geiger et al. 1985, 11; R. A. Drummond, pers. comm.).

screech *n.* A flock of gulls (Sparkes 1975).

scry *n.* A flock of wild fowl (Sparkes 1975).

sedge *n.*

1. A group of rush-like marsh plants (Sparkes 1975).

2. A group of sea, or marsh, birds; *e.g.*, a sedge of bitterns, cranes, or herons (Sparkes 1975).

- syn.* sege, siege (of herons) (Sparkes 1975)
- shoal** *n.* A school of fish (Lipton 1968, 9).
[from the habitat of a school of fish (Lipton 1968, 9)]
- shrewdness** *n.* A group of apes (Lipton 1968).
- siege** See ²group: sedge.
- single-male group** See harem.
- singular** *n.* A pack of *Sus scrofa* (Wild Boars) (Sparkes 1975).
- sister group** *n.* A species, or a higher monophyletic taxon, hypothesized to be the closest genealogical relative of a given taxon exclusive of the ancestral species of both taxa (Wiley 1981, 7).
syn. sister-species group (Lincoln et al. 1985)
cf. ²group: holophyletic group, natural group, paraphyletic group, phyletic group, polyphyletic group; species: sibling species
- sitting** *n.* The number of eggs that a fowl covers in a single brooding (Sparkes 1975).
- skein** *n.*
 1. A flight of geese; a line of geese in flight (Michaelis 1963; Choate 1985, 13).
 2. A flock of wild fowl, ducks, or geese (Sparkes 1975).
- skull** *n.* A shoal of fish (Sparkes 1975).
Comment: This is an obsolete term (Sparkes 1975)
- skulk** *n.* A group of Foxes (Lipton 1968, 9).
[from fox behavior, Lipton 1968, 9]
- sleuth, slewthe, sloth, slought** *n.* A group of bears (Sparkes 1975).
- smack** *n.* A small group of jellyfish (Sparkes 1975).
cf. ²group: fluther.
- social group, society** See ²society.
- sord, sore, safe** *n.* A flock of *Anas platyrhynchos* (Mallards) or other ducks (Sparkes 1975).
- sort, sorte** *n.* A group of animals (Sparkes 1975).
- sounder** *n.*
 1. A herd of *Sus scrofa* (Wild Boars), or *Sus scrofa domestica* (Domestic Pig) (Sparkes 1975).
 2. A group of swans (Sparkes 1975).
[English sounder < Norman French *soundre* < Old English *sunor*, herd, Lipton 1968, 50]
- sowse** *n.* A group of *Panthera leo* (Lions) (Sparkes 1975).
- span** *n.* A group of *Equus xmulus* (Mules) (Sparkes 1975).
- spawn** *n.* A brood; numerous offspring (Oxford English Dictionary 1972, entries from 1590).
See spawn.
cf. ²group: fall, fry
- species-group** *n.*
 1. A group of closely related species, usually with partially overlapping ranges (Lincoln et al. 1985).
syn. superspecies (sometimes) (Lincoln et al. 1985)
cf. ²species: superspecies
 2. In zoology, the categories of species and subspecies (Lincoln et al. 1985).
- spring** *n.*
 1. A group of animals that is flushed from its covert, *e.g.*, a spring of teal (Sparkes 1975).
 2. A group of teal (Choate 1985, 13).
[This term possibly comes from the bird's quick flight as they spring into flight (Choate 1985, 13).]
- stable** *n.* A group of *Equus ferus caballus* (Domestic Horses) (Sparkes 1975).
See ²group: stud.
- stand, set** *n.*
 1. A hive of bees (Sparkes 1975).

2. A group of animals, *e.g.*, a stand of plovers or flamingos (Sparkes 1975).
See hive.
- stem group** See clade: stem group.
- string** *n.* A line of ponies (Lipton 1968, 27).
See ²group: stud.
cf. ²group: line
- stubbornness** *n.* A group of rhinoceri (Sparkes 1975).
See ²group: crash.
[from an observer's viewpoint (Lipton 1968, 9)]
- stuck** See ²group: smack, smuth.
- stud, stable, string** *n.* A group of *Equus ferus caballus* (Domestic Horses), or other animals, kept for breeding, racing, or riding; *e.g.*, a stud of *Canis familiaris* (Domestic Dogs), Domestic Horses, mares, or racehorses (Sparkes 1975).
- swarm** *n.*
 1. A group of *Apis mellifera* (Western Honey Bees), that at a particular season, leave their hive and form a dense cluster and may find a new nesting site or be artificially transferred to one (Oxford English Dictionary 1972, entries from 725).
syn. synhesma (Lincoln et al. 1985)
 2. A human crowd, throng, or multitude (Oxford English Dictionary 1972, entries from 1423).
 3. A very large, dense group of insects, other small organisms, or rarely large animals (Oxford English Dictionary 1972, entries from 1560).
 4. A large number of unicellular organisms, gametes, or small animals, usually in motion; *e.g.*, a swarm of ants, bees, flies, hornets or other wasps, other insects, *Palola viridis* (Palolo Worms), termites, or zoospores (Michaelis 1963; Barnes 1974, 276–277; Sparkes 1975). Young reproductive individuals of Termites, including *Reticulitermes flavipes* (Eastern Subterranean Termite) in Maryland, U.S., participate in mating swarms (fig. 20).
syn. bike, fare, flock, nest, plague, rabble (Sparkes 1975)
- sympedium** See ²group: juvenile group.
- syncheimadium** *n.* A hibernating aggregation (Deegener 1918 in Wilson 1975).
- taxon** See taxon.
- team** *n.*
 1. A group of animals that may be moving together; *e.g.*, dolphins, ducks, polo Horses (*Equus ferus caballus*), or swans (Sparkes 1975).
 2. A group of animals that are harnessed together, *e.g.*, a team of carriage Horses or oxen (Sparkes 1975).
syn. yoke (of oxen) (Sparkes 1975)
- teem** *n.* A brood of ducks (Sparkes 1975).
[Anglo Saxon, Sparkes 1975]
- tiding** *n.* A flock of magpies (Sparkes 1975).
- toft** *n.* A small group of trees (Sparkes 1975).
- tok** *n.* A nesting place of *Tetrao urogallus* (Western Capercailles); an assembly of capercailles (Sparkes 1975).
- tower** *n.* A group of towering things, *e.g.*, a tower of *Giraffa camelopardalis* (Giraffes) (Sparkes 1975).
- town** *n.* A local population of *Cynomys* sp. (prairie dogs) (Wilson 1975, 472).
- trace** *n.* A group of hares (Sparkes 1975).
[from hare traces in snow (Sparkes 1975)]
- train** *n.* A procession of camels (Sparkes 1975).
syn. line (Sparkes 1975)
cf. ²group: parade

trait group *n.* “A recognizable entity composed of more than one individual within a population that represents a unit upon which selection can act” (Wittenberger 1981, 622).

Comment: For any individual, a “trait group” is the group of conspecifics the individual interacts with during a specified time interval (Wittenberger 1981, 622).

tribe *n.*

1. Any group of Humans that perceives itself as a distinct group, and that is so perceived by other Humans outside its group (Wilson 1975, 565).

Note: The group may be a human “race,” a religious sect, a political group, or an occupational group. A tribe follows “a double standard morality — one kind of behavior for in-group relations, another for out-group” (Hardin 1972 in Wilson 1975, 565).

2. A social group that consists of a number of families; any group whose members have a common feature; *e.g.*, a tribe of goats, savages, or sparrows (Sparkes 1975).

trio *n.* For example, in *Hyla* frogs: Three calling individuals that alternate sounds (Wilson 1975, 443).

See animal sounds: trio.

cf. animal sounds: duet, ²group: chorus, quartet.

trip *n.* A flock or troop; a brood or litter; *e.g.*, a trip of dotterel (Migratory Plover), goats, hares, hippies (Humans), seals, sheep, *Sus scrofa domestica* (Domestic Pigs), or wild fowl (Sparkes 1975).

syn. trippe (of goats) (Sparkes 1975)

Comment: A trip of hippies seems to be a pun related to hippies’ “tripping out” (getting high) on drugs and being on a “trip” (being high on drugs).

troop, troupe *n.*

1. A group of things; *e.g.*, a troop of baboons, dogfish, Humans (acrobats, actors, dancers, or soldiers), kangaroos, monkeys, or *Panthera leo* (Lions) (Sparkes 1975).

2. A conspecific group of apes, Humans, lemurs, or monkeys (Sparkes 1975).

3. In some baboon species: A sleeping unit composed of as many as 750 individuals in regions where suitable shelters are scarce, and as few as 12 where they are common (Wilson 1975, 534).

cf. ²group: band, horde, rout, trip

turmoil *n.* A group of porpoises (Sparkes 1975).

cf. ²group: pod

turn *n.* A group of turtles (Sparkes 1975).

tussock *n.* A tuft or small cluster; *e.g.*, a tussock of grass, hair, or twigs (Sparkes 1975).

unkindness *n.* A group of ravens (Sparkes 1975). [From a human observer’s viewpoint, 15th-century term (Lipton 1968, 9)]

variety *n.*

1. In horticulture, any variant of a species (Lawrence 1957, 55).
2. In botany, a morphological variant of a species without regard to distribution (Lawrence 1957, 55).
3. In botany, a morphological variant with its own geographical distribution (Lawrence 1957, 55).
4. In botany, a morphological variant that shares an area in common with one, or more, other conspecific varieties (Lawrence 1957, 55).
5. In botany, a variant that represents a color, or habit, phase (Lawrence 1957, 55).
6. In organisms, an individual, or group of individuals, that differs from the type species in certain characters and is usually fertile with any other

member of the species; a subdivision of species (Michaelis 1963).

7. In botany, a taxonomic rank between species and form (Lincoln et al. 1985).

cf. ²species: subspecies

8. An infrasubspecific taxon, such as varietas or cultivar (Lincoln et al. 1985).

9. An ambiguous term for any variant group within a species (Lincoln et al. 1985).

10. A group that differs from other varieties of the same subspecies including nongenetic variants and microgeographic races (Lincoln et al. 1985).

abbr. var.

Comments: Different workers designate the same intraspecific plant group as a subspecies, variety, or form (Lawrence 1957, 54–55). When more than one variety occurs within a species, specialists follow the trinomial form of nomenclature. For example, *Carex aquatilis* var. *aquatilis* (a sedge) is the typical element, and *Carex aquatilis* var. *altior* is an infraspecific taxon of this element.

variety See ²group: variety.

volery See ²group: flock.

walk, parade *n.* A procession or a group of animals in procession, *e.g.*, a walk of snails or snipe (Sparkes 1975).

ward *n.*

1. A group of *Cynomys* sp. (prairie dogs) (Wilson 1975, 472).

2. A group of prairie-dog societies (coteries) separated from others by some kind of physical barrier, such as a band of vegetation, stream, or ridge (Wilson 1975, 472).

cf. ²group: colony, group, town

[Old English *weard*, watching, *weardian*, to watch, guard]

warp *n.* A set of four, *e.g.*, a warp of herrings or oysters (Sparkes 1975).

warren *n.*

1. The inhabitants of a warren (Oxford English Dictionary 1972, entries from 1607).

2. Any collection, or assemblage of small animals (Oxford English Dictionary 1972, entries from 1607). See warren.

watch *n.* A group of *Luscinia megarhynchos* (Nightingales) (Lipton 1968, 53).

wedge *n.* A group of things in the form of a wedge, *e.g.*, a wedge of swans (Sparkes 1975).

whisp, wisp *n.*

1. A group of snipe (Sparkes 1975).

2. A group of shorebirds in flight (Choate 1985, 13). [This term derives from the shorebird group’s looking like a thin smoke column (Choate 1985, 13).]

wing *n.* A flock of plovers (Sparkes 1975).

wisp See ²group: whisp.

zoo *n.* The Zoological Gardens in Regent’s Park, London; a similar collection of living animals elsewhere (Oxford English Dictionary 1972, entries from circa 1847).

syn. zoological garden, zoological park (Michaelis 1963).

Comments: In the broad sense, some people now think of a zoo as a collection of living animals plus things including a research center, an education building, a miniature tropical rain forest, souvenir shop, and restaurant. The word “zoo” was popularized in the 1860s in the song Walking the Zoo is the Thing to Do (Reuter 1992).

- zoological garden, zoological park** See ²group: zoo.
- ♦ **group calling** See animal sounds: song: communal call.
- ♦ **group cohesion** *n.* In social-animal species, especially those with closed societies, including Humans: A group of adult animal's continuous association, often with their offspring, over time (Eibl-Ebesfeldt 1972, 1973 in Heymer 1977, 80; Immelmann and Beer 1989, 121).
- ♦ **group consciousness** See ³consciousness: group consciousness.
- ♦ **group courtship** See courtship: communal courtship.
- ♦ **group effect** See effect: group effect.
- ♦ **group-living species** See ²species: group-living species.
- ♦ **group odor** See odor: group odor.
- ♦ **group pheromone** See odor: clan-specific odor.
- ♦ **group predation** See predation: group predation.
- ♦ **group recognition** See recognition: group recognition.
- ♦ **group scent** See odor: group odor.
- ♦ **group selection** See selection: group selection.
- ♦ **group song** See animal sounds: song: group song.
- ♦ **group territory** See territory: group territory.
- ♦ **group transport** See transport: group transport.
- ♦ **grouping, upward classification** *n.* Classifying organisms into larger hierarchical groups (Mayr 1982, 238).
cf. downward classification, logical division
- ♦ **grove** See ²community: grove; ²group: grove.
- ♦ **growing season** See season: growing season.
- ♦ **growl** See animal sounds: growl.
- ♦ **growth** *n.*
 - Something's action, process, or manner of growing both in material and immaterial senses; vegetative development; increase (Oxford English Dictionary 1972, entries from 1587).
 - An organism's increase in its biomass (Willson 1983, 5).*syn.* auxesis, *q.v.*
cf. principle: principle of allocation
- ♦ **exponential growth** *n.* "Growth, especially in the number of organisms of a population, that is a simple function of the size of the growing entity; the larger the entity, the faster it grows" (Wilson 1975, 584).
- ♦ **population growth** *n.* Change in population size with time as a net result of natality, mortality, immigration, and emigration (Lincoln et al. 1985).
- ♦ **grunt, stomp** *v.t.* In some tortoise species and Humans: To cause earthworms to come to the surface of the ground by vibrating it (Kaufmann 1989, 10).
Comment: Some tortoises grunt (for worms) by stomping their feet (Kaufmann 1989, 10).
cf. animal sounds: grunt
- ♦ **grunt whistle** See animal sounds: grunt whistle.
- ♦ **Gruppenauslese** See selection (table).
- ♦ **G_{ST}** See index: fixation index: *G_{ST}*.
- ♦ **guano** *n.*
 - An accumulation of sea-bird droppings rich in phosphates and nitrates (Oxford English Dictionary 1972, entries from 1604).
 - An accumulation of bat droppings.
- ♦ **guarding behavior** See behavior: guarding behavior: mate-guarding behavior.
- ♦ **guard bee** See bee: guard bee.
- ♦ **guest** *n.*
- A
1. A person who is entertained at the house, or table, of another (Oxford English Dictionary 1972, entries from 1800).
2. An animal that lives, breeds, or both within a heterospecific nest, domicile, or colony (Lincoln et al. 1985). See parasite.
v.i., v.t. guest
cf. inquiline
- ♦ **guidance procedure** See procedure: guidance procedure.
- ♦ **guide species** See ²species: characteristic species.
- ♦ **guild** *n.*
 - An ecological group of plants that is distinguished from other ecological groups by a special mode of life, and sometimes similar physiological requirements [Webster's New International Dictionary of the English Language (1960) in Balon 1975, 825].
 - A group of plants that is dependent on another plant in some way; *e.g.*, climbing vines, epiphytes, parasites, or saprophytes (Atsatt and O'Dowd 1976, 24, who indicate that this botanical definition predates def. 1.)
 - "A group of species that exploit the same class of environmental resources in a similar way" [coined by Root 1967 in Hawkins and MacMahon 1989, 423 who indicate that Elton alluded to a "guildlike niche"].
Notes: Root (1967) emphasized that a guild is (1) an ecologically appropriate context for studying interspecific competition, and (2) a natural ecological unit that recurs across communities. Cummins (1973) emphasized Root's second point and the use of guilds to simplify the complex, numerous interactions among species that characterize real communities and ecosystems. Hawkins and MacMahon (1989, 442) suggest that the concept of guild is more useful if it contains the idea that guild members are co-occurring, interacting species of different taxa.
 - A group of plants that are functionally dependent, or interdependent, with respect to their herbivores (Atsatt and O'Dowd 1976, 24).
syn. plant-defense guild (Atsatt and O'Dowd 1976, 24)*Note:* This definition does not necessarily imply spatial association. "Although close spatial relationships are often important, functional guild boundaries are in each case defined by herbivore feeding behavior and dispersal capacity" (Atsatt and O'Dowd 1976, 24–25).
5. "All organisms that use the same investigator-defined resource" (Hawkins and MacMahon 1989, 444).
syn. functional group [coined by Cummins (1973 in Hawkins and MacMahon 1989, 425) for aquatic invertebrates]
cf. clique, -vore, parasite, predator
- Comments:* Different workers have used "guild" in ways that are very different from Root's (1967) original meaning; *e.g.*, reproductive styles, characteristics of a basic body plan, and physiological systems (Hawkins and MacMahon 1989, 423). Guild definitions are "loose and are inconsistent among investigators (or even among studies by the same investigator), and guilds are seldom analyzed before they are accepted as existing in nature;" some workers "view guilds as natural units worthy of detailed study, while others deny that guilds exist except in the minds of ecologists" (Hawkins and MacMahon 1989, 424, 441). Fauth et al. (1996, 283) attempt to clear up definitions of assemblage, ensemble, ²community, local guild, and guild with the use of a Venn diagram. Balon (1975, 827) putatively classifies all living fishes into 32 ecoethological guilds in three divisions each with two

subdivisions. Balon (1984, 40–41) classifies reproductive styles into 3⁴ reproductive guilds in three sections. Jaksic (1981 in Hawkins and MacMahon 1989, 426) distinguished between resource-based “true community guilds” and taxonomically based “assemblage guilds.” Researchers have described many kinds of guilds, including “dung feeders,” “epiphyte grazers,” “fungivores,” “gall formers,” “generalists,” “large-particle shredders,” “macrophyte piercers,” “nectarivores,” “omnivores (scavengers),” “parasites,” “pit feeders,” “predators” (including “engulfers”), “sap feeders” (miners and suckers), “scrapers” of algae and other attached organic material, “seed feeders,” “small-particle shredders,” “stem borers,” “strip feeders” (“chewers”), “tourists,” and “wood borers” (references in Hawkins and MacMahon 1989, 430, 432, 440–441). Hubbell et al. (1999, 554) classify light-gap-inhabiting woody plants into three regeneration niche guilds: “intermediate species,” “shade-tolerant species,” and “strongly gap-dependent-pioneer species.” In his study of spider diversity in Redwood forests Willett (2001) worked with three spider guilds: diurnal-hunter, nocturnal-hunter, and web-builder guilds.

local guild *n.* A group of species that live in the same location at the same time (*i.e.*, live in the same community) and are in the same guild (*i.e.*, a group of species that exploit the same class of environmental resources in a similar way); *e.g.*, local bird species of a foliage-gleaning guild; contrasted with assemblage, ensemble,²community, guild, and taxon in the Venn diagram of Fauth et al. (1996, 283).

management guild *n.* A group of species that respond in a similar way to a variety of changes likely to affect their environment
[coined by Verner (1984 in Hawkins and MacMahon 1989, 441)].

♦ **guilty look** *n.* A Domestic Dog’s appearing guilty to a human observer when the Dog shows one, or more, of these behaviors: avoids eye contact, drops its head, drops its tail, licks its lips, offers its paw, pulls ears back, quickly wags its lowered tail, rolls over on its side or back, and slinks away (Horowitz 2009, 447; Stein 2009, A4).

Comments: Experimentation suggests that Domestic Dogs’ guilty looks are responses to owner cues, rather than the Dogs perceiving that they performed misdeeds (Horowitz 2009, 447; Stein 2009, A4).

♦ **Gulick effect** See drift: random drift.
♦ **gumivore** See -vore: gumivore.
♦ **Gunflint Formation** See geological stratum: Gunflint Formation.

♦ **Gunnung Leuser National Park** See place: Gunnung Leuser National Park.

♦ **gurgle** See animal sounds: grunt: baby-grunt.
♦ **gustation** See modality: chemoreception: gustation.
♦ **GWP** See unit of measure: global-warming potential.
♦ **gymnogamy** See -gamy: gymnogamy.

♦ **Gymnosperm Database** See database: Gymnosperm Database.
♦ **gynandromorphism** See -morphism: gynandromorphism.

♦ **gyne** See caste: gyne.
♦ **gynecoid** *n.* In Ants: Referring to a female that is queenlike, specifically a worker with some typically queen characters; *e.g.*, an enlarged abdomen (Hölldobler and Wilson 1990, 638).
♦ **gynecogeny** See parthenogenesis.
♦ **gynergate** See caste: gynergate.
♦ **gynic** *adj.* Female (Lincoln et al. 1985).

cf. andric

♦ **-gyno, gyn** *comb. affix*

1. “Woman; female” (Michaelis 1963).
2. “Female reproductive organ; ovary; pistil” (Michaelis 1963).

[Greek *gynē*, woman]

♦ **gynochore** See -chore: gynochore.

♦ **gynochromatypic coloration** See coloration: gynochromatypic coloration.

♦ **gynodioecism, gynodioecy** See -oecism: gynodioecism.

♦ **gynomonoecism, gynomonoecy** See -oecism: gynomonecism.

♦ **gynogamete** See gamete: gynogamete.

♦ **gynogenesis** See parthenogenesis: gynogenesis.

♦ **gynogenetic** See study of: genetic: gynogenetic.

♦ **gynogenous** See -genous: gynogenous.

♦ **gynogeny** See -geny: gynogeny.

♦ **gynomorphic** See -morphic: gynomorphic.

♦ **gynopaedium** See -paedium: gynopaedium.

♦ **gypsophile** See -phile: gypsophile.

♦ **-gynous** See -gyny.

♦ **-gyny** *comb. f.* Female.

adj. -genic, -gynous

See mating system.

[Greek *gynē*, woman]

heterogyny *n.* An organism’s having two kinds of females (Lincoln et al. 1985).

hologyny See character: hologeny.

metagyny See -gyny: protogyny.

monogyny *n.* In some social-insect species: The existence of only one functional queen in a colony (Wilson 1975, 589).

cf. -gyny: oligyny, polygyny

Comment: Hölldobler and Wilson (1990, 640) distinguish between “primary monogyny” and “secondary monogyny.”

► **functional monogyny** *n.* In some ant species: The condition in which several mated queens co-exist, but only one produces reproductive brood (Hölldobler and Wilson 1990, 638).

oligyny *n.* In some ant species: Two through several functional queens’ occurring in the same colony (Hölldobler and Wilson 1990, 641).

cf. -gyny: monogyny, polygyny

poecilogyny *n.* A species’ having more than one form of female (Lincoln et al. 1985).

cf. poecilandry

polygyny *n.* In some social-insect species: The co-existence of two, or more, egg-laying queens in the same colony (Wilson 1975, 592).

See mating system.

adj. multiple queen, polygynous (Bourke 1991, 295)

cf. -gyny: monogyny, oligyny

protogyny *n.* The rare phenomenon in insects in which females tend to emerge from their natal nests sooner than males; *e.g.*, in a tephritid-fly and mosquito species and some solitary-bee species (Thornhill and Alcock 1983, 104).

syn. metagyny (Lincoln et al. 1985)

See hermaphroditism: protogynous hermaphroditism.

adj. protogenous, proterogynous

cf. protandry

pseudopolygyny *n.* In some ant species: Several dealated virgin queens’ coexisting with one egg-laying mated queen (Hölldobler and Wilson 1990, 642).

spanogyny *n.* A scarcity, or progressive decrease, in the number of females (Lincoln et al. 1985).

h

♦ **H** See index: species-diversity index: Shannon-Weiner Function.

♦ **habit** *n.*

1. A person's bearing, demeanor, deportment, behavior; posture (obsolete definition, Oxford English Dictionary 1972, entries from 1413).
2. A person's bodily condition or constitution (Oxford English Dictionary 1972, entries from 1576).
3. An individual organism's characteristic mode of growth and general appearance (Oxford English Dictionary 1972, entries from Ray 1691); all of a species' adaptations present at a particular time, including its external appearance and growth form (Gregory 1913, 1936 in Mayr 1982, 590; Lincoln et al. 1985).
syn. ad hoc adaptations, constitutional type, habitus (Lincoln et al. 1985)
4. A person's mental, or moral, constitution (Oxford English Dictionary 1972, entries from 1386).
5. A person's settled disposition, or tendency, to act in a certain way, especially one acquired by frequent repetition of the same act until it becomes quite, or almost, involuntary; a settled practice, custom, usage; a customary way, or manner, of acting (Oxford English Dictionary 1972, entries from 1581).
6. An individual animal's stimulus-response connection that it acquires through experience (Immelmann and Beer 1989, 125).
7. In animals, especially Humans: An individual's recurrent behavior performed without its thought or attention (Immelmann and Beer 1989, 125).
8. An animal's behavior; habits of a certain species (Immelmann and Beer 1989, 125).
syn. behavior, behavior pattern, conditioned reflex (Immelmann and Beer 1989, 125)

See behavior.

cf. behavior, heritage

v.i., v.t. habit

♦ **habit formation** See learning: becoming accustomed.

♦ **habit preening** See grooming: habit preening.

♦ **habitat** *n.*

1. The locality (*e.g.*, chalky hill, rocky cliff, or sea shore) in which an organism normally grows or lives (Oxford English Dictionary 1972, entries from 1854).

Note: "Habitat" sometimes means an organism's geographical range or a special locality to which it is confined; a particular spot where a specimen is found (Oxford English Dictionary 1972).

2. "The organisms and physical environment in a particular place" (Wilson 1975, 585).

3. The place in a physical environment (*e.g.*, climate) and biotic community (*e.g.*, vegetation type) where a species lives at a particular time (Wittenberger 1981, 616; Immelmann and Beer 1989, 125).
4. Broadly, an area of Earth's physical environment, that is distinct from other areas in a broad range of abiotic and biotic variables, *e.g.*, a coral-reef habitat or a running-water habitat (= lotic habitat) (Kramer et al. 1995, 2).
syn. ecosystem, habitat type

5. Narrowly, an area within an ecosystem that differs in enough ways to appear qualitatively distinct from other areas; *e.g.* a pool habitat and a riffle habitat within a stream; or a backreef habitat and reef-crest habitat within a coral reef (Kramer et al. 1995, 2).
syn. biotope (of some authors), habitation (Oxford English Dictionary 1972), ece, local environment, oike, oikos (Lincoln et al. 1985)

cf. biome, biotope, ²community: tropical rainforest and other communities

Comments: The same term (*e.g.*, bog, forest, marsh, or prairie) can refer to a habitat or community. Some kinds of habitats are defined below. Those not defined below include coniferous forest, coral reef, deciduous forest, elfin forest, jack-pine plain, jungle, krummholz, ocean, rain forest, river, spring, stream, tidal zone, and wood. Habitats vary in their extents from those of small ranges (*e.g.*, grass bald or shale barren) to those of large ranges (*e.g.*, forest or ocean). Habitats often intergrade with one another. Many sources (*e.g.*, NatureServe 2008) list hundreds of communities and habitats that are not in this book.

SOME CLASSIFICATIONS OF HABITATS^a

-
- I. Classification with regard to amount of homogeneity, includes synusia.
 - A. synusia
 - II. Classification with regard to amount of water, kind of water, etc.
 - A. aquatic habitat
 1. acidic habitat
 - a. dystrophic lake (*syn.* acidic lake)
 - (1) bog lake

SOME CLASSIFICATIONS OF HABITATS^a (CONT.)

- (2) brown-water lake
- (3) humic lake
- b. fen
- c. volcanic lake
- 2. alkaline habitat
 - a. desert-alkali lake (*syn.* soda lake)
 - b. fen
 - c. volcanic lake
- 3. brackish habitat
 - a. bay
 - b. beach (*syn.* coast, shore)
 - (1) back shore
 - (2) fore shore
 - (3) littoral zone (*syn.* intertidal zone)
 - (4) near-subtidal zone
 - (5) supralittoral zone
 - c. canyon
 - d. cave
 - e. cliff
 - f. creek (*syn.* gut, run, stream)
 - g. estuary
 - h. fluvial plain
 - i. lake
 - j. lagoon
 - k. marsh
 - l. mudflat
- m. near-subtidal zone
- n. pond
 - (1) limnetic zone (*syn.* open-water zone, submersed-plant zone)
 - (2) littoral zone
 - (a) emergent-plant zone
 - (b) floating-leaf plant zone
 - (3) profundal zone
- o. ridge
- p. river
- q. spring
- r. sublittoral zone (*syn.* subtidal zone)
- s. surface film
- t. swale
- u. swamp
- v. swamp forest
- w. talus slope
- x. terrace
- y. tide pool
- z. wet prairie
- 2. freshwater
 - a. bay
 - b. beach (*syn.* coast, shore)
 - (1) back shore
 - (2) fore shore
 - (3) littoral zone (*syn.* intertidal zone)
 - (4) near-subtidal zone
 - (5) supralittoral zone
 - c. bog
 - d. canyon
 - e. cave
 - f. cave pool
 - g. cliff
 - h. creek (*syn.* run, stream)
 - (1) pool zone
 - (2) rapids zone (*syn.* riffles zone)
 - i. estuary
 - j. everglade
 - k. fen
 - l. fluvial plain
- m. geobenthos
- n. glade
- o. impoundment
- p. lake
 - (1) epilimnion
 - (2) eutrophic lake
 - (3) hypolimnion
 - (4) mud
 - (5) oligotrophic lake
 - (6) thermocline
 - (7) volcanic lake
- q. marsh
- r. mudflat
- s. phytobenthos
- t. pond
 - (1) artificial pond
 - (2) beaver pond
 - (3) bog pond
 - (4) cypress pond
 - (5) farm pond
 - (6) flood-plain pond
 - (7) limnetic zone (*syn.* open-water zone, submersed-plant zone)
 - (8) littoral zone
 - (a) emergent-plant zone
 - (b) floating-leaf plant zone
 - (9) meadow-stream pond
 - (10) mill pond
 - (11) mountain pond
 - (12) profundal zone
 - (13) sink-hole pond
 - (14) temporary pond
- u. ridge
- v. river
- w. seep
- x. swale
- y. spring
- z. swamp
- aa. swamp forest
- bb. surface film
- cc. talus slope
- dd. terrace
- ee. tide pool
- ff. wet prairie
- 3. saltwater habitat
 - a. bay
 - b. beach (*syn.* coast, shore)
 - (1) back shore
 - (2) fore shore
 - (3) neritic zone
 - (a) littoral zone (*syn.* intertidal zone)
 - (b) lower-neritic zone
 - (c) near-subtidal zone
 - (d) subtidal zone
 - (4) supralittoral zone (*syn.* supratidal zone)
 - c. cave
 - d. canyon
 - e. cliff
 - f. coral reef^b
 - (1) barren zone
 - (2) breaker zone
 - (3) deep fore reef
 - (4) fore reef escarpment
 - (5) fore reef slope
 - (6) fore reef terrace
 - (7) inshore zone

- (8) lagoon
 (9) mixed zone (*syn.* buttress zone)
 (10) rear zone
 (11) reef flat (*syn.* rubble zone)
 g. estuary, including salt-marsh estuary
 h. desert salt lake
 i. lagoon
 j. marsh, including tide-land marsh
 k. mudflat
 l. ocean
 (1) abyssal plain
 (2) abyssopelagic zone
 (3) abyssobenthic zone
 (4) bathybenthic zone
 (5) bathypelagic zone
 (6) benthos
 (7) mesopelagic zone (*syn.* twilight zone)
 (8) cave
 (9) canyon
 (10) cliff
 (11) continental rise
 (12) continental shelf
 (13) continental slope
 (14) hadobenthic zone
 (15) pelagic zone, including epipelagic zone
 (16) ocean rise
 (17) ocean floor
 (18) outer sublittoral zone
 (19) ridge
 (20) sea floor
 (21) seamount
 (22) talus slope
 (23) terrace
 (24) trench
 m. plain, including fluvial plain
 n. pond
 o. sea
 p. spring
 q. surface film
 r. swale
 s. swamp, including mangrove swamp
 t. swamp forest
 u. talus slope
 v. terrace
 w. tide pool
 x. wet prairie
- B. terrestrial habitat
 1. atoll
 2. bay
 3. beach
 4. bush
 5. canyon
 6. cave
 7. cliff
 8. coast (*syn.* shore)
 9. dry prairie
 10. dune
 11. field
 12. forest (*syn.* woods)
 13. glade
 14. grass bald
 15. hammock
 16. heath
 17. hummock
 18. island
 19. meadow
 20. maqui (*syn.* garrigue matorral)
21. orchard
 22. plain, including alluvial plain
 23. ridge
 24. savanna (*syn.* savannah)
 25. shale barrens
 26. steppe
 27. swale
 28. talus slope
 29. terrace
 30. thicket
 31. woodland
- III. Classification with regard to amount of water movement
 A. lentic freshwater habitat
 1. lake
 2. pond
 3. stagnant pool
 B. lotic freshwater habitat
 1. river
 a. pool
 b. rapids (*syn.* riffle)
 2. stream
 a. pool
 b. rapids (*syn.* riffle)
- IV. Classification with regard to complexity and size
 A. macrohabitat (*syn.* ecosystem, habitat type)
 B. microhabitat
- V. Classification with regard to supporting a population
 A. sink habitat
 B. source habitat
-
- ^a Odum (1969)
^b Kaplan (1982, 12)
- bay**
 1. A body of water that is partly enclosed by land (*e.g.*, an inlet of the sea) (Michaelis 1963).
 2. “A recess of lowland between hills” (Michaelis 1963).
 3. In the U.S., land partly surrounded by forest (Michaelis 1963).
 4. An often oval, shallow, wetland depression in the Eastern Coastal Plain of the U.S. from New Jersey south into Northern Florida (Krajick 1997, 45, illustrations).
Notes: Bays are ringed with ridges of sand, and there are several hypotheses regarding how they formed; they possibly formed due to strong prevailing winds and ocean waves during a time of dropping sea level (Krajick 1997). The oval ones have northwest-southeast axes. Bays were probably important in the evolution of carnivorous plants including the *Dionaea muscipula* (Venus Flytrap), as well as many other organisms. People have drained most of the bays.
 [bay, after bay trees which often grow in these habitats (Krajick 1997, 48)]
syn. Carolina bay (after the fact that bays are more concentrated in the Carolinas than in other U.S. states), whale wallow (a term for a bay in the Delmarva Peninsula, after the erroneous hypothesis that a beached whale made the depression in land) (Krajick 1997, 48–49)
 [bay, Old French *baie* < Late Latin *baia*]
- bog** *n.*
 1. A piece of wet, spongy ground, consisting chiefly of decaying, or decayed, moss and other organic matter, that is too soft to bear the weight of any heavy body (Oxford English Dictionary 1972, entries from 1505).

Note: Some bogs may zonation as described in def. 2. Marshes are wetlands that are similar to some bogs; however, marshes do not have spongy, springy ground (pers. obs.).

syn. bogland, boggy soil, morass, moss (Oxford English Dictionary 1972)

2. A habitat with a with a central pond, surrounded by a floating mat of vegetation, which grades into a zone of herbaceous and shrubby plants (and sometimes dwarfed trees) which grades into swamp forest and higher forest (Voss 1972, 17–18; pers. obs.)

Notes: The edge of a bog pond is a floating (and hence quaking) mat that borders the open water and is formed largely of interlacing rhizomes and roots, usually with much sphagnum moss that causes the mat waters to be very acidic (Voss 1972, 18). The surrounding forest is often fully or mostly gymnospermous. Parts of bogs have spongy, springy floors comprising mosses and organic material. Some bogs have alkaline areas, totally filled in ponds, or both. Zoned bogs (fig. 21), occur in Canada and the U.S. in glacial potholes. In this figure, small flags in the foreground mark locations of organisms under study.

See habitat: glade, swamp.

cf. ²community: hydrophytum; habitat: fen, forest, bog forest, marsh, swamp; mire, moss

Comment: Bogs preserved many bodies of *Homo sapiens sapiens* (bog bodies, *q.v.*) and other things found in a sacred offering site (Flag Fen, England), bowls, *Canis familiaris* (Domestic Dogs), jewelry, tools, and weapons (Deem 1998).

[Gaelic, *bogach*, a bog < *bog*, soft, D. A. M. Mackay, pers. comm.]

► **Arctic bog, palsa bog** *n.* A bog with an ice core characteristic of Arctic zones with permafrost that can form a small hillock up through 7 m high (Council of Europe Commission of the European Communities 1987, 198).

► **blanket bog** *n.* A bog that forms a continuous carpet on very wet hills in some parts of northern Europe (Council of Europe Commission of the European Communities 1987, 18).

Comment: The peat thickness of a blanket bog is up through 7 m (Council of Europe Commission of the European Communities 1987, 16, illustration; 18).

► **raised bog** *n.* A bog with a convex profile that results from abundant rainfall (that enables sphagnum mosses to grow above the water table) and a peripheral extension supplied by an aquifer maintained within peat by infiltrating rainfall (Council of Europe Commission of the European Communities 1987, 16, illustration; 18; D. A. M. Mackay, pers. comm.).

Comment: The peat thickness of a raised bog may be up through 7 m at the center of the bog's bulge (Council of Europe Commission of the European Communities 1987, 18).

► **string bog, aapa mire** *n.* A bog that occupies an elongated depression supplied with melt water and may be separated from another string bog by a peat ridge (Council of Europe Commission of the European Communities 1987, 19).

bog forest, coniferous swamp *n.* The area of a bog that is dominated by trees (Voss 1972, 18).

cf. ²community: forest

bogland, boggy soil See habitat: bog.

brownfield site *n.* A site that people previously used for development and that is currently abandoned, such as a factory site, quarry, railway, and road (New 2009, 145).

Comment: A brownfield site can be a habitat of a threatened or endangered species (New 2009, 146).

bush *n.*

1. A clump of shrubs; thicket; undergrowth (Michaelis 1963).

2. Wild, uncleared land covered with scrub; any rural or unsettled area; usually preceded by Ath.

3. Wood lot (Canadian).

cf. forb, habitat: forest, shrub, tree

cliff *n.* A high, steep face of rock; a precipice (Michaelis 1963).

obsolete cliff (Michaelis 1963)

Comment: A similar face of unconsolidated sediment is also called a cliff, *e.g.*, Calvert Cliffs, Maryland, a rich Miocene fossil deposit primarily in silt and sand.

coast *n.* The land next to the sea; seashore (Michaelis 1963).

syn. shore (Michaelis 1963)

[Old French < *coste* < *costa*, rib, flank]

► **rocky coast** *n.* The rocky area, above an intertidal fringe habitat of larger marine algae in Mediterranean areas which has *Cymodocea nodosa* and *Zostera* spp. (Council of Europe Commission of the European Communities 1987, 13).

coral reef *n.* A ridge of coral skeletons, with or without living coral, formed by the gradual buildup of these skeletons (Michaelis 1963).

cf. coral bleaching; place: Pacific Ocean Preserve

Comment: Coral poachers, damage from fishing with dynamite, global warming, pollution, and unwise coastal development have already killed more than 25% of Earth's recent coral reefs (Associated Press 2000, A23). About 90% of the coral reefs of the Central Indian Ocean are bleached white and dead.

critical habitat *n.* Specific areas within a geographical area that a species occupies at the time that officials list the species as threatened or endangered and that contain physical, biological, or both features essential for the species conservation plus specific areas outside that geographical area that the species occupies if officials determine that the latter area is essential for the species conservation (United States Endangered Species Act in New 2009, 83).

Note: Areas of land that are crucial to survival of a threatened ecological community, population, species, or a combination of these things (New 2009, 84).

dune *n.* A hill of loose sand heaped up by wind (Michaelis 1963).

syn. down (Michaelis 1963)

cf. habitat: dune slack

Comment: The Council of Europe Commission of the European Communities (1987, 14) describes calcareous and noncalcareous dunes.

[French < Middle Dutch *akin* to down]

► **coastal dune** *n.* A dune along a body of water, *e.g.*, along an ocean or lake (Council of Europe Commission of the European Communities 1987, 14; 15, illustration).

► **fixed calcareous dune, gray dune** *n.* An inshore dune that is less exposed to wind than a moving calcareous dune and is stabilized by grasses and other plants (Council of Europe Commission of the European Communities 1987, 14).

► **moving calcareous dune, white dune** *n.* A high littoral dune, rich in calcium carbonate and exposed to constant wind impact, colonized by grasses and other plants (Council of Europe Commission of the European Communities 1987, 14).

dune slack, panne, slack *n.* An original European hydrosere ranging from *Littorellion* and *Molinion* groupings to basic and minerotrophic mire communities (Council of Europe Commission of the European Communities 1987, 14; 15, illustration).

everglade *n.* A tract of low, swampy land covered with tall grass (Michaelis 1963).

cf. place: Everglades

fen *n.*

1. Low land covered wholly, or partly, with water, or subject to frequent inundations; a tract of such land (Oxford English Dictionary 1972, entries from Beowulf).

syn. marsh (Oxford English Dictionary 1972)

See community: meadow: sedge meadow.

2. A hollow where the water table is permanently above ground level (Council of Europe Commission of the European Communities 1987, 18).

syn. soligenous mire (Council of Europe Commission of the European Communities 1987, 18)

3. A hillside where the water table is permanently above ground level (Council of Europe Commission of the European Communities 1987, 18).

syn. topogenous mire (Council of Europe Commission of the European Communities 1987, 18)

Notes: A fen can be acidic or alkaline (Council of Europe Commission of the European Communities 1987, 18). Most of the plant debris of a fen decomposes and only a few decimeters of fibrous peat accumulate from abundant sedges.

4. In the U.S., a rare, grassy wetland with alkaline, peat soils and often with *Larix laricina* (Tamarack) and *Rhus vernix* (Poison Sumac) (Michigan Department of Natural Resources 2009).

Note: Fens may have profusions of wild flowers, rare species, streams, marl pits, or combinations of these things (Michigan Department of Natural Resources 2009).

cf. bog, marsh, swamp

[Old English, *fēn, fēnn*]

field *n.*

1. Open ground as opposed to a forest; a stretch of open land; a plain (Oxford English Dictionary 1972, entries from 1050).

Note: This is an obsolete definition.

2. Land that is tilled or used as a pasture, usually parted off by boundary stones, fences, hedges, and so forth (Oxford English Dictionary 1972, entries from 1025).

3. A piece of land with few, or no, trees (covered with grass, weeds, or similar vegetation) that is growing wild (Michaelis 1963).

4. "A piece of cleared land covered with grass, clover, or other plants suitable for grazing animals and set aside for use as a pasture" (Michaelis 1963).

5. A piece of cleared, cultivated land on which crops are grown (Michaelis 1963).

6. An area that is, or has been, cultivated or pastured (Voss 1972, 20).

cf. ²community: amanthium; habitat: meadow, waste ground

[Old English *feld*, akin to Old English *folde*, earth]

► **old field** *n.* A field that was cleared by Native Americans (Strausbaugh and Core 1978, x).

forest *n.*

1. A large tract of land covered with trees and undergrowth, sometimes intermingled with pasture; also the trees themselves (Oxford English Dictionary 1972, entries from 1300).

2. An area dominated by trees (Voss 1972, 18); contrasted with savanna, woodland.

3. A plant formation composed of trees with touching crowns that form a continuous canopy; contrasted with woodland (Allaby 1994).

4. In Great Britain, from Norman times, a district reserved for deer hunting, often belonging to the sovereign, managed by special officers, and to which special laws applied (Allaby 1994).

Note: Such forest ranged from being plots of dense trees only through areas with trees and other habitats including bogs, grassland, and heaths (Allaby 1994). See ²community: forest.

cf. habitat: bush

syn. wood, woods (Michaelis 1963; Voss 1972, 18)

Comments: Global Forest Watch presents current information on world forest loss (www.globalforestwatch.org). People classify forests by many criteria including major plant taxon (Angiospermae and Gymnospermae), main tree and other species, amount of soil moisture, and geographic location. Kinds of forests grade into each other in nature.

adj. forest, sylvan

[Old French < Medieval Latin (*silva*) *foresta*, an unenclosed (wood) < Latin *foris*, outside]

► **angiospermous forest** *n.* A forest with 80–100% angiosperms and 0–20% gymnosperms; contrasted with evergreen, gymnospermous, and mixed forest (inferred from Allaby 1994).

syn. broadleaf forest, hardwood forest (Alden et al. 2007, 35)

Comment: Angiospermous forests occur in low, wet areas through high, dry areas (pers. obs.).

► **Appalachian cove forest** *n.* An angiospermous Appalachian forest of the Eastern U.S. that has the indicator tree species *Halesia carolina* (Carolina-silverbell) and *Tilia heterophylla* (White Basswood) and is especially rich in wildlife (Alden et al. 2007, 39).

► **bottomland forest** *n.* An angiospermous, Appalachian forest of the Eastern U.S. that grows in low-elevation areas along river flood plains and is dominated by tree species including American Chestnut (once common), Black Walnut, Canadian Hemlock, Eastern Sycamore, Northern Red Oak, Red Maple, Wild Black Cherry, willows, and Yellow Birch (Alden et al. 2007, 36).

► **broadleaf forest** *n.* A forest with 80–100% angiosperms and 0–20% gymnosperms; contrasted with broad-leaved-evergreen forest, deciduous forest, evergreen forest, evergreen-mixed forest, mixed forest (inferred from Allaby 1994).

syn. Angiospermous forest

► **broad-leaved-evergreen forest** *n.* A forest dominated by evergreen angiosperms; contrasted with broadleaf forest, deciduous forest, evergreen forest, evergreen-mixed forest, mixed forest (Allaby 1994).

Comment: This kind of forest occurs in the coastal plain of the Gulf of Mexico, southern Japan, and central China, and south of the tropics, except for Chilean Patagonia (Allaby 1994).

► **cloud forest** *n.* An angiospermous, tropical montane forest that is shrouded in clouds for much of each day (Allaby 1994).

Comments: Cloud forests are usually located more than 1,000 m above sea level (Allaby 1994). Trees in these forests often have profuse growths of epiphytes including bryophytes, ferns, filmy ferns, and lycopods.

► **deciduous forest** *n.* An angiospermous forest in which most or all of the trees shed their leaves in autumn; contrasted with broadleaf forest, broad-leaved-evergreen forest, evergreen forest, evergreen-mixed forest, mixed forest (Allaby 1994).

syn. deciduous summer forest (Allaby 1994)

Comments: Leaf loss may be, in part, an adaptation to winter drought when the ground is frozen (Allaby 1994). Some gymnospermous trees, *e.g.*, *Larix* (Larches) and *Taxodium distichum* (Baldcypress) are deciduous.

northern hardwood forest *n.* An Appalachian angiospermous forest of the Eastern U.S. dominated by *Acer saccharum* (Sugar Maple) and *Fagus grandifolia* (American Beech) (Alden et al. 2007, 39).

oak-hickory forest *n.* An angiospermous forest dominated by *Quercus* spp. (oaks) and *Carya* spp. (hickories) found in the Eastern U.S. (Alden et al. 2007, 34).

► **evergreen forest** *n.* A forest with no complete, seasonal leaf loss, and composed of angiosperms, gymnosperms, or both; contrasted with angiospermous forest (= broadleaf forest, deciduous forest), mixed forest (= broad-leaved-evergreen forest, evergreen-mixed forest) (Allaby 1994).

See forest: gymnospermous forest.

Comments: “Evergreen” in this “evergreen forest” refers to both angiospermous and gymnospermous trees that have leaves throughout the year, not only to gymnospermous (= coniferous) trees. Evergreen forests include temperate gymnospermous forests and angiospermous tropical rain forests. Evergreen angiospermous and gymnospermous tree species generally lose their leaves throughout a year, *e.g.*, in *Sabal palmetto* (Cabbage Palms) and *Syagrus romanzoffiana* (Queen Palms), or mostly during a short period during the year after they have produced many new leaves during that year, *e.g.*, *Ilex opaca* (American Holly), *Pinus strobus* (Eastern White Pine), *Magnolia grandiflora* (Southern Magnolia), and *Quercus virginiana* (Southern Live Oak). (pers. obs.).

► **evergreen-mixed forest** *n.* A forest dominated by both evergreen angiosperms and gymnosperms; contrasted with broadleaf forest, broad-leaved-evergreen forest, deciduous forest, evergreen forest, mixed forest (Allaby 1994).

Comments: This kind of forest occurs in particular in the southern hemisphere in Chile, New Zealand, South Africa, and Tasmania, and in the northern hemisphere in eastern Asia and the Mediterranean Basin (Allaby 1994).

► **gymnospermous forest** *n.* A forest with 80–100% gymnosperms and 0–20% angiosperms; contrasted with angiospermous, evergreen, and mixed forest (inferred from Allaby 1994).

syn. coniferous forest, evergreen forest (Alden et al. 2007, 35)

Comments: Gymnospermous forests occur in low, wet areas through high, dry areas (pers. obs.). Many species are native to gymnospermous forests including *Monotropa hypopithys* (Pinesap, fig. 22) which is a parasite of fungi associated with tree roots (Ladybird Johnson Wildflower Center 2010).

upland gymnospermous forest *n.* A gymnospermous, Appalachian forest of the Eastern U.S. that is dominated by *Abies fraseri* (Fraser Fir), *Betula alleghaniensis* (Yellow Birch), and *Picea rubra* (Red Spruce) (Alden et al. 2007, 39).

syn. upland coniferous forest

► **mixed forest** *n.* A forest with 20–80% angiosperms or 20–80% gymnosperms; contrasted with broadleaf forest, broad-leaved-evergreen forest, deciduous forest, evergreen forest, evergreen-mixed forest (inferred from Allaby 1994 who defines mixed woodland).

► **Niagara Escarpment forest** *n.* A sparse, old-growth forest on the cliffs of the Niagara Escarpment, Ontario, Canada, dominated by *Thuja occidentalis* (Eastern Whitecedar), some up to 1,600 yr old (Douglas Larson and Steven Spring in Wheeler 1996, 76–82, illustrations).

► **pine-oak forest** *n.* A forest of the Eastern U.S. dominated by *Pinus* spp. (pines) and *Quercus* spp. (oaks) (Alden et al. 2007, 36).

northern pine-oak forest *n.* A mixed forest of the Eastern U.S. dominated by *Pinus rigida* (Pitch Pine), *Pinus virginiana* (Virginia Pine), and *Quercus* spp. (oaks) (Alden et al. 2007, 36).

southern pine-oak forest *n.* A mixed forest of the Eastern U.S. dominated by *Pinus echinata* (Shortleaf Pine), *Pinus taeda* (Loblolly Pine), and *Quercus* spp. (oaks) (Alden et al. 2007, 36).

► **riverine forest** *n.* A swamp forest that grows along a river (Alden et al. 2007, 34, 37).

northern riverine forest *n.* A riverine forest of the Eastern U.S. dominated by *Acer saccharinum* (Silver Maple), *Fraxinus* spp. (ashes), *Platanus occidentalis* (Eastern Sycamore), *Populus deltoides* (Eastern Cottonwood), and *Salix* spp. (willows) and with few herbaceous plant species in its understory due to spring flooding (Alden et al. 2007, 34).

Comment: The northern and southern riverine forests intergrade (Alden et al. 2007, 37).

southern riverine forest *n.* A riverine forest of the Eastern U.S. dominated by *Celtis occidentalis* (Hackberry), some *Fraxinus* spp. (Ashes), *Liquidambar styraciflua* (Sweetgum), *Nyssa sylvatica* (Blackgum), *Populus deltoides* (Eastern Cottonwood), and some *Ulmus* spp. (elms) (Alden et al. 2007, 34).

► **swamp forest** *n.* A wet area with dense trees, subjected to daily, or periodic flooding, as occurs on river flood plains and along ocean shores; contrasted with swamp (inferred from Alden et al. 2007, 35).

syn. swamp (Voss 1972, 17)

Comments: Some authors synonymize “swamp” and “swamp forest,” and others consider a “swamp” to be a wet habitat with fewer trees than a “swamp forest.” Some swamp forests are in standing water during much through all of a year (*e.g.*, some Baldcypress forests); others are inundated twice per day by tides (*e.g.*, mangroves along a seacoast and angiospermous forests along a tidal freshwater river). Swamp forests are angiospermous forests,

gymnospermous forests, and mixed forests (pers. obs.). *Rhizophora mangle* (Red Mangrove) is a common tree of mangrove swamps in the New World *cf.* ²community: forest; habitat: bog, marsh [*cf.* Lower German *swampen*, to quake (said of a bog), akin to *sump + forest*]

Baldcypress swamp forest *n.* A swamp forest of the Eastern U.S. that is dominated by *Persea borbonia* (Redbay), *Quercus nigra* (Water Oak), and *Taxodium distichum* (Baldcypress) (Alden et al. 2007, 36–37).

southern-hardwood swamp forest *n.* An angiospermous, swamp forest of the Eastern U.S. that is dominated by *Asimina lobata* (Pawpaw), *Liquidambar styraciflua* (Sweetgum), *Nyssa sylvatica* (Blackgum), and *Quercus* spp. (species of oaks that live in wet soil) (Alden et al. 2007, 36–37).

geobenthos *n.* That part of the bottom of a stream, or lake, not covered by vegetation (Lincoln et al. 1985).

See ²community: geobenthos; habitat: geobenthos. *cf.* ²community: benthos

glade *n.*

1. A clear, open space, or passage, in a forest that is either natural or produced by Humans' felling trees (Oxford English Dictionary 1972, entries from 1529).
2. A poorly drained, treeless area on a mountain in West Virginia that is similar to a more northern bog community in both appearance and floristic composition (Strausbaugh and Core 1978, xii).

syn. bog (Strausbaugh and Core 1978, xii) [*probably* akin to *glad* in the obsolete sense of bright, sunny]

grass bald *n.* A treeless mountain top in West Virginia covered with a more, or less, continuous stand of grasses and their kin (Strausbaugh and Core 1978, x).

grove *n.*

1. "A small stand of trees" (Lincoln et al. 1985).
2. A fragment of a former extensive forest (Lincoln et al. 1985).

cf. ²community: forest

hammock *n.* A thickly wooded tract of fertile land that is often elevated, and found in the Southern U.S. (Michaelis 1963).

syn. tree island (Kloor 2001, 24)

cf. habitat: hummock; place: Everglades

Comments: Everglades hammocks are on raised land that is drier than surrounding grasslands and harbor subtropical forest (Kritcher and Morrison 1988, 84–85, plate 20). About 4,000 yr ago, deepwater sloughs covered much of the Everglades (Kloor 2001, 24). Patches of Sawgrass marsh interrupted the sloughs and grew on high points on the underlying limestone. About 1,200 yr ago, the water level dropped, and shrubs such as Buttonbush and Wax Myrtle colonized the mounds. Their decaying remains built up the peat soil into islands invaded by Pond-apples, Gumbo-limbos, willows, and other trees. About 800 yr ago the islands were well established. Rising water is currently eliminating these hammocks.

[a variation of hummock (origin unknown)]

heath *n.*

1. An area of open land in Britain overgrown with heath (primarily *Calluna*) or coarse herbage (Michaelis 1963).

Note: Williams (1989, 6) discusses a heath in the strict sense and broad senses.

2. A habitat dominated by ericaceous plants ("heath" and "heathland" in Council of Europe Commission of the European Communities 1987, 21, which describes many kinds of heathlands).

hummock *n.* A wooded tract of land that rises above an adjacent marsh or swamp (Michaelis 1963). *adj.* hummocky *cf.* habitat: hammock [origin unknown]

lake *n.* A large, inland body of fresh, or salt, water, contrasted with pond (Morris 1982).

Comments: In general, lakes have larger areas than ponds; however, some named ponds on Cape Cod, Massachusetts, e.g., are larger in area than some named lakes elsewhere.

[Middle English < Old French *lac* < Latin *lacus*]

marsh *n.*

1. A tract of low-lying land, flooded in winter and usually more, or less, watery throughout the year (Oxford English Dictionary 1972, entries from 725).

Note: In many cases, it would be more accurate to state that the land is flooded during the cold season, because marshes can be flooded during much of the time from fall through spring.

2. A wet, treeless area (Voss 1972, 17); contrasted with bog, fen, forest, meadow, swamp, swamp forest, and other habitats.

syn. *Marsch* and polder (in the North Sea area) (Council of Europe Commission of the European Communities 1987, 14)

See habitat: swamp.

cf. ²community: mangrove

[Old English *mersc, merisc*, akin to morass]

► **fresh-water marsh** *n.* A marsh in fresh water (Council of Europe Commission of the European Communities 1987, 14; 15, illustration)

cf. ²community: marsh

Comment: Plants in U.S. fresh-water marshes in Maryland are listed by Brown and Brown (1984, xx–xxi).

► **tidal-fresh-water marsh** *n.* A marsh that occurs along a tidal freshwater river (pers. obs.).

Comment: Examples of tidal fresh-water marshes occur along rivers in the Eastern U.S. Dyke Marsh Wildlife Preserve on the west side of the Potomac River near Washington, D.C., has a tide up to about 1 m and high organism diversity.

► **salt marsh** *n.* A saltwater wetland with non-woody, emergent plants along an ocean shore (Alden et al. 2007, 45).

cf. ²community: marsh

Comment: Plants of Maryland salt marshes are listed by Brown and Brown (1984, xx). A salt marsh along the North Sea is called a shorre (Council of Europe Commission of the European Communities 1987, 13; 154, illustration).

maquis, matorral *n.* An area of low, sclerophyllous ligneous plants in the Mediterranean Region (Council of Europe Commission of the European Communities 1987, 51, illustration; 57).

See ²community: maquis.

meadow *n.*

1. A piece of land permanently covered with grass that is mown to be used as hay; any piece of grassland, used either for cropping or pasture, in some cases, well watered ground usually near a river (Oxford English Dictionary 1972, entries from 969).

2. In North America, a low, level tract of uncultivated grassland especially along a river or a marshy region near the sea (Oxford English Dictionary 1972, entries from 1670).
3. One of many treeless areas such as a grassy field, a grazed area (= pasture), and a grassy, or sedgy, place that is usually less level (and therefore less wet), than what is generally termed a marsh; a vague term when it is used for so many kinds of habitats (Voss 1972, 20); contrasted with marsh, prairie, swamp.

cf. ²community: *pouim*

[Old English *mædwe*, oblique case of *mæd*, meadow]

► **moist meadow** *n.* A meadow that has soil which is usually moist except in late summer (Alden et al. 2007, 31).

Note: In the Eastern U.S., *e.g.*, wetland plants such as some grass, iris, milkweed, rush, and sedge species grow in moist meadows (Alden et al. 2007, 31).

► **sedge meadow** *n.* A treeless area that is dominated by *Carex* spp. (sedges) in West Virginia (Strausbaugh and Core 1978, vii).

See *fen*.

syn. *fen* (Strausbaugh and Core 1978, vii)

macrohabitat *n.* The larger habitat, *e.g.*, boreal forest, that encompasses a smaller habitat (= microhabitat), *e.g.*, fallen log, in which an organism lives (inferred from New 2009, 81).

cf. habitat: *matrioschkas*

marisma, sansourire *n.* A Mediterranean, or thermoatlantic, mudflat (Council of Europe Commission of the European Communities 1987, 13).

microhabitat *n.*

1. A small, specialized habitat (Lincoln et al. 1985). *syn.* microenvironment (Lincoln et al. 1985)

2. A narrowly defined environment that a species occupies (Goldschmidt 1996, 248).

Notes: For example, the cichlid species *Haplocromis argens* occurs almost exclusively in the uppermost 2 m of water (Goldschmidt 1996, 248).

3. A division of a habitat that is relatively homogeneous and differs primarily in quantitative values of a small number of variables from other divisions of the same habitat; *e.g.*, the deep-water microhabitat and shallow-water microhabitat of a pool; or the live-branched-coral microhabitat and the rubble-substrate habitat within a backreef habitat (Kramer et al. 1995, 2).
4. The smaller habitat, *e.g.*, inside a leaf, in which an organism lives that is encompassed by a larger habitat (= macrohabitat), *e.g.*, a tropical rain forest (inferred from New 2009, 81).

cf. habitat *matrioschkas*

Comments: Researchers often use “habitat” for the general type of place where an animal lives and, therefore, apply to it to a scale larger than the animal’s normal daily range. In contrast, researchers typically use “microhabitat” for a finer division of an animal’s space use that occurs within its normal daily range.

moss See habitat: bog.

morass See habitat: bog.

mud flat *n.* A muddy area in a coastal area (Council of Europe Commission of the European Communities 1987, 13).

syn. *silkke* (Council of Europe Commission of the European Communities 1987, 13)

Comment: Many rivers deposit mud flats, including the Rio Grande in New Mexico (fig. 23).

orchard *n.*

1. A garden for herbs and fruit trees (obsolete definition) (Oxford English Dictionary 1972, entries from 1000).

2. An enclosure for fruit-tree culture (Oxford English Dictionary 1972, entries from 1000).

3. A plantation of trees grown for the products such as fruit, nuts, or oils (Michaelis 1963).

4. The enclosure, or ground, that contains trees grown for their products (Michaelis 1963).

cf. ²community: *dendrium, orchard*

[Old English *orceard* < *ort-geard*, garden < *ort* (akin to Latin *hortus*) + *geard*, yard, enclosure]

phytobenthos *n.* The part of a stream, or lake, bottom covered with vegetation (Lincoln et al. 1985).

cf. ²community: *phytobenthos*

plain *n.* An expanse of low, treeless land; a prairie, *q.v.* (Michaelis 1963).

[Old French < Latin *planus*, flat]

► **fluvial plain** *n.* An alluvial plain that experiences periodic flooding (Council of Europe Commission of the European Communities 1987, 17; 16, illustration)

pond *n.*

1. A body of nonrunning water that is smaller than a lake, *q.v.* (Morris 1982).

2. A body of water that is shallow enough so that sunlight can reach its bottom and rooted plants can grow anywhere across its area (Alden et al. 2007, 29).

Note: There are exceptions to this definition (pers. obs.). Some ponds have deep areas with no emergent vegetation. Further, although lakes do not have emergent vegetation throughout, many lakes have shallow areas with emergent vegetation.

Comments: In general, ponds have luxuriant plant life and many associated animals and other organisms (Alden et al. 2007, 29). Ponds are often artificial, such as those made for livestock (Morris 1982).

[Middle English *ponde* < Old English *pund-*, enclosure]

prairie *n.*

1. A treeless, level, or undulating, tract of grassland, usually of great extent; applied chiefly to the grassy plains of North America (Oxford English Dictionary 1972, entries from 1682).

syn. savanna; savannah, steppe (Oxford English Dictionary 1972)

2. A naturally treeless area, dominated by grasses, and often maintained in this condition by fire (Voss 1972, 20).

cf. ²community: amanthium, plains

Comments: Conservationists are preserving and restoring prairies, including ones in Kansas, Maryland, Ohio, and Necedah Wildlife Refuge and Sandhill Wildlife Area in Wisconsin (fig. 41). This photo shows a young prairie that is still dominated by hundreds of towering plants of the alien, invasive *Verbascum thapsus* (Common Mullein) and also has hundreds of native *Erigeron strigosus* (Prairie Fleabane) with white-and-yellow flower heads and *Rudbeckia hirta* (Black-eyed-Susan) with brown-and-orange flower heads.

[French *prairie*, large meadow < *pré*, meadow < *pratum*]

► **dry prairie** *n.* A prairie that is not periodically flooded; contrasted with wet prairie (Voss 1972, 20).

► **wet prairie** *n.* A prairie that is periodically flooded; contrasted with dry prairie (Voss 1972, 20).

sandy beach *n.* The sandy-shore habitat of a lake, ocean, pond, river, or stream.

cf. ²community: actium, thalassium

savanna *n.*

1. A treeless plain, properly one found in tropical America (Oxford English Dictionary 1972, entries from 1555).

2. A tract of level land covered with low plants (Michaelis 1963).

3. Any large area of tropical, or subtropical, grassland, covered in part with trees and spiny shrubs (Michaelis 1963).

syn. savannah

See prairie.

cf. habitat: steppe

[earlier *zavana* < Spanish < Carib]

shale barrens *n.* (construed as singular or plural)

A habitat with a shale substrate.

syn. shale-barrens (Wherry 1930, 43; Henry 1933, 65), shale bank (Artz 1937, 45), shale slope (Wherry 1929, 104)

cf. ²community: heath barren

Comments: Shale barrens in the U.S. occur in states including Colorado, Kentucky, Maryland, Montana, Pennsylvania, Virginia, and West Virginia (Steele 1911, Bittner et al. 1998, Kentucky State Nature Preserves Commission 2000, Maryland–National Capital Park and Planning Commission 2001). A forested shale barrens in Montgomery County, Maryland is on Triassic shale. The shale barrens in the Ridge-and-Valley Province of the Eastern U.S. are primarily on Devonian shale, and occasionally on Ordovician and Silurian shale (Artz 1937, 45; Platt 1951, 273; Strausbaugh and Core 1978, xviii–xix; Morse 1983). These shale barrens are up to about 20 ha (Keener 1983, 71), and not currently believed to harbor any plant species that is restricted only to them. “Shale barrens” refers to an isolated patch of shale-barrens habitat through all of the patches in this province. Valleys within shale barrens often have heavy clay soil derived from shale and may be covered with forest (Silberhorn 1968, 111–114, pers. obs.). Declivities and uplands harbor a low, open oak-pine forest or shrubs and herbs. A shale barrens’ kind and density of vegetation vary with the aspect of its slope and the direction that it faces which affect moisture availability and rate of organic decomposition. Vegetation is absent on some steep, southerly facing slopes of shale barrens. The sparse vegetation of shale barrens grades into dense forest where conditions are moister (Wherry 1930, 43). [coined by Steele 1911, 359, after the areas of sparse, or no, vegetation in this habitat]

► **“shale-barrens forest”** *n.* Part of a shale barrens that is dominated by more closely spaced trees.

► **“shale-barrens opening”** *n.* Part of a shale barrens that has no plants (except for seeds in its seed bank) or that is dominated by nonwoody plants and has no, or only a few, low woody plants.

► **“shale-barrens woodland”** *n.* Part of a shale barrens that is dominated by more widely spaced trees.

shore *n.* The coast, or land, next to lake, large river, ocean, or sea (Michaelis 1963).

Comment: Shores can be muddy, rocky, or sandy and have particular dominant organisms depending on a shore’s location (Council of Europe Commission of the European Communities 1987, 13).

sink habitat *n.* A habitat in which a population has a net size decrease; contrasted with source habitat (Pulliam 1988, 652; Lewin 1989, 477).

Comments: Pulliam (1988) argues that for many populations, a large fraction of individuals may regularly occur in sink habitats, where within-habitat reproduction is insufficient to balance local mortality; nevertheless, populations may persist in such habitats, being locally maintained by continued immigration from nearby, more-productive source habitats.

source habitat *n.* A habitat that supports a population’s net size increase; contrasted with sink habitat (Pulliam 1988, 652; Lewin 1989, 477).

steppe *n.*

1. One of the vast, comparatively level, treeless plains in Southeastern Europe and Siberia (Oxford English Dictionary 1972, entries from 1671).

Note: Steppe also occurs in Southwestern and Western Asia (Robinson and Challinor 1995, 225).

2. An extensive, usually treeless plain (Oxford English Dictionary 1972, entries from 1837).

See habitat: prairie.

Comment: The Council of Europe Commission of the European Communities (1987, 69) describes steppe woodlands.

[Russian step]

swale *n.*

1. A hollow, low place; especially in the U.S., a moist, or marshy, depression in a tract of land, especially in the midst of rolling prairie (Oxford English Dictionary 1972, entries from 1584).

2. A naturally elongated depression, such as an interdunal trough; contrasted with ditch (Voss 1972, 20).

syn. swail (Michaelis 1963)

[*cf.* Old Norse *svahr*; cool]

swamp *n.*

1. A tract of low-lying ground in which water collects; a piece of wet spongy ground (Oxford English Dictionary 1972, entries from 1624).

syn. bog, marsh (Oxford English Dictionary 1972)

2. A tract of rich soil harboring trees and other vegetation, but too moist for cultivation (Oxford English Dictionary 1972, entries from 1741).

3. A wet wooded area, generally subjected to periodic flooding, as occurs on river flood plains; swamp forest (Voss 1972, 17).

Note: This is a commonly used definition of “swamp.” Current swamp forests are dominated by angiospermous trees, gymnospermous trees, or both. Swamp forests with *Taxodium distichum* (Baldcypress) have “cypress knees” as does this one in Maryland, U.S. (fig. 24). *Rhizophora mangle* (Red Mangrove) occurs in many salt-water swamp forests, including those in Everglades National Park, Florida, U.S. (fig. 25).

syn. swampland (Michaelis 1963)

[*cf.* ²community: forest; habitat: bog, marsh.

[*cf.* Lower German *swampen*, to quake (said of a bog), akin to sump]

swampland See ²community: swamp.

synusia *n.* A habitat of characteristic and uniform conditions (Lincoln et al. 1989). See ²community: synusia.

adj. synusial

thicket *n.* Usually a small, or narrow, area characterized by dense shrubs or small second-growth trees (Voss 1972, 19).

See ²community: thicket.

[Old English *thicct* < *thicce*, thick]

tundra *n.* A vast cold, dry, fairly level, treeless plain, often overlying permafrost, found in Asia, Europe, and North America (Robinson and Challinor 1995, 227).

cf. biome

veld, veldt *n.* An area of open grasslands with scattered shrubs and trees, found in parts of Southern Africa (Robinson and Challinor 1995, 227).

wetland *n.* A low-lying, water-saturated area, such as a bog, marsh, swamp, and swamp forest (Robinson and Challinor 1995, 227).

woodland *n.*

1. Land covered with wood (= trees); a wooded region or piece of ground (Oxford English Dictionary 1972, entries from 869).

2. An area with trees that are less dense than those in a forest (Voss 1972, 19).

cf. ²community: forest, xylum; habitat: bush; shale barren: shale-barren woodland

woods See habitat: forest.

♦ **habitat choice** See habitat selection.

♦ **habitat corridor** *n.* A linear band, or series of “stepping stones,” of undisturbed or secondary habitat that connects two protected regions for a particular species (Buchmann and Nabhan 1996, 247).

♦ **habitat form** *n.* The characteristic growth form of an organism under a particular set of environmental conditions (Lincoln et al. 1985).

syn. ecad (Lincoln et al. 1985)

♦ **habitat fragmentation** *n.* The division of natural ecosystems into patchwork habitats as a result of forestry, land conversion for agriculture, and urbanization (Buchmann and Nabhan 1996, 247).

Comment: Habitat fragmentation often stops an area from supporting its original complement of species and can entirely extirpate populations or species (Buchmann and Nabhan 1996, 247).

♦ **habitat imprinting** See learning: imprinting: habitat imprinting.

♦ **habitat matrioschkas** *n.* The nesting of an organism's habitats within one another (Hanski 2005 in New 2009, 81).

Comment: For example, the pythid beetle *Pytho kolwensis* lives in a particular stage in the decay succession of phloem under detaching bark, within a fallen spruce log with its base above the ground, within a spruce-mire forest with high temporal continuity of fallen logs, within a spruce-dominated forest, within a boreal forest (New 2009, 81). The first two are microhabitats, and the last three are macrohabitats.

[*matrioschka*, Russian nested, wooden, egg-shaped doll]

♦ **habitat preference** *n.* A measure of the degree to which an organism chooses one habitat over another (Johnson 1980 in Kramer et al. 1995, 3).

♦ **habitat saturation** *n.* The point on a continuum when all of a population's suitable territories are occupied and defended (Brown 1987, 300).

♦ **habitat selection** *n.* An animal's nonrandom use of space that results from its voluntary movements in its environment (Kramer et al. 1995, 3).

See selection: habitat selection.

syn. habitat choice (Kramer et al. 1995, 3)

Comments: When we do not know the role of an organism's active habitat selection in relation to other processes, we should use “habitat correlation” or “habitat use” (Kramer et al. 1995, 3). An animal's movements range from simple locomotor, or settlement responses, through behaviorally-sophisticated decisions, *q.v.*, concerning its allocation of time to different parts of its familiar home range. Organisms move only slightly through thousands of kilometers when selecting their habitats, and they may move over a broad range of environmental complexity.

♦ **habituation** *n.*

1. A person's making a behavior habitual; forming an action into a habit (Oxford English Dictionary 1972, entries from 1449).
2. A person's becoming accustomed to something (Oxford English Dictionary 1972, entries from 1816).
3. A mechanism that lowers the responsiveness of each specific behavioral pathway of an individual animal to its particular integrated input; distinguished from adaptation (Gould 1982, 84).
4. An animal's becoming dependent on a drug (Immelmann and Beer 1989, 127).

See learning: habituation.

cf. ³adaptation

syn. adaptation (not a preferred synonym according to Verplanck 1957)

♦ **habitudinal segregation** *n.* The separation and consequent reproductive isolation of organism populations that occupy different habitats (Lincoln et al. 1985).

♦ **habitus** See habit.

♦ **Haeckel's law** See law: biogenetic law.

♦ **Haeckel's laws of heredity** See -genesis: biogenesis.

♦ **haematobium** *n.* An organism that lives in blood (Lincoln et al. 1985).

cf. parasitism: haemoparasitism; -troph-: hemotroph

♦ **haematocryal** See -therm: poikilotherm.

♦ **haematocytozoon** See -zoon: haematocytozoon.

♦ **haematogenesis** See -genesis: haematogenesis.

♦ **haematherm** See -therm: haematherm.

♦ **haematozoon** See zoon: haematozoon.

♦ **haemocoelous viviparity** See -parity: viviparity: haemocoelous viviparity.

♦ **haemoglobin** See molecule: hemoglobin.

♦ **haemoparasitism** See parasitism: haemoparasitism.

♦ **haemophage** See -vore: sanguivore.

♦ **haemopoiesis** See -genesis: haematogenesis.

♦ **haemotophage** See -vore: sanguivore.

♦ **haemotroph** See -troph-: haemotroph.

♦ **Hagedoorn effect** See effect: Hagedoorn effect.

♦ **Haines index** See index: Haines index.

♦ **hair pulling** *n.* A child's grabbing and pulling on another child's hair during a serious quarrel (Heymer 1977, 81).

♦ **Haldane's evolutionary unit** See unit of measure: darwin.

♦ **Haldane's exclamation** *n.* Supposedly when the great British evolutionist J. B. S. Haldane was asked if he would give his life for his brother, he responded: “Not for one, but for three brothers ... or nine cousins” (Daly and Wilson 1983, 30).

Comment: He seems to have meant that on the average his genome is genetically equivalent to two full brothers or eight full cousins so sociobiologically speaking, he should be willing to give up his life for more than

- two (at the least three) full brothers or more than eight (at the least nine) full cousins.
- ♦ **Haldane map distance** See distance: Haldane map distance.
- ♦ **Haldane's rule** See law: Haldane's law.
- ♦ **half sib, half-sib** *n.* Organisms that share only one parent (Lincoln et al. 1985).
- ♦ **half sister** See sister: half sister.
- ♦ **hali-, halo** *comb. f.* Of, or relating to, salt (Michaelis 1963). Before vowels, hal-.
[Greek, *hals, halos*, salt, the sea]
- ♦ **halibios** See -bios: halibios.
- ♦ **halicole** See -cole: halicole.
- ♦ **-haline** *comb. f.* Referring to salt.
- euryhaline** *adj.* Referring to an organism that is tolerant of a wide range of salinities (Lincoln et al. 1985).
syn. eurycladous, polyhalophilic (Lincoln et al. 1985)
- holeuryhaline** *adj.* Referring to an organism that freely inhabits fresh, sea, and brackish water, or that has established populations in all three environments (Lincoln et al. 1985).
- oligohaline** *adj.* Referring to an organism that tolerates only a moderate range of salinities (Lincoln et al. 1985).
- polystenohaline** *adj.* Referring to an organism that inhabits only oceanic waters of relatively constant high salinity (Lincoln et al. 1985).
- stenohaline** *adj.* Referring to an organism that tolerates only a narrow range of salinities (Lincoln et al. 1985).
- ♦ **haliplankton** See plankton: haliplankton.
- ♦ **halobenthos** See ²community: benthos: halobenthos.
- ♦ **halobiont** See -biot: halobiont.
- ♦ **halobios** See -bios: halobios.
- ♦ **halocline** See -cline: halocline.
- ♦ **halodrymium** See ²community: halodrymium.
- ♦ **halolimnetic, halolimnic** *adj.* Referring to a marine organism that is adapted to live in fresh water (Lincoln et al. 1985).
- ♦ **halophile** See ¹-phile: halophile.
- ♦ **halophobe** See -phobe: halophobe.
- ♦ **haloplankton** See plankton: haloplankton.
- ♦ **halosphere** See -sphere: halosphere.
- ♦ **haloxenic** See -xenic: haloxenic.
- ♦ **hamabiosis** See -biosis: hamabiosis.
- ♦ **hamation** See display: wing display: hamation.
- ♦ **Hamilton's condition for evolution of altruism** See rule: Hamilton's rule.
- ♦ **Hamilton's inclusive-fitness theory** See ³theory: kin selection theory.
- ♦ **Hamilton's rule** See rule: Hamilton's rule.
- ♦ **hammock** See habitat: hammock.
- ♦ **hand axe** See tool: hand axe.
- ♦ **hand-pairing** *n.* A person's causing a male and female butterfly to copulate by placing their abdomen posteriors together (New 2009, 178).
Comment: This technique works with some species in Hesperiidae, Nymphalidae, and Pieridae and can be an important part of captive rearing of threatened and endangered species (New 2009, 178).
- ♦ **hand patting** *n.* In human babies beginning at 9 months of age: An individual's begging movements involving smacking or patting hands together (Heymer 1977, 81).
- ♦ **hand-rearing** See fostering.
- ♦ **handedness** *n.*
1. For example, in some rodent and primate species including Humans: An individual's preference for using one front hand, or paw, rather than its other, for manipulating certain objects (Michaelis 1963; Lewin 1986, 115; Deneberg 1981 in Güntürkün et al. 1988, 602).
syn. foot preference, footedness (Güntürkün et al. 1988, 602)
Comment: Vallortigara et al. in Leary (1996) reported handedness in *Bufo bufo* (European Toad) and *Bufo marinus* (Marine Toad).
2. For example, in *Spinus tristis* (American Goldfinches) and several parrot species: An individual's preference for using one foot, rather than its other, for manipulation of certain objects (Friedman and Davies 1938, etc. in Güntürkün et al. 1988, 602).
syn. foot preference, footedness (Güntürkün et al. 1988, 602)
3. In spider wasps (Pompilidae): An individual female's tendency to lay eggs on either the right, or left, side of a host insect (called left-handed and right-handed in Day 1988, 15).
Notes: Trilobite fossils from the Burgess Shale often have bite marks on the right sides of their posterior regions (Babcock and Robison in Browne 1993, 15 June, C1). This trilobite species might have shown "left-handedness" in that it tended to turn to the left when attacked by a crustacean, that the crustacean was "right-handed" in that it attacked left sides of trilobites, or both.
- ♦ **handicap principle** See hypothesis: handicap principle.
- ♦ **Hansen system** See sampling technique.
- ♦ **haphazard sample** See sample: haphazard sample.
- ♦ **haplo-** prefix Simple, single.
- ♦ **haplobiont** See biot: haplobiont.
- ♦ **haplodiploid** See -ploid: haplodiploid.
- ♦ **haplodiploidy** See parthenogenesis: arrhenotoky; -ploidy: haplodiploidy.
- ♦ **haplodiplomeiosis** See meiosis: haplodiplomeiosis.
- ♦ **haplogenesis** See ²evolution: haplogenesis.
- ♦ **haploidy** See -ploidy: haploidy.
- ♦ **haploid effect** See effect: haploid effect.
- ♦ **haploid parthenogenesis** See parthenogenesis: generative parthenogenesis.
- ♦ **haploidy** See -ploidy: haploidy.
- ♦ **haplometrosis** See -metrosis: haplometrosis.
- ♦ **haplont, haplophase** See -plont: haplont.
- ♦ **haplosis** *n.* Establishment of an organism's gametic (haploid) chromosome number, usually by meiosis (Lincoln et al. 1985).
- ♦ **haplotype** See -type, type: haplotype.
- ♦ **haptophobia** See -phobia: haptophobia.
- ♦ **haptobenthos** See ²community: benthos: haptobenthos.
- ♦ **haptotropism** See tropism: stereotropism.
- ♦ **haras, harras** See ²group: haras.
- ♦ **hard inheritance** See inheritance: hard inheritance.
- ♦ **hard science** See study of: science: hard science.
- ♦ **hard selection** See selection: hard selection.
- ♦ **hardware** *n.* The electrical and other parts that comprise a computer, which are distinguished from software (programs) (Lincoln et al. 1985).
- ♦ **hardwoods** See ²community: deciduous forest.
- ♦ **Hardy-Weinberg equilibrium** *n.* Maintenance of more, or less, constant allele frequencies in a population through successive generations (Lincoln et al. 1985).

- syn.* genetic equilibrium (Lincoln et al. 1985)
- ♦ **Hardy-Weinberg law** See law: Hardy-Weinberg law.
- ♦ **harem** *n.*
1. The part of a Mohammedan dwelling-house appropriated to women, constructed so as to secure the utmost seclusion and privacy (Oxford English Dictionary 1972, entries from 1634).
 2. The occupants of a human harem collectively; the female members of a Mohammedan family; especially the wives and concubines collectively of a Turk, Persian, or Indian Mussulman ... (Oxford English Dictionary 1972, entries from 1781).
 3. For example, in some antelope, baboon, langur, and parrot species; many fish, lizard, and monkey species, including *Erythrocebus patas* (Patas Monkey), *Papio hamadryas* (Hamadryas Baboons), and *Theropithecus gelada* (Geladas); Elephant Seals; and Zebras: A stable and lasting group of females guarded by a male that prevents other males from mating with them (Wilson 1975, 137, 585; Immelmann and Beer 1989, 128).
- Comment:* Some workers feel that “harem” is a sexist term and prefer the synonyms “one-male social unit” (Gowaty 1982), “single-male group” (Immelmann and Beer 1989, 195), and “unimale society.” [Arabic *haram*, prohibited or unlawful, that which a man defends and fights for, as his family, a sacred place, sanctuary, enclosure; the women’s part of the house; wives, women ...]
- ♦ **harem polygyny** See mating system: polygyny.
- ♦ **harm avoidance** See need: harm avoidance.
- ♦ **harmonious development of the type** *n.* The concept that transitional species, e.g., *Australopithecus* spp., should have traits that are at approximately the same level of derivedness from a common ancestor (Mayr 1982, 613).
- Comment:* This concept was a major dogma of idealistic morphology (Mayr 1982, 613).
- ♦ **harmosis** *n.* An organisms’ total response to a stimulus, comprising both reaction and adaptation (Lincoln et al. 1985). *cf.* response, taxis
- ♦ **photoharmosis** *n.* An organism’s response to light (Lincoln et al. 1985). *cf.* taxis: phototaxis
- ♦ **harpactophage** See -phage: harpactophage.
- ♦ **hart** See animal names: hart.
- ♦ **hatch** See ²group: hatch.
- ♦ **hauling grounds** *n.* The place where male pinnipeds (e.g., Elephant Seals or Sea Lions) congregate on shore (Wilson 1975, 297).
- ♦ **hawk-dove game, hawk-dove-assessor game, hawk-dove-bourgeois game** See game (table).
- ♦ **hawking** See feeding: hawking.
- ♦ **HBEF** See place: Hubbard Brook Experimental Forest.
- ♦ **h_B^2** See heritability in the broad sense.
- ♦ **head** See ²group: head.
- ♦ **head flagging** See behavior: head flagging.
- ♦ **head lunge** See behavior: head lunge.
- ♦ **head mimicry** See mimicry: automimicry: body-self mimicry: head mimicry.
- ♦ **head-neck dipping** See behavior: head-neck dipping.
- ♦ **head nodding** See behavior: head nodding.
- ♦ **head scratching** See behavior: head scratching.
- ♦ **head-up-tail-up behavior** See behavior: head-up-tail-up behavior.
- ♦ **heart-weight rule** See law: Hesse’s rule.
- ♦ **heat** See estrus.
- ♦ **“heat defense”** See behavior: defensive behavior: “heat defense.”
- ♦ **heath, heathland** See habitat: heathland.
- ♦ **heath barren** See ²community: heath barren.
- ♦ **Hebb-Williams test** See test: Hebb-Williams test.
- ♦ **hebetism** *adj.* Referring to adolescence (Lincoln et al. 1985). *syn.* juvenile (Lincoln et al. 1985)
- ♦ **Hebb’s rule** See rule: Hebb’s rule.
- ♦ **hedonic** *n.* Referring to factors that stimulate sexual activity (Lincoln et al. 1985).
- ♦ **hekistoplankton** See plankton: hekistoplankton.
- ♦ **helcotropism** See tropism: geotropism.
- ♦ **heleoplankton** See plankton: heleoplankton.
- ♦ **helio-** *comb. f.* Sun; of the Sun (Michaelis 1963). Before vowels, “heli-.” [Greek *hēlios*, the Sun]
- ♦ **heliophile** See ¹-phile: heliophile.
- ♦ **heliophobe** See -phobe: heliophobe.
- ♦ **heliophytum** See ²community: heliophytum.
- ♦ **heliotaxis** See taxis: heliotaxis.
- ♦ **heliotherm** See therm: heliotherm.
- ♦ **heliotropism** See tropism: heliotropism.
- ♦ **helioxerophile** See ¹-phile: helioxerophile.
- ♦ **helium** See ²community: helium.
- ♦ **helminthology** See study of: helminthology.
- ♦ **helobius** See uliginous.
- ♦ **helodium** See ²community: helodium.
- ♦ **helodrium** See ²community: helodrium.
- ♦ **helohyllum** See ²community: helohyllum.
- ♦ **helohylophilie** See ¹-phile: helohylophilie.
- ♦ **helolochmophile** See ¹-phile: helolochmophile.
- ♦ **helolochmum** See ²community: helolochmum.
- ♦ **helophile** See ¹-phile: helophile.
- ♦ **helorgadium** See ²community: helodium.
- ♦ **helorgadophile** See ¹-phile: helorgadophile.
- ♦ **helotism** See parasitism: social parasitism: slavery.
- ♦ **helper** *n.*
1. A person who helps or assists; an auxiliary (Oxford English Dictionary 1972, entries from 1300).
 2. For example, in *Aphelocoma coerulescens* (Florida Scrub Jays), *Lycaon pictus* (African Wild Dogs), and *Vulpes vulpes* (Red Foxes): An individual that performs parent-like behavior toward young, or potential young (for example, in nest building), that are not its own (Skutch 1935, 1961 in Brown 1987, 301; Wilson 1975, 452; Henry 1993, 44–45). *Notes:* This definition excludes “flocking” and “alarm calling” in winter flocks. In this definition, “helping” is not necessarily beneficial toward conspecific animals (Brown 1987, 301).
 3. An animal that performs parent-like behavior toward young that are not its own offspring, typically in company with the young’s parents; thus, helping excludes brood parasitism and brood capture (Brown 1987, 300–302). *Note:* A helper may, or may not, benefit its helped young or its parents; helpers may be altruistic, cooperative, or selfish. *cf.* Animalia: Phylum Chordata: Class Aves: *Aphelocoma coerulescens* (Appendix 1) *syn.* alloparent, attendant, associate, auxiliary, secondary, supernumerary (Brown 1987, 300–302, questions

the need for all these synonyms and discusses meanings of some of them.)

♦ **helping behavior, help, helping** See behavior: helping behavior.

♦ **hemerophile** See ¹-phile: hemerophile.

♦ **hemi-** prefix Half. Before vowels, "hem-" [Greek *hemi*, half]

♦ **hemiallopoloid** See -ploid: hemiallopoloid.

♦ **hemiautopoloid** See -ploid: hemiautopoloid.

♦ **hemichimonophile** See ¹-phile: hemichimonophile.

♦ **hemiclone** See clone: hemiclone.

♦ **hemiedobiotic** See -biotic: hemiedobiotic.

♦ **hemigamy** See -gamy: hemigamy.

♦ **hemikaryon** See -karyon: hemikaryon.

♦ **hemikaryotic** See -karyotic.

♦ **hemilectic** See -tropic: hemitropic.

♦ **hemimetabolous metamorphosis, hemimetaboly, hemimetamorphy** See metamorphosis: hemimetabolous metamorphosis.

♦ **hemiparasite** See parasite: hemiparasite.

♦ **hemipenis** See organ: copulatory organ: hemipenis.

♦ **hemiphile** See ¹-phile: hemiphile.

♦ **hemiplankton** See plankton: hemiplankton.

♦ **hemiploid** See -ploid: hemiploid.

♦ **hemitropic** See -tropic: hemitropic.

♦ **hemizygoid parthenogenesis** See parthenogenesis: hemizygoid parthenogenesis.

♦ **hemizygous** See -zygous: hemizygous.

♦ **hemlock-hardwoods** See ²community: deciduous forest.

♦ **hemoglobin** See molecule: hemoglobin.

♦ **hemophobia** See -phobia: hemophobia.

♦ **HENNIG-86** See program: HENNIG-86.

♦ **Hennigian systematics** See study of: systematics: phylogenetic systematics.

♦ **Hennig's progression rule** See law: progression rule.

♦ **hepaticology** See study of: hepaticology.

♦ **herbalist** *n.*

1. A person who deals in herbs, especially medicinal ones; one who prepares or administers herbal remedies (Oxford English Dictionary 1972, entries from 1592; Michaelis 1963).

2. A person who is knowledgeable about herbs or plants; a collector or writer on plants; a botanist; now used to refer to early botanical writers (Oxford English Dictionary 1972, entries from 1594).

v.i. herbalize (archaic)

♦ **herbicide** See -cide: pesticide.

♦ **herbicole** See -cole: herbicole.

♦ **herbivore** See -vore: herbivore.

♦ **herbosa** See ²community: herbosa.

♦ **hercogamous** See -gamous: hercogamous.

♦ **herd** See ²group: herd.

♦ **herd instinct** See drive: bonding drive.

♦ **'herding** *n.*

1. Individual animal's going into, or forming, a herd (Oxford English Dictionary 1972, entries from 1392).

2. A person's joining a band, or company, of others; becoming part of a faction or a party; an individual's being one of the "common herd" or crowd (Oxford English Dictionary 1972, entries from 1400).

cf. *harem*

♦ **²herding** *n.*

1. A person's tending Domestic Cattle or Domestic Sheep (Oxford English Dictionary 1972, entries from 1400).

2. For example, in bovids and cervids: A male's gathering females during "harem" formation and retention (Darling 1937 in Heymer 1977, 86).

3. An individual ant's causing an ant-cow (aphid) to move to a particular place (Ross 1985).

♦ **hereditary** *adj.*

1. Referring to a trait that is transmitted from parents to offspring (Oxford English Dictionary 1972, entries from 1597).

2. Referring to a trait that has a genetic basis (Lincoln et al. 1985).

♦ **heredity** *n.*

1. An offspring's inheriting the nature and characteristics of its parents and ancestors in general; the tendency of like organisms to beget like organisms (Oxford English Dictionary 1972, entries from 1863).

2. The mechanism of transmission of specific characters from parent to offspring (Lincoln et al. 1985). [Latin *herre*, *hereditis*, heir]

♦ **¹heritability** *n.*

1. A trait's capacity of being inherited (Lincoln et al. 1985).

2. A measure of the degree of resemblance of an offspring with its parents due to genes they hold in common (Wade 1992, 149).

3. Additive genetic variance (*q.v.*).

See ²heritability: heritability in the narrow sense.

♦ **²heritability (h²)** *n.*

1. A fraction of the observed phenotypic variance of a trait within a population that is caused by the trait's genetic variance (Lush 1937 in Feldman 1992, 151; Wilson 1975, 68, 586).

2. The degree to which the phenotypic variation of a trait in a population is determined by the trait's genetic variation (Alstad 2005).

syn. heritability of a character (Wilson 1975, 68), *b*² (Hartl 1987, 228)

Comments: Heritability is abbreviated as *h*², not *h*, because heritability is a variance, a standard deviation squared. "To my knowledge the word 'heritability' first appears in *Animal Breeding Plans* by J. L. Lush (1937)" (Feldman 1992, 151). A heritability estimate is specific to a real population with a particular history of natural selection and a specific environment in which the population exists. Researchers classify heritability (in the general sense) into broad-sense heritability, narrow-sense heritability, and other kinds of heritability. Broad-sense heritability involves the amount of offspring phenotypic variation caused by additive, dominance, and epistatic variance of the offspring's genes. Narrow-sense heritability, is the the amount of offspring phenotypic variation caused only by the additive variance of the offspring's genes. Feldman (1992) also discusses "cultural heritability," "genetic heritability," and "realized heritability." Different authors write the parts of the formula differently. For example, some authors write *h*² as *b*², *V_a* as *V_A* or *V_a*, and so forth. I standardized the symbols in the heritability definitions in this book.

♦ **broad-sense heritability (h_b²)** *n.* The proportion that genetic variance contributes to the total phenotypic variance" in a population; $h_b^2 = V_g/V_t = V_g/(V_g + V_e)$; where *V_g* is the genetic contribution to a population's total variation; *V_t*, the total phenotypic variation; and

V_e, the proportion that the environmental variation contributes to the total phenotypic variation (Feldman 1992, 154; Alstad 2005).

syn. degree of genetic determination (Falconer 1960 in Feldman 1992, 154); heritability in the broad sense, coefficient of genetic determination, CGD, h^2 (Dewsberry 1978, 121)

Comment: A heritability score of 1 means that all of the variation has a genetic basis; a score of 0 means that all of the variation is due to a population's environment.

narrow-sense heritability (h_n^2) *n.* Heritability measured as the fraction of total phenotypic variance from only additive genetic effects; $h_n^2 = V_a/V_t$; where V_a is additive genetic variance, and V_t is total, or phenotypic, variance in a group (Falconer 1960, 135,); where $V_t = V_a + V_d + V_i + V_e$, and V_a = the additive variance, V_d = the dominance variance, V_i = the epistatic variance, and V_e = the environmental variance (Feldman 1992, 154; Alstad 2005).

cf. variance: additive genetic variance

syn. heritability (Falconer 1960, 135); heritability in the narrow sense, true heritability, (h^2) (Dewsberry 1978, 122)

Comments: Narrow-sense heritability excludes genetic variation due to dominance, epistasis, and environment; narrow-sense heritability is estimated by the variance in breeding values (Wade 1992, 150). Different authors write the parts of the formula differently. The heritability simulation in Populus (Alstad 2005) computes the h_n^2 of a quantitative trait in a hypothetical infinitely large population and also simulates a Monte Carlo breeding experiment to estimate heritability in a finite population.

realized heritability *n.* Heritability, $h^2 = (\text{mean } S)/(\text{mean } R)$, that is estimated from empirical data; where R = the response to selection; S = the selection differential (Hartl 1987, 228).

♦ **heritage** *n.* Characters, or parts, of organisms that no longer have function, have reduced function, or malfunction, but are still extant, e.g., in Humans, the appendix, vulnerable sacroiliac joint, and poorly built sinuses (Gregory 1913, 1936 in Mayr 1982, 590).

♦ **herkogamy** See -gamy: herkogamy.

♦ **herkogamous** See -gamous: hercogamous.

♦ **hermaphrodite** *n.*

1. In some mammals including Humans: An individual with parts of both sexes that are really, or apparently, combined (Oxford English Dictionary 1972, entries from 1398).

2. In animals, including many mollusc and worm species: An individual that normally has both male and female sexual organs (Oxford English Dictionary 1972, entries from 1727).

3. In the majority of flowering-plant species: A single flower, or plant, that bears both stamens and pistils (Oxford English Dictionary 1972, entries from 1727). *syn.* cosexual (for plants Lloyd 1980 in Policansky 1987), monoclinous flower

4. In many organism species: An individual that has both female and male sex organs simultaneously or sequentially (Wilson 1975, 586).

Note: Some hermaphrodites, such as many species of plants, can self-fertilize themselves (Willson 1985, 55).

5. A single flower (in contrast to an individual plant) that has both female and male parts (Policansky 1987, 468).

Note: With regard to plants, Policansky (1987, 468) restricts the meaning of "hermaphrodite" to this definition. Thus, to him "sequential hermaphroditism" does not make sense for a plant. He prefers the term "sequential cosexuality" (instead of "sequential hermaphroditism") for both plants and animals.

cf. chimera; gonochorism; hermaphrodisim; -oecism; dioecism; mosaic

adj. hermaphrodite, hermaphroditic

[Greek *Hermes* + *Aphrodite*]

consecutive hermaphrodite *n.* In some organ-ism species: An individual that is either a protogynous, or protandrous, hermaphrodite (Lincoln et al. 1985).

syn. sequential hermaphrodite (Lincoln et al. 1985)

cf. hermaphrodite: simultaneous hermaphrodite

Comment: In some fish species, consecutive hermaphroditism occurs in which small individuals of a group are functional females and the largest female undergoes a sex change to become a male when the current male of a group dies or is removed (Wittenberger 1981, 621).

► **protogynous hermaphrodite** *n.*

1. For example, in parrot fish, wrasses (fish): A hermaphrodite that is first a female then a male (Policansky 1987, 468).

syn. metandric hermaphrodite (as an adjective in Lincoln et al. 1985)

2. In some plant species, e.g., some aroid species: An individual plant whose female flowers open before its male flowers (Policansky 1987, 468).

adj. protogynous hermaphrodisim, sex reversal

cf. gyny: protogyny

► **protandrous hermaphrodite** *n.*

1. For example, in anemone fish, *Crepidula* sp. (slipper-shell): A hermaphrodite that is first a male then a female (Barnes 1974, 362; Policansky 1987, 468).

2. In some plant species: An individual whose male flowers open before its female flowers (Policansky 1987, 468).

adj. sex reversal

simultaneous hermaphrodite *n.* For example, in many plant species; ctenophores, earthworms, slugs; snails; some parasite, zooplankter, scale-insect, serranid-bass, and tetrapod-vertebrate species; a few hydra species: A hermaphrodite that is functionally both a male and a female at the same time (Barnes 1974, 94, 141; Thornhill and Alcock 1983; E. A. Fischer, pers. comm.)

syn. synchronous hermaphrodite (Lincoln et al. 1985)

♦ **hermaphroditism** *n.* An organism's being a her-

maphrodite (*q.v.*).

syn. androgyny, bisexuality

consecutive hermaphroditism *n.* An organ-ism's being a consecutive hermaphrodite (*q.v.*).

syn. gender change, sequential cosexuality (Policansky 1987, 468); consecutive sexuality, sequential her-

maphrodisim, sex reversal (Lincoln et al. 1985)

progesterin-induced hermaphroditism *n.* In

some mammal species: Masculization of a female's appearance due to an experimenter's administering progestins to her to help her maintain her pregnancy (Dewsberry 1978, 231).

cf. adrenogenital syndrome, testicular feminization

pseudohermaphrodisim, pseudogonochorism

n. In consecutive hermaphrodites: The condition in which either male, or female, gonads are normally found, and a hermaphrodite gonad occurs at sex reversal (Lincoln et al. 1985).

- simultaneous hermaphroditism** *n.* An organism's being a simultaneous hermaphrodite (*q.v.*) (Lincoln et al. 1985).
syn. synchronous hermaphroditism (Lincoln et al. 1985)
- ◆ **heronry** See ²group: heronry.
- ◆ **herpesian** *adj.* Referring to amphibians and reptiles (Lincoln et al. 1985).
- ◆ **herpetogeny** See -geny: herpetogeny.
- ◆ **herpetology** See study of: herpetology.
- ◆ **herpism** *n.* Creeping locomotion of protists employing pseudopodia (Lincoln et al. 1985).
- ◆ **herpobenthos** See ²community: benthos: herpobenthos.
- ◆ **herpon** *n.* "Crawling organisms" (Lincoln et al. 1985).
- ◆ **hertz** See unit of measure: hertz.
- ◆ **Herrnstein's principle of quantitative hedonism** See principle: Herrnstein's principle of quantitative hedonism.
- ◆ **hesmosis** See swarming: budding.
- ◆ **Hesse's rule** See law: Hesse's rule.
- ◆ **heteracme** See -gamy: dichogamy.
- ◆ **heterauxesis** See auxesis: heterauxesis.
- ◆ **hetereocism** See -oecism: hetereocism.
- ◆ **heteroecious parasite** See parasite: heteroxenous parasite.
- ◆ **hetero-** *comb.f.* Other; different; opposed to homo- (Michaelis 1963).
Before vowels, "heter-."
[Greek *hetero* < *heteros*, other]
- ◆ **heteroallellic** *adj.* Referring to genes that have mutations at different mutational sites (Lincoln et al. 1985).
cf. homoallellic
- ◆ **heterobathmy of characters** *n.* The mosaic distribution of relatively ancestral and relatively derived characters in related species and species groups (Lincoln et al. 1985).
- ◆ **heterobrachial inversion** See inversion: paracentric inversion.
- ◆ **heterocannibalism** See cannibalism: heterocannibalism.
- ◆ **heterochromatic coloration, heterochrome coloration** See coloration: gynochromatypic coloration.
- ◆ **heterochromatism** *n.* Color change (Lincoln et al. 1985).
- ◆ **heterochromosome** See chromosome: allochromosome.
- ◆ **¹heterochrony** *n.* The appearance of a particular fauna, or flora, in two different regions at different times (Lincoln et al. 1985).
- ◆ **²heterochrony** *n.*
1. A change in timing of one organ's development relative to others in an individual organism
[coined by Haeckel 1905 in Gould 1992, 161].
Note: Haeckel considered heterochrony to be a disruption and falsification of his biogenetic law (*q.v.*) (Gould 1992, 161).
 2. Phyletic change in developmental onset, or timing, so that the appearance of, or rate of development, of a feature in a descendant's ontogeny is either accelerated, or retarded, relative to the appearance, or rate of development, of the same feature in an ancestor's ontogeny (De Beer 1930 9, 24 in Gould 1992, 160; Gould 1977, 222, 482).
- Note:* Haeckel's definition of heterochrony became obsolete, but his term lived on due to de Beer's definition (Gould 1992, 165).

SOME KINDS OF HETEROCHRONY

- I. acceleration
- II. hypermorphosis
- III. merostasis
- IV. neoteny
- A. hysterotely
- B. metathetely
- V. paedomorphosis
- VI. progenesis, including prothetely
- VII. retardation

adj. heterochronic, heterochronous

cf. -genesis: cenogenesis, -morphosis: peramorphosis

acceleration *n.* "A speeding up of development in ontogeny (relative to any criterion of standardization), so that a feature appears earlier in the ontogeny of a descendant than it did in an ancestor" (De Beer 1930, 37–38 in Gould 1977, 226, 479); contrasted with retardation.

hypermorphosis *n.* Evolutionary extension of an organism's ontogeny beyond its ancestral termination (usually to larger body sizes and increased complexity of differentiating organs) that results in recapitulation because ancestral adult stages are now intermediate stages of a lengthened descendant ontogeny (De Beer 1930, 37–38 in Gould 1977, 228, 482; Futuyma, 416).

merostasis, partial paedomorphosis *n.* "Possession of a small number of juvenile characters in an otherwise adult organism" (Lincoln et al. 1985).

neoteny *n.*

1. Paedomorphosis (evolutionary retention of formerly juvenile characters by adult descendants) that is produced by retardation of somatic development (Kollmann 1885 and Giard 1887 in Gould 1977, 227–228, 483).

syn. neoteinia, neotenia, neoteny, superlarvation (Lincoln et al. 1985)

2. Evolution in which an animal's bodily development is slowed relative to its development of sexual maturity, resulting in reproduction practiced by animals that resemble juvenile stages of their ancestral forms (Dawkins 1982, 291) (*e.g.*, in salamanders that breed in their tadpole stage).

syn. palaeogenesis (Lincoln et al. 1985)

n. neotene

adj. neotene, neoteinic, neotenous

cf. axolotl (Appendix 1); -genesis: paedogenesis; ²heterochrony: progenesis; -morphosis: paedomorphosis

Comments: Some major steps in evolution (*e.g.*, the origin of the Vertebrates and Humans, may have occurred through neoteny (Gould, 1977; Dawkins 1982, 291). Teddy bears and several cartoon heroes, including Mickey Mouse and Pogo have undergone a process similar to neoteny (Morris et al. 1995, 1697). De Beer (in Gould 1977, 227) uses "neoteny" to describe both acceleration of gonads and retardation of somatic characters. Futuyma (1986, 554) classifies "neoteny" as a kind of "heterochronic evolution."

[coined by Kollmann (1905 in Gould 1977, 356)]

► **hysterotely** *n.* In some insect species: Neoteny in which a species retains larval characteristics in its pupal, or adult, stages, or pupal characteristics in adults (Singh-Pruthi 1924; etc. in Gould 1977, 304; Lincoln et al. 1985).

- syn.* metathetely (Gould 1977, 304; Lincoln et al. 1985), neoteny (Gould 1977, 304)
- **metathetely** *n.* In some insect species: Neoteny in which a species retains some juvenile characteristics in adults that have undergone a normal number of molts (Lincoln et al. 1985).
- paedomorphosis** *n.* Retention of juvenile characters of ancestral forms by adults, or later ontogenetic stages of their descendants (Garstang 1928, 62 in Gould 1977, 227, 484).
syn. paedomorphism, pedomorphism, superlarvation (Lincoln et al. 1985)
cf. -genesis: paedogenesis; ²heterochrony: merostasis
Comment: Gould (1977, 227) uses “paedomorphosis” to specify the common result of both progenesis and neoteny—the appearance of ancestors’ youthful characters in later ontogenetic stages of their descendants. This is faithful to Garstang’s (1928, 62) meaning.
[New Latin < Greek *pais*, *paidos*, child + *morphosis*, shaped like]
- progenesis** *n.* For example, in some parasitic-crustacean and salamander species; possibly in the extinct Isorophid Echinoderms: Paedomorphosis (evolutionary retention of formerly juvenile characters by adult descendants) that is produced by precocious sexual maturation of an organism still in a morphologically juvenile stage (Futuyma 1986, 418–419; Giard 1887 in Gould 1977, 228, 485).
syn. pedogenesis, paedogenesis (confusing synonyms, Lincoln et al. 1985)
See -genesis: pedogenesis
cf. neoteny
- **prothetely** *n.* In some insect species: A kind of progenesis that has accelerated sexual maturation and results in an adult with larval, or pupal, characters (Lincoln et al. 1985).
- retardation** *n.* A decrease in an organism’s speed of ontogenetic development so that a given feature appears later in a descendant’s ontogeny than its ancestor’s ontogeny (Lincoln et al. 1985); contrasted with acceleration.
- ♦ **heterodichogamy** See -gamy: heterodichogamy.
- ♦ **heterodynamic** *adj.*
 - Referring to a life cycle composed of two, or more, distinct forms, or stages, that exhibit dissimilar biological activity (Lincoln et al. 1985).
 - Referring to a gene that simultaneously effects different developmental processes (Lincoln et al. 1985).*cf.* homodynamic
See hybrid: poikilodynamic hybrid.
- ♦ **heterofacial** *adj.* Having regional character differentiation (Lincoln et al. 1985).
- ♦ **heterogameon** See ²species: heterogameon.
- ♦ **heterogamete** See gamete: heterogamete.
- ♦ **heterogametic** See -gametic: heterogametic.
- ♦ **heterogametic sex** See sex: heterogametic sex.
- ♦ **heterogamet** See sex determination.
- ♦ **heterogamy** See -gamy: heterogamy.
- ♦ **heterogen** See -genetic: heterogenetic.
- ♦ **heterogeneous-nuclear RNA** See nucleic acid: ribonucleic acid: heterogeneous-nuclear RNA.
- ♦ **heterogeneous summation** See law: law of heterogeneous summation.
- ♦ **heterogenesis** See -genesis: heterogenesis.
- ♦ **heterogenetic** See -genetic: heterogenetic.
- ♦ **heterogenetic parasite** See parasite: heterogenetic parasite.
- ♦ **heterogenic** See -genic: heterogenic.
- ♦ **heterogonic** life cycle See life cycle: heterogonic life cycle.
- ♦ **heterogony** *n.* The false belief that seeds of one species of plant could germinate into another species of plant (Mayr 1982, 254).
syn. allometry (in some cases) (Lincoln et al. 1985)
See -gamy: heterogamy; mating: disassortative mating; parthenogenesis: heterogony.
Comment: Aristotle, Theophrastus, and others believed in heterogony (Mayr 1982, 254).
- ♦ **heterograft, xenograft** *n.* Tissue transplanted from an organism to a heterospecific organism (Lincoln et al. 1985).
- ♦ **heterogynistic character** See character: heterogynistic character.
- ♦ **heterogynous** See -gynous: heterogynous.
- ♦ **heterogyny** See -gyny: heterogyny.
- ♦ **heteromesogamic species** See ²species: heteromesogamic species.
- ♦ **heterometabolic metamorphosis** See metamorphosis: hemimetabolic metamorphosis, paurometabolous metamorphosis.
- ♦ **heteromorphic, heteromorphous** See -morphic: heteromorphic.
- ♦ **heteromorphic coloration** See coloration: gynochromatypic coloration.
- ♦ **heteromorphosis** See -morphosis: heteromorphosis.
- ♦ **heteromorphous coloration** See coloration: gynochromatypic coloration.
- ♦ **heteroparthenogenesis** See parthenogenesis: heteroparthenogenesis.
- ♦ **heterophage** See -phage: heterophage.
- ♦ **heterophasic life cycle** See cycle: life cycle: heterophasic life cycle.
- ♦ **heterophyadic** *adj.* Referring to a genetic polymorphism (Lincoln et al. 1985).
- ♦ **heterophyll** *n.* A plant’s having different leaf shapes (Lewontin 2000, 18–19, illustration).
Comment: Heterophyll occurs in many plant species, and is often related to different developmental stages of an individual plant.
- ♦ **heteroplanobios** See -bios: heteroplanobios.
- ♦ **heteroploid** See -ploidy: heteroploidy.
- ♦ **heteroselection** See selection: heteroselection.
- ♦ **heterosexual** See sexual: heterosexual.
- ♦ **heterosexual pseudocopulation** See copulation: pseudocopulation: heterosexual pseudocopulation.
- ♦ **heterosis** *n.*
 - The superiority of the offspring of a cross between two stocks to either of the stocks (Paul 1992, 166).
syn. hybrid vigor (Paul 1992, 166)
Note: Whaley (1944) protested the growing use of “heterosis” as a synonym for “hybrid vigor;” he felt that “hybrid vigor should denote the manifest effects of heterosis (Paul 1992, 169).
 - The superiority of a heterozygote to homozygotes, e.g., AA’ to either homozygote AA or A'A' (Paul 1992, 166).
syn. heterozygote advantage, overdominance
cf. luxuriance
Comment: Heterosis has two meanings that are frequency confused, or simply fused (Lincoln et al. 1985; Paul 1992, 166). It has been a theory-laden concept since it was named by Shull (Paul 1992, 169). [coined by Shull who considered it free from any hypothesis regarding its cause (1914 in Paul 1992, 166)]

- ♦ **heterospecific** *adj.* Belonging to another species (Lincoln et al. 1985).
cf. conspecific
- ♦ **"heterospecific-avoidance hypothesis"** See female-mate-choice hypothesis: "heterospecific-avoidance hypothesis."
- heterosymbiosis** See symbiosis: heterosymbiosis.
- ♦ **heterotelergone** See chemical-releasing stimulus: semiochemical: allelochemic: allomone.
- ♦ **heterotherm** See -therm: heterotherm.
- ♦ **heterotopic** *adj.* Referring to an organism that occurs in a wide variety of habitats (Lincoln et al. 1985).
- ♦ **heterotopy** *n.* Change in differentiation place within an organism; *e.g.*, reproductive organs' developing from endoderm, or ectoderm, in an ancestral line, and later from mesoderm in a derived line; an obsolete term; contrasted with ²heterochrony (Haeckel 1905 in Gould 1992, 160).
cf. -genesis: cenogenesis
- ♦ **heterotroph** See -troph: heterotroph.
- ♦ **heteroxenousparasite** See parasite: heteroxenous parasite.
- ♦ **heteroxeny** See -xeny: heteroxeny.
- ♦ **heterozon** See zone: heterozone.
- ♦ **heterozygosity** See -zygosity: heterozygosity.
- ♦ **heterozygote** See zygote: heterozygote.
- ♦ **heterozygote superiority** *n.* Balanced polymorphism in which the heterozygote has greater fitness than either homozygote (Wilson 1975, 71).
cf. heterosis
- ♦ **heterozygous** See -zygous: heterozygous.
- ♦ **heterozygous lethal (mutation)** See ²mutation: heterozygous lethal (mutation).
- ♦ **HGP** See project: Human Genome Project.
- ♦ **H horizon** See soil horizon: H horizon.
- ♦ **hibernaculum** *n.* An animal's domicile in which it overwinters or hibernates (Oxford English Dictionary 1972, entries from White 1789).
syn. "winter-quarters" (Lincoln et al. 1985)
- ♦ **hibernal** *adj.* Referring to winter (Lincoln et al. 1985).
syn. hiemal (Lincoln et al. 1985)
cf. aestival, vernal
- ♦ **hibernation** See dormancy: hibernation.
- ♦ **hibernator** *n.* A hibernating animal (Lincoln et al. 1985).
- ♦ **hidden load** See genetic load: hidden load.
- ♦ **hider** *n.* In many ungulate species: A young that leaves its mother and chooses a lying-out place where it spends the greater part of its day away from its mother (Immelmann and Beer 1989, 177).
cf. follower, period: lying out period
Comment: "Hider" is on a continuum with "follower" (Immelmann and Beer 1989, 177).
- ♦ **hidroplankton** See plankton: hidroplankton.
- ♦ **hiemal** See hibernal.
- ♦ **hierarchical model of behavior** See ⁴model: Tinbergen's hierarchical model (of behavior regulation).
- ♦ **hierarchical promiscuity** See mating system: promiscuity.
- ♦ **hierarchy** *n.*
1. A group of persons, or things, arranged in successive orders, or classes, each of which is subject to, or dependent on, the one above it (Oxford English Dictionary 1972, entries from 1643; Michaelis 1963).

2. A series of systematic groupings in graded order: kingdoms, subkingdoms, phyla, subphyla, etc. (Oxford English Dictionary 1972, entries from 1643). See hierarchy: dominance hierarchy.
cf. ²group
- aggregational hierarchy** *n.* An ordered arrangement of units made for convenience in which the lower units are not compounded by any interaction into emerging new higher level units as a whole, *e.g.*, the Linnaean hierarchy of taxonomic categories (Mayr 1982, 65–66).
- central hierarchy** *n.* In *Cynocephalus* baboons, *Macaca mulatta* (Rhesus Macaques), and some species of New World Monkeys: An alliance of males that forms a dominance hierarchy in which males call on each other for support in disputes and, thus, together dominate their troop (Rowell 1969a in Wilson 1975, 598; Immelmann and Beer 1989, 41).
- constitutive hierarchy** *n.* A hierarchy in which the members of a lower level are combined into new units that have unitary functions and emergent properties, *e.g.*, tissues organized into organs (Mayr 1982, 65).
- despotism** *n.* The simplest form of dominance hierarchy, composed of a despot and subordinates which are not of distinctive rank (Wilson 1975, 279).
- dominance hierarchy** *n.*
1. Any group of persons, or things, arranged in successive orders or classes, each of which is subject to, or dependent on, the one above it (Michaelis 1963).
 2. In some bumble-bee, cockroach, crab, crayfish, lizard, paper-wasp, primate, rodent, and *Xiphophorus* (platyfish) species; *Bos primigenius* (Domestic Cattle, dairy-cow herds); *Gallus gallus* (Domestic Chickens); *Rangifer tarandus* (Reindeer); social canids: The physical domination of some members of a group by other members, in relatively orderly and long-lasting patterns; except for the highest and lowest ranking individuals, a given member dominates one, or more, of its companions and is dominated in turn by one, or more, of the others (Huber 1802, Schjelderup-Ebbe 1922, 1923, 1935 in Wilson 1975, 281, 282, 444, 583).
Note: A hierarchy is initiated and sustained by hostile behavior, albeit sometimes of a subtle and indirect nature (Wilson 1975, 281, 282, 444, 583).
 3. The dominance of one member of a group (of two or more members) over another, as measured by superiority in aggressive encounters and order of access to food, mates, resting sites, and other objects that promote survivorship and reproductive fitness (Wilson 1975, 11).
 4. A dominance order, especially in birds (Wilson 1975, 281, 283, 591).
 5. In *Gallus gallus* (Domestic Chickens): A hierarchy involving a despot, or alpha bird, that has priority of access over all others in its flock; a second ranking animal, the beta, has priority of access over all others except the alpha; etc. (Dewsbury 1978, 93).
Note: This hierarchy gives dominant animals priority of access to food, water, roosts, mates, and other resources (Dewsbury 1978, 93).
 6. In monogamous species, especially some bird species: Dominance in which a male of a pair is dominant except during the beginning of his species breeding season when his mate is dominant (Immelmann and Beer 1989, 242).

Note: At least in earlier literature, the highest ranking animal of a hierarchy is designated as the alpha animal; the lowest ranking, the omega animal (Immelmann and Beer 1989, 242).

syn. bunt order, dominance order, dominance system, hierarchy, hook order, peck order (usually refers to birds, now more likely to be used in a colloquial rather than a scientific context, Immelmann and Beer 1989, 216), peck-right hierarchy, pecking order (Immelmann and Beer 1989, 216), rank order, ranking order
cf. hierarchy, rank
 [Late Latin *bieraticus* < Greek rule of a hierarch (sacred ruler)]
 [peck order, coined by Schjelderup-Ebbe 1922 in Heymer 1977, 81]
 7. “A hierarchical form of social organization based on overt or implied aggression. A status system based on agonistic interactions” (Wittenberger 1981, 621).

► **absolute dominance hierarchy** *n.* A dominance hierarchy in which rank order remains the same wherever the group goes and whatever the circumstance (Wilson 1975, 280).

► **biological-rank ordering** *n.* A rank order between (among) members of different species that live in the same area and exploit the same resources, e.g., a watering place or a choice food source (Hediger 1941 in Immelmann and Beer 1989, 243).

► **bunt order** *n.* “Social order or rank in de-horned cattle as determined by aggressive bunting [head butting] of one individual by another” (Woodbury 1941, 419).

► **hook order** *n.* In some species of horned mammals: A social dominance hierarchy (*q.v.*), that is established by aggressive use of horns (Lincoln et al. 1985).

► **linear dominance hierarchy** *n.* A dominance hierarchy in which an alpha animal dominates over all of the group, a beta dominates over all but the alpha, a gamma dominates over all but the first two, etc. (Dewsbury 1978, 93).

► **relative dominance hierarchy** *n.* A dominance hierarchy that changes when a social group moves to a new location or other circumstances change (Wilson 1975, 280).
cf. hierarchy: dominance hierarchy: absolute dominance hierarchy

► **teat order** *n.* For example, in *Felis catus* (Domestic Cats) and *Sus scrofa domestica* (Domestic Pigs): A dominance order that involves the young’s competing for teat positions, that once established, are maintained until weaning (Wilson 1975, 288).

► **territorial hierarchy** *n.* A dominance hierarchy in which higher ranking animals obtain more spacious territories while lower ranking ones obtain less spacious ones (Heymer 1977, 174).

Linnaean hierarchy *n.* A method of classifying organisms into hierarchical taxa such as Domains, Kingdoms, Phyla, Classes, Orders, Family, Genera, and Species (Minelli 1999, 462).
Comment: Some researchers are developing a rank-less classification system (Minelli 1999, 462).
cf. ²group (table)

♦ **hierarchy of needs** *n.* A system in which human needs in lower levels must be satisfied before much attention is devoted to the needs in higher levels; these needs are in order of lower to higher level: hunger

and sleep, safety, belonging to a group and receiving love, next self-esteem, self-actualization, and creativity (Maslow 1954, 1972 in Wilson 1975, 550).
cf. need

- ♦ **higher** See derived.
- ♦ **high diversity** See diversity: high diversity.
- ♦ **high eusociality** See sociality: eusociality.
- ♦ **high-fidelity mimicry** See mimicry: specialized mimicry.
- ♦ **High-Latitude Mode** See oscillation: Antarctic Oscillation.
- ♦ **high-throughput-DNA sequencer** See machine: high-throughput-DNA sequencer.
- ♦ **high-throughput DNA sequencing** See method: high-throughput DNA sequencing.
- ♦ **high-order conditioning** See learning: conditioned learning: high-order conditioning.
- ♦ **high-resolution electrophoresis** See method: electrophoresis: high-resolution electrophoresis.
- ♦ **highly repeated DNA** See nucleic acid: deoxyribonucleic acid: highly repeated DNA.
- ♦ **hilltopping** *n.* In some butterfly, fly, and other insect species: An individual’s flying to the top of a hill, isolated tree, mountain, or other prominence where mates congregate (Alcock 1987; New 2009, 97).
Comments: Male insects of many species patrol or perch in a prominence’s upper areas and approach females that arrive at hilltopping sites (New 2009, 97). Some species are susceptible to human overcollecting at such sites.
- ♦ **hind** See animal names: hind.
- ♦ **hindbrain** See organ: brain: hindbrain.
- ♦ **Hinny** See hybrid: Hinny.
- ♦ **hip thrusting** See behavior: hip thrusting.
- ♦ **hippopotobia** See -phobia: equinophobia.
- ♦ **histogenesis, histogeny** See -genesis: histogenesis.
- ♦ **histogram** See graph: histogram.
- ♦ **histology** See study of: histology.
- ♦ **histone** See molecule: histone.
- ♦ **histophile** See ¹-phile: histophile.
- ♦ **historical biogeography** See study of: geography: biogeography: historical biogeography.
- ♦ **historical cause of phenotypic variation** *n.* Phenotypic variation “from deviant cytoplasmic traits transmitted over a period of two or more generations without benefit of special instructions from the hereditary nucleic acids” (Wilson 1975, 68).
- ♦ **historical mimicry** See mimicry: historical mimicry.
- ♦ **historical zoogeography** See study of: geography: historical zoogeography.
- ♦ **historicism** *n.* One’s “belief that an adequate understanding of the nature of any phenomenon and an adequate assessment of its value are to be gained through considering it in terms of the place which it occupied and the role it played within a process of development” (Mandelbaum 1971, 42 in Mayr 1982, 129).
- ♦ **histozoic** *adj.* Referring to an organism that lives within the tissues of another organism (Lincoln et al. 1985).
syn. parasitic (Lincoln et al. 1985)
- ♦ **histozoite** See -zoite: histozoite.
- ♦ **hit theory** See ³theory: hit theory.
- ♦ **hitch-hiker hypothesis** See hypothesis: hypotheses of the evolution and maintenance of sex: hitch-hiker hypothesis.
- ♦ **hitchhiking effect** See effect: hitchhiking effect.

- ♦ **hive, bee hive** *n.* A human-made container in which a bee colony lives, distinguished from “colony” and “nest” (Michener 1974, 372).
cf. ²group: hive
- ♦ **hive aura, hive odor** See odor: hive aura.
- ♦ **h^2** See heritability: narrow-sense heritability.
- ♦ **hoarding** *n.* A person’s amassing, or putting away, something for preservation, security, or future use, especially money or wealth (Oxford English Dictionary 1972, entries from 1000).
- food hoarding** *n.* For example, in Burying Beetles, Dung Beetles, Harvester Ants; some carabid and rove beetle species; many bee, spider, wasp species; many bird and mammal species, including Humans: An individual’s gathering and storing food reserves for later use (Heymer 1977, 81; Agren et al. 1989, 28; Immelmann and Beer 1989, 110; Vander Wall 1990, 369–372; Clarke and Kramer 1994, 299).
syn. food caching, food storing (Vander Wall 1990, 1)
cf. behavior: caching; food hiding
Comment: Food hoarding appears to be an animal’s means of avoiding starvation during food-shortage periods; it may also be a means for an animal to gain more food from a temporary rich patch than it could immediately consume (Clarke and Kramer 1994, 299).
- **larder hoarding** *n.* An animal’s hoarding food in one to a few dense aggregations to which it makes repeated visits to add food; contrasted with scatter-hoarding (Clarke and Kramer 1994, 299).
Comments: Larder hoarding, in its strictest sense, is an animal’s concentration of all of its cached food in one site (e.g., in *Apis mellifera*, Western Honey Bees) (Vander Wall 1990, 3). Larder hoarding is on a continuum with scatter hoarding. Most larder-hoarding species store food in several discrete, closely spaced sites.
- **scatter hoarding** *n.* An animal’s hoarding food in many, widely dispersed, small caches to which it typically makes only a single visit with food; contrasted with larder-hoarding (Vander Wall 1990, 4; Clarke and Kramer 1994, 299).
Comments: Scatter hoarders include *Myoprocta pratti* (Green Acouchis), *Nucifraga columbiana* (Clark’s Nutcracker), *Peromyscus leucopodus* (White-footed Mouse), *Poecile palustris* (Marsh Tit), and *Sciurus niger* (Fox Squirrel). Many species store their food in both larders and scattered surface caches. These species include some species of chipmunks, flying squirrels, kangaroo rats, and wood mice; *Melanerpes erythrocephalus* (Red-headed Woodpecker); *Peromyscus leucopodus* (White-footed Mouse); *Vulpes vulpes* (Red Foxes) (Vander Wall 1990, 3–4). In *Tamias striatus* (Eastern Chipmunks), scatter-hoarding appears to reduce pilferage of hoarded food by individuals unable to defend a larder and to increase the rate at which subordinate individuals can sequester food from ephemeral patches (Clarke and Kramer 1994, 299).
[coined by Morris (1962) to describe captive Green Acouchis’ tendencies to space their buried food items widely (Vander Wall 1990, 3)]
- ♦ **Hofacker-and-Sadler’s law** See law: Hofacker-and-Sadler’s law.
- ♦ **hol-** var. of *holo-* (*q.v.*)
- ♦ **holandric character, holandry** See character: holandric character.

- ♦ **hold-bottom** *n.* In *Macaca arctoides* (Stump-tailed Macaque): One individual’s pulling another onto its lap, sitting behind it, and clasping its hips, a behavior commonly shown during reconciliation (Waal 1989, 153–154, 163–165).
- ♦ **hold-up** See ³lactation: milk ejection (comments).
- ♦ **holeuryhaline** See -haline: holeuryhaline.
- ♦ **holism** *n.*
1. The philosophical theory that a material object, especially a living organism, has a reality other and greater than the sum of its constituent parts (Michaelis 1963).
 2. The whole is more than the sum of its parts combined with vitalism (*q.v.*) (Smuts 1926 in Mayr 1982, 66).
 3. Definition 2 plus the concept that all physical and biological entities form a single, unified, interacting system (Lincoln et al. 1985).
syn. gestalt (Lincoln et al. 1985), organicism (Mayr 1997, 17)
cf. organicism, reductionism
Comments: Mayr (1997, 17) commented that since the 1920s, “holism” and “organism” have been used interchangeably. “Holism” is not a strictly biological term, because many inanimate systems are also holistic. The more restricted term “organicism” is not more frequently used in biology.
[hol- + -ism]
- extreme holism** *n.* The view that “the world is a single, unanalyzable structure of interactions which cannot be broken down into parts in any way without destroying what is essential to it” (Lewontin 2000, 109).
- obscurantist holism** *n.* The view that a natural system is an indissoluble whole which cannot be understood by taking it apart and studying its parts (inferred from Lewontin 2000, 72).
cf. holism, reductionism
Comment: “Obscurantist holism is both fruitless and wrong as a description of the world” (Lewontin 2000, 111).
- progressive holism** *n.* The idea that an understanding of systemic process in nature can help improve the way in which human societies interact with their natural environments (Jamison 1993, 497).
- ♦ **holo-** *comb. f.* Whole, wholly, complete, entire (Michaelis 1963). Also, before vowels, “hol-.”
[Greek *holos*, whole]
- ♦ **holobenthic** See benthic: holobenthic.
- ♦ **holocoen** See ¹system: ecosystem.
- ♦ **holocyclic** See cyclic: holocyclic.
- ♦ **holocyclic parthenogenesis** See parthenogenesis: holocyclic parthenogenesis.
- ♦ **holoendemic** See ¹endemic: schizoendemic: holoendemic.
- ♦ **hologamodeme** See deme: gamodeme: hologamodeme.
- ♦ **hologamy** See -gamy: hologamy.
- ♦ **hologenesis, theory of** See ²evolution: hologenesis.
- ♦ **holological method** See method: holological method.
- ♦ **hologynous character, hologyny** See character: hologyny.
- ♦ **holometabolous** See metamorphosis: holometabolous metamorphosis.
- ♦ **holometabolous development, holometabolic development, holometabolism, holometaboly,**

holometamorphosis, holometamorphy See metamorphosis: holometabolous metamorphosis.

♦ **holomorphosis** See -morphosis: holomorphosis.

♦ **holomorphospecies** See ²species: holomorpho-species.

♦ **holoparasite** See parasite: holoparasite.

♦ **holopelagic** See pelagic: holopelagic.

♦ **holophyletic group** See ²group: monophyletic group (def. 2).

♦ **holoplankton** See plankton: holoplankton.

♦ **holoschisis** See mitosis: amitosis.

♦ **holoschizoendemic** See ¹endemic: schizoendemic: holoschizoendemic.

♦ **holotroph** See -troph: holotroph.

♦ **holozoic** See -zoic: holozoic.

♦ **Hom-C** See homeotic complex.

♦ **home** *n.*

1. A person's dwelling place, house, abode; a family's fixed residence or household; one's seat of domestic life and interests; a person's own house (Oxford English Dictionary 1972, entries from 950).

2. An individual animal's dwelling, or resting, place (Oxford English Dictionary 1972, entries from 1774).

3. An individual animal's resting and breeding place (Lincoln et al. 1985).

cf. hotel, range, territory

♦ **home range, home realm** See ³range: home range.

♦ **home site** *n.* The location of an animal's domicile, or resting place, that it regularly uses (Lincoln et al. 1985).

♦ **homeo-, homoeo-, homoio-** *comb.f.* "Like; similar" (Michaelis 1963).

[< Greek *homoios*, similar]

♦ **homeobox** *n.* A highly conserved DNA sequence (of about 180 base pairs) that codes for a protein domain (60 amino acids) and is found in all homeobox genes (= *Hox* genes) (Garber et al. 1983 in Rieger et al. 1991; Dye 2002, 73).

cf. gene: homeobox gene, homeotic homeobox gene, *Hox* cluster, "nonhomeotic-homeobox gene"

Comments: The first homeobox predates the origin of animals (Arthur 2002, 758). Homeoboxes are remarkably similar among species, and in many cases their expression patterns are also highly conserved. Researchers discovered homeoboxes in 1983 (Erwin et al. 1997, 133). In the 1980s, researchers proposed different functions for homeoboxes, *e.g.*, producing proteins that bind to DNA sequences that act as enhancers and silencers of gene expression, including the expression of other *Hox* genes (Gould 1985c; Alberts et al. 1989, 937). Identical, or similar, homeoboxes occur in *Hox* genes of arthropods, chorates (including fish, frogs, birds, and mammals), molluscs, and nematodes (Campbell et al. 1999, 404). Sequences similar to homeoboxes occur in prokaryotes and yeast. By 2002, researchers found homeobox genes in many multicellular organisms and determined that their genes play important roles in development, and they reveal general mechanisms that underlie the development of diverse organisms. Some researchers call the homeobox the "Rosetta Stone" of developmental biology because one can extrapolate knowledge of *Drosophila* development to that of the less-well known area of mammalian development (Dye 2002, 73). For example, in *D. melanogaster*, homeoboxes are not only in homeotic genes but also in *bicoid* (the egg- polarity gene), in the master regulatory gene for eye development, and in several

segmentation genes. The *D. melanogaster* homeobox has 180 base pairs and is responsible for specifying the 60 amino acids of the homeodomain portion of the homeoprotein (= the homeobox-specified portion of this protein). The homeoprotein is part of a protein that binds with DNA when the protein functions as a transcription factor (Campbell et al. 1999, 404). Homeodomain-containing proteins may regulate development by coordinating the transcription of groups of developmental genes that are active in different parts of an embryo. In *D. melanogaster*, the homeobox gene *engrailed* controls segment polarity; in frogs, a homeobox-containing gene controls "posteriority;" and in Humans, a homeobox-containing gene turns on genes for antibody formation. The same homeotic genes specify the anterior-posterior body axis of developing *D. melanogaster* and some mammal species. [Greek *homeo*, similar; box, a discrete unit of tight composition, referring to the similarity of a particular DNA sequence (= a homeobox) among species]

♦ **homeobox gene cluster** *n.* A group of *Hox* genes that are arranged in a series on a chromosome that specifies the developmental fate of a region of a complex organism (Erwin et al. 1997, 133; illustration, 136; Gerhard and Krischner 1997, 317).

syn. *Hox* cluster (Erwin et al. 1997, 133)

Comments: Erwin et al. (1997) describe the evolution of *Hox* clusters from a cnidarian ancestor through mammals. *Amphioxus* has a cluster of 11 *Hox* genes; *Mus musculus*, 9, 9, 10, and 11 *Hox* genes in four different clusters; *Caenorhabditis elegans*, 4 *Hox* genes; *Drosophila melanogaster*, 8 *Hox* genes; *D. pseudoobscura* 5 *Hox* genes; Porifera, 1 *Hox* gene; *Tribolium*, 7 *Hox* genes (Gerhard and Krischner 1997, 317). Many of the *Hox* genes are homologous among these taxa. The common ancestor of arthropods and chordates had a cluster of 6 *Hox* genes. Mammals have four *Hox* clusters, with a total of 38 genes, derived from an ancestral gene.

♦ **homeobox gene** See gene: homeobox gene.

♦ **homeochronous** See homochronous.

♦ **homeodomain** See domain: homeodomain.

♦ **homeodomain protein** See protein: homeodomain protein.

♦ **homeomorph, homeomorphic, homeomorphy, homoeomorphy** See morphy: homeomorphy.

♦ **homeosis** *n.* The transformation of one structure of an animal's body into a homologous (but inappropriate) structure of another body segment due to a mutation in a developmental gene which is a homeotic gene, *e.g.*, the transformation of a drosophila's antenna into a leg (= antenniferia) (Bateson 1894 in Rieger et al. 1991; Dye 2002, 74).

cf. mutation: homeotic mutation

Comment: Homeosis occurs when a homeotic selector gene specifies the inappropriate part for a particular location (Dye 2002, 74).

♦ **homeostasis** *n.*

1. The tendency for the characteristics of a physiological, or morphological, system to be held constant (Cannon 1932 in Bradshaw 1965, 117).

Note: Bradshaw (1965, 117) indicates that discussions of the semantic problems with "homeostasis" are presented by Waddington (1957, 1961) and Lewontin (1957).

2. An organism's tendency "to maintain a uniform and beneficial physiological stability within and between its parts" (Michaelis 1963).

syn. organic equilibrium

cf. canalization (developmental homeostasis); *milieu intérieur*; plasticity; principle: Bernard's principle
adj. homeostatic

genetic homeostasis *n.*

1. Evolving populations' automatic resistance to selection that proceeds at a rate fast enough to make marked decreases in genetic variability (Lerner 1954; Mayr 1963).
2. A population's tendency to move to genetic equilibrium and resist sudden changes in its genetic composition (Lincoln et al. 1985).

syn. genetic inertia (Lincoln et al. 1985)

social homeostasis *n.*

1. In social organisms: An individual's, or society's, maintenance of its colony population, caste proportions, and the nest environment at a constant level (Emerson 1956a in Wilson 1975, 11).
2. In social animals: An individual's maintenance of steady states at the level of its society either by control of its nest microclimate or by regulation of its population density, behavior, and physiology of its group members as a whole (Wilson 1975, 595).

thermal homeostasis *n.* In birds and mammals: Homeostasis involving an individual's maintaining a relatively constant body temperature (McFarland 1985, 259).

cf. -therm: homeotherm

♦ **homeotely** See ²evolution: homeotely.

♦ **homeotherm** See -therm: homeotherm.

♦ **homeothermic** *adj.* Referring to a homeotherm, *q.v.*

♦ **homeotic complex (Hom-C)** *n.* The region of chromosome 3 of *Drosophila* that contains both the *antennapedia* complex and the *bithorax* complex (Gould 1985c, Dye 2002, 74).

♦ **homeotic-homeobox gene** See gene: homeotic-homeobox gene.

♦ **homeotic mutant gene** See gene: homeotic mutant gene.

♦ **homeotic mutation** See ²mutation: homeotic mutation.

♦ **homeotic-selector gene** See gene: homeotic-selector gene.

♦ **homing** *n.* In many animal species including many wasp species; ant, bee, and salmonid-fish species; *Columba livia* (Rock Doves) and Humans: An individual's capability to return, or actually returning, to its nest (or home as in Humans) (Oxford English Dictionary 1972, entries from 1765; Miller 1954 in Halvorsen and Stabell 1990, 1089).

syn. homing behavior (Halvorsen and Stabell 1990, 1089)

cf. behavior, navigation, *ortstreue*

v.i. home

♦ **homio(gamy)** See -gamy: homio(gamy).

♦ **homio(therm), homio(thermic)** See -therm: homio(therm).

♦ **homo-** *comb. form* Similar, alike, like, same; opposed to -hetero (Michaelis 1963)

[Greek *homo-* < *homos*, same]

♦ **homoallellic** *adj.* Referring to genes that have mutations at the same mutational sites (Lincoln et al. 1985).
cf. heteroallellic

♦ **homobrachial inversion** See inversion: pericentric inversion.

♦ **homochemy** *n.* A mimic's imitation of a model's emitted odors; contrasted with homochromy, homo-electry, homokinemy, homomorphy, homophony, homophoty, homothermy, and homotopy (Pasteur 1982, 170).

Comments: For homochemy, homochromy, etc., Pasteur (1982, 170), gives a table that indicates the nature of mimicking signals from a dupe's standpoint. Many kinds of mimicry include more than one kind of imitation (Pasteur 1982, 174).

♦ **homochrome mimicry, homoeochromatic mimicry** See mimicry: androchromatic mimicry.

♦ **homochromy** *n.* A mimic's imitation of a model's emitted light; contrasted with homochemy, homo-electry, homokinemy, homomorphy, homophony, homophoty, homothermy, and homotopy (Pasteur 1982, 170).

♦ **homochronous, homeochronous, simultaneous** *adj.* Referring to phenomena that occur at the same time or age in successive generations (Lincoln et al. 1985).

♦ **homodichogamy** See -gamy: autoallogamy.

♦ **homodynamic** See -dynamic: homodynamic.

♦ **homodynamous** *adj.* "MetamERICALLY homologous" (Lincoln et al. 1985).

♦ **homoecism** See -xeny: monoxeny.

♦ **homoelectry** *n.* A mimic's imitation of a model's emitted conductivity or emitted electricity; contrasted with homochemistry, homochromy, homokinemy, homomorphy, homophony, homophoty, homothermy, and homotopy (Pasteur 1982, 170).

Comment: Homoelectry is not yet known in nature (Pasteur 1982, 174).

♦ **homoeochromatic mimicry** See mimicry: androchromatypic mimicry.

♦ **homoeologous chromosomes** See chromosome: homoeologous chromosomes.

♦ **homoeomorphy** See -morph: homeomorphy.

♦ **homoeotherm** See -therm: homoeotherm.

♦ **homoeotic mutation** See ²mutation: homeotic mutation.

♦ **homogamete** See gamete: homogamete.

♦ **homogametic** See -gametic: homogametic.

♦ **homogametic sex** See ¹sex: homogametic sex.

♦ **homogamety** See -gamety: homogamety.

♦ **homogamy** See breeding: inbreeding; -gamy: homogamy; mating: assortative mating.

♦ **homogen** See -genetic: homogenetic.

♦ **homogeneity of variances** See homoscedasticity.

♦ **homogeneon** See ²species: homogeneon.

♦ **homogenesis** See -genesis: homogenesis.

♦ **homogenetic** See -genetic: homogenetic.

♦ **homogenetic parasite** See parasite: homogenetic parasite.

♦ **homogenous** See -genous: homogenous.

♦ **homogeny** See homolog: homogeny.

♦ **homogonic life cycle** See cycle: life cycle: homogonic life cycle.

♦ **homoi-** See homeo-.

♦ **homoiogamy** See -gamy: homoiogamy.

♦ **homoiohydric** *adj.* Referring to protists, fungi, and plants that can compensate for short-term fluctuations in water supply and rate of evaporation so that their water content can be maintained at a given

level more, or less, independently of ambient humidity (Lincoln et al. 1985).
cf. poikilohydric

♦ **homoiolog, homoiologue, homology** See homolog.

♦ **homiotherm, homiothermic** See -therm: homotherm.

♦ **homokinemey** *n.* A mimic's imitation of a model's moves and postures; contrasted with homochemy, homochromy, homoelectry, homomorphy, homophony, homophoty, homothermy, and homotopy (Pasteur 1982, 170).

♦ **homolog, homologue, homology** *n.*

1. One animal species' trait that is similar to another's trait because both of the traits are construction variants based on one of God's blueprints (historical definition, Owen 1843 in Hailman 1976, 181).
2. The same organ in different animals under every variety of form and function" (called "homologue" by Owen 1843 in Donoghue 1992, 170).

Note: Owen cited Saint-Hilaire who noted its presence in even earlier German literature (*e.g.*, Goethe's writing, Donoghue 1992, 170).

3. An individual's character (trait) that has a common ancestry with another character of the same individual, or heterospecific individual, but does not necessarily retain similarity of structure, function, or behavior with it; contrasted with analog and homoplasy (Darwin 1859 in Mayr 1982, 45; Campbell and Hodos 1970, 358 in Hailman 1976, 186; Lincoln et al. 1985) (*e.g.*, horse forelegs and bird wings are homologs as tetrapod forelimbs, but bat wings and bird wings are not homologs as flight organs, Theissen 2002, 741).

syn. homoiologue, homoiolog, homology (Lincoln et al. 1985)

adj. homolog, homologous

cf. analog; character: apomorph: synapomorph: homologous synapomorph: homolog: homogeny; homoplasy

Note: This concept is commonly called "homology" today, and this is a widely used definition. Donoghue (1992) discusses changes in the meaning of homology and difficulties and controversies related to this term. These include the (1) implication of both constancy and change in this concept, (2) argument that a certain definition of homology is a nonoperational concept because it is circular to define homology with regard to ancestry if it is then to be used as evidence of ancestry, (3) distinction between homology and nonhomology, and (4) use of homology in reference to ultrastructural features of organisms, cells, species and higher taxa, and behaviors in addition to organs.

4. A character that is derived directly from another character; both are considered to be homologs of one another (Wiley 1981, 9).
5. One of three, or more, characters that are part of a character transformation series in which one character gave rise to the next in a linear sequence (Wiley 1981, 9).
6. A homologous synapomorph, *q.v.* (Wiley 1981, 9–10).
7. A derived trait that characterizes a monophyletic group; a synapomorphy (Patterson 1982 in Donoghue 1992, 170).

Note: Using this definition, "homology" becomes "the relation through which we discover" monophyly

resulting in the "taxic" view of homology (Patterson 1982 in Donoghue 1992, 170).

8. A structure that shares "a set of developmental constraints, caused by locally acting self-regulatory mechanisms of organ differentiation" with a structure from another individual or within the same individual (Wagner 1989, 62, in Donoghue 1992, 170).

See chromosome: homologous chromosome; homolog: homogeny, sequence homology; homology.
adj. homologous

[Greek *homologos*, agreeing < *homos*, same + *logos*, measure, a proportion < *legein*, to speak]

♦ **homogeny** *n.* A homolog that is morphologically similar to another homolog due to inheritance from a common ancestor; contrasted with homoplasy as a division of homolog [coined by E. R. Lankester (1870 in Donoghue 1992, 171)].

Comment: "Homogeny" did not become a widely used term; "homology" is used instead (Donoghue 1992, 171).

See homolog.

♦ **homotype** *n.* An organ that is the same as another organ within an organism's body; contrasted with homolog (def. 2) (Owen 1848 in Donoghue 1992, 170).

♦ **iterative homology** *n.* A character that is traceable to the same element of a precursor which causes the repetition of parts in a larger whole (Ghiselin 1976 in Hailman 1976, 195).

Comments: "Iterative homology" includes homonomy (repeated units within an individual, *e.g.*, hair) and serial homology (Donoghue 1992, 176). Biologists debate whether iterative homology is "true homology."

♦ **partial homology** *n.* An organ that is intermediate in characteristics between two other organs, *e.g.*, the phylloclade of a monocot that is borne in the position of a branch but similar in development, symmetry, and internal anatomy to a leaf (Sattler 1984, 1988 in Donoghue 1992, 170).

Comment: Patterson (1987 in Donoghue 1992, 170) considers the concept of partial homology to be incompatible with evolutionary views that hold that organs are either homologous or not homologous, but not partially homologous.

♦ **phylogenetic homology** *n.* A behavioral homolog that is transmitted genetically (Wickler 1961, 1965 in Heymer 1977, 88).

♦ **tradition homology** *n.* For example, in Humans: A behavioral homolog that is transmitted culturally (Wickler 1961, 1965 in Heymer 1977, 88).

♦ **homologous** See homolog.

♦ **homologous chromosome** See chromosome: homologous chromosome.

♦ **homologous synapomorph, homologous synapomorphy** See character: apomorph: synapomorph: homologous synapomorph.

♦ **homology** *n.*

1. Formal resemblance between species A and B such that the relations among certain parts of A are similar to the relations among corresponding parts of B; a resemblance considered to be evidence of evolutionary relatedness (Bateson 1979, 242).
2. "A correspondence between two or more characteristics of organisms that is caused by continuity of information" (Van Valen 1982 in Donoghue 1992, 177).
3. "An equivalence relation on a set of structures, partitioning the set into classes whose members share certain invariant internal relationships and are

transformable one into the other while preserving the invariance" (Goodwin 1982, 51, in Donoghue 1992, 178).

See homolog.

adj. homologous

Comments: The concept of homology is considered to be among the more important principles in comparative biology. The history of the meanings of "homology" can be interpreted as a series of responses to challenges brought on by underlying conceptual changes" (Donoghue 1992). Developmentally oriented evolutionary biologists seek a causal understanding and definition of "homology" that differs profoundly from a phylogenetic systematic definition (Futuyma 1993, 1153–1154). The meaning of "homology" can be very puzzling because phylogenetically homologous characters can have different genetic bases and ontogenies (e.g., cartilage in different vertebrate classes) and ontogenetically indistinguishable, perhaps causally identical, character states can originate by convergent and parallel evolution. Hailman (1976) gives more definitions of homology and discusses how authors have confounded the definitions of "analogy," "homogeny," "homology," and "homoplasy." Fitch (1976) has organized others to appeal against a confusing genetics definition of "homology" (*syn.* sequence homology, *q.v.*). Since 1972, he and others have been arguing over its usage, yet they still do not totally agree on it (Lewin 1987a). "Homology" and a kind of homology (e.g., serial homology) can refer to both a condition and a trait; I do not include both condition and trait definitions for each kind of homology. The kinds of homologies listed below are grouped together because they share the word homology not because they are necessary divisions of homology as defined above.

[Greek *homologos*, agreeing < *homos*, same + *logos*, measure, a proportion < *legein*, to speak]

latent homology *n.* The condition in which two, or more, related lineages share a character that is absent from their ancestral stock although it is presumed to have had the potential to develop the character (Lincoln et al. 1985).

paramorphic homology *n.* Two distinct species' having polypeptide variants whose ancestral forms were polymorphic alleles in their ancestral species (Lincoln et al. 1985).

syn. polymorphism-dependent homology (Lincoln et al. 1985)

parhomology *n.* Characters' apparent similarity of structure or function (Lincoln et al. 1985).

polymorphism-dependent homology See homolog: paramorphic homology.

sequence homology *n.* The degree of matching of DNA bases of two organisms; the higher the degree, the greater the genealogical relationship between them (Gould 1988).

syn. homology (Lewin 1987a), percent identity (Kamelberg 1987), sequence similarity (Gould 1988 and other workers quoted by him), similarity (Niesbach-Klösgen et al. 1987, 223)

serial homology *n.* In Annelids, Arthropods, and Chordates: an individual's having a series of homologous structures, frequently functionally differentiated (Lincoln et al. 1985).

cf. homology: iterative homology; metamorphism

♦ **homomorphy** *n.* A mimic's imitation of a model's body outline; contrasted with homochemistry, homochromy, homoelectry, homokinemy, homophony,

homophoty, homothermy, and homotopy (Pasteur 1982, 170).

Comment: Homomorphy and homokinemy may involve hearing-and-touch organs in potential dupes such as fish lateral lines and arachnid trichobothria which enable their bearers to identify solid objects and distant movements (Pasteur 1982, 174).

♦ **homophony** *n.* A mimic's imitation of a model's emitted sound; contrasted with homochemistry, homochromy, homoelectry, homokinemy, homomorphy, homophoty, homothermy, and homotopy (Pasteur 1982, 170).

♦ **homophoty** *n.* A mimic's imitation of a model's emitted light; contrasted with homochemistry, homochromy, homoelectry, homokinemy, homomorphy, homophony, homothermy, and homotopy (Pasteur 1982, 170).

♦ **homophytic** *adj.* Referring to organisms' traits that show resemblance due to common ancestry (Lincoln et al. 1985).

cf. homoplasy

♦ **homoplasia, homoplasias, homoplast, homoplastic similarity, homoplasity** See homoplasy.

♦ **homoplasy** *n.*

1. A character's resemblance to another due to parallel, or convergent, evolution, rather than common ancestry; opposed to homogeny (Campbell and Hodos 1970, 359 in Hailman 1976, 187; Lincoln et al. 1985).

2. Unrelated species' sharing nucleotides at a particular site by chance alone, not because they share a recent common ancestor (Maley and Marshall 1998, 505).

syn. homoplasia (Lankester 1870 in Oxford English Dictionary 1972), homoplastic similarity, nonhomologous similarity, homoplasia, homoplast, homoplasity (Lincoln et al. 1985)

cf. analog, homogeny, homolog

Comments: Hailman (1976) gives more definitions and discusses how authors have confounded the definitions of "analog," "homogeny," "homolog," and "homoplasy." Homoplasies can produce erroneous dendograms (Maley and Marshall 1998, 505).

[coined by Lankester (1870 in the Oxford English Dictionary 1972)]

♦ **homoplyletic** See -phyletic: homoplyletic.

♦ **homoscedasticity** *n.* Statistical or actual equality of variances among two or more samples (Sokal and Rohlf 1969, 369).

syn. homogeneity of variances

♦ **homoselection** See -selection: homoselection.

♦ **homosexual** See -sexual: homosexual.

♦ **homosexual behavior** See behavior: homosexual behavior.

♦ **homosexual copulation** See copulation: homosexual copulation.

♦ **homosexual courtship** See courtship: homosexual courtship.

♦ **homosexual mating** See mating: homosexual mating.

♦ **homosexual mounting** See copulation: pseudo-copulation: homosexual pseudocopulation.

♦ **homosexual pseudocopulation** See copulation: pseudocopulation: homosexual pseudocopulation.

♦ **homosymbiosis** See symbiosis: homosymbiosis.

♦ **homotelerone** See chemical-releasing stimulus: semiochemical: pheromone.

- ♦ **homotene** See homotenus.
- ♦ **homotenous** *adj.* Referring to a “primitive” form or condition (Lincoln et al. 1985).
- n.* homotene
cf. ancestral
- ♦ **homotherm** See -therm: homotherm.
- ♦ **homothermy** *n.* A mimic’s imitation of a model’s temperature; contrasted with homochemistry, homochromy, homoelectry, homokinemy, homomorphy, homophony, homophoty, and homotypy (Pasteur 1982, 170).
- ♦ **homotypy** *n.* A mimic’s imitation of a model’s inhabited, or visited, spots; contrasted with homochemistry, homochromy, homoelectry, homokinemy, homomorphy, homophony, homophoty, and homothermy (Pasteur 1982, 170).
- ♦ **homotropic** See -tropic: homotropic.
- ♦ **homotype** See homolog: homotype.
- ♦ **homotypy** *n.* A mimetic imitation’s eliciting the same reaction from a dupe as the model (Pasteur 1982, 184).
- abstract homotypy** *n.* Homotypy in which the model is an abstraction of a general type of organism, or organ, that is not identifiable at the species level or at all; contrasted with concrete homotypy (Pasteur 1982, 184).
- concrete homotypy** *n.* Homotypy in which the model is an actual species or a cluster of similar species; contrasted with abstract homotypy (Pasteur 1982, 184).
- ♦ **homoxenic** See -xenic: homoxenic.
- ♦ **homozone** See zone: homozone.
- ♦ **homozygosity** See -zygosity: homozygosity.
- ♦ **homozygote** See zygote: homozygote.
- ♦ **homozygous** See -zygous: homozygous.
- ♦ **homozygous lethal (mutation)** See ²mutation: homozygous lethal (mutation).
- ♦ **honest signal** See signal: honest signal.
- ♦ **honey** *n.* A sweet yellowish through brownish viscid fluid primarily derived from honeydew (*q.v.*), nectar (*q.v.*), or both, collected by some bee taxa; *e.g.*, honey-bee, some bumble-bee, and stingless-bee species (Michener 1974, 320, 335–344).
Comment: Honey is composed primarily of fructose and glucose; further honey is more concentrated than honeydew and nectar as a result of evaporation of their water while they transform into honey (Michener 1974, 372).
- ♦ **honeydew** *n.*
1. A sugar-rich fluid derived from plant phloem that is passed as excrement through the anus of certain homopteran insect species; distinguished from honey and nectar (Oxford English Dictionary 1972, entries from 1577 as honey-dew; Wilson 1975, 423, 586; Borror et al. 1989, 797).
Notes: Honeydew is produced by some kermesid and eriococcid species, many leafhopper species, planthoppers, and aphids (Borror et al. 1989, 328, 333, 337, 343, 346; Batra 1993b, 125) and from the surface of some galls (Torre-Bueno 1978). In some species, it is rich in amino acids; aphid honeydew comprises their wastes and consumed excess sap and sugars (Borror et al. 1989, 45). In arid regions, honeydew of the Tamarisk Manna Scale solidifies on leaves and accumulates as thick layers called manna (a sweet sugarlike material) which is believed to be the manna mentioned in the Bible (Borror et al. 1989, 343). Some ant species tend and protect honeydew-producing insects such as “ant cattle,” *q.v.*, and feed on their honeydew (Ebbers and Barrows 1980 and references therein). Paper wasps and yellowjackets defend kermesids from which they obtain honeydew (Barrows 1979b). Bumble bees sometimes, and Western Honey Bees frequently, consume honeydew (Batra 1993, 125).
 2. A sweet fluid exuded by leaves of some plant species during warm weather (Michaelis 1963).
Note: This form of honeydew may be a plant’s normal extrafloral nectar or sugary fluid caused by a parasite such as a *Monolinia* fungus. This fungus causes blueberry leaves to produce such a fluid, and bees and other insects that consume this honeydew transmit the fungus’s spores (Batra and Batra 1985, 228; Batra 1987, 57).
- ♦ **honeydew gland** See gland: honeydew gland.
- ♦ **honeypot** *n.* In some bumble-bee species: A wax vessel made for holding nectar (Wilson 1975, 430).
- ♦ **honing** *n.* An animal’s sharpening its teeth (Lincoln et al. 1985).
- ♦ **hook order** See hierarchy: dominance hierarchy: hook order.
- ♦ **hop-scratching** See scratching: hop-scratching.
- ♦ **hopeful monster** *n.*
1. A mutation in a gene(s) that affects development (Goldschmidt 1940, 310 in Dietrich 1992, 198).
 2. An individual with a small genetic change that affects its established pathways of ordinary embryological and sexual development, resulting in a markedly different phenotype that is more adapted to its environment than conspecific individuals that do not have this mutation (Goldschmidt 1940 in Gould 1984).
Notes: Hopeful monsters may be the bases of saltational evolution. “The decisive step in evolution, the first step toward macroevolution, the step from one species to another, requires another evolutionary method [that is, the origin of hopeful monsters] than that of sheer accumulation of micromutations” (Goldschmidt 1940, 183, in Mayr 1982, 562).
 3. A coordinated, novel structure of highly improbable origin within the normal spectrum of mutations (Goldschmidt 1940 in Levinton 1983, 103).
cf. ²mutation: macromutation; ³mutation: systemic mutation
- Comments:* The concept of macromutation that most commonly appears in contemporary literature is at least in part based on Goldschmidt’s concept of macromutations and their roles in developmental systems. Gould (1982, 88–89) and Dawkins (1983, 414–415) discuss legitimate and illegitimate forms of macromutation (Dietrich 1992, 199).
- ♦ **Hopkin’s bioclimatic law** See law: Hopkin’s bioclimatic law.
- ♦ **horary** *adj.* Lasting 1 through 2 hr (Lincoln et al. 1985).
cf. ephemerals
- ♦ **horiodimorphism** See morphism: dimorphism: horiodimorphism.
- ♦ **horizontal DNA transfer** *n.* DNA’s movement from one species to another coexisting species; contrasted with horizontal gene transfer and vertical DNA transfer (Stebbins and Ayala 1985, 75).
cf. transposable element: transposon
Comment: Horizontal DNA transfer can be between highly unrelated species (Stebbins and Ayala 1985, 75).
- ♦ **horizontal gene transfer** *n.* The movement of a gene from one species to another coexisting species;

contrasted with horizontal DNA transfer (Stebbins and Ayala 1985, 75).

cf. transposable element: transposon

Comment: Horizontal gene transfer has been common and intense in Prokaryotes (Koonin and Galperin 1997, 761). Presumed major events in horizontal gene transfer occurred when eukaryotes first evolved, *i.e.*, when a prokaryote acquired another prokaryote which evolved into a mitochondrion; and when the eukaryotic plant ancestor first acquired a prokaryote that evolved into a chloroplast (Strickberger 2000, 181).

◆ **hormesis** *n.* The stimulus afforded by an organism's exposure to nontoxic concentrations of a potentially toxic substance (Lincoln et al. 1985).

◆ **hormonal imprinting** See learning: imprinting: hormonal imprinting.

◆ **hormonal signaling** See signaling: hormonal signaling.

◆ **hormone** *n.*

1. Any substance, secreted by an individual animal's endocrine gland into its blood, or lymph, that affects the physiological activity of its other organs (Starling 1905 in Nordlund 1981, 496; Wilson 1975, 586).

Notes: Hormones are found in the majority, if not all, of multicellular-animal species. This definition is appropriate for many of the more derived species. Hormones are classified by their general function C "developmental hormone," "primer hormone," and "releaser hormone" and by their chemistry C amino-acid derivatives and lipid and steroid, hormones (Curtis 1983, 777; Campbell 1996, 914). Hormones can influence an individual's nervous system, and through it, behavior. Cells that are not part of endocrine glands can produce hormones (Kolata 1982, 1383). A hormone may move between endocrine glands via nerve cells in some kinds of insects (Chapman 1971). Barrington (1979) reviews hormones of both invertebrates and vertebrates. Humans have more than 50 known hormones (Campbell 1996, 914). Below, I list below only a few of the hundreds of known kinds of animal hormones.

2. A chemical signal that coordinates the parts of an organism (Campbell 1996, 751).
3. In multicellular organisms: one of many types of circulating chemical signals that form in specialized cells, travel in body fluids, and act on specific target cells which changes their functioning (Campbell and Reece 2005, glossary).

Notes: Each kind of plant hormone has a multiplicity of effects, depending on its action site and concentration and a plant's developmental stage (Campbell 1996, 753). Two, or more, kinds of hormones often work in concert effecting a specific plant response.

cf. endocrine disrupter, environmental estrogen, neuropeptide Y, peptide YY

[Greek *hormōn* < *hormaein*, to excite]

abscissic acid (ABA) (AB SIS ik) *n.* A plant hormone (produced in green fruit, leaves, and stems) that has the main functions of closing stomata during water stress, counteracting breaking of dormancy, and inhibiting growth (Campbell 1996, 753).

[abscissic < Latin *ab*, loss, and *caedere*, to cut; after leaf abscission of deciduous trees. However, no one has demonstrated a clear-cut role of ABA in leaf abscission (Campbell 1996, 758).]

SOME CLASSIFICATIONS OF HORMONES

A

- I. Animal hormones
 - A. amino-acid derived hormones
 1. amine hormones
 - a. catecholamine hormones
 - (1) epinephrine (*syn.* adrenalin)
 - (2) norepinephrine
 - b. melatonin
 - c. thyroxine (*syn.* T₄)
 - d. triiodothyronine (*syn.* T₃)
 2. glycoproteins
 - a. follicle-stimulating hormone (FSH)
 - b. luteinizing hormone (LH)
 - c. thyroid-stimulating hormone (TSH)
 3. peptide hormones
 - a. adrenocorticotrophic hormone (ACTH) (*syn.* corticotrophin)
 - b. antidiuretic hormone (ADH) (*syn.* vasopressin)
 - c. brain hormone (BH)
 - d. calcitonin
 - e. oxytocin
 - f. parathyroid hormone (PTH)
 - g. thymosin
 4. protein hormones
 - a. insulin
 - b. insulin-like growth factor-I (IGF-I)
 - c. glucagon
 - d. growth hormone (GH)
 - e. prolactin (PRL)
 - B. steroid hormones (*syn.* lipid hormones)
 1. corticosteroid hormones
 - a. glucocorticoids
 - (1) corticosterone
 - (2) cortisol
 - (3) cortisone
 - b. mineralocorticoids, including aldosterone
 - c. sex hormones
 - (1) androgens
 - (a) testosterone
 - (b) dihydroepiandrosterone
 - (2) estrogens (*syn.* oestrogens), including estradiol
 - (3) progesterones (*syn.* progestins)
 2. ecdysteroid hormones
 - a. ecdysone
 - b. ecdysterone
 3. prostaglandins (PGs) (about 16 kinds)
 - a. prostaglandin E (PGE)
 - b. prostaglandin F (PGF)
 - II. Plant hormones
 - A. abscissic acid
 - B. auxin
 - C. cytokinins
 - D. ethylene
 - E. gibberellins

adrenaline *n.*

1. In Vertebrates: a hormone that is produced by the medulla of an adrenal gland, increases blood sugar concentration, raises blood pressure and heartbeat rate, and increases muscular power and resistance to fatigue (Curtis 1983, 1087).
 2. A neurotransmitter that works across synaptic junctions (Curtis 1983, 1087).
- syn.* epinephrine (Curtis 1983, 1087)

adrenocorticotrophic hormone (ACTH) *n.*

In Vertebrates: A hormone produced by a pituitary gland that influences activities of adrenal cortices (Immelmann and Beer 1989, 221).

syn. corticotropin

androgen *n.* In Vertebrates: One of several sex hormones (e.g., testosterone, androsterone) that controls the appearance and development of masculine characteristics (Curtis 1983, 777).

cf. hormone: estrogen
Comment: In Mammals, androgens are 19-carbon steroids with methyl groups at C-10 and C-13 and are secreted by the Leydig cells of the testes (Wilson 1975, 251).

angiotensin *n.* In Vertebrates: A hormone with two main effects — causing an animal's vascular system to maintain normal blood pressure and circulation and causing it to drink (McFarland 1985, 269).

cf. hormone: renin
antidiuretic hormone (ADH) See hormone: vasopressin.

antihormone *n.* A synthetic substance that antagonizes the effect of a hormone; *e.g.*, antiandrogen (e.g., cyproterone, cyproteronacetate) or antiestrogen (e.g., Tamoxifen®) (Dewsbury 1978, 226; Immelmann and Beer 1989, 17).

cf. hormone

auxin (AUK sin) *n.*

1. A plant hormone (indoleacetic acid, IAA) that causes Oats seedlings to bend toward light (= exhibit phototropism)
[coined by F. W. Went in Campbell (1996, 752)].

2. Any chemical substance that promotes the elongation of coleoptiles (Campbell 1996, 754).

3. The plant hormone indoleacetic acid (produced in apical-bud meristems, seed embryos, and young leaves) that has the main functions of stimulating branching, differentiation, root growth, and stem elongation; apical dominance; gravitropism; and phototropism (Campbell 1996, 753).

Comment: Researchers have made synthetic auxins.
[Greek *auxein*, to increase]

auxins *n.* A class of plant hormones, including indoleacetic acid (Campbell 1996, G-4).
catecholamine *n.* A hormone (*e.g.*, epinephrine and norepinephrine) that is derived from tyrosine and secreted primarily by the adrenal-gland medullas (Wilson 1975, 253).
corpus-allatum hormones See hormone: juvenile hormones.
corticosteroid *n.* One of several hormones produced by adrenal-gland cortices, including corticosterone, cortisol, and cortisone (Wilson 1975, 253).
corticotropin See hormone: adrenocorticotrophic hormone.
corticotropin-releasing factor (CRF) *n.* In Humans, a brain hormone that orchestrates many of a person's responses to stress, including alertness, anxiety, blood pressure, breathing, and heart-rate changes (Anonymous 1996, 11 July, A18).

Comments: Researchers discovered CRF in 1981 (Anonymous 1996, 11 July, A18).

crustecdysone *n.* In some decapod-crab and lobster species: Molting hormone which in females attracts males as if it were a sex attractant (Wilson 1975, 224).

Comment: This is the same substance as "ecdysterone" in insects (Barrington 1979, 235).

cytokinins (SIGH toh Kigh nins) *n.* Plant hormones

(synthesized in roots) that have the main functions of affecting root growth and differentiation; stimulating cell division and growth, flowering, and germination; and delaying senescence (Campbell 1996, 753).

Zeatin is one of several known cytokinins.
[after cytokinesis (= plant cell division) (Campbell 1996, 755)]

dihydroepiandrosterone (DHEA) *n.* A human androgen hormone produced in adrenal glands (Marano 1997, C1).

Comment: DHEA is involved with the onset of puberty (Marano 1997, C1).

ecdysteroid *n.* In many arthropod species: A hormone that mediates molting; *e.g.*, ecdysone and ecdysterone which are two important insect ecdysteroids (Barrington 1979, 234–235).
egg-laying hormone (ELH) *n.* In *Aplysia* snails: A chemical that acts as a hormone when it mediates coordinated behavior patterns of egg extraction and deposition and also acts as a neurotransmitter (Scheller and Axel 1981 in McFarland 1985, 27).
endorphin *n.* A member of a group of peptide hormones that are liberated by proteolytic cleavage from a 29-kilodalton prohormone called pro-opio-cortin (King and Stansfield 1985).

Comment: Beta-endorphins occur in the intermediate lobes of pituitary glands and are potent analgesics (pain suppressors) (King and Stansfield 1985).

[endorphin, a contraction of *endogenous morphine*, because an endorphin is produced within an animal's body and attaches to the same neuron receptors that bind morphine and produces similar physiological effects (King and Stansfield 1985)]

environmental hormone See chemical-releasing stimulus: semiochemical: allelochemical: allomone: exocrine substance.
epinephrine See hormone: adrenaline.
estradiol *n.* In vertebrates: A kind of estrogen.
estrogen, oestrogen *n.* In Vertebrates: One of a group of sex hormones (Wilson 1975, 253; Curtis 1983, 780).

cf. hormone: premarin, estrone
Comments: Estrogens are found principally in ovaries, but also in adrenals, placentae, testes, and even spermatozoans (Wilson 1975, 253). Receptors are found in about 300 different tissues including brain, bone, and liver. Estrogens have many effects including mediation of egg development, mediation of female-sex characteristic development, maintenance of female reproductive behavior, and promotion of low levels of aggression and male fertility (Wilson 1975, 253; Curtis 1983, 780). Estrogen is the number one prescription drug in the U.S., being used to reduce menopausal symptoms and bone loss (osteoporosis) (Wallis 1995, 46, 49). Estrogen treatment can increase a woman's risk of breast cancer (Brown 1995, A1). Estrogen stimulates breast growth and other puberty changes in women (Angier 1997, 7 January, C3).

estrone *n.* A form of human estrogen manufactured by fat cells (Wallis 1995, 50).
ethylene *n.* A gaseous plant hormone (produced in ripening-fruit tissues, senescent flowers and leaves, and stem nodes) that has the main functions of opposing some auxin effects; promoting fruit ripening; and promoting, or inhibiting, development and

growth flowers, leaves, and roots, depending on the species (Campbell 1996, 753).

follicle-stimulating hormone (FSH) *n.* In Vertebrates: A gonadotropic hormone that activates growth of ovarian follicles and estrogen secretion (Immelman and Beer 1989, 108).

Comment: In Humans, FSH is released by a pituitary gland, and it travels through a bloodstream to ovaries which it prompts to release estrogen (Angier 1997, 7 January, C3).

gibberellins (JIB ur EL ins) *n.* Plant hormones (produced in embryos, apical-bud and root meristems, and young leaves) that have the main functions of affecting root differentiation and growth; promoting bud and seed germination, leaf growth, and stem elongation; and stimulating flowering and fruit development (Campbell 1996, 753).

Comment: Scientists have identified more than 70 different gibberellins (Campbell 1996, 757).

[after the fungus genus *Gibberella* which causes abnormal elongation of rice seedlings (= foolish-seedling disease) (Campbell 1996, 757)]

glandotropic hormones, glandotrophic hormones *n.* In Vertebrates: Hormones produced by pituitary glands that influence activities of other endocrine glands, including adrenal cortices, gonads, and thyroids (Immelman and Beer 1989, 221).

glucagon-like factor-1 *n.* A mammalian brain hormone that suppresses appetite (Anonymous 1996, 11 January, A18).

Comment: Corticotropin-releasing factor, leptin and urocortin are other brain hormones that suppress appetite (Anonymous 1996, 11 January, A18).

gonadotrophic hormone *n.* In Vertebrates: One of a group of hormones (follicle-stimulating hormone, luteinizing hormone, and interstitial-cell-stimulating hormone) produced by pituitary glands that stimulates growth and activity of testes and ovaries, e.g., sex-hormone secretion (McFarland 1985, 293).

syn. gonadotropin (Immelman and Beer 1989, 120)

gonadotropin-releasing hormone (GNRH) *n.* For example in Humans: A hormone, released by the hypothalamus, that stimulates the pituitary gland to release luteinizing hormone and follicle-stimulating hormone (Angier 1997, 7 January, C3).

insulin *n.* In most animal species: A hormone that has many effects including regulating the level of glucose in vertebrate blood (Campbell and Reece 2005, 955) and mediating the dauer state in *Caenorhabditis elegans* and reproductive diapause in *Culex pipiens* and *Drosophila melanogaster* (Sim and Denlinger 2008, 6779).

insulinlike-growth factor-I (IGF-I) *n.* In Humans: A protein hormone (Barinaga 1998, 475).

Comment: Men with high blood levels of IGF-1 are about four times more likely to develop prostate cancer than are men with the lowest level (Chan et al. 1998, 563).

juvenile hormones (JHs) *n.* In Insects: Hormones secreted by corpora allata that regulate metamorphosis and reproductive development (Barrington 1979, 243).

syn. corpus-allatum hormones (Barrington 1979, 243)

Comment: In experimental work, researchers use methoprene as a JH analog (Sim and Denlinger 2008, 6781).

lactogenic hormone See hormone: prolactin.

leptin *n.* In laboratory mice: A fat-cell-produced hormone (Kolata 1995, 27 July, A20).

Comments: Leptin administration to mice causes them to lose weight, even if they are lean mice (Kolata 1995, 27 July, A20). Humans produce a hormone that is similar to leptin. Leptin's principal role may be preparation of an animal's response to a long hunger period which includes decreased body temperature, diminished procreation (in either sex), and secretion of substances that help stress survival (Suplee 1996, 22 July, A2). Leptin also initiates puberty in female mice, and possibly Humans (Angier 1997, 7 January, C1). Corticotropin-releasing factor, glucagon-like factor-1, and urocortin are other brain hormones that suppress appetite (Anonymous 1996, 11 July, A18).

luteinizing hormone (LH) *n.* For example, in Humans: A hormone, released by the pituitary gland, that stimulates ovaries and causes them to release estrogen (Angier 1997, 7 January, C3).

neurohormone, neurohumor *n.* In many animal species: A secretion of a neuroendocrine cell, *q.v.* (Immelman and Beer 1989, 202).

neuropeptide Y (NPY) *n.* A protein that signals a Human's or a rat's brain, causing it to eat (Anonymous 1996, 11 July, A18).

cf. hormone: peptide YY.

norepinephrine *n.* In Vertebrates: A catecholamine hormone secreted by adrenal-gland medullas (Wilson 1975, 253).

Comment: Norepinephrine coupled with the parasympathetic nervous system has generally different and sometimes opposite effects of epinephrine (Wilson 1975, 253).

oxytocin *n.* In Vertebrates: A hormone produced by a posterior pituitary gland and that induces uterine contractions of parturition and milk ejection during suckling (Immelman and Beer 1989, 222).

peptide YY *n.* A protein that signals a rat's brain and causes the rat to eat (Anonymous 1996, 11 July, A18).

cf. hormone: neuropeptide Y.

premarin *n.* A form of estrogen made from pregnant mare's urine (Wallis 1995, 48).

[*pregnant mare's urine*]

progesterone *n.* A progestin, *q.v.* (Immelman and Beer 1989, 233).

progestin *n.* In Vertebrates: One of a group of female sex hormones produced in ovaries and placentas in mammals and in analogous tissues in other vertebrates that regulate reproductive processes usually later than estrogens (Immelman and Beer 1989, 233).

prolactin *n.* In Vertebrates: A hormone produced by a pituitary gland that induces mammary development and milk production in mammals, promotes crop milk production in pigeons and doves, and may be involved in brood-patch development and sustaining incubation in some bird species (Immelman and Beer 1989, 221, 235).

syn. lactogenic hormone (Immelman and Beer 1989, 221, 235)

prolactin-release inhibiting factor *n.* A releasing hormone, *q.v.*, that stops release of prolactin (Immelman and Beer 1989, 251).

prostaglandins (PGs) *n. pl.* A group of about 16 animal hormones that are released from most cell types into interstitial fluid and function as local regulators affecting nearby cells in various ways (Campbell 1996, 915).

Comments: Prostaglandin E (PGE) causes muscles to relax which dilates blood vessels and

promotes oxygenation of blood (Campbell 1996, 915). Prostaglandin F (PGF) signals muscles and causes their contraction, which constricts blood vessels and reduces blood flow through lungs. Prostaglandins, secreted by placental cells, cause chemical changes in nearby uterine muscles, making them more excitable and, thereby, helping to induce labor during human childbirth. Various prostaglandins help to induce fever and inflammation and intensify the sensation of pain.

releasing hormone *n.* Substances produced by hypothalamus cells and conveyed to an animal's anterior lobe of its pituitary gland via its hypothalamohypophyseal portal system; these substances influence secretion of pituitary hormones which in turn affect release of hormones from other endocrine glands (Immelmann and Beer 1989, 251).

renin *n.* In Vertebrates: A hormone, produced by kidneys, that stimulates production of another hormone, angiotensin (McFarland 1985, 269).

sex hormone *n.* A hormone that regulates development and the process of reproduction; sex hormones include androgens, estrogens, and progestins, *q.v.* (Curtis 1983, 777; Immelmann and Beer 1989, 267).

sociohormone See chemical-releasing stimulus: semiochemical: pheromone.

steroid hormone *n.* A hormone that is a steroid (a fat-soluble organic compound with four linked carbon rings), including aldosterone, cortisol and other glucocorticoids, estrogens, progesterone, and testosterone (Curtis 1983, 792).

testosterone *n.* In Vertebrates: A hormone made in testes that has various effects including developing and maintaining male sex characteristics, increasing aggressiveness, and supporting spermatogenesis (Wilson 1975, 251–252; Curtis 1983, 792).

cf. hormone: androgen

thymosin *n.* One member of a family of hormones that communicates between a person's brain and immune system (Robinson 1987, 74).

thyrotropic hormone *n.* A hormone produced by a vertebrate's pituitary gland that influences thyroid-gland activities (Immelmann and Beer 1989, 221).

urocortin *n.* In Humans, rats, and possibly other mammals: A brain hormone that may cause an individual to lose its appetite when it is under stress or in danger when survival can depend on fighting or fleeing, rather than feeding (Anonymous 1996, 11 July, A18).

Comments: Wylie Vale, Paul Sawchenko, and other scientists identified urocortin in 1995. Corticotropin-releasing factor, glucagon-like factor-1, and leptin are other brain hormones that suppress appetite (Anonymous 1996, 11 July, A18).

vasopressin, antidiuretic hormone *n.* In Mammals: A hormone that elevates blood pressure and promotes water reabsorption by kidneys (Dewsbury 1978, 221).

♦ **hormone system** See ²system: hormone system.

♦ **horn** See body part: horn.

♦ **Horn's principle** See principle: Horn's principle.

♦ **horodimorphism** See -morphism: dimorphism: horiodimorphism.

♦ **horos** *comb.f.*

[Greek *horos*, boundary, landmark, limit, rule, standard]

♦ **horotely** See ²evolution: horotely.

♦ **hospicidal** *adj.* Referring to a larval cuckoo bee that is highly modified in having elongate, sickle-

shaped mandibles used to destroy its host larva or egg [coined by Rozen 1989, 2].

ant. nonhospicidal [coined by Rozen 1989, 2]

Comment: In a nonhospicidal cuckoo bee, a mother bee destroys an immature host when she oviposits on her host's provisions (Rozen 1989, 2)

[Latin *hospes*, host; *caedo*, to cut down, to kill]

♦ **hospitalism** *n.* Disturbed emotional and bodily development of people who have grown up in orphanages without normal maternal affection (Heymer 1977, 89).

cf. behavior: abnormal behavior

Comment: Similar behavior occurs in Rhesus Monkeys (Spitz 1945 in Heymer 1977, 89).

♦ **hospiator** *n.* An organism that offers refuge, or acts as a host, to another organism (the hospitate) (Lincoln et al. 1985).

v.i. hospitate

cf. host

♦ **hospite** *n.* An organism that takes refuge in, or inhabits another organism, the hospitator (Lincoln et al. 1985).

cf. inquiline

♦ ¹**host** See ²group: host.

♦ ²**host** *n.* An individual animal that receives a tissue graft (Lincoln et al. 1985).

♦ ³**host** *n.*

1. A man who lodges and entertains another person in his house; the correlative of guest (Oxford English Dictionary 1972, entries from 1303).

2. An individual organism that habitually has a relationship with a parasite or commensal (Oxford English Dictionary 1972, entries from 1857); the inhabited symbiont in an endosymbiosis or an exhibited symbiont in an exosymbiosis (Lincoln et al. 1985).

3. An individual organism that provides food, or shelter, for another organism (Lincoln et al. 1985).

cf. hospitator

carrier host *n.* An animal that carries a phoretic animal (Heymer 1977, 130).

definitive host, primary host *n.* A host in which a parasite attains sexual maturity (Lincoln et al. 1985).

intermediate host, secondary host *n.* A host occupied by a parasite's juvenile stages, prior to its occupying its definitive host, and in which it is likely to undergo asexual reproduction (Lincoln et al. 1985).

paratenic host *n.* A host that is not essential for a parasite's completing its life cycle, but is used as a temporary habitat or as a means of reaching its definitive host (Lincoln et al. 1985).

syn. transfer host, transport host

cf. symbiosis: phoresy

primary host See ³host: definitive host.

reservoir host, reservoir *n.* A host that carries a pathogen without detriment to itself and that serves as a source of infection for other hosts (Lincoln et al. 1985).

secondary host See ³host: intermediate host.

transfer host, transport host See ³host: paratenic host.

♦ **host discrimination** *n.*

1. An individual parasitic wasp's ability "to distinguish unparasitized from parasitized hosts and to lay eggs only in the former" (Lenteren et al. 1978, 71, who discuss problems with this definition).

2. A parasitic wasp's ability to distribute her eggs in a "nonrandom way" among her hosts (Lenteren et al. 1978, 71, who discuss virtues of this definition).
- ♦ **host imprinting** See learning: imprinting: host imprinting.
- ♦ **host list** See ¹range: host range.
- ♦ **host race, hostile race** See ¹race: host race.
- ♦ **host range** See ¹range: host range.
- ♦ **host specificity** See specificity.
- ♦ **hotel** *n.* The part of an organism's habitat that it uses for resting, breeding, and feeding (Lincoln et al. 1985). *cf.* home, range, territory
- ♦ **housekeeping gene** See gene: housekeeping gene.
- ♦ **housekeeping enzyme** See enzyme: housekeeping enzyme.
- ♦ **hotspot model** See ⁴model: hotspot model.
- ♦ **hover** See ²group: hover.
- ♦ **howl** See animal sounds: howl.
- ♦ **Hox cluster** See gene: *Hox* cluster.
- ♦ **Hox gene** See gene: homeobox gene.
- ♦ **Hox proteins** See protein: Hox proteins.
- ♦ **b²** See ²heritability, heritability in the narrow sense, realized heritability.
- ♦ **Huarango Forest** See ²community: forest: Huarango Forest.
- ♦ **Hubbard Brook Experimental Forest** See place: Hubbard Brook Experimental Forest.
- ♦ **huddle** See ²group: huddle.
- ♦ **huddling, huddling behavior** See behavior: contact behavior.
- ♦ **hula display** See display: hula display.
- ♦ **human behavior** See behavior: human behavior.
- ♦ **human carrying capacity** See carrying capacity: human carrying capacity.
- ♦ **human culture** See ⁵culture: human culture.
- ♦ **human ethology** See study of: ³ethology: human ethology.
- ♦ **Human Genome Initiative** See project: Human Genome.
- ♦ **Human Genome Project** See project: Human Genome Project.
- ♦ **human imprinting** See learning: imprinting: human imprinting.
- ♦ **human-female "pheromone"** See chemical-releasing stimulus: semiochemical: pheromone: human-female "pheromone."
- ♦ **human-male "pheromone"** See chemical-releasing stimulus: semiochemical: pheromone: human-male "pheromone."
- ♦ **human-perspiration odor** See odor: human-underarm odor.
- ♦ **human reciprocity** See altruism: reciprocal altruism.
- ♦ **human-underarm odor** See odor: human-underarm odor.
- ♦ **human-vaginal odor** See odor: human-vaginal odor.
- ♦ **humanology** See study of: humanology.
- ♦ **humbleness** See abasement.
- ♦ **humicole** See -cole: humicole.
- ♦ **hummock** See habitat: hummock.
- ♦ **humped posture** See posture: humped posture.
- ♦ **Humpty-Dumptyism** *n.* A person's taking a word, or term, from common usage and redefining it to mean only what he wants it to mean (Beach 1978, 1979; Astington 1998, 30). [from Carroll (1932, 184 in Beach 1978, 1979): Humpty Dumpty said rather scornfully to Alice Lidell, "When I

use a word, it means just what I choose it to mean — neither more nor less."]

- ♦ **hunting** *n.* An animal's searching for, or pursuing, prey (Michaelis 1963).

mock hunting *n.* An animal's showing prey-capture movements in the absence of prey, *e.g.*, playing with a wool ball by a *Felis catus* (Domestic Cat) or playing with siblings by a young *Panthera leo* (Lion) (Heymer 1977, 94).

- ♦ **hunting camouflage** See camouflage: hunting camouflage.

- ♦ **hurtle** See ²group: hurtle.

♦ **husbandry** *n.* A person's tillage and cultivation of soil to grow plant crops; husbandry can also include rearing livestock and poultry, even *Apis mellifera* (Western Honey Bees) and *Bombyx mori* (Domesticated Silkworms) (Oxford English Dictionary 1972, entries from 1380).

syn. agriculture, farming (Oxford English Dictionary 1972)

- ♦ **huske** See ²group: huske.

- ♦ **hybrid** *n.*

1. Often an offspring of a cross between heterospecific individuals; also an offspring of a cross between conspecific populations, strains, or subspecies (Oxford English Dictionary 1972, entries from 1601; King and Stansfield 1985; Immelmann and Beer 1989, 137).

syn. cross, *q.v.* (King and Stansfield 1985)

cf. hybridization

Note: In taxonomy, a hybrid is usually considered to be from an interspecific cross (Lincoln et al. 1985). *syn.* crossbreed, halfbreed, mongrel (Oxford English Dictionary 1972)

2. A community comprising taxa from two, or more, separate, distinct communities (Lincoln et al. 1985).

Comments: Misunderstanding about the meaning of "hybrid" thwarted Gregor Mendel's research efforts (Mayr 1997, 59). Taxonomists formerly indicated a hybrid between two species with an "x" between the generic and species names: *Ambrosia x helenae* Rouleau is a hybrid of *A. trifida* and *A. artemisiifolia* (ragweeds). Currently, in accordance with the International Code of Botanical Nomenclature, biologists write hybrid names with an "x" (which is not italicized) attached to the species name: *Ambrosia xhelenae*. Taxonomists formerly indicated a cross between two genera with an X before the new genus name: X *Cupressocyparis leylandii* (a conifer in Appendix 1) with the X capitalized and separate from the genus name. Currently, they use an upper-case, non-italicized "X" attached to the genus name: X *Cupressocyparis leylandii*. The plus in front of +*Laburnocytisus adamii* means that it is a graft hybrid of *Cytisus purpureus* and *Laburnum anagyroides*. The plus sign and combining the two parent-plant genus names comprise the designation for a graft chimera outlined by the International Code of Botanical Nomenclature (Geneve 1991, 34). Plant breeders have crossed members of different genera, species, subspecies, and varieties. Many orchid cultivars derive from two, or more, genera. There are over 30,000 cultivars of *Hemerocallis* (Daylilies) each derived from one through several species (Brickell and Zuk 1996, 511). Figure 26 shows the flowers of the parents (first row) of two hybrid offspring (second row). *Hemerocallis* 'Mistress of the Dark' (Apps, 2002), which has dark purple flowers, is the ovum parent and

H. ‘When My Sweetheart Returns’ (Apps, 2000), which has the cream-and-pink flowers, is the pollen parent.

anisogonous hybrid *n.* A hybrid that does not show equal expression of both of its parental characters (Lincoln et al. 1985).

cf. hybrid: isogonous hybrid

cryptohybrid *n.* A hybrid that shows unexpected phenotypic traits (Lincoln et al. 1985).

heterodynamic hybrid See hybrid: segregate.

interspecific hybrid See ²species: interspecies.

intervarietal hybrid *n.* A cross between two conspecific varieties (Lincoln et al. 1985).

Hinny *n.* A hybrid between a stallion (*Equus ferus caballus*, Domestic Horse) and sheass (*Equus africanus asinus*, Donkey) (Michaelis 1963).
[L. *hinnus* < Greek *ginnos*]

isogonous hybrid, isogonic hybrid *n.* A hybrid that shows equal expression of parental characters (Lincoln et al. 1985).

cf. hybrid: anisogonous hybrid

Ligon *n.* A hybrid between a male *Panthera leo* (Lion) and a female *Panthera tigris* (Tiger) produced in a zoo (Hoffmeister 1967, 46).
syn. Liger (Wilson 1975, 9)
cf. hybrid: Tigon

Mule *n.*

1. *Equus xmulus*; a hybrid between an *Equus africanus asinus* (Donkey) and an *Equus ferus caballus* (Domestic Horse), especially a jackass and a mare (Michaelis 1963).
cf. hybrid: Hinny
2. Any hybrid or cross, especially a sterile one, e.g., a cross between a canary and related bird (Michaelis 1963).

[Old French *mul* < Latin *mulus*]

multihybrid *n.* A hybrid individual that is heterozygous at more than one locus (Lincoln et al. 1985).

numerical hybrid *n.* A hybrid that is derived from parental gametes with differing chromosome numbers (Lincoln et al. 1985).

permanent hybrid *n.* An organism in which heterozygosity is fixed due to balanced, or partially balanced, lethal factors (Lincoln et al. 1985).

poikilodynamic hybrid See hybrid: segregate.

polyploid hybrid See ploidy: allopolyploidy.

pseudozygote *n.* A hybrid that shows phenotypic traits of only one of its parents (Lincoln et al. 1985).

reciprocal hybrids *n. pl.* A hybrid whose father is species A and mother is species B and whose father is B and mother is A, e.g., a mule and hinny (Oxford English Dictionary 1972).
syn. reciprocal crosses (Lincoln et al. 1985)

segregate *n.* A hybrid that exhibits predominantly only one of its parent's phenotype (Lincoln et al. 1985).
syn. heterodynamic hybrid, poikilodynamic hybrid (Lincoln et al. 1985)

sesquireciprocal hybrid *n.* A hybrid crossed with one of its parental types (Lincoln et al. 1985).

Tigon *n.* A hybrid between a male *Panthera tigris* (Tiger) and a female *Panthera leo* (Lion) produced in a zoo (Hoffmeister 1967, 46).
syn. Tiglon (Wilson 1975, 9)
cf. hybrid: Ligon

♦ hybrid breakdown *n.* “Reproductive failure of F_2 hybrids (Lincoln et al. 1985).

♦ hybrid cline See cline: hybrid cline.

♦ hybrid inviability *n.* Failure of F_1 hybrids to reach sexual maturity (Lincoln et al. 1985).

♦ hybrid speciation See speciation: hybrid speciation.

♦ hybrid-sterility gene See gene: hybrid-sterility gene.

♦ hybrid swarm *n.* A group of natural hybrids that live in nature, e.g., *Helianthus annuus* spp. *texanus*, *q.v.* (inferred from Kim and Rieseberg 1999, 965).

♦ hybrid vigor See heterosis.

♦ hybrid zone See zone: hybrid zone.

♦ hybridization, Brit. hybridisation *n.* Any crossing of individuals of different genetic composition that typically belong to separate species and result in hybrid offspring (Lincoln et al. 1985; King and Stansfield 1985).
syn. cross (King and Stansfield 1985)

cf. hybrid
v.i., v.t. hybridize

introgressive hybridization See introgression.

nucleic-acid hybridization *n.* Base pairing of single-stranded nucleic acid from different nucleic acid molecules (Campbell et al. 1999, 369).

sympatric hybridization *n.* “The occasional production of hybrids between two well-defined sympatric species” (Lincoln et al. 1985).

♦ hybridogenesis See parthenogenesis: hybridogenesis.

♦ hydrarch succession, hydrosere See ²succession: hydrarch succession.

♦ hydraulic model of behavior See ⁴model: Lorenz's hydraulic model.

♦ hydric *adj.* Referring to water; wet (Lincoln et al. 1985).
cf. hydroid

♦ -hydro, -hydr- *comb.f.* Water, of, related to, or resembling water” (Michaelis 1963).
[Greek *hydro-* < *hydrōr*, water]

♦ hydrobiology See study of: biology: hydrobiology.

♦ hydrobius See -bius: hydrobius.

♦ hydrocarbon See molecule: hydrocarbon.

♦ hydrochore See -chore: hydrochore.

♦ hydrocole See -cole: hydrocole.

♦ hydrogen hypothesis See hypothesis: hydrogen hypothesis.

♦ hydrogenosome See organelle: hydrogenosome.

♦ hydrograph See graph: hydrograph.

♦ hydroharmose *n.* An organism's total reaction and adaptation (harmosis) to water (Lincoln et al. 1985).
cf. harmosis

♦ hydroid *adj.* Wet, watery (Lincoln et al. 1985).
cf. hydric

♦ hydrologic cycle See cycle: hydrologic cycle.

♦ hydrolysis *n., pl. hydrolyses*

1. Action between the ions of water (H^+ and OH^-) and those of a salt to form an acid or a base that changes the pH of the solution when the acid and base are sufficiently different in strength (Michaelis 1963).
2. Decomposition of a compound by water resulting in products that each contain part of the water (Michaelis 1963).

♦ hydromegatherm See -therm: hydromegatherm.

♦ hydromorphic See -morphic: hydromorphic.

♦ hydromorphosis See -morphosis: hydromorphosis.

♦ hydrophile See ¹-phile: hydrophile.

♦ hydrophobe See -phobe: hydrophobe.

♦ hydrophytum See habitat: bog.

♦ hydrosere See ²succession: hydrach succession.

- ◆ **hydrosphere** See -sphere: hydrosphere.
- ◆ **hydrotaxis** See *taxis*: hydrotaxis.
- ◆ **hydrothermal-vent** See ²community: hydrothermal-vent community.
- ◆ **hydrothermograph** See instrument: hydrothermograph.
- ◆ **hydrotribophile** See ¹-phile: hydrotribophile.
- ◆ **hydroxyl group** See group: functional group: hydroxyl group.
- ◆ **hyemal** See *hiemal*.
- ◆ **hyetal** *adj.* Referring to rain or precipitation (Lincoln et al. 1985).
- ◆ **hygienic behavior** See behavior: hygienic behavior.
- ◆ **hygric** *adj.* Referring to moisture, moist conditions, or humid conditions (Lincoln et al. 1985).
- ◆ **hygro-** *comb.f.* Wet; humid; damp; moist (Michaelis 1963). Before vowels, *hygr-*
[Greek *hygros* wet, moist]

- ◆ **hygrodrymium** See ²community: rain forest.
- ◆ **hygrokinesis** See -kinesis: hygrokinesis.
- ◆ **hygroklinokinesis** See -kinesis: hygroklinokinesis.
- ◆ **hygromorphic** See -morphic: hygromorphic.
- ◆ **hygroorthokinesis** See -kinesis: hygroorthokinesis.
- ◆ **hygropetric** *adj.* Referring to an organism that lives in the surface film of water on rocks (Lincoln et al. 1985).
syn. hygropetrobiontic, hygropetrobiotic, petrimadicolous
- ◆ **hygropetriebios** See -bios: hygropetriebios.
- ◆ **hygrophile** See ²-phile: hygrophile.
- ◆ **hygrophobe** See -phobe: hygrophobe.
- ◆ **hygrophorbiump** See ²community: hygrophorbiump.
- ◆ **hygrosphagnium** See ²community: hygrosphagnium.
- ◆ **hygrotaxis** See *taxis*: hygrotaxis.
- ◆ **hyla-, hylo-, hyl-** *comb.f.* Wood, or referring to wood (Michaelis 1963).
[Greek *hylē*, wood]
- ◆ **hylacole, hylocole** See -cole: hylacole.
- ◆ **hylium, hylion** See ²community: forest.
- ◆ **hylodium** See ²community: hylodium.
- ◆ **hylodophile** See ¹-phile: hylodophile.
- ◆ **hylogamy** See -gamy: hylogamy.
- ◆ **hylophage** See -vore: lignivore.
- ◆ **hyophile** See ¹-phile: hyophile.
- ◆ **hylotomous** *adj.* Referring to wood-cutting insects (Lincoln et al. 1985).
- ◆ **hyper-** *comb.f.*
 1. Over; above; excessive, more than (effect of quantity), higher (position) (Michaelis 1963).
 2. In medicine, denoting an abnormal state of excess (Michaelis 1963).

[Greek *hyper-* < *hyper*, above]
- ◆ **hyperallobiosphere** See -sphere: biosphere: eu-biosphere: allobiosphere: hyperallobiosphere.
- ◆ **hyperanisogamic** See -gamic: hyperanisogamic.
- ◆ **hyperbenthos** See ²community: benthos: hyperbenthos.
- ◆ **hypercapnia** *n.* An animal's sensitivity to an overdose of carbon dioxide which can be lethal (Browne 1996, 30 July, C10).
- ◆ **hypercyesis** See superfoetation.
- ◆ **hyperdispersed distribution** See distribution: overdispersed distribution.
- ◆ **hyperdiversity** See diversity: hyperdiversity.

- ◆ **hypergamesis** *n.* Utilization of excess sperm by a female, or female gamete, for nourishment (Lincoln et al. 1985).
- ◆ **hypermetabolous metamorphosis** See metamorphosis: hypermetabolous metamorphosis.
- ◆ **hypermorph** See -morph: hypermorph.
- ◆ **hypermetamorphic metamorphosis** See metamorphosis: hypermetamorphic metamorphosis.
- ◆ **hypermorphistic allele** See allele: hypermorphistic allele.
- ◆ **hypermorphosis** See ²heterochrony: hypermorphosis.
- ◆ **hyperparasitism** See parasitism: hyperparasitism.
- ◆ **hyperthermia** See thermia: hyperthermia.
- ◆ **hyperphagia** See -phagia: hyperphagia.
- ◆ **hyperploidy** See -ploidy: hyperploidy.
- ◆ **hypersexuality** See sexuality: hypersexuality.
- ◆ **hypersociality** See sociality: hypersociality.
- ◆ **hyperteley** See ²evolution: hyperteley.
- ◆ **hypertrophy** *n.*
 1. Enlargement of an organism's organ due to excessive nutrition; an organ's excessive growth or development (Oxford English Dictionary 1972, entries from 1834).
 2. The marked evolutionary development of an organism's trait, *e.g.*, mental hypertrophy (Wilson 1975, 548).
 3. An animal's excessively frequent production of a particular behavior, *e.g.*, hypersexuality in domestic animals (Immelmann and Beer 1989, 137).
v.i., v.t. hypertrophy
cf. behavioral deficit
- ◆ **hypervariable marker** See marker: hypervariable marker.
- ◆ **hyphalomyraplankton** See plankton: hyphalomyraplankton.
- ◆ **hyphydrogamic, hyphydrogamous** See -gamous: hyphydrogamous.
- ◆ **hyphydrophile** See ²-phile: hydrophile: hyphydrophile.
- ◆ **hypnody** *n.* A prolonged resting period, or diapause, during an organism's development (Lincoln et al. 1985).
adj. hypnodic
- ◆ **hypnophobia** See -phobia: hypnophobia.
- ◆ **hypnoplasia** *n.* Arrested development that results in failure to reach normal size (Lincoln et al. 1985).
- ◆ **hypnosis** *n.* An animal's tonic immobility induced by its restraint by, or its close proximity to, a predator (Immelmann and Beer 1989, 138).
cf. playing dead
- ◆ **hypnote** *n.* A dormant organism (Lincoln et al. 1985).
cf. dormancy
- ◆ **hypnotic reflex** See playing dead.
- ◆ **hypo-, hyp-** *comb.f.*
 1. "Under; beneath" (Michaelis 1963).
 2. "Less than" (Michaelis 1963).
 3. Medically, "denoting a lack of or deficiency in;" opposed to *hyper-* (Michaelis 1963).

[Greek < *hypo*, under]
- ◆ **hypoallobiosphere** See -sphere: biosphere: eu-biosphere: allobiosphere: hyperallobiosphere.
- ◆ **hypobenthos** See ²community: -benthos: hypobenthos.
- ◆ **hypobiosis** See -biosis: hypobiosis.
- ◆ **hypobiotic** See -biotic: hypobiotic.

- ◆ **hypocaloric** *adj.* Referring to a habitat, or condition, of sparse, or reduced, food supply (Lincoln et al. 1985).
- ◆ **hypodispersal distribution** See distribution: underdispersed distribution (def. 1).
- ◆ **hypogenesis** See -genesis: hypogenesis.
- ◆ **hypogenous** See -genous: hypogenous.
- ◆ **hypohydrogamic** See -gamous: hyphydrogamous.
- ◆ **hypolistic** *adj.* Referring to an organism that lives beneath rocks or stones (Lincoln et al. 1985).
cf. -cole: lapidocole
- ◆ **hypomorph** See -morph: hypomorph.
- ◆ **hypomorphic allele** See allele: hypomorphic allele.
- ◆ **hyponeuston** See neuston: hyponeuston.
- ◆ **hypopharyngeal gland** See gland: hypopharyngeal gland.
- ◆ **hypophlooeodal** *adj.* Referring to an organism that lives, or occurs, immediately below bark surface (Lincoln et al. 1985).
- ◆ **hypophyllous** *adj.* Referring to an organism that grows on the lower surfaces of leaves (Lincoln et al. 1985).
cf. -cole: folicole
- ◆ **hypophysis** See gland: pituitary gland.
- ◆ **hypoplankton** See plankton: hypoplankton.
- ◆ **hypoplasia** *n.* Underdevelopment or lack of normal growth (Lincoln et al. 1985).
- ◆ **hypoploidy** See -ploidy: hypoploidy.
- ◆ **hypostasis** *n.* One gene (the hypostatic gene) being masked by the expression of another gene (the epistatic gene) at different locus (Lincoln et al. 1985).
cf. epistasis
- ◆ **hypostatic gene** See gene: hypostatic gene.
- ◆ **hypothalamohypophysial system** See ²system: hypothalamohypophysial system.
- ◆ **hypothalamus** See organ: brain: hypothalamus.
- ◆ **hypothermia** See thermia: hypothermia.
- ◆ **hypothesis** *n.*
 1. A proposition that is stated, without any reference to its correspondence with fact, merely as a basis for reasoning or argument, or as a premise from which to draw a conclusion (Oxford English Dictionary 1972, entries from 1656).
 2. A scientific supposition, or conjecture, made to account for known facts, from which one can draw a conclusion that is in accord with known facts, and that serves as a starting point for further investigation (Oxford English Dictionary 1972, entries from 1646).
 3. A metaphysical speculation without empirical substance (Dobzhansky et al. 1977, 485).
See ⁴model.

Note: This is a definition used during Charles Darwin's time (Dobzhansky et al. 1977, 485). "Darwin expressed distaste and even contempt for empirically untestable hypotheses."

syn. model (Futuyma 1998, 591), supposition (Oxford English Dictionary 1972), theory (but some workers, e.g., Moore, 1984, do not recommend this synonymy in science)

adj. hypothetical

v.i., v.t. hypothesize

cf. axiom, concept, falsification, ⁴model, principle, selection: species selection, ³theory

Comments: See ³theory for an explanation of the difference between "hypothesis" and "theory." A hypothesis is given as a statement, not as a question: The brilliant

plumage of peacocks attracts peahens. I listed many hypotheses under "theory" in this book because their names contain the words theorem or theory in the literature. In conventional statistics, a researcher tests a null hypothesis(es) (*q.v.*). A researcher should design experiments that can reject a hypothesis, if it is indeed false. If he cannot reject a hypothesis after experimentation, he would only provisionally accept the hypothesis being aware that further testing could reject it. Glass and Hall (2008, 378) consider "hypothesis" and "model," to be distinct concepts. They explain that a model is constructed from data, while a hypothesis is constructed before a researcher obtains data from an experiment that tests the hypothesis. They note that a researcher tests falsifiable hypotheses, but verifies models. However, in actual practice, many researchers synonymize the terms "hypothesis" and "model." In some studies, a hypothesis evolves into different renditions. The first rendition may be based on no, or very few, data, later renditions may be based on different quantities of data, and the final version of the hypothesis may be the one that a researcher tests most rigorously and states in his presentation of his work. [New Latin < Greek foundation, supposition < *hypothetēnai*; to put under, *hypo*, under + *tithenia*, to put]

African-origin hypothesis of human mitochondrial DNA evolution *n.* The hypothesis that all mitochondrial DNA types in contemporary Humans (*Homo sapiens sapiens*) stem from a common female ancestor (mitochondrial Eve, *q.v.*) present in an African population about 200,000 yr ago (Cann et al. 1987, 31; Vigilant et al. 1991, 1503).

syn. African origin hypothesis (Wilson et al. 1991, 365), Eve hypothesis (Gibbons 1992b, 873), Eve theory (Thorne and Wolpoff 1992, 76), mitochondrial-Eve hypothesis (Lewin 1987c), mother-Eve hypothesis (Wainscoat 1987, 13), single African origin hypothesis (Templeton 1991, 737).

cf. mitochondrial Eve

Comments: Wolpoff and Thorne (1991) call this hypothesis "the most controversial theory about human origins ever proposed" because it suggests that Modern Humans (wherever they evolved) replaced, rather than mixed with, indigenous Archaic Humans. Some studies support this hypothesis (Lewin 1991; Vigilant et al. 1991), while other analyses do not (Hedges et al. 1991, 738; Maddison 1991; Barinaga 1992, 686; Templeton 1992, 737). Humans generally inherit their mtDNA through the mothers, but can also inherit a small amount of mtDNA from their fathers (Ross 1991, 30). *Homo s. sapiens* may have arisen sometime from 100,000 through 200,000 yr ago (Allan C. Wilson in Lewin 1987, 238; Maryellen Ruvolo in Gibbons 1993a).

age-and-area hypothesis *n.* The hypothesis that the area occupied by a species is proportional to its evolutionary age (Lincoln et al. 1985).

cf. dominance (ecological): faunal dominance

aggression-frustration hypothesis *n.* The hypothesis that aggression regularly follows frustration, and its strength is directly related to the degree of frustration; however, depression, rather than aggression, might result from frustration (Heymer 1977, 70).

allelic-replacement hypothesis *n.* The hypothesis that major steps in social evolution, occur via new alleles' replacing earlier ones in a species (West-Eberhard 1987, 38).

cf. hypothesis: "no-allelic-replacement hypothesis"

alternative-adaptation hypothesis *n.* The hypothesis that “novel traits originate and become elaborated as stable alternative phenotypes or morphs within species, prior to reproductive isolation and speciation, when they come to characterize distinctive new lineages;” that is, “drastic innovation can begin not with the branching of a phylogenetic tree but with the bifurcation of a developmental or behavioral program (“epigenetic divergence”) giving rise to intraspecific alternative adaptations” (West-Eberhard 1986, 1388).

alternative hypothesis (H_1) *n.* A hypothesis of nonequal relationship between phenomena; *e.g.*, feeding behavior of a test group takes a different amount of time, takes a longer time, or takes a shorter time than that of the control group (Lehner 1979, 227). *syn.* experimental hypothesis (Sokal and Rohlf 1969, 557)

cf. hypothesis; null hypothesis

Comment: If one is examining two means for a possible difference between them, then the alternative hypotheses are H_1 , H_2 , and H_3 . H_1 is $\text{mean}_1 > \text{mean}_2$; H_2 is $\text{mean}_1 < \text{mean}_2$; and H_3 is mean_1 does not equal mean_2 ($\text{mean}_1 \neq \text{mean}_2$).

“ancestral-brain hypothesis” *n.* The hypothesis that human ancestors were “primitive” in a general way, and all their body parts, including their brains, were ancestral in their characteristics (Washburn 1985, 5); contrasted with the “brain-first hypothesis.”

Comment: This hypothesis was a major one regarding human evolution at the time of Raymond Dart’s report of the Taung Child in 1925 (Washburn 1985, 5).

angiosperm-origin hypotheses *cf.* Darwin’s abominable mystery; Plantae: plant: *Amborella trichopoda* (Appendix 1)

Comments: Angiosperms might have originated 200 Ma ago (Waters 1991, 79). Molecular data do not support the anthophyte hypothesis, or the piperalloid hypothesis, and suggest that the dicot lineage and gymnosperm lineage split about 290 Ma ago in the late Carboniferous Period and that *Amborella trichopoda* is the sibling group of the rest of the flowering plants (Kenrick 1999, 359; Qui et al. 1999, 404; Soltis et al. 1999, 402).

► **anthophyte hypothesis** *n.* The hypothesis that flowering plants (Anthophyta) are most closely related to the extinct Bennettitales and still-extant Gnetales (Crane et al. 1995 in Qui et al. 1999, 404; Kenrick 1999, 359).

► **“piperalloid hypothesis”** *n.* The hypothesis that angiosperms originated from a small, rhizomatous perennial which resembles a member of the Piperales, and has secondary growth, and diminutive reproductive organs arranged cymosely and subtended by a bract-bracteole complex (Taylor and Hickey 1990, 704; Monastersky 1992, 74); contrasts with “magnolioid hypothesis” and “shrub hypothesis.”

syn. lowly-origin hypothesis (Monastersky 1992, 74) *Comments:* Taylor and Hickey (1990) found a fossil, possibly in the Piperales, that dates to 120 Ma old and thus supports this hypothesis. The oldest fossil of a magnolia-like flower dates to 100 Ma old.

► **“magnolioid hypothesis”** *n.* The hypothesis that angiosperms originated from a small tree, or shrub, with pinnately veined, simple leaves and moderate

to large flowers with numerous reproductive parts (Cronquist 1988 in Taylor and Hickey 1990, 702).

► **“shrub hypothesis”** *n.* The hypothesis that angiosperms originated from a shrub with spirally arranged, simple leaves and woody tissues formed from a single vascular cylinder (Stebbins 1974 in Strickberger 1990, 265).

Anthropoidea-origin hypotheses

► **“Adapidæ hypothesis”** *n.* The hypothesis that the extinct lemur-like adapids gave rise to Anthropoidea (Culotta 1995, 1851; Simons 1995, 1886).

► **“Anthropoidea hypothesis”** *n.* The hypothesis that Anthropoidea is a early taxon that originated soon after the first primates appeared (Culotta 1995, 1851).

► **“Omomyidae hypothesis”** *n.* The hypothesis that Omomyidae is the ancestor of Anthropoidea (Culotta 1995, 1851).

Comment: A living descendent of omomyids is *Tarsius* (Simons 1995, 1886).

battered-Earth hypothesis *n.* The hypothesis that two major impacts struck the Earth at the end of the Cretaceous (Mesozoic Era), about 64.4 Ma ago, and are responsible for extinction of many species including dinosaurs; contrasted with single-impact hypothesis (Fastovsky 1990 in Kerr 1992, 160).

Comments: The Chicxulub and Manson Craters were proposed as sites of impacts that occurred about 64.4 Ma ago. More refined dating of the Manson Crater revealed that it formed *ca.* 73.8 Ma ago; thus, it was not part of a multiple impact at the end of the Cretaceous, and the battered-Earth hypothesis is not supported (Izett et al. 1993, 729).

beacon hypothesis See hypothesis: firefly-flash-synchronization hypotheses: beacon hypothesis.

bee-language hypothesis See hypothesis: dance-“language” hypothesis.

behavior hypothesis See hypothesis: population-limiting hypotheses: behavior hypothesis.

big-bang hypothesis See hypothesis: hypotheses of the beginning and evolution of the Universe: big-bang hypothesis.

big-mother hypothesis *n.* The hypothesis that in some mammal species, compared with a smaller mother, a bigger mother is often a better mother because she can carry her young better, defend her young better, produce a greater number of surviving offspring, produce larger young with greater chances of survival, produce more milk, produce better milk, or a combination of these things.

[coined by Ralls 1976, 268].

Comments: Ralls formulated this hypothesis to suggest why females of many mammal species are larger than conspecific males. In bats, bigger mothers might be better able to fly with and nourish large fetuses, and occasionally young, than smaller mothers (Myers 1978, 709).

bird-origin hypotheses

► **crocodylomorph hypothesis** *n.* The hypothesis that Birds evolved from a crocodylomorph clade (Wellnhofer 1994, 301).

► **pseudosuchian hypothesis** *n.* The hypothesis that Birds evolved from a pseudosuchian-archosaur clade (Heilmann 1926 in Wellnhofer 1994, 300).

► **theropod hypothesis** *n.* The hypothesis that Birds evolved from a theropod-dinosaur clade (Huxley 1870, Nopcsa 1907, and Ostrom 1969, 1975 in Wellnhofer 1994, 299).

Comments: This is probably the most widely accepted bird-origin hypothesis today (Wellnhofer 1994, 301). Gauthier (1986 in Elzanowski and Wellnhofer 1992) suggested that birds evolved from a coelurosaur-theropod clade, while Elzanowski and Wellnhofer (1992, 823) suggest that birds evolved from an archaeornithoid-dinosaur clade.

Blitzkrieg hypothesis *n.* A computer model that includes the ideas that early American big-game hunters entered North America in Alaska; multiplied rapidly under conditions of unlimited food supply, low incidence of human disease, and an efficient social organization; spread southward and eastward; and extinguished large-game populations, eventually causing these species to go extinct (Mosimann and Martin 1975 in Burney 1993, 534).

Comments: Supporting evidence for this hypothesis is that the hunters arrived later in southern and eastern parts of North America where the large mammals went extinct later than in northern parts, and there was only a brief period of overlap between the very early hunter groups and last mammoths. However, other factors such as human activities besides hunting and climatic change may have played roles in extinction of big-game species (Burney 1993, 534–535). [German *Blitzkrieg*, lightning, war, warfare]

“brain-first hypothesis” *n.* The hypothesis that brain development occurred long before other body parts characteristic of Humans occurred (Washburn 1985, 5); contrasted with the “ancestral-brain hypothesis.”

syn. brain-first theory (Washburn 1985, 5)

Comment: This hypothesis was a major one regarding human evolution at the time of Raymond Dart's report of the Taung Child in 1925 (Washburn 1985, 5).

catastrophism *n.*

1. The hypothesis that biological and geological phenomena were caused by sudden, violent natural disturbances (catastrophes, upheavals) rather than by continuous and uniform processes that had a major impact on organic evolution (Huxley 1869 in Oxford English Dictionary 1972).
2. The views held by catastrophists or directionists, *q.v.* (Mayr 1982).

syn. convulsionism, directionism, *q.v.*

cf. phyletic gradualism, progressionism, uniformitarianism

Comments: Georges Cuvier (1769–1832) used the milder term “revolution” rather than “catastrophe” to refer to the presumed upheavals. Catastrophism is supported by many data, including sharp discontinuities in the geological record such as layering of fossils, stratifications of rocks, and the transition of marine fossils into freshwater ones (Mayr 1982, 365, 375–378; Strickberger 2000, 14).

[coined by Whewell (1832 in Mayr 1982)]

Chitty hypothesis See hypothesis: population-limiting hypotheses: Chitty hypothesis.

climatic hypothesis of human emergence *n.*

The hypothesis that climate affected the evolution of Humans because (1) from 5 through 6 Ma ago, a cooling and drying of global climate caused the African grassland to expand and rain forests to contract; (2) at least one species of tree-dwelling ape left its shrinking forest habitat and foraged on a savanna; (3) this ape became bipedal and evolved into the first hominid (*Australopithecus*); (4) between the late Miocene

cooling and about 3 Ma ago, the climate of most of tropical Africa fluctuated from mildly warm-moist and mildly cool-dry states, and savanna woodlands proliferated in the warm-moist times and shrank and became fragmented during cool-moist times; (5) two lines of hominids (*Australopithecus* and *Homo*) emerged during the major cooling and drying that set in about 2.8 Ma ago; (6) *A. robustus* went extinct; and (7) about 1 Ma ago during a major cold spell, *Homo erectus* evolved from *H. habilis* and eventually migrated out of Africa perhaps using better land connections between Africa and central Asia that formed when ice sheets formed and sea levels lowered (E. S. Vrba in Stevens 1993, C1, C18).

compression hypothesis of interspecific competition *n.* The hypothesis that as more species are packed into a community, the habitats occupied by particular species shrink, but acceptable food items within the occupied habitat are not changed (MacArthur and Wilson 1967 in Wilson 1975, 277).

conflict hypothesis *n.* The hypothesis that a genome is like a “society, of which the genes are the members, sometimes in conflict and sometimes in harmony” (Haig 1993, 498).

continental drift *n.*

1. The hypothesis that portions of the Earth's crust moved relative to an arbitrarily chosen portion (Wegener 1966, 147).
2. The hypothesis that Earth's landmasses were once continuous and then broke apart and drifted away from each other (Lightman and Gingerich 1992, 692).

syn. drift theory, Taylor-Wegener theory (Wegener 1966, 4); hypothesis of continental drift (Sutton 1970, 7; Hallam 1975, 9); continental displacement, drift hypothesis (Hallam 1975, 13); displacement theory, epeirophoresis theory (Lincoln et al. 1985)

cf. ²theory: theory of plate tectonics

Comments: The hypothesis of continental drift as proposed by the meteorologist Alfred Wegener was originally rejected by most scientists, but it is now widely accepted by scientists (Hallam 1975, 17; Stanley 1989, 192–198). Wegener (1966, 1) reported that the idea of continental drift came to him in 1910 when he was studying a map of the world; he later found that some aspects of the continental-drift concept were published decades earlier. Wegener's original data that support continental drift include the geometric fit of continental margins, matching mountain chains on opposite continents, corresponding rock succession, similar ancient climatic conditions, and identical species on continents now widely separated by ocean (Wegener 1915 in Erickson 1992, 11).

[from a translation of German *Verschiebung*, which is more precisely translated as continental displacement (Hallam 1975, 13)]

dance-“language” hypothesis, dance-language hypothesis *n.* The hypothesis that workers of *Apis mellifera* (Western Honey Bees) recruit other workers to food sources primarily by distance and direction communication transmitted by symbolic dances (Johnson 1967; Wenner 1967; Wenner et al. 1967; Wenner and Johnson 1967; Wenner et al. 1969; Johnson and Wenner 1970; Wenner 1971, 27; Michener 1973, 175).

syn. bee-language hypothesis (Wenner 1971, 1)

cf. hypothesis: locale-odor hypothesis

Comment: This hypothesis appears to be true based on many studies of Frisch and others (Gould 1976, 211).

DIH See hypothesis: diversity-invasibility hypothesis.

dinosaur-extinction hypotheses *Comments:*

Some paleontologists believe that dinosaurs as a group did not go extinct, instead the dinosaur lineage is still extant as Aves (Birds). Thus, to these paleontologists, the following hypotheses relate to nonavian dinosaurs, not all dinosaurs. Below I list hypotheses of different possibilities concerning the reason for nonavian dinosaur extinction.

► **“clumsy hypothesis”** *n.* The hypothesis that dinosaurs became too clumsy to breed, or perhaps even move (Lambert 1983, 208).

► **“egg-predation hypothesis”** *n.* The hypothesis that small mammals ate dinosaur eggs and eventually extinguished them (Lambert 1983, 208).

► **“glutton hypothesis”** *n.* The hypothesis that carnivorous dinosaurs ate all the herbivorous ones causing all dinosaurs to die out (Lambert 1983, 208).

Comment: There is no good evidence for this hypothesis (Lambert 1983, 208).

► **“impact hypothesis-1”** *n.* The hypothesis that an asteroid hit the Earth at the end of the Cretaceous Period and put much dust into its atmosphere, the dust reflected sunlight, and the Earth cooled, which markedly reduced plant growth and caused starvation in herbivorous dinosaurs followed by carnivores (Gore 1989, 672).

Comments: This hypothesis was formulated by Luis and Walter Alvarez, Frank Asaro, and Helen Michel (Kerr 1989, 3B). The asteroid may have been about 6 mi across. The impact also might have caused acid precipitation. Evidence that supports this hypothesis includes an iridium-rich layer in about 50 localities on Earth at the Cretaceous-Tertiary boundary (KT boundary = Mesozoic-Cenozoic boundary). Iridium is rare on Earth but common in some meteorites, therefore, Alvarez et al. assumed that the iridium came from an asteroid. Evidence and suppositions that do not support this hypothesis include: (1) Many dinosaur species went extinct over millions of years before the supposed time of impact, and (2) the Earth might have become very hot after the dust settled, because moisture in the atmosphere stopped heat from escaping (Lambert 1983, 209). There might have been a worldwide forest fire, too, because there is a lot of soot in the iridium layer.

syn. asteroid hypothesis (1978)

► **“impact hypothesis-2”** *n.* The hypothesis that a group of comets hit the Earth (Gore 1989, 692).

Comment: These different comet groups explain multiple stages in the K-T extinctions.

► **“magnetic-wave hypothesis-1”** *n.* The hypothesis that the Earth switched magnetic poles and caused deadly radiation that killed dinosaurs (Lambert 1983, 208).

► **“magnetic-wave hypothesis-2”** *n.* The hypothesis that the Earth switched magnetic poles and this somehow chilled the Earth and killed off dinosaurs (Lambert 1983, 208).

► **“mammal-competition hypothesis”** *n.* The hypothesis that mammals ate plants used by dinosaurs causing their starvation (Sloan in Gore 1989, 691).

► **“oxygen hypothesis”** *n.* The hypothesis that a reduction in atmosphere caused dinosaur extinction because oxygen was insufficient for dinosaurs due

to their inefficient respiratory systems (Associated Press, 1993, A3).

Comments: The oxygen level in air trapped in 120-Ma-old amber dropped from 35% to 28% in from 300,000 to 500,000 yr (G. Landis et al. in Associated Press 1993, A3). The oxygen-rich air resulted from volcanic activity that produced carbon dioxide, which was converted to oxygen by plants. Dinosaurs primarily evolved during a period of high atmospheric oxygen according to the Pele hypothesis. Although most nonavian dinosaurs went extinct during the time of low oxygen, the same trend is not apparent in other taxa (M. Norell in Associated Press 1993, 28 October, A3).

► **“pathogen hypothesis”** *n.* The hypothesis that pathogens killed off dinosaurs (Lambert 1983, 208).

► **Pele hypothesis** *n.* The hypothesis that dinosaurs primarily evolved during a period of high atmospheric oxygen of about 35% (Associated Press 1993, A3).

cf. hypothesis: dinosaur-extinction hypotheses: “oxygen hypothesis”

[after Pele, a Polynesian goddess of volcanoes]

► **“poison-angiosperm hypothesis”** *n.* The hypothesis that newly evolved angiosperms poisoned herbivorous dinosaurs (Lambert 1983, 208).

► **“racial-senescence hypothesis”** *n.* The hypothesis that just as individual organisms are born, grow old, and die, so do populations, species, and other taxa; and dinosaur lineages simply got old and the last living members were not competitive for this reason (Strickberger 1990, 355; Fastovsky 1996, 422).

Comments: There is no evidence for this hypothesis in dinosaurs or other taxa (Fastovsky 1996, 422). Taxa probably go extinct when they can no longer adapt to environmental changes.

► **“slow-climate-change hypothesis”** *n.* The hypothesis that the possible cool climate during the late Cretaceous caused dinosaur extinction (Steven Stanley in Gore 1989, 692).

Comments: In the late Cretaceous Period, seas were receding from continental lowlands, and over 50% of the species in many animal groups went extinct around the end of the Cretaceous Period (Strickberger 1990, Table 17-2). There may have been long-term cooling at the end of the Cretaceous (Steven Stanley in Gore 1989, 692).

► **“supernova hypothesis”** *n.* The hypothesis that cosmic rays from a supernova deformed and killed unborn dinosaurs (Lambert 1983, 208).

► **“volcanism hypothesis”** *n.* The hypothesis that volcanoes erupted and spewed much dust into the air, which darkened the skies and caused the Earth to cool or could have heated the Earth with a greenhouse effect, and this change caused extinction of dinosaurs and other organisms (Gore 1989).

Comment: This hypothesis is not favored by many paleontologists (Kerr 1989, 7 May, B3).

“direct-benefit hypothesis” See female-mate-choice hypothesis: “direct-benefit hypothesis.”

“directed-mutation hypothesis” *n.*

1. The hypothesis that a bacterium that is attacked by a particular virus can somehow acquire the genetic ability to resist further attacks as a result of the initial attack (called “acquired hereditary immunity” by Luria and Delbrück 1943 in Lenski and Mittler 1993a, 188).

- A**
2. The hypothesis that bacteria living in an unfavorable environment are able to choose which mutations they produce that enable them to adapt to this environment; contrasted with the hypothesis of random mutation, *q.v.* (Cairns et al. 1988, 142; Gillis 1991, 202).

Notes: Some experiments might support this hypothesis (Cairns et al. 1988), and other experiments do not support this hypothesis (Hall 1990, 5; Mittler and Lenski 1990; Lenski and Mittler 1993a, 188). This hypothesis is further discussed by Rainey and Moxon (1993), Watson (1993), Hurst and Grafen (1993), and Lenski and Mittler (1993b).

3. The hypothesis that a selective substrate “directs” mutations to particular regions of a bacterium’s genome (Shapiro 1995, 374).

Note: This hypothesis remains unsubstantiated (Shapiro 1995, 374).

syn. hypothesis of directed mutation

disinhibition hypothesis *n.* The hypothesis that all displacement behavior can be explained by two contrasting behaviors’ stopping one another, with the result that a third behavior is allowed to occur (Eibl-Eibesfeldt, Tinbergen in Heymer 1977, 61).

cf. behavior: displacement behavior

diversity-invasibility hypothesis (DIH) *n.*

The hypothesis that species richness decreases as invasibility by outside species increases within a focal area (Arndt and Perner 2008, 202).

Comment: A study of arthropods in the Canary Islands did not support the DIH (Arndt and Perner 2008, 202).

dominance hypothesis *n.* The hypothesis that in Primates, females are merely passive objects of male competition (Smuts 1987, 38).

eat-and-run hypothesis *n.* The hypothesis that ruminant artiodactyls are better able to avoid predation than nonruminant herbivores because they do not have to chew their food thoroughly at their feeding sites and, thus, can spend less time exposed to predators (Young 1950, 744; Colbert 1955, 400).

[coined by Janis 1976, 758]

ecological-saturation hypothesis *n.* The hypothesis that the number of niches stays roughly constant in a particular habitat due to interspecific competition for a finite supply of resources; as new species evolve in this habitat, others are excluded by competition and become extinct; contrasted with the expanding-resources hypothesis (Raup 1972; May 1974, 1981; Gould 1981 in Strong et al. 1984, 39).

Comment: Available data firmly reject this hypothesis with regard to the evolution of phytophagous-insect communities (Strong et al. 1984, 43). Data on insect families support this hypothesis (Labandeira and Sepkoski 1993, 312).

“ecosystem-diversity-productivity hypothesis” *n.* The hypothesis that ecosystems with more species are more productive than ones with fewer species (Hector et al. 1999, 1123).

Comments: A study of eight European field sites with artificial grassland communities supports this hypothesis. The sites had different numbers of plant species, and there was an overall log-linear reduction of average above-ground biomass with loss of species (Hector et al. 1999, 1123).

effect of volition See hypothesis: volition.

endosymbiosis hypothesis *n.*

1. The hypothesis that the first eukaryotic cell evolved by physically incorporating prokaryotic organisms into its cytoplasm, and these prokaryotes became mitochondria and chloroplasts (Schimper 1883, etc. in Dodson 1979, 652; Portier 1918, Wallin 1927, and Schanderl 1948 in Margulis 1981, xvii; Margulis 1970, 178; Strickberger 1990, 157).

Notes: Alberts et al. (1989, 19, 398–399) hypothesize the following. The first eukaryotic cell evolved from an anaerobic organism without mitochondria and chloroplasts that established a stable endosymbiotic relation with bacteria. These bacteria with oxidative-phosphorylation systems became mitochondria. This ancestral line evolved into other Protists, Animalia, Fungi, and Plantae. The Plantae ancestor obtained oxygen-evolving, photosynthetic, endosymbiotic bacteria of different taxa which became chloroplasts.

2. The hypothesis that the three classes of organelles (basal bodies, cilia, flagella, mitochondria, and photosynthetic plastids) of eukaryotic cells evolved from free-living prokaryotic ancestors by a series of endosymbiotic relationships (Margulis 1985, 78; Lincoln et al. 1985).

syn. endosymbiont hypothesis (Alberts et al. 1989, 398–399), endosymbiosis theory (Dodson 1979, 653), endosymbiotic hypothesis (Curtis 1983, 414)

cf. hypothesis: serial-endosymbiosis hypothesis

Comments: This hypothesis contrasts with the autogenous hypothesis (Campbell 1987, 554) and the “genome-duplication hypothesis” (Raff and Mahler 1972, 579; Strickberger 1990, 158). The endosymbiosis hypothesis is currently favored by many biologists. The aerobic bacterium *Paracoccus denitrificans* appears to be similar to an ancestral mitochondrion symbiont because of its many mitochondrion-like enzymatic, membranous, and respiratory features (John and Whatley 1975, 495).

- **serial-endosymbiosis hypothesis** *n.* The hypothesis that mitochondria are direct descendants of a taxon of bacterial endosymbiont that became established at an early stage in a nucleus-containing, but amitochondriate, host cell; contrasts with “simultaneous-endosymbiosis hypothesis” (Gray et al. 1991, 1476).

- **“simultaneous-endosymbiosis hypothesis”** *n.* The hypothesis that the first mitochondrion and nucleus arose in a common ancestor of all extant eukaryotes at essentially the same time; contrasted with the serial-endosymbiosis hypothesis (Gray et al. 1991, 1476).

cf. hypothesis: hydrogen hypothesis

Comment: The fact that nuclear genomes are evolutionary chimeras that have substantial contributions from both archaeal and bacterial progenitors supports this hypothesis (Gray et al. 1991, 1479). Informational genes are largely of archaeal origin; whereas, operational genes appear to have come primarily from bacteria. Moreover, the bacterial component of a nuclear genome appears to be considerably greater than that usually attributed to specific gene transfer from an evolving mitochondrial genome, and includes genes that have nothing to do with mitochondrial biogenesis and function. Other lines of evidence are consistent with the hypothesis as well.

escalation hypothesis *n.* The hypothesis that through evolutionary time, organisms are faced with

increasing risks due to predation by their enemies, and they evolve increasing abilities in coping with these risks; organisms' relative rates of adaptation are at best continually maintained rather than improved (Vermeij in Geary 1988, 1257).

cf. hypothesis: Red Queen hypothesis

Eve hypothesis, Eve theory See hypothesis: African-origin hypothesis of human mitochondrial DNA evolution.

exploitation-ecosystems hypothesis (EEH)

n. A hypothesis, in the form of a mathematical model, that regards bottom-up and top-down control of biomass in particular trophic levels in an ecological community (Oksanen et al., 1981 in Steiner et al. 2001, 2495).

Comments: The EEH predicts that a particular trophic-level biomass is affected ("controlled") by either bottom-up control or top-down control, *q.v.* Further, the EEH predicts that consumer and resource control alternates as one moves up a food chain. Data support the EEH in general; however, a growing body of knowledge suggests that the biomasses of adjacent trophic levels often increase jointly as ecosystem productivity increases (references in Steiner 2001, 2495). *cf.* ⁴model: keystone-predator model

face-to-face-mating hypothesis *n.* The hypothesis that face-to-face mating in Humans has great psychological importance and is "a major cause of human society" (Washburn 1985, 7).

Comment: Nonhuman-ape behavior does not seem to support this hypothesis. Face-to-face mating is common in Bonobos, Gibbons, Gorillas, and Orangutans (Washburn 1985, 7).

falsifiable hypothesis *n.* A hypothesis that can be demonstrated to be false, if, indeed, it is false (Popper in Mayr 1982, 26).

cf. falsification, method: Popperian method

female-mate-choice hypotheses *n. pl.* Hypothesis concerned with why female organisms choice particular conspecific males over others as mates.

► **"direct-benefit hypothesis"** *n.* The hypothesis that a female organism chooses a conspecific male mate that provides her with a direct benefit over other males, which do not provide such a benefit (Futuyma 1998, 590).

Comments: The benefit improves her survival chances, reproductive success, or both (Futuyma 1998, 590). Benefits include nutrition, parental care, and a superior territory with resources for rearing offspring. This is the least controversial female-mate-choice hypothesis. Hill's (1991 in Futuyma 1998, 590) work with House Finches supports this hypothesis.

► **"heterospecific-avoidance hypothesis"** *n.* The hypothesis that a female organism chooses a male mate with distinctive characters (as an indication that it is her species) as a way of avoiding mating with another species and producing unfit progeny (Futuyma 1998, 589).

Comment: This hypothesis is unsupported in most studies (Futuyma 1998, 589).

► **"indirect-benefit hypothesis"** *n.* The hypothesis that a female organism chooses a conspecific male mate that provides her with an indirect benefit over other males that do not provide such a benefit (Futuyma 1998, 590).

cf. hypothesis: good-gene hypothesis

Comments: An indirect benefit is one that improves a female's survival chances, reproductive success,

or both (Futuyma 1998, 590). Such benefits include nutrition, parental care, and a superior territory with resources for rearing offspring. This is the least controversial female-mate-choice hypothesis. Hill's (1991 in Futuyma 1998, 590) research on *Carpodacus mexicanus* (House Finches) and Welch et al.'s (1998, 1928) work on *Hyla versicolor* (Gray Tree Frogs) appear to support this hypothesis. In these Frogs, females choose males with longer calls over those with shorter calls; progeny of males with longer calls were more successful larvae and juveniles.

firefly-flash-synchronization hypotheses

► **beacon hypothesis** *n.* The hypothesis that in some Southeast Asian firefly species, a tree with synchronously flashing male fireflies provides "a sufficiently bright and large beacon, perhaps enhanced by reflections, that attracts fireflies that wander out into the clear over water" and provides "enough opportunities for mating to compensate for the (assumed) long flight required of the mated females for egg dispersal" (Buck and Buck 1966, 563).

Comment: Buck and Buck (1978) indicate that data support their individual-selection "lek hypothesis" of firefly flash synchronization rather than their group-selection beacon hypothesis.

[Possibly coined by Buck and Buck (1976, 79)]

► **"lek hypothesis"** *n.* The hypothesis that in some Southeast Asian firefly species, each male increases his own fitness by grouping with other conspecific males on trees and synchronously flashing which attracts mates (Buck and Buck 1978, 476–478).

Comment: Buck and Buck (1966, 1978) also discuss physiological hypotheses of firefly synchronous flashing.

first-cell hypothesis *n.* The hypothesis that the first cell was similar to a mycoplasma (Norstog and Meyerriecks 1983, 38; Alberts et al. 1989, 10).

Gaia hypothesis *n.*

1. The hypothesis that "life, or the biosphere, regulates or maintains the climate and the atmospheric composition at an optimum for itself" (1972 definition in Lovelock 1990).

[coined by Margulis and Lovelock (1974, 471)]

2. "The concept that the atmosphere of the Earth flows in a closed system controlled by and for the biosphere" (Lovelock and Margulis 1974, 93).

Note: In addition, Lovelock and Margulis (1974, 93) suggest that the physical and chemical state of the Earth's surface "is in homeostasis at an optimum set by the contemporary biota."

3. The hypothesis that Earth's biota created an atmosphere with an acidity, composition, redox potential, and temperature history that differ greatly from that of other terrestrial planets (Mars and Venus), and has actively maintained these conditions with a stability akin to the self-regulating physiologies of living organisms (Lovelock and Margulis 1974 and Margulis and Lovelock 1974 in Barlow and Volk 1992, 686).

syn. Gaia, Gaia concept (Barlow and Volk 1992, 686)

Comments: There are many distinct versions of the controversial Gaia hypothesis. Early definitions have been criticized for being teleological (Kerr 1988), but Lovelock (1990) wrote "neither Lynn Margulis nor I have ever proposed a teleological hypothesis." Lovelock (1990 in Barlow and Volk 1992, 687) modified his original Gaia hypothesis by indicating that the

stability was not always homeostatic but punctuated homeostatic. After a disturbance, Earth becomes relatively stable again, albeit sometimes at an altogether new chemical, or thermal, state. Margulis (1990 in Barlow and Volk 1992, 687) proposed that the stability is more homeostatic than fixed from outside set points. She considers Gaia to be an ecosystem, not an individual (Margulis 1993). Kirchner (1989 in Resnik 1992, 573) distinguished among five versions of the Gaia hypothesis. He considers many versions to be false, untestable, or internally contradictory. Resnik (1992) analyzes three of these hypotheses and two others. Gaia hypotheses have generated fruitful research (Resnik 1992; Slobodkin 1993).

[coined by (Margulis and Lovelock 1974, 471) after *Gaia*, the common society to which the ancient Greeks believed all organisms on Earth belonged; *Gaia* is roughly translated as Mother Earth. It is also considered to be the Greek goddess of the Earth (Michaelis 1963)]

Gause's hypothesis See principle: Gause's principle.

genetic-behavioral-polymorphism hypothesis See hypothesis: population-limiting hypotheses: genetic-behavioral-polymorphism hypothesis.

Geoffroyism *n.* Étienne Geoffroy Saint-Hilaire's hypothesis that an organism's environment causes a direct induction of its organic change (Mayr 1982, 687).

cf. inheritance of acquired characters, Lamarckism

Comments: Lamarck rejected "Geoffroyism," but the neo-Lamarckians at the end of the 18th century held such direct induction in high esteem (Mayr 1982, 362). "Geoffroyism" was widely believed by biologists almost to the end of the 19th century (Mayr 1982, 687).

Goldschmidt's-speciation hypothesis *n.* The hypothesis that speciation results from systematic mutations (Goldschmidt 1940).

Comments: Opposition to this hypothesis led Mayr to propose the widely accepted hypothesis that geographic isolation is a major factor that influences speciation (Mayr 1982, 381).

hypotheses of female choice *n. pl.* Hypotheses concerned with why females choose particular male mates over others.

cf. mate choice

► **indicator hypothesis of female choice** *n.* The hypothesis that a female chooses a particular mate because part of his phenotypic trait indicates that he has a heritable adaptive trait(s), determined by "good genes" (Futuyma 1998, 591).

Comments: This hypothesis contrasts with the runaway hypothesis of female choice. Female choice could theoretically result in male ornaments, such as bright, ornate plumage of a male bird, if this plumage indicates he is less affected by parasites than less ornate males through the process of runaway sexual selection, *q.v.* (Hamilton and Zuk 1982 in Futuyma 1998, 592). Females of a stalk-eyed fly that choose males with wider eye-spans tend to produce more sons than daughters. This appears to be adaptive because sex bias is daughter biased in the female population in general, thus a son has more reproductive value than a daughter.

► **runaway hypothesis of female choice** *n.* The hypothesis that a female chooses a particular mate that is more ornate than other males, not because his ornamentation indicates that he has a heritable adaptive trait associated with the ornamentation, but

because her sensory system simply finds a more ornate male more attractive; the male ornamentation and female tendency to choose more ornate males are heritable; her sons are more ornamented than the average male; her daughters choose more ornamented males as mates; and this process continues until highly ornate males evolve through runaway sexual selection, *q.v.* (Futuyma 1998, 591).

cf. selection: runaway sexual selection

Comment: This hypothesis contrasts with the indiscriminate hypothesis of female choice.

good-genes hypothesis *n.* The hypothesis that a female organism chooses a conspecific male mate that has a higher genetic quality (= "good genes") over other males with lower genetic qualities (Futuyma 1998, 591).

cf. hypothesis: female-mate-choice hypothesis: "indirect-benefit hypothesis"

syn. good-genes model (Welch et al. 1998, 1928)

Comments: A female could use any male trait that is correlated with genetic quality — an indicator of good genes — as a guide to an advantageous mating (Futuyma 1998, 591). Welch et al.'s (1998) work on Gray Tree Frogs provides direct genetic evidence that appears to support this hypothesis.

gradient hypothesis *n.* The hypothesis that gradients of substances called morphogens establish an embryo's axes and other features of its form (Campbell et al. 1999, 400).

grandmother hypothesis *n.* The hypothesis that evolution selected for increased longevity in women because older women share food with their daughters and grandchildren (Suplee 1998, 9 February, A3).

Comments: Menopause might have evolved because it was not beneficial for older women to reproduce (Suplee 1998, 9 February, A3). Jonathan Marks suggests that there are other reasons for menopause besides natural selection, including a woman's running out of eggs. In Gibbons, Macaques, and *Pan troglodytes* (Chimpanzees) females remain fertile throughout almost all of their lives.

green-beard effect *n.* The hypothesis that a gene might be responsible for both the expression of a specific trait and the recognition of it in conspecific organisms (Lewin 1984).

[Dawkins (in Lewin 1984) coined this term, and put simply in his words: "I have a green beard and I will be altruistic to anyone else with green beard."]

handicap principle *n.* The hypothesis that an attribute (*e.g.*, large tail or large antlers) of a male animal is a handicap that he shows to a female demonstrating that he can survive and has "good genes" despite his handicap (Zahavi 1975, 207; 1977; Spencer and Masters 1992, 299).

syn. handicap hypothesis (Kirkpatrick 1986, 222)

Comments: This concept suggests that males with handicaps that survive to mate are compensated by being fitter in other respects, thus their handicaps are advertisements for good genes. Females that mate with such males are expected to gain generally better genes for their offspring. The handicap principle is supported by some mathematical models but not others (Kirkpatrick 1986; Spencer and Masters 1992, 299).

heterospecific-avoidance hypothesis See female-mate-choice hypothesis: "heterospecific-avoidance hypothesis."

hydrogen hypothesis *n.* The hypothesis that metabolic syntrophy was the driving force for an association between a hydrogen-producing eubacterial symbiont (assumed to be an α -Proteobacterium) and a hydrogen-requiring archaean (the host) which led to the evolution of the first eukaryote (Martin and Müller 1998 in Gray et al. 1991, 1480).

cf. hypothesis: “simultaneous-endosymbiosis hypothesis”

Comments: This hypothesis suggests the simultaneous origin of the eukaryote ancestor and its mitochondrion with a major bacterial contribution to the eukaryote’s nucleus from the same α -bacterial genome whose reduction is postulated to result later in mitochondrial genomes (Gray et al. 1991, 1480). A similar hypothesis involves a δ -Proteobacterium symbiont (Moreira and López-García in Gray et al. 1991, 1480).

hypothesis of biogenesis See law: biogenetic law.

hypotheses of *Canis familiaris* (Domestic Dog) and smelly substances

► **disguise hypothesis** *n.* The hypothesis that a *Canis familiaris* (Domestic Dog) rolls in a smelly substance because it masks its scent from prey (Achenbach 1995, F5).

► **attention hypothesis** *n.* The hypothesis that a *Canis familiaris* (Domestic Dog) rolls in a smelly substance because the odor communicates to other dogs that the dog found something of interest, e.g., food (Randy Lockwood in Achenbach 1995, F5).

► **coat hypothesis** *n.* The hypothesis that a *Canis familiaris* (Domestic Dog) rolls in a smelly substance to because its fatty acids help keep its coat water repellent (Achenbach 1995, F5).

hypotheses of divergent evolution of animal genitalia *Comment:* Eberhard (1985) discusses evidence for and against these hypotheses.

► **genitalic-recognition hypothesis** *n.* The hypothesis that females determine species identity of a potential mate based on species-specific genitalic stimuli and avoid fertilization if stimuli are not appropriate (Stephenson 1930; etc., in Eberhard 1985, 27).

► **lock-and-key hypothesis** *n.* The hypothesis that females avoid fertilization by heterospecific males due to their evolution of complicated genitalia that permit insemination by only conspecific males; a male has the “key” that fits a female’s “lock,” and “each new speciation event necessitates a new lock and a new key” (Dufour 1844 in Mayr 1963, 63; Eberhard 1985, 19–20, who cites evidence for and against this hypothesis).

Comment: *Tatocilia* butterflies do not support this hypothesis (Porter and Shapiro 1990, 107).

► **mechanical-conflict-of-interest hypothesis** *n.* The hypothesis that a male’s genitalia damages a female’s genitalia and, thus, prevents her further copulations, and female genitalia evolves protection against this damage (Wing 1982 in Eberhard 1985, 29, who indicates that the status of this hypothesis is unclear).

► **pleiotropism hypothesis** *n.* The hypothesis that genitalia are pleiotropically affected by many genes, any change in a species’ genetic constitution may result in an incidental change in its genitalic structure, and because genitalia of many species are internal structures, they are less subject to corrective influences of natural selection provided their

basic function of gamete transfer is not impaired (Mayr 1963, 104, in Eberhard 1985, 27–28).

syn. pleiotropism argument, pleiotropism theory (Eberhard 1985, 28)

Comments: Arnold (1973) modified this hypothesis; concrete data that support, or do not support, this hypothesis, are very limited (Eberhard 1985, 28).

► **sexual-selection-by-male-conflict hypothesis**

n. The hypothesis that sexual selection in the form of direct male-male competition is responsible for rapid divergence of genitalic structure (Eberhard 1985, 183, who rejects this hypothesis).

► **sexual-selection-by-female-choice hypothesis**

n. The hypothesis that male genitalia function as “internal courtship devices” that increase the likelihood that females will actually use a given male’s sperm to fertilize her eggs rather than those of another male; the diversity of male genitalic form is the result of runaway sexual selection (Eberhard 1985, 14–15, 182; 1992, 1774, who offers data that support this hypothesis).

hypothesis of nonspecificity *n.* The hypothesis that there are no distinct major gene groups that exclusively affect one class of characters, such as morphological, physiological, or ethological ones (Lincoln et al. 1985).

hypothesis of punctuated equilibrium *n.*

The hypothesis that an organism lineage (equilibrium) changes gradually, but also shows rapid, episodic times of change, even speciation (punctuations) during geological time (Eldredge and Gould 1972, 84; Gould 1980; Eldredge 1985; Futuyma 1986, 401–403). *syn.* theory of punctuated equilibrium (Futuyma 1986, 402)

cf. ²evolution: punctuational evolution; punctuated equilibrium

Comments: The hypothesis of punctuated equilibrium is contrasted with Charles Darwin’s gradualism, but Darwin’s views overlapped with those of proponents of this hypothesis (Rhodes 1983, 269; Arthur 1984, 119). Hull (1984) writes that this hypothesis proposes that “evolutionary development is a good deal more ‘punctuational’ than advocates of the modern theory of evolution have been willing to admit and contains an important non-adaptive phase.” Gould and Eldredge (1986, 1993) and Futuyma (1986) discuss some of the controversy related to this hypothesis. Dawkins (1986), Hecht and Hoffmann (1986), and Levinton (1988) critique this hypothesis. Gould and Eldredge (1986, 145) conclude that “Punctuated equilibrium is now quite acceptable, rather smaller in scope than once suspected, and a good, comfortable part (or perhaps, at best, a mild extension) of neo-Darwinism, the Modern Synthesis, or whatever orthodoxy is called.” Gould (1987b) describes how a punctuated equilibrium regards speciation and its deployment in geological time and is different from quantum evolution. Brown (1987) indicates that the original data of Eldredge and Gould (1972) do not support their hypothesis. Bryozoan fossils as well as other data support this hypothesis (Jackson and Cheetham 1990, 579) which requires further testing. Gould and Eldredge (1993) explain how this hypothesis is supported by four classes of evidence: cases from particular organism groups, cases from entire faunas, inductions about environments in

which punctuated equilibria should and should not prevail, and tests with living organisms.

hypothesis of random mutation *n.* The hypothesis that a bacterium has some probability of spontaneously mutating from a viral sensitive into a viral resistant state, even in the absence of the virus (Luria and Delbrück 1943 in Lenski and Mittler 1993, 188); contrasted with the directed-mutation hypothesis.

Comments: This hypothesis was formulated to account for the appearance of bacteria resistant to infection by viruses and has experimental support (Lenski and Mittler 1993, 188). It is an alternative hypothesis to the hypothesis of directed mutation, *q.v.*

hypotheses of 17-yr Cicada speciation by life-cycle evolution

► “**nurse-brood-facilitation hypothesis**” *n.* The hypothesis that mutations that influence life-cycle length facilitate evolution of a new *Magicicada* species by allochronic isolation if founders (with the mutations) of the new species can escape predation (Alexander and Moore 1962 in Marshall and Cooley 2000, 1323).

► “**life-cycle-canalization hypothesis?**” *n.* The hypothesis that the expression of latent phenotypic plasticity in one *Magicicada* population can isolate it from another population, leading to speciation of the former population (Lloyd and Dybas 1966 in Marshall and Cooley 2000, 1323).

Comment: For example, some members of a population of a 17-yr cicada may mature in 13 yr instead of 17 yr, becoming reproductively isolated from its mother population.

hypotheses of species organization *n. pl.*

Hypotheses concerning community equilibrium, organization, and stability.

cf. hypothesis: hypotheses of species richness

► “**equilibrium hypothesis of species organization**” *n.* The hypothesis that communities, such as coral reefs and tropical rain forests, are stabilized, ordered systems of species resulting from natural selection; and when a factor(s) disturbs such a community, it quickly returns to its original state; contrasted with nonequilibrium hypothesis of species organization (Connell 1978, 1306–1307).

► “**nonequilibrium hypothesis of species organization**” *n.* The hypothesis that equilibrium in species organization is seldom attained, species assemblages seldom reach an ordered state, and communities of competing species are not highly organized by diffuse coevolution into systems in which optimal strategies produce highly efficient associations whose species composition is stabilized; contrasted with equilibrium hypothesis of species organization (Connell 1978, 1306–1307).

hypotheses of species richness *n. pl.* Hypotheses that attempt to explain why certain communities, including coral reefs and tropical rain forests have high numbers of species.

Comments: Connell (1978) discussed six such hypotheses which fall into two categories: nonequilibrium hypotheses (equal-chance hypothesis, gradual-change hypothesis, and intermediate-disturbance hypothesis) and equilibrium hypotheses (circular-networks hypothesis, compensatory-mortality hypothesis, and niche-diversification hypothesis). On Earth in general, all of these hypotheses could be true, and for a particular location, more than one of these hypotheses could be true (Connell 1978, 1309).

SOME HYPOTHESES OF SPECIES RICHNESS

I. “equilibrium hypotheses of species richness”

- A. circular-networks hypothesis
- B. compensatory-mortality hypothesis
- C. niche-diversification hypothesis

II. “nonequilibrium hypotheses of species richness”

- A. equal-chance hypothesis
- B. gradual-change hypothesis
- C. intermediate-disturbance hypothesis
- D. recruitment-limitation hypothesis

► **circular-networks hypothesis** *n.* An equilibrium hypothesis of species richness (*q.v.*) that circular competitive hierarchies, in which organisms eliminate others locally, maintain high species richness in an area in general (Connell 1978, 1307).

Comment: Coral-reef research did not support this hypothesis (Connell 1976 in Connell 1978, 1307).

► **compensatory-mortality hypothesis** *n.* An equilibrium hypothesis of species richness (*q.v.*) that high species richness occurs in a community in which competitive elimination of species is prevented indefinitely because mortality is greatest in the species with the highest competitive ability, or if all species have approximately equal competitive abilities, mortality is the greatest in the commonest species (Connell 1978, 1307).

Comment: This hypothesis generally does not seem to account for high diversity in coral reefs and mixed tropical rain forests (Connell 1978, 1307).

► **equal-chance hypothesis** *n.* A nonequilibrium hypothesis of species richness (*q.v.*) that species richness is high in a community because each of its species has an equal chance of colonizing empty spaces, hold them against invaders, and survive the vicissitudes of physical extremes and natural enemies (Connell 1978, 1306).

Comment: Research on certain guilds of coral-reef fish might support this hypothesis (Sale 1977 in Connell 1978, 1306).

► **“equilibrium hypothesis of species richness”** *n.* The hypothesis that communities, such as coral reefs and tropical rain forests, are stabilized, ordered systems of species; and when a factor(s) disturbs such a community, it quickly returns to its original high number of species (inferred from Connell 1978, 1306–1307); contrasted with nonequilibrium hypothesis of species richness.

► **gradual-change hypothesis** *n.* A nonequilibrium hypothesis of species richness (*q.v.*) that climate changes (from seasonal through millennial and longer) change species abundances and compositions in a particular location over time (inferred from Connell 1978, 1306, who indicates that Hutchinson 1941 suggested this hypothesis).

Comment: Data from forests and phytoplankton support this hypothesis (Connell 1978, 1306).

► **intermediate-disturbance hypothesis** *n.*

- 1. A nonequilibrium hypothesis of species richness (*q.v.*) that species richness is highest during intermediate states of disturbance frequency, disturbance size, time after a disturbance occurred, or a combination of these factors (Connell 1978, 1303, fig. 1).

Note: Studies of an Australian coral reef and rain forests in Australia, Nigeria, and Uganda do not reject this hypothesis (Connell 1978, 1303).

2. The hypothesis that many species can coexist in the same area because localized disturbances, such as light gaps (*q.v.*) promote the coexistence of species that have different competitive and dispersal abilities and resource-use strategies (Hubbell et al. 1999, 554).
3. The hypothesis that many species can coexist in the same area because localized disturbances, such as light gaps (*q.v.*) promote the coexistence of species that have different competitive and dispersal abilities and resource-use strategies (Hubbell et al. 1999, 554).

Notes: This is a more restrictive definition of the first definition. In this rendition, the hypothesis predicts that there is a greater species richness in light gaps than in mature forest and that species richness will be greater in gaps collectively than in their forest matrix because gaps provide more diverse conditions and resources in ecological time (Chazdon et al. 1999, 1459a; Hubbell 1999, 1459a; Hubbell et al. 1999, 554). A study of tree-fall gaps in a Panamanian tropical rainforest supports the recruitment-limitation hypothesis (*q.v.*), rather than the intermediate-disturbance hypothesis (Hubbell et al. 1999, 554).

► **niche-diversification hypothesis** *n.* An equilibrium hypothesis of species richness (*q.v.*) that many specialized species can coexist in a habitat with a range of attribute variations (Connell 1978, 1306).

Comment: Data from motile organisms might support this hypothesis (Schoener 1974 in Connell 1978, 1306).

► **“nonequilibrium hypothesis of species richness”** *n.* The hypothesis that an equilibrium in species organization in a community is seldom attained and that species richness is highest when a factor(s) causes the community to be in a state of disturbance (inferred from Connell 1978, 1306–1307); contrasted with equilibrium hypothesis of species richness.

► **recruitment-limitation hypothesis** *n.* A non-equilibrium hypothesis of species richness (*q.v.*) that many species can coexist in the same area because many species cannot dominate the area because they simply cannot colonize all available subareas; these species have low local abundance, have poor dispersal ability, do not arrive in a sub-area by chance, or a combination of these factors (Tilman 1999a, 496).

Comments: There are several versions of the general recruitment-limitation hypothesis explained by Tilman (1999a, 496).

hypotheses of the beginning and evolution of the Universe

Comment: These hypotheses are also called theories and models.

► **big-bang cosmology** *n.* The hypothesis that in the large-scale average, the Universe is expanding in a nearly homogeneous way from a dense early state (Slipher 1922 and Hubble 1929 in Peebles 1994, 53); contrasted with the big-bang hypothesis.
syn. big-bang model, big-bang theory

Comment: At present, there are no fundamental challenges to this cosmology, although there are

certainly unresolved issues within the theory itself (Peebles et al. 1994, 53).

► **big-bang hypothesis** *n.* The hypothesis that the Universe was once a small sphere of concentrated energy and matter (energy-matter combination), this sphere exploded, mostly hydrogen and some helium formed when the temperature decreased, protogalaxies formed about 100 Ma after the blast, and so forth (Ralph Alpher, George Gamow, and Ralph Herman in Strickberger 1990, 66; Sullivan 1997, 1275); contrasted with the steady-state hypothesis.

Comments: The Belgian priest Georges Lemaître first proposed this hypothesis in 1927 (Sawyer 1992, A1). Many lines of evidence support this hypothesis including microwave glow thought to result from the original blast, Doppler light shifts that indicate stars and galaxies are moving apart, a background temperature of 3° Kelvin, 10% of the Universe is helium, and faint “hot spots” in the microwave sky that are 300,000-yr-old relicts of the big blast detected by the Cosmic Background Explorer Satellite (Strickberger 1990, 66; Powell 1992, 17).

[coined by Fred Hoyle, English cosmologist, who used “big bang” to disparage the hypothesis (Peebles et al. 1994, 53). Some people want to rename this hypothesis because “big bang” has sexual connotations (Allen 1993, 16 June, B1)]

► **oscillating-big-bang hypothesis** *n.* A hypothesis that our Universe started with a big blast and then has been alternating between expanding (big bangs) and contracting (big crunches) perhaps *ad infinitum* (Strickberger 1990, 66); contrasted with the big-bang hypothesis.

► **quasi-steady-state model** *n.* A modification of the steady-state hypothesis that states that things including large amounts of matter are produced in discreet explosions called creation events, the creation events occur throughout the Universe in creation centers (regions that already contain dense matter and have strong gravity, a series of large creation events occurred 10 through 15 Ga ago and caused the expansion of our part of the Universe, and small creation events have continued to occur and produce energetic objects such as quasars and radio galaxies (Hoyle et al. 1993 in Croswell 1993, 14).

Comment: The quasi-steady-state model is meant to account for the microwave background which is not explained by the steady-state hypothesis (Croswell 1993, 14).

► **steady-state hypothesis** *n.* The hypothesis that our Universe is expanding to some extent, new galaxies appear in gaps among older ones, and when hydrogen becomes helium, new hydrogen is replenished from an unknown source (proposed by Fred Hoyle, Hermann Bondi, and Thomas Gold 1948, in Strickberger 1990, 66); contrasted with the big-bang hypothesis and quasi-steady-state model.

Comments: This hypothesis proposes that the Universe had no beginning and thus is infinitely old (Croswell 1993, 14). Most astronomers do not support this hypothesis (Sullivan 1997, 1275).

hypotheses of the evolution and maintenance of sex **Comments:** Because the costs of sex (*q.v.*) are high, one would expect evolution to favor parthenogenetic species rather than sexually reproducing ones, yet the majority of eukaryans are sexually

reproducing species. This leads people to wonder why sex evolved in the first place and how natural selection maintains it in populations in the face of its costs (Lenski 2001, 533). Researchers have formulated many relevant hypotheses regarding the evolution and maintenance of sex. The highly compelling hypotheses are not mutually exclusive, especially those regarding why sex is maintained in populations. Bell (1982) discusses data that support and do not support many of these hypotheses. Zinder (1985, 7–12) hypothesizes how sex evolved in prokaryotes. “Why did sex evolve and come to predominate in species” remains unanswered. Sex involves a large set of complex phenomena and there is a great variety of manifestations of sex; “each of these manifestations may well require separate, though integrated explanations” (Mooney 1993, 113). There are at least 20 hypotheses regarding the origin and evolution of sex (Kondrashov 1993 in Judson and Normark 1996, 41). I include some of the hypotheses below.

► **best-man hypothesis** *n.* The hypothesis that sexual reproduction maximizes an individual’s number of successful offspring by producing genetically variable offspring; some variants are more successful than others in particular environments (Williams 1966, 129; Emlen 1973, 54–55; Williams 1975 in Bell 1982, 104–122).

Comments: Herder (1784–1791 in Mayr 1982, 706) suggested that sexual reproduction causes offspring variability. The best-man hypothesis is similar to the variation hypothesis, *q.v.*, and Williams’ hypothesis (Williams 1966a in Wilson 1975, 316).

[coined by Bell 1982, 105]

► **Crow-Kimura hypothesis, Crow-Kimura model** *n.* The hypothesis that “entire populations evolve faster when they reproduce by sex, and as a result they will prevail over otherwise comparable asexual populations” (Crow and Kimura 1965 in Wilson 1975, 315–316).

► **“freedom-from-deleterious-mutations hypothesis”** *n.* The hypothesis that gene recombination due to sexual reproduction puts beneficial mutations into new combinations of genes, that some of these combinations are more free from the baggage of deleterious mutations than others and will be more favored by natural selection, and the beneficial mutations will increase in frequency when they are in the more favored combinations of genes (Lenski 2001, 534; Rice and Chippindale 2001, 555, 559).

Comments: Rice and Chippindale (2001, 555) performed an experiment on *Drosophila melanogaster* which had a newly arisen mutation that was located within genome-wide, synthetic chromosomes that propagated with, or without, recombination in new flies. Artificial selection on the mutation in their laboratory markedly increased in the fly cultures with recombining chromosomes, lending some support for the “freedom-from-deleterious-mutations hypothesis.”

► **hitch-hiker hypothesis** *n.* The hypothesis that sexual reproduction can cause increased recombination when a recombination allele “hitches a ride” with a high-fitness chromosome it has created and, thus, increases in frequency by autoselection [coined by Bell 1982, 125, after Maynard Smith’s phraseology].

► **inertia hypothesis** *n.* The hypothesis that sex persists in slowly reproducing species due to phylogenetic inertia, *i.e.*, it is very difficult for natural

selection to eliminate sex once it evolved in ancestral lines (Williams in Maranto and Brownlee 1984).

► **“parasite hypothesis of the evolution and maintenance of sex”** *n.*

1. The hypothesis that parasites, that are short lived and rapidly evolving compared to hosts they attack, are an evolutionary factor sufficiently general to account for the evolution of sex (Hamilton 1980, 282).

2. The hypothesis that the coevolution between parasites and their hosts provides the necessary changing environment that gives a twofold advantage to the host’s having sexual reproduction; sexual reproduction gives the host’s offspring the possibility of rapid change in the face of its population’s losing its resistance to certain kinds of parasites (Hamilton 1980; Dawkins 1986, 136–137).

syn. parasite-avoidance hypothesis (Angier 2000, 10 March, A18)

► **ratchet hypothesis, ratchet mechanism** *n.*

The hypothesis that sexual reproduction facilitates the elimination of unfavorable mutations in a group of individuals in uniform environments that do not change in time (Muller 1964 in Bell 1982, 101–104). [coined by Bell 1982, 101]

► **Red Queen hypothesis** *n.*

1. The hypothesis that evolution favors sexual reproduction because continual adaptation through meiosis and gene recombination is necessary for a species to remain extant when its environment changes (Bell 1982, 157).

2. The hypothesis that antagonistic biotic interactions, especially those between parasite and host species are a sufficient evolutionary force that counterbalances the supposed inefficiency of sexual reproduction (Ladle 1992, 405).

Notes: This hypothesis combines parts of the Red Queen hypothesis (def. 1) above and Red Queen hypothesis (def. 1) below under H in this book. Some studies provide strong empirical evidence in support of this hypothesis (Ladle 1992, 405).

syn. Red Queen’s hypothesis (Boyce 1990, 263)

cf. hypothesis: Red Queen hypothesis

[coined by Bell (1982, 157) for his hypothesis for the evolution and maintenance of sex because of its generic similarity to Van Valen’s Red Queen hypothesis. This name is derived from Alice in Wonderland by Lewis Carroll: “It takes all the running you can do, to keep in the same place,” the Red Queen.]

► **rejuvenescence hypothesis** *n.* The hypothesis that populations naturally age, and sex rejuvenates them (Maupas 1889 in Mooney 1993, 111).

Comment: Weismann favored his variation hypothesis and strongly attacked the rejuvenescence hypothesis (Mooney 1993, 111–112). The notion that asexual populations age has been rejected, and the idea of rejuvenation has been replaced with “nuclear repair” (*e.g.*, in the repair hypothesis).

► **repair hypothesis** *n.* The hypothesis that the recombination of genes resulting from sexual reproduction repairs genetic damage and outcrossing yields new gene combinations that mask mutations; the genetic variation found in offspring of sexually reproducing organisms is an important byproduct of the selection for repair, but not the principal driver of the evolution of sex (Bernstein et al. 1985).

Comment: The repair hypothesis has been criticized as being too broadly applicable because all organisms “require” DNA repair yet they do not all have meiotic sex (Sterns 1987 in Mooney 1993, 113).

► **tangled-bank hypothesis** *n.* The hypothesis that sexual conspecific organisms are more fit in an environment composed of slightly different subniches; if a clone line invades such an environment, its offspring quickly inhabit all subniches to which it is genetically suited, but occupies less suitable ones only tenuously; if sexual organisms invade the environment, their offspring can displace clones living in marginal subniches; and clonal and sexual forms compete, with the latter’s taking over most of the subniches (Bell 1982, 127–142).

Comment: Bell (1982, 388) states that the tangled-bank hypothesis is “by far the most broadly supported of all the empirically vulnerable theories which attempt to identify the function of sex.” [coined by Bell (1982, 131) from tangled bank in the last paragraph of Darwin (1859) which expresses the complexity of natural habitats]

► **variation hypothesis** *n.* The hypothesis that the object of sex “is to create those individual differences which form the material out of which natural selection produces new species” (Weismann 1891, 1 in Mooney 1993, 110).

Comment: This hypothesis has been modified resulting in more recent hypotheses (*e.g.*, the best-man hypothesis, *q.v.*).

► **Vicar-of-Bray hypothesis** *n.* The hypothesis that sexual reproduction speeds up evolution by fostering the spread of adaptive mutations in groups of individuals; and sex is adaptive in a uniform, but changing, environment, because it facilitates the rapid fixation of favorable mutations (Weissmann 1889, 281; Guenther 1904; Fisher, 1930, 137; Muller 1932, 120–123 all in Bell 1982, 91–101).

syn. Fisher-Muller theory (Bell 1982).

[named by Bell 1982, 92, after the Vicar of Bray, an English cleric noted for his ability to change his religion whenever a new monarch ascended the British throne]

► **Williams’ hypothesis** See hypothesis: hypotheses of the evolution and maintenance of sex: best-man hypothesis (comment).

hypothesis of the origin of continents *n.* The hypothesis that the world’s land area was originally united in a single primordial supercontinent called Pangea (Wegener 1915 in Hallam 1975, 13). *cf.* hypothesis: continental drift

hypotheses of the origin of eukaryotic organelles

► **autogenous hypothesis** *n.* The hypothesis that the first eukaryotic cell evolved by the specialization of internal membranes derived originally from the plasma membrane of a prokaryote; the endomembrane system (consisting of the nuclear envelope, endoplasmic reticulum, Golgi, and organelles (*e.g.*, lysosomes) that are bound by a single membrane are differentiated products of invaginated membranes; and mitochondria and chloroplasts acquired their double-membrane status by secondary invagination of more elaborate membrane folding (Campbell 1990, 558, illustration).

► **“genome-duplication hypothesis”** *n.* The hypothesis that eukaryotic organelles arose from genetic duplications that each became enclosed in a

separate set of membranes; mitochondria originated in a one-celled, eukaryotic, plantlike ancestor; and lines from this ancestor became Animalia, Fungi, and Plantae (Raff and Mahler 1975 in (Strickberger 1990, 158).

hypotheses of the origin of insect wings

Comments: Some of these hypotheses have been called theories. Kukalova-Peck (1978) also discusses hypotheses related to modification of evolving insect wings and how a group of hypotheses might account for the origin of insect wings. Kingsolver and Koehl (1994) review many hypotheses.

► **flying-fish hypothesis of wing origin** *n.* The hypothesis that wings evolved from gill plates in ancestral pterygote insects that broke falls and that enabled insects’ gliding to other pools of water by their flapping (Kukalova-Peck in Evans 1985, 37).

► **flying-squirrel hypothesis of insect wing origin** See hypothesis: hypotheses of the origin of insect wings: paranotal hypothesis of insect wing origin.

► **gill-cover hypothesis of insect wing origin** *n.* The hypothesis that insect wings evolved from gill covers (Woodworth 1906 in Kukalova-Peck 1978, 70).

► **paranotal hypothesis of insect wing origin** *n.* The hypothesis that insect wings evolved from “rigid, doubled, lobe-like expansions of thoracic terga, the paranotal lobes” (Kukalova-Peck 1978, 59); wings evolved from lateral flanges on thoraxes of terrestrial, arboreal ancestral pterygote insects that were used for gliding from tree to tree to the ground (Evans 1984, 38).

syn. flying-squirrel hypothesis of wing origin (Müller 1873–1875 in Kukalova-Peck 1978, 59)

Comment: Kukalova-Peck (1978) suggests that this hypothesis is not valid.

► **spiracular-flap hypothesis of insect wing origin** *n.* The hypothesis that insect wings evolved from integumental evaginations which originally served as spiracular flaps (Bocharova-Messner 1971 in Kukalova-Peck 1978, 66).

► **stylus hypothesis of insect wing origin** *n.* The hypothesis that insect wings evolved from coxal styli of Apterygota (Wigglesworth 1973, 1976 in Kukalova-Peck 1978, 67).

► **thermoregulation hypothesis of insect wing origin** *n.* The hypothesis that insect wings evolved from thoracic lobes that an insect used to heat its thoracic muscles (Walley 1979 in Lewin 1985b; Douglas 1981; Kingsolver and Koehl 1985).

hypotheses regarding the disappearance Neanderthals, etc.

► **Neanderthal-extinction hypothesis** *n.* The hypothesis that Neanderthal Persons disappeared because *Homo sapiens sapiens* killed them off or outcompeted them.

syn. complete-replacement hypothesis (Wolpoff 1989, 102)

► **Neanderthal-interbreeding hypothesis** *n.* The hypothesis that Neanderthal Persons disappeared because *Homo sapiens sapiens* interbred with them.

► **Neanderthal-as-progenitors hypothesis** *n.* The hypothesis that Neanderthal Persons were not replaced by *Homo sapiens sapiens* but evolved into it (Schwalbe, Hrdlicka, and Weidenreich in Brace and Montagu 1977, 194; Culotta 1991, 376).

hypotheses regarding the origin of the Cambrian Explosion *Comment:* The following hypotheses assume that there really was a Cambrian Explosion. Its occurrence is open to debate; see Cambrian Explosion.

- **Bekner-Marshall hypothesis** *n.* The hypothesis that atmospheric oxygen became high enough to form a protective ozone layer and provide adequate oxygen for respiration in new forms resulting in the Cambrian Explosion [references in Gould (1981b, 305–306); Kerr (1993, 261, 1274)].
- **“complexity-level hypothesis”** *n.* The hypothesis that animals reached a certain level of complexity (that of modern worms) that enabled them to exploit many open niches and evolve into many new forms resulting in the Cambrian Explosion [references in Gould (1981b, 305–306); Kerr (1993, 261, 1274)].
- **“continental-drift hypothesis”** *n.* The hypothesis that geologically sudden shifts in latitude and climate due to movement of tectonic plates enabled many species to evolve quickly resulting in the Cambrian Explosion [references in Gould (1981b, 305–306); Kerr (1993, Science 261, 1274)].
- **“fecal hypothesis”** *n.* The hypothesis that the early surface-dwelling, plankton-eating, gut-carrying animals produced fecal pellets that dropped quickly to the ocean floor; this gave surface bacteria less food and their populations shrank; they consumed less oxygen and more oxygen became available to multicellular creatures which fueled the evolution of more energetic forms; and this resulted in the Cambrian Explosion (Graham Logan in Oliwenstein 1996, January, 43).
- **“log-phase hypothesis”** *n.* The hypothesis that ordinal and familial diversity increased as a sigmoid function over time, and the log phase occurred during the Cambrian Explosion [references in Gould (1981b, 305–306); Kerr (1993, 261, 274)].
- **“predator hypothesis”** *n.* The hypothesis that newly evolved predators decreased the numbers of dominant prey species and thereby enabled evolution of new species, resulting in the Cambrian Explosion [references in Gould (1981b, 305–306); Kerr (1993, 261, 1274)].
- **“plentiful-food hypothesis”** *n.* The hypothesis that an increase in nutrients entered the oceans (due to increased erosion on land, increased speed in ocean circulation that pumped up unused nutrients from the deep sea, or both) and caused some organisms to flourish and out-compete and out-reproduce others and the flourishing organisms caused many others to go extinct leaving many open niches and many new productive organisms filled the niches, resulting in the Cambrian Explosion (Ronald Martin in Oliwenstein 1996, January, 43).
- **“volcano hypothesis”** *n.* The hypothesis that submarine volcanoes erupted and changed Earth's climate by producing CO₂ that caused a greenhouse effect resulting in the Cambrian Explosion (Geerat Vermeij in Oliwenstein 1996, January, 43).

hypotheses regarding the Permian mass extinction

- **“carbon-dioxide hypothesis”** *n.* The hypothesis that a “rapid overturn of deep anoxic oceans, which introduced toxic CO₂ and, perhaps, H₂S into surficial environments” in part caused the Permian mass extinction on Earth (Knoll et al. 1996, 452).

Comments: The overturn perhaps took a few centuries (Browne 1996, 30 July, C1, C10). The CO₂ may have originated from plant material that settled in deep ocean water. Evidence in support of this hypothesis is the types of calcium-carbonate sediments laid down at the end of the Permian Period (Knoll et al. 1996, 453). Contemporaneous Siberian volcanism (= the Siberian Traps eruption) possibly added additional CO₂ to Earth's atmosphere.

► **“Pangea hypothesis”** *n.* The hypothesis that Pangea's coming together and causing a warm continental climate caused the Permian mass extinction (references in Gould 1981b).

► **“poisonous-gas hypothesis”** *n.* The hypothesis that poisonous gases released by a gigantic volcanic eruption (the Siberians Traps eruption) coupled with the climatic effects of a large scale release of volcanic CO₂ caused the Permian mass extinction (Browne 1996, 30 July, C1).

► **“salt hypothesis”** *n.* The hypothesis that a drop in ocean salt concentrations caused the Permian mass extinction (references in Gould 1981b).

► **“supernova hypothesis”** *n.* The hypothesis that supernova explosions changed Earth's environment in a way that killed many organisms and caused the Permian mass extinction (references in Gould 1981b).

hypotheses regarding the site of first life on Earth

► **“agreeable hypothesis”** *n.* The hypothesis that life first evolved in a rich broth of organic molecules in a warm pond of fresh through salt water (= a primordial soup) (Darwin 1871 in Nash 1993, 71).
syn. “warm-little-pond hypothesis”

Comment: Some biologists are now favoring hypotheses that life originated under conditions that were more like a hot pressure cooker, than a nice, warm pond (K. Stetter in Nash 1993, 71).

► **“hot-spring hypothesis”** *n.* The hypothesis that life first evolved in hot springs.

► **“hydrothermal-vent hypothesis”** *n.* The hypothesis that life first evolved in very hot areas associated with hydrothermal vents under the sea (Nash 1993).

syn. hot-world hypothesis (Nash 1993, 71)

► **“ocean-foam hypothesis”** *n.* The hypothesis that life first evolved in ocean foam (Louis Lerman in Nash 1993, 73).

► **“volcano hypothesis”** *n.* The hypothesis that life first evolved in warm to hot pools of water associated with volcanoes, lava flows, or both.

► **“warm-rock-space hypothesis”** *n.* The hypothesis that life first evolved in water-filled spaces in warm (to hot) subterranean and suboceanic rocks (J. A. Baross in Broad 1993, 2 November, C14).

“indirect-benefit hypothesis” See female-mate-choice hypothesis: “indirect-benefit hypothesis.”

information-center hypothesis *n.* The hypothesis that in some bird species, “individuals may track a food supply that varies unpredictably in time and space by nesting colonially or roosting communally” (Fisher 1954 in Waltz 1987, 48; Ward and Zehavi 1973).

Comments: Depending on the bird species, tests of this hypothesis have refuted it, not refuted it, or have produced equivocal results (de Grot 1980, etc. in Waltz 1987, 48; Götmark 1990, 487). Bird colonies

might have evolved for other reasons besides tracking food supplies (Heeb and Richner 1994; Clode 1994).

"introns-early hypothesis" *n.* The hypothesis that introns occurred in organisms that are ancestral to both prokaryotes and eukaryotes, but more prokaryotic lines lost their introns due to selection for streamlined DNA replication and improved transcription efficiency; contrasts with the introns-late hypothesis (Doolittle and Daniels 1985 in Strickberger 1996, 167).

"introns-late hypothesis" *n.* The hypothesis that introns arose in eukaryotes after they evolutionarily separated from prokaryotes; contrasts with the introns-early hypothesis (Stoltzfus et al. 1994 in Strickberger 1996, 167).

land-bridge hypothesis *n.* The hypothesis that continent-sized land bridges existed during the Cenozoic but have since disappeared leaving no trace of their existence (Lincoln et al. 1985).

cf. hypothesis: continental drift.

larval-imagery hypothesis *n.* The hypothesis that lepidopteran wings have color patterns that resemble lepidopteran larvae and these patterns help to protect their owners after they are discovered by avian predators (Grant and Miller 1995, 47).

larval-transfer hypothesis *n.* The hypothesis that the holometabolous-insect clade (including Coleoptera, Diptera, Hymenoptera, Lepidoptera, Mecoptera, and Neuroptera) acquired its larval form by incorporating an onychophoran genome through hybridization with an onycophoran (inferred from Williamson 2009, 1).

Comments: This hypothesis contrasts with the hypothesis that the larvae and adults evolved from a single ancestor not through such an inter-taxon hybridization (Williamson 2009, 1). Based on current knowledge of arthropod evolution, genetics, and other areas, the larval-transfer hypothesis is evidently based on misguided conceptualization (Kean 2009, 1486). Scientists' complaints about Williamson's (2009) paper and some other papers in the Proceedings of the National Academy of Science caused this journal to change its publication policies.

"late-season-mimic-scarcity hypothesis" *n.* The hypothesis that specialized mimics of aculeate Hymenoptera are absent, or fewer in number, from mid- through late summer because natural selection has caused them not to fly at this time because it is when large numbers of young, inexperienced birds are still learning to avoid hymenopteran model and are highly likely to eat models (Waldbauer and Sheldon 1971, 371).

Comment: Studies in two Illinois habitats and one Michigan habitat support this hypothesis by showing that the majority of these mimics fly in spring and early summer (Waldbauer and Sheldon 1971; Waldbauer et al. 1977; Waldbauer and LaBerge 1985).

"lek hypothesis" See hypothesis: firefly-flash-synchronization hypotheses: "lek hypothesis."

locale-odor hypothesis *n.*

1. The hypothesis that although *Apis mellifera* (Western Honey Bees) communicate relatively precise direction information in their waggle dances, local cues (including locality odor, food odor, hive odor, and bee odor at a feeding site), dictate the location(s) at which recruits settle to feed (Johnson 1967, 847).

2. The hypothesis that although *Apis mellifera* communicate food-distance information in their dances, they use other information obtained after they leave their hives (including hive-mate odor and other-bee odor) in the process of orienting to a particular food site (Wenner 1967, 849).

3. The hypothesis that *Apis mellifera* indicate the distance as well as the direction of food sites, but hive mates do not use the direction information to the accuracy reported by Frisch or the distance information; instead newcomers to a food source are guided by local scents (Frisch 1967, 1073; Wenner and Johnson 1967, 1076; Wenner et al. 1969; Gould, 1976; Gould and Gould 1988, 73–74).

syn. locale-odor theory

cf. hypothesis: dance—"language" hypothesis

Comments: This hypothesis and the dance—"language" hypothesis are not mutually exclusive. The locale-odor hypothesis appears to be true under some experimental conditions; however, *Apis mellifera* do often use distance and direction communication as well (Gould et al. 1970, Michener 1973, 1975). [coined by Gould (1976)]

lock-and-key hypothesis See hypothesis: hypotheses of divergent evolution of animal genitalia: lock-and-key hypothesis.

Ludwig hypothesis *n.* The hypothesis that new genotypes can be added to a gene pool if they can utilize new components of their environment and thereby occupy a new subniche, even if they are competitively inferior in their ancestral niche (Lincoln et al. 1985).

syn. Ludwig effect, Ludwig's theorem, Ludwig's theory

macromutationism *n.* The hypothesis that a new taxon can evolve essentially instantaneously via a major genetic mutation that simultaneously establishes both reproductive isolation and new adaptations (Lincoln et al. 1985).

cf. ²mutation: macromutation

maximum-homology hypothesis, red-king hypothesis *n.* The hypothesis that the optimum reconstruction of a phylogenetic tree is one that maximizes identity due to common ancestry, as indicated by homologous genetic coding sites (Lincoln et al. 1985).

Medawar-Williams hypothesis of senescence *n.* The hypothesis that "selection for genes postponing mortality will be most intense at the ages of greatest reproductive value" (Wilson 1975, 339).

Comment: Attributes that can enhance fitness early in the life cycle of an organism may have degenerative consequences later, *e.g.*, the structural modification of a jaw of a male *Salmo* sp. (salmon).

minimum-interaction hypothesis *n.* The hypothesis that evolution reduces the genetic risk associated with reciprocal translocations (Imai 1986 in Howard 1988).

mitochondrial-Eve hypothesis See hypothesis: African-origin hypothesis of human mitochondrial DNA evolution.

molecular-clock hypothesis *n.*

1. The hypothesis that random, neutral point mutations occur at a regular rate in DNA (Zuckerkandl and Pauling 1962, 200; 1965, 149; Strickberger 1990, 237). *Note:* This hypothesis is supported by data from some taxa, but not others.

2. The hypothesis that for each protein, the rate of evolution (measured as amino-acid substitutions)

is approximately constant per year per site for different lines, as long as the protein molecule's function and tertiary structure remain essentially unaltered (Kimura 1983, 98 in Ayala 2000, 27).

Note: An investigation of α -globin, β -globin, cytochrome-c, and fibrinopeptide-A and a study of 20 proteins both rejected this hypothesis (Langley and Fitch 1974, Fitch 1976, and Gillespie 1989 in Ayala 2000, 27).

syn. clock hypothesis (Lewin 1988, 561), evolutionary clock (Strickberger 1990, 237), molecular clock (Vawter and Brown 1986, 194), molecular clock hypothesis (Li and Tanimura 1987, 93; Zuckerkandl 1987, 34), molecular clock model of evolution (Lincoln et al. 1985), molecular evolutionary clock (Zuckerkandl and Pauling 1965, 149), molecular evolutionary clock hypothesis (Zuckerkandl 1987, 34)

Comments: Zuckerkandl conceived the idea of a molecular clock in 1960 (Lewin 1988, 561), and Zuckerkandl and Pauling (1962, 200) discuss that idea. Researchers have used molecular clocks to estimate dates of divergences in the evolution of particular taxa, but different molecular clocks can give different divergent dates. Molecular clocks "tick at different speeds;" therefore researchers are proposing and applying sophisticated statistical methods to deal with clock idiosyncrasies (Strauss 1999, 1437). The speed of these clocks is related to the kind of informational molecule (*e.g.*, mitochondrial DNA and nuclear DNA), molecular sites on a molecule, and taxon (Fitch and Langley 1976 in Strickberger 1990, 238–239; Vawter and Brown 1986, 194; Lewin 1988, 561; Li and Tanimura 1987, 93; Li et al. 1990, 6703). For example, the gene that encodes the enzyme Cu, Zn superoxide dismutase (SOD) and the one that encodes for glycerol-3-phosphate dehydrogenase have variable evolution rates depending on the taxon measured (Ayala 1997 in Strauss 1999, 1437; Ayala 2000, 27). Although many analyses of mitochondrial and nuclear DNA suggest divergence dates that match those of fossils, there are some serious discrepancies (Mayr 1982, 577; Fitch 1976, Goodman 1982a in Ruse 1984; Stebbins and Ayala 1985, 77; Lewin 1988; Strauss 1999, 1437), including the time of the Cambrian explosion (= evolution of many animal phyla) and emergences of the more-derived bird and mammal orders.

Moon-origin hypotheses

► **capture hypothesis** *n.* The hypothesis that the Moon formed independently from the Earth and was gravitationally captured by it (Drake 1990, 128). *syn.* capture theory (Drake 1990, 128)

► **co-accretion hypothesis** *n.* The hypothesis that the Moon formed simultaneously with the Earth from material in orbit about the Earth (Drake 1990, 128). *syn.* co-accretion theory (Drake 1990, 128), double-planet theory (Kerr 1984, 1061)

Comment: This hypothesis was proposed by Ruskol (1972 in Newsom and Taylor 1989, 29).

► **fission hypothesis** *n.* The hypothesis that the Moon is derived from the Earth's mantle after core formation through rotational instability (Drake 1990, 128)

syn. rotational fission (Kerr 1984, 1060)

► **giant-impact hypothesis** *n.* The hypothesis that the Moon formed by a collision of a Mars-sized object with the Earth late in the Earth's accretionary stages (Boss 1986a, b, 341; Taylor 1987, 469; Drake 1990, 128).

syn. collision-ejection hypothesis (Drake 1990, 128), impact hypothesis, single impact hypothesis (Newsom and Taylor 1989, 29), large-impact hypothesis (Kerr 1984, 1060)

Comments: This hypothesis has become the paradigm for lunar origin (Drake 1990, 128). It was first proposed by W. Hartmann and D. Davis in 1975 (Kerr 1984, 1060).

Mother-Eve hypothesis See hypothesis: African-origin hypothesis of human mitochondrial DNA evolution.

multiple-factor hypothesis *n.* The true hypothesis that proposes polygeny (multiple-factor inheritance), *q.v.*, and refutes the one-gene-one-character hypothesis, *q.v.*, of early Mendelism (Mayr 1982, 792). *cf.* gene: polygene

natal-homing hypothesis See hypothesis: turtle-homing hypotheses: natal-homing hypothesis.

nexus hypothesis *n.* The hypothesis that each phenotypic character of an organism is likely to be influenced by more than one gene, and, conversely, most genes affect more than one character (Lincoln et al. 1985).

"no-allelic-replacement hypothesis" *n.* The hypothesis that major steps in social evolution, occur via pleiotropic effects and contextual shifts rather than allelic replacement (West-Eberhard 1987, 38).

cf. hypothesis: allelic-replacement hypothesis

nomogenesis *n.* The hypothesis that external environmental factors can produce heritable adaptations in all individuals of the same species that experience these factors (Lincoln et al. 1985). See -genesis: abiogenesis.

♦ null hypothesis, H_0 *n.*

1. The hypothesis that one quantitative sample is not different than another; that is one sample is "statistically equal" to another, *e.g.*, feeding behavior of the control group does not take a statistically different amount of time than that of the test group (*e.g.*, mean feeding time of group 1 = mean feeding time of group 2) (Lehner 1979, 227), or that a coefficient of association = 0, meaning that there is no statistical association between two variables (Siegel 1956; Lincoln et al. 1985); contrasted with experimental hypotheses, H_1 , H_2 , and H_3 .

Notes: In testing this kind of null hypothesis, one determines if the data in question depart from those expected on the basis of chance alone (Futuyma 1998, 297, who keeps this kind of null hypothesis in quotes). A null hypothesis, H_0 , can be viewed as a hypothesis of nondifference, *e.g.*, the mean of your test group = the mean of your control group, or a correlation coefficient = 0. Conventional statistical tests (= those that use alpha levels) are designed to reject null hypotheses. Thus, it is conservative to reject a null hypothesis, but nonconservative not to reject one. Therefore, if you "accept a null hypothesis" without special testing of the hypothesis, you are doing something that you have a high probability of doing in the first place due to the design of conventional statistical tests. Not rejecting a null hypothesis (sloppily called "accepting a null hypothesis") is essentially negative evidence, unless you have undertaken exhaustive efforts to reject the null hypothesis which include using large sample sizes and different lines of investigation to do so (Milinski 1997, 177–178). Sometimes, a researcher truly needs to

find out if a null hypothesis is indeed nonrejectable before performing his next experiment.

syn. hypothesis of nondifference

cf. hypothesis: alternative hypothesis

2. The basic, or default, hypothesis of a group of hypotheses (Futuyma 1998, 297).

Notes: This newer use of “null hypothesis” is analogous to definition 1, and an example of this kind of null hypothesis is that random genetic drift in a population causes its evolution (Futuyma 1998, 297). Alleles at all loci are potentially subject to random genetic drift, but not necessarily natural selection at a particular time. Therefore, random genetic drift, rather than natural selection, is the “null hypothesis” of evolutionary change.

cf. gene: polygene

one-gene-one-character hypothesis, unit-character theory *n.* The hypothesis that one gene affects only one of an organism’s traits (Mayr 1982, 774, 786, 792); contrasted with the one-gene-one-enzyme hypothesis and one-gene-one-polypeptide hypothesis.

Comment: The “multiple-factor hypothesis” which proposes that several, if not, many genes may affect, or modify, a single character, led to the abandonment of the “one-gene-one-character hypothesis” (Mayr 1982, 774, 786, 792).

one-gene-one-enzyme hypothesis *n.* The hypothesis that one gene dictates the production of a specific enzyme (Beadle and Tatum in Campbell 1987, 325); contrasted with the one-gene-one-character hypothesis, one-gene-one-polypeptide hypothesis.

one-gene-one-polypeptide hypothesis *n.* The hypothesis that one gene dictates the production of a specific polypeptide (Beadle and Tatum in Campbell 1987, 325); contrasted with the one-gene-one-character hypothesis and one-gene-one-enzyme hypothesis.

Comments: This hypothesis replaced the one-gene-one-enzyme hypothesis after biologists learned more about proteins (Campbell 1987, 326). Scientists now know that one gene encodes one RNA molecule or one set of closely related polypeptide chains (protein isoforms) (Alberts et al. 1989, 486, 592).

optimal-outbreeding hypothesis *n.* The hypothesis that as the degree of genetic similarity between mates decreases, the costs associated with inbreeding should decrease as well (Keane 1990, 264).

cf. breeding: outbreeding; maximum outbreeding; law: Knight-Darwin law.

panspermia hypothesis *n.* The hypothesis that “life did not originate on Earth but was introduced from elsewhere in the Universe” (Arrhenius 1920s, Brooks and Shaw 1973; Hoyle and Wickramasinghe 1978; and Crick 1981 in Strickberger 1990, 104; Lincoln et al. 1985).

syn. panspermia (Lincoln et al. 1985)

Comments: Life may have come to Earth as a space-resistant spore or other means (Strickberger 1990, 104). This hypothesis was fostered by the chemist Arrhenius in the early 20th century and is still supported by some scientists today.

Parker-Baker-Smith model of the evolution of sex *n.* The hypothesis that in the primeval situation, each diploid organism produced a similar number of equally well-provisioned haploid gametes and shed them into the sea; then a mutant parent

provisioned its gametes slightly better than any of the others; selection favored these better nourished gametes over smaller ones; the extra fitness that a larger gamete (female) would gain from doubling its amount of nutrients was presumably less than the extra fitness a smaller one (male) would gain from going from almost nothing to the female amount; selection then favored individuals that produced a smaller, more mobile gametes that sought larger ones more than those that produced larger gametes that combined with other larger ones because of their difference in the benefit of combining with a large gamete; intermediate sized gametes did not compete for large gametes as well as small ones; finally, disruptive selection led to evolution of sperm (small gametes) and ova (large gametes) (Parker et al. 1972 in Thornhill and Alcock 1983, 56–57 and Dawkins 1986, 133–134).

periodic-extinction hypothesis *n.* The hypothesis that in the last 600 Ma mass extinctions have occurred approximately every 26 Ma (Raup and Sepkoski 1984; etc.).

cf. hypotheses regarding mass extinctions

Comments: There are different renditions of this hypothesis implied in the literature. The validity of this hypothesis has been debated. Benton’s (1995) quantitative analysis of the fossil record, focusing on the pattern of diversification and seven major extinctions, indicates that the timing of major extinctions is not periodic.

perpetual-intervention hypothesis *n.* The hypothesis that new species occur as a result of continuous special creation by God (Lyell in Mayr 1982, 882).

pet hypothesis *n.* A hypothesis that a researcher favors over others in a set of hypotheses (pers. obs.).

Comments: “Pet hypothesis” has a negative connotation when it implies that its proposer is biased against alternative hypotheses because he favors his pet one. To avoid pitfalls of pet hypotheses, scientists should cautiously, ethically, and rigorously use the method of multiple working hypotheses (Chamberlin 1890, 754).

plant’s-dilemma hypothesis *n.* The hypothesis that in angiospermous plants whose fitnesses are lowered by self-pollination (geitonogamy), insect pollinators should select for larger floral displays via pollen deposition because they find larger displays more attractive than smaller ones, and they spend more time on larger displays than on smaller ones, however on the other hand, increased self-pollination caused by pollinators being on larger displays longer than on smaller ones should decrease display size (Klinkhamer and De Jong 1993, 180; Ohashi and Yahara 1999, 386; Finer and Morgan 2003, 1746).

pleiotropy hypothesis See hypothesis: hypotheses of divergent evolution of animal genitalia.

pollen-donation hypothesis *n.* The hypothesis that in animal-pollinated hermaphroditic plants when female reproductive success is not pollen limited, natural selection due to resource-limited fruit production affects reproductive characters, such as flower size and number flowers per inflorescence (after Queller, 1983; Broyles and Wyatt, 1990).

Comments: For example, if a plant has resource-limited fruit production, its increasing its number of flowers per inflorescence is not likely to increase the plant’s fruit production (its female function) but is likely to increase its pollinating other plants and, in turn, frequency of siring seeds (its male function) (after Queller, 1997).

polymorphic behavior hypothesis See hypothesis: population-limiting hypotheses: polymorphic behavior hypothesis.

population-limiting hypotheses

► **self-regulation hypothesis** *n.* The hypothesis that an indefinite increase in population density is prevented by a qualitative change in a population (Lincoln et al. 1985).

► **behavior hypothesis** *n.* The hypothesis that mutual interactions involving spacing behavior prevent unlimited increase in population density, and this spacing behavior is not an inherited trait (Lincoln et al. 1985).

► **polymorphic-behavior hypothesis** *n.* The hypothesis that spacing behavior limits population density, and individual differences in spacing behavior have a genetic basis and respond to rapid natural selection (Lincoln et al. 1985). *Syn.* Chitty hypothesis, genetic-behavioral polymorphism hypothesis

► **social-subordination hypothesis** *n.* The hypothesis that as population density increases, increased intraspecific competition leads to increased aggression, resulting in subordinate individuals' being forced to disperse to suboptimal habitats (Lincoln et al. 1985).

► **stress hypothesis** *n.* The hypothesis that mutual interactions in an increasing population lead to physiological changes that are phenotypic in origin and eventually reduce birth rate and increase death rate (Lincoln et al. 1985).

► **"pregnancy-sickness hypothesis"** *n.* The hypothesis that maternal nausea due to pregnancy minimizes maternal ingestion of dietary teratogens (Profit 1988, 1992 in Haig 1993, 510).

red-king hypothesis See hypothesis: maximum-homology hypothesis.

Red Queen hypothesis *n.*

1. The hypothesis that a species evolves as quickly as possible in remaining extant because its biotic environment is continually deteriorating due to continual evolution of other species (*e.g.*, competitors, predators, and parasites) with which it interacts (Van Valen 1973, 17; Lewin 1985a, 399; Futuyma 1986, 362; Clarke et al 1994, 4821).

Comments: Van Valen (1973, 17) formulated this hypothesis to account for the fact that within most taxa, the probability of extinction of a genus, or a family, is independent of its prior duration. He suggests that an improvement in the fitness of one species represents a deterioration in the environment of other species in its community (Strickberger 1990, 443). This hypothesis emphasizes biotic environmental change rather than abiotic environmental change. Michael Rosenzweig conceived of the Red Queen hypothesis independently of Van Valen (Lewin 1985a) and called this idea the "rat race" because he was interested in predator-prey interactions. Stenseth and Maynard Smith (1984) reformulated this hypothesis by including the idea of evolutionary lag and dismissing Van Valen's zero-sum assumption. They contrast their Red Queen hypothesis with the stationary hypothesis, *q.v.* Hoffman and Kitchell (1984 in Lewin 1985a, 400) offer some support for the Red Queen hypothesis. It may not be possible to test the Red Queen hypothesis with regard to community evolution because of the difficulty in

determining if and when periods of physical environmental constancy occurred in the past. Clarke et al (1994, 4821) indicate that a laboratory study of two competing virus populations supports the Red Queen hypothesis as it can be extrapolated to these nonorganisms.

syn. red queen hypothesis (Lincoln et al. 1985), Red Queen model (Lewin 1985a)

2. The hypothesis that both a predator and its prey continually coevolve ("run faster and faster"), the predator evolves better prey catching, and the prey evolves better predator evasion (Abrahamson et al. 1989).

cf. hypothesis: hypothesis of the evolution and maintenance of sex: Red Queen hypothesis, law: law of extinction

[coined by Van Valen (1973, 17) as Red Queen's hypothesis. This name is derived from *Through the Looking Glass* by Lewis Carroll in which the Red Queen ran to stay in the same place because the ground moved under her feet.]

regional-continuity hypothesis *n.*

1. The hypothesis that Humans (*Homo sapiens sapiens*) evolved in different geographic locations at the same time and interbred, forming a single species; contrasted with the Noah's-ark model (Gibbons 1992, 874).

syn. multiregional model (Stringer and Andrews 1988, 1263)

2. The hypothesis that all populations of Humans (*Homo sapiens sapiens*) trace back to when humans first left Africa at least 1 Ma ago, through an interconnected web of ancient lineages in which the genetic contributions to all living peoples varied regionally and temporally; contrasted with the Noah's-ark model and called "multiregional evolution" in Thorne and Wolpoff (1992, 76).

research hypothesis *n.* A hypothesis about behavior that an investigator perceives to be the true situation (Lehner 1979, 57).

RNA-world hypothesis *n.* The hypothesis that in the origin of life on Earth, RNA appeared before DNA about 4 Ga ago, and after efficient protein synthesis catalyzed by RNA evolved, then DNA appeared and took over the primary genetic function, and proteins became the major catalysts, while RNA remained primarily as the intermediary connecting DNA and proteins (Alberts et al. 1989, 10; Campbell 1990, 516; Gibbons 1992, 31; Illangasekare et al. 1995, 643; Doeblei 2000, 19).

Comments: Data that support this hypothesis are that RNA has both genetic and catalytic properties, and scientists have produced RNAs in a test tube without life from RNA monomers. RNA molecules (ribozymes) catalyze reactions in living cells, *e.g.*, removing introns from mRNA, and RNAs catalyze synthesis of new RNA (mRNA, rRNA, and tRNA) (Cech 1986; Campbell 1990, 516). One kind of RNA molecule catalyzes its own acylation when offered an activated amino acid, showing how RNA self-catalysis could have translated linear nucleotide sequences into amino-acid sequences (Illangasekare et al. 1995). Other related hypotheses are that in the evolution of life on Earth, either peptides or proteins formed and reproduced before RNA appeared (Doeblei 2000, 15).

saturation-presaturation-dispersal-hypothesis *n.* The hypothesis that individuals dispersing from a population at its peak are qualitatively different from those emigrating from a declining

population or one at low density, and the latter are typically in better condition with higher survivorship and greater fecundity (Lincoln et al. 1985).

self-centered-DNA hypothesis See hypothesis: selfish-DNA hypothesis.

selfish-DNA hypothesis *n.* The hypothesis that transposons (selfish DNA) simply spread on their own accord from chromosome to chromosome, making more copies of themselves; and these transposons persist because they have no significant effect on the organisms in which they reside (Doolittle et al. in Gould 1981, 7).

syn. self-centered-DNA hypothesis (Gould 1981, 14)
cf. gene: selfish gene; nucleic acid: deoxyribonucleic acid: selfish DNA

Comment: The transposons are in effect “ultimate parasites” (Doolittle et al. in Gould 1981, 7).

selfish-herd hypothesis *n.* The hypothesis that an animal herd results from its individual members’ moving toward the central area of the group; because predators tend to take the first individuals that they encounter, and there is a great advantage for each animal to be protected in the central region of a herd (Galton 1871; Williams 1964, 1966a; and Hamilton 1971a in Wilson 1975, 38).

syn. selfish herd, selfish-herd theory (Parrish 1989, 1048)

Comment: Parrish’s (1989, 1048) work with fish does not support this hypothesis.

serial-endosymbiosis hypothesis *n.* The hypothesis that three classes of organelles of eukaryotic cells (mitochondria, plastids, and undulipodia) originated from bacterial symbionts; first, a host prokaryotic cell acquired motile bacterial symbionts (spirochetes) that became undulipodia, and this combination became a mastigote; second, the mastigote acquired symbionts that became mitochondria; and third, the one-celled algae and plants acquired photosynthetic symbionts that became chloroplasts (Margulis 1992, 150–151).

syn. serial-endosymbiosis theory, theory of symbiosis (Margulis 1992, 150)

cf. hypothesis: endosymbiosis hypothesis

Comments: This hypothesis suggests that all animals have at least three kinds of ancestors, all plant cells have at least four, and all are chimeras (Margulis 1992, 150–151).

“sexual-attraction hypothesis” *n.* The hypothesis that continuous sexual attraction, as opposed to seasonal sexual attraction, holds human society together (Washburn 1985, 7).

Comment: Nonhuman-ape behavior does not seem to support this hypothesis. Orangutans are the most continually sexually active nonhuman apes and Gorillas are the least sexually active ones, yet Gorillas are the most social (Washburn 1985, 7).

sexual-selection hypothesis *n.* The hypothesis that in certain animal species, males regularly invade new groups and kill other males’ young, inseminate the young’s mothers, and thereby eliminate other males’ genes from the population and increase their own genes in the population (Hrdy 1974 in Brown 1996).

Comments: Studies consistent with this hypothesis are Hrdy (1974), Sääl (1982), and others (all in Brown 1996, 175). Studies inconsistent with this hypothesis are Sussman et al. (1995) and Hoogland (in Brown 1996).

sexy-son hypothesis *n.* The hypothesis that female animals that mate with males with attractive

physical attributes, but poor paternal care, will have fewer surviving offspring, but their sons, having inherited genes for attractiveness (sexiness), will be extremely attractive to the next generation of females; thus, such females of more sexy sons will have higher fitnesses than females with less sexy sons [proposed by and coined by Weatherhead and Robertson 1979].
Comments: This hypothesis is theoretically rejected by Kirkpatrick (1985) and not supported by data of Alatalo and Lundberg (1986, 1454). Diploid models support this hypothesis (Spencer and Masters 1992, 299).

single-impact hypothesis *n.* The hypothesis that one major impact of a huge asteroid, or comet, struck the Earth about 65 Ma ago and is responsible for extinction of many species including dinosaurs at the end of the Mesozoic Era (Fastovsky 1990 in Kerr 1992, 160); contrasted with battered-Earth hypothesis.

Comments: The Chicxulub Crater, perhaps as large as 300 km in diameter, in the Yucatán Peninsula might have been caused by this impact (Kerr 1992, 160; 1993, 1518; Sharpton et al. 1993). This impact may have caused global wildfires, acid precipitation, and up to 10 yr of darkness (Morell 1993c, 1519).

size-fitness-correlation hypothesis *n.* The hypothesis that in parasitic wasps, the hypothesis that within a brood from one host individual, a mother’s offspring sex ratio is influenced, through evolution, by the sizes of her offspring that can develop from their host; *e.g.*, if daughters benefit by being large, a mother wasp should adjust her sex ratio with regard to host size so that she will have large daughters (Charnov et al. 1981).

Comment: Other factors besides maternal control of egg sex ratio (*e.g.*, sex-biased larval mortality) may be involved in determining the sex ratio of emergent adult progeny (Charnov et al. 1981).

[coined by Barash (1983, 300)]

social-cohesion hypothesis *n.* The hypothesis that an animal species’ social interaction prior to emigration is the major factor that determines its dispersal patterns rather than its agonistic interactions at emigration time (Lincoln et al. 1985).

social-facilitation hypothesis See hypothesis: turtle-homing hypotheses: social-facilitation hypothesis.

species selection *n.*

1. The hypothesis that entire species undergo natural selection in the same sense as organisms; *i.e.*, they function as interactors (Eldredge and Gould 1972; Stanley 1975 in Hull 1992, 186).

Comment: This has been a highly controversial topic in evolutionary biology during the past two decades (Hull 1992, 186).

2. “The theory that some evolutionary change takes place by a form of natural selection at the level of species or lineages” (Dawkins 1982, 294).

3. The hypothesis (embraced by some punctualists) that a species with a certain attribute will be more likely to persist and give rise to new species than one lacking the attribute (Stebbins and Ayala 1985, 81).

cf. speciation: geographical speciation, saltational speciation

Comment: Vrba and Gould (1986) expanded the argument for species selection.

spinster hypothesis *n.* The hypothesis that the probability of a low-fertility female paper wasp’s establishing and bringing a nest through maturity, may

be so low that it is more profitable, as measured by inclusive fitness, for these high-risk individuals to subordinate themselves to female relatives in foundress associations than to be queens (West 1967 in Wilson 1975, 290).

stability-time hypothesis *n.* The hypothesis that where physiological stresses have been historically low, biologically accommodated communities have evolved; as a gradient of environmental stress increases, a community gradually changes to a physically controlled one until the stress conditions exceed organisms' adaptive abilities and an abiotic condition is reached; and the number of species present diminishes continuously along the stress gradient (Lincoln et al. 1985).

stationary hypothesis *n.* The hypothesis that organisms do not evolve during periods of absolutely no perturbations in their physical environments, but as soon as their environments change the organisms are likely to evolve; periods of stasis are punctuated by periods of change, including speciation and extinction; and the balance between them determines the overall shift in species diversity in a community (Lewin 1985a).

syn. stationary hypothesis, stationary model (Lewin 1985a, 399)

Comments: This hypothesis is contrasted with the Red Queen hypothesis. Wei and Kennett (in Lewin 1985a) present data that support the stationary hypothesis.

statistical hypothesis *n.* A null hypothesis or an alternative hypothesis, *q.v.* (Lehner 1979, 227).

stress hypothesis See hypothesis: population-limiting hypotheses: stress hypothesis.

tabula rasa *n.* The false hypothesis that a "higher" animal's nervous system is not genetically programmed for any behavior and all of its behaviors are the result of learning (Wilson 1975, 156, John Locke in Mayr 1982, 80).

See tabula rasa under T in this book.

Comment: This hypothesis was a main tenet of American behaviorism.

Thayer's-countershading hypothesis *n.* The little-tested hypothesis that a prey animal's counter-shading diminishes its three-dimensional shape and improves its background matching, thereby making it more difficult to be seen by predators (A. H. Thayer 1896, 124–125; G. H. Thayer 1909, 14; Kiltie 1989, 542). *Comment:* Work with squirrels suggests that "the degree of shadow obliteration achieved by counter-shading is imperfect and hence of questionable value in deterring predators" (Kiltie 1989, 543).

[after A. H. Thayer]

theory-of-mind hypothesis *n.*

1. The hypothesis that an individual animal has a system of inferences in which it imputes mental states to itself and another conspecific, or heterospecific, animal(s) (Premack and Woodruff 1978, 515; Heyes 1998, 101).

Comments: Depending on the species, the mental states may include belief, doubt, guessing, liking, pretending, purpose (*syn.* intention), or some combination of these phenomena. Premack and Woodruff (1978, 515) assumed that this hypothesis is true for Humans and possibly true for Chimpanzees. Regarding testing the hypothesis, Heyes (1998, 101) wrote, "... no substantial progress has been made through this work with nonhuman primates. A survey of empirical studies of imitation,

self-recognition, social relationships, deception, role-taking and perspective-taking suggests that in every case where nonhuman-primate behavior has been interpreted as a sign of theory of mind, it could instead have occurred by chance or as a product of nonmentalistic processes such as associative learning or inferences based on nonmental categories." Astington (1998, 31) explains that some human developmentalists assumed that this hypothesis is true for children, and they applied Premack and Woodruff's (1978) definition to them. Bulloch et al. (2008) report data from a group of lab Chimpanzees that may be consistent with this hypothesis. Premack and Woodruff (1978) evidently initially coined this hypothesis as "theory of mind" according to Astington (1998, 30). "Theory" in the term derives from the fact that a researcher cannot directly observe the system in other Humans and other animals. She refers to "theory of mind" as a bedeviled term (page 30) and describes the range of possibilities encompassed by it from a psychologically real structure constructed by a young child through a scientist's creation used to provide a less than adequate explanation of a child's development of social understanding (page 35). Heyes (1998, 101) referred to "theory of mind" as the "theory-of-mind hypothesis" which partly clarifies the term; however, "mind-reading hypothesis" (which I have not found in the literature) seems to be a better name for the hypothesis because it is descriptive and does not contain "theory" in its name.

syn. for "theory of mind (TOM, TTM)" common-sense psychology and folk psychology in reference to children (Moore and Fry 1991 in Astington 1998, 32), Machiavellian intelligence (Byrne and Whiten 1988 and Whiten and Byrne 1988 in Heyes 1998, 101), metacognition (Povinelli 1993 in Heyes 1998, 101), metarepresentation (Whiten and Byrne 1991 in Heyes 1998, 101), mind reading (Whiten 1991 in Astington 1998, 33), mentalizing ability (Frith 1989, Happé 1994 in Astington 1998, 33) mental state attribution (Cheney and Seyfarth 1990a, 1990b, and 1992 in Heyes 1998, 101), panmorphism, pongoformism (Povinelli 1995 in Heyes 1998, 101) perspective-taking (Astington 1998, 32)

toxin hypothesis *n.* The hypothesis that human allergy evolved as an active immunological defense against toxins; thus, it is not a malfunctioning of one's immune system; (Profit 1991, 27); contrasted with the helminth hypothesis (Profit 1991, 41–42).

Comment: Data that support this hypothesis include toxins are ubiquitous, chemical correlates of toxicity frequently trigger allergy, most known allergens appear to be toxic substances or carrier proteins that bind well to low-molecular-weight toxins, and allergy symptoms have attributes of an evolved mechanism (Profit 1991, 27–28).

[coined by M. Profit (1991, 27)]

transportation hypothesis *n.* The hypothesis that at any stage of an organism's life cycle, its cells may throw off gemmules "which circulate freely throughout the system, and when supplied with proper nutrient multiply by self division, subsequently becoming developed into cells like those from which they were derived" (C. R. Darwin 1868, who proposed this hypothesis to account for inheritance of acquired characters, in Mayr 1982, 694). cf. ³theory: theory of pangenesis

Trivers'-parental-investment hypothesis *n.*

The hypothesis that "the sex whose typical [average-per-offspring] parental investment is greater than that of the opposite sex will become a limiting resource for that sex" (Trivers 1972).

Trivers-Willard hypothesis, Trivers-Willard principle *n.*

1. The hypothesis that in polygynous mammals, a healthy mother should produce a son because her son will mate more successfully and produce more grandchildren than a similar mother that produces a daughter, while a mother in poor condition that produces a daughter will leave more surviving grandchildren than a similar female that produces a son (Trivers and Willard 1973, 90; Wilson 1975, 317–318).

Comment: If this hypothesis is correct, "natural selection favors deviations from 50/50 investment in the sexes, rather than deviations in sex ratios, per se" (Trivers and Willard 1973, 91).

2. The hypothesis that in polygynous mammals, the healthier females should have more sons per female than less healthy ones; more healthy females should produce more healthy sons that are more likely to acquire many mates than less healthy sons; on the other hand, a less healthy female should produce daughters rather than competitively disadvantaged sons because receptive females are competed for by males; small, or sickly, sons are likely to have low fitnesses (Thornhill and Alcock 1983, 72).

Comment: Thornhill and Alcock (1983, 72) suggest that this hypothesis could apply to insects in certain situations.

true hypothesis *n.* A hypothesis that has not been falsified by all attempts; a hypothesis that is true beyond all reasonable doubt (Moore 1984, 475).**"turnover-pulse hypothesis"** *n.* The hypothesis that evolution is concentrated in punctuational bursts at times of worldwide climatic pulsing (Vrba 1985 in Gould and Eldredge 1993, 225).

Comment: A climatic pulse, about 2.5 Ma ago, may have stimulated the origin of the genus *Homo* (Gould and Eldredge 1993, 225).

turtle-homing hypotheses

► **natal-homing hypothesis** *n.* The hypothesis that in marine turtles, a female returns to her natal beach where she lays her eggs (Meyland et al. 1990, 724).

Comment: Data on mitochondrial DNA frequencies in *Chelonia mydas* (Green Sea Turtles) support this hypothesis (Meyland et al. 1990, 724).

► **social-facilitation hypothesis** *n.* The hypothesis that in marine turtles, a virgin, mature female randomly encounters experienced females in foraging areas, she then follows these females to a nesting beach, and after having a "favorable" nesting experience, she fixes on this site for her future nesting (Hendrickson 1958 and Owens et al. 1982 in Meyland et al. 1990, 724–725).

uncorrelated-asymmetry hypothesis *n.* The hypothesis, based on game theory, that any differences in the attributes of two opponents can be used arbitrarily as the means for settling disputes (Maynard Smith and Parker 1976 in Thornhill and Alcock 1983, 220); e.g., when ownership of a territory, is correlated with resource-holding power or fighting ability, it is used as a cue that resolves fights over ownership of a resource.**uniform-convergence hypothesis** *n.* The hypothesis that convergent evolution in all parts of a

phylogenetic tree takes place at a uniform rate (Lincoln et al. 1985).

uniform-species-substance hypothesis *n.* The hypothesis that a uniform species substance, perhaps in cytoplasm, is transmitted from generation to generation (Mayr 1982, 786).

Comments: This hypothesis attempts to explain continuous variation independently of discontinuous Mendelian genetics. The theory of particulate inheritance gradually replaced this hypothesis (Mayr 1982, 786).

unit-character theory See hypothesis: one-gene-one-character hypothesis.**Upper Devonian impact hypothesis** *n.* The hypothesis that an asteroid impact caused a mass extinction of marine species in the Upper Devonian (McLaren 1970 in Claeys et al. 1992, 1102).

Comment: Glass spherules found near the Frasnian-Famennian boundary in Belgium support this hypothesis (Claeys et al. 1992, 1102).

vigilance hypothesis *n.* The hypothesis that there has been natural selection against hallucinations during human sleep that compromise a person's vigilance of external stimuli that might occur during sleep (Donald Symons 1993 (in Cognition) in Achenbach 1995).

Comments: This hypothesis addresses why Humans usually do not feel pain or tactile sensations, smell, and taste during dreaming (Symons 1993 in Achenbach 1995, F5). This may be because people evolved vigilance for odors of fires, wolves, and other potentially harmful things that can occur during sleep. The vast majority of auditory sensations that occur in dreams usually comprises speech and other human vocalizations that are generated by mechanisms of speech production, not by those of auditory perception. A sleeping person's audition is not used during dreaming, but is free to receive sounds such as those of a crying baby.

volition, effect of volition, theory of volition *n.* The hypothesis that animal adaptations arise from animals' slow willing of these adaptations (Mayr 1982, 357).

Comment: This idea was erroneously ascribed to Lamarck by other biologists including C. R. Darwin. "In part the misunderstanding was caused by the mistranslation of the word *besoin* into "want" instead of "need" and a neglect of Lamarck's carefully developed chain of causation from needs to efforts to physiological excitations to the stimulation of growth to the production of structures" (Mayr 1982, 357).

working hypothesis *n.* A hypothesis that serves as the basis for future experimentation (Lincoln et al. 1985).**zoo hypothesis** *n.* The hypothesis that extraterrestrial intelligent life is not interacting with us because it "set us aside as part of a wilderness area or zoo" (Ball 1973, 347).♦ **hypothetical construct** See variable: intervening variable.♦ **hypothetico-deductive method** See method: hypothetico-deductive method.♦ **hypotrophic** *n.* See -troph-: hypotroph.♦ **hypsiphobia** See -phobia: hypsiphobia.♦ **hypsophobia** See -phobia: hypersophobia.♦ **hysteresis mechanism** See mechanism: hysteresis mechanism.♦ **hysterogenic** See -genic: hysterogenic.♦ **hysterotely** See ²heterochrony: neoteny: hysterotely.

i

- ♦ **I** See opportunity for selection; variance; standardized variance.
- ♦ **ichnite, ichnolite** See fossil: ichnite.
- ♦ **ichnofauna** See fauna: ichnofauna.
- ♦ **ichnoflora** See flora: ichnoflora.
- ♦ **ichnofossil** See fossil: trace fossil.
- ♦ **ichnolite** See fossil: ichnite.
- ♦ **ichnology** See study of: ichnology.
- ♦ **ichnospecies** See ²species: ichnospecies.
- ♦ **ichthyofauna** See fauna: ichthyofauna.
- ♦ **ichthyology** See study of: ichthyology.
- ♦ **ichthyophage** See -phage: ichthyophage.
- ♦ **ICZN** See International Code of Zoological Nomenclature.
- ♦ **idea** *n.*
 1. A person's picture, or notion, of anything conceived by his mind; a conception (Oxford English Dictionary 1972, entries from 1612).
 2. A person's conception to which no reality exists; an imagined or fanciful conception (Oxford English Dictionary 1972, entries from 1588).
 3. Any product of a person's mental apprehension, or activity, that is in his mind as an object of knowledge or thought; a belief; conception; thought; way of thinking (Oxford English Dictionary 1972, entries from 1645).

Note: This is a more widely used definition.

cf. concept

Comment: Idea has many other meanings not listed here.
- ♦ **ideal character** See character: ideal character.
- ♦ **ideal-dominance distribution** See distribution: ideal-dominance distribution.
- ♦ **ideal free distribution** See distribution: ideal free distribution.
- ♦ **ideal trait** See character: ideal trait.
- ♦ **idealistic morphology** See -morphology: idealistic morphology.
- ♦ **identical twin** *n.* See twin: fraternal twin.
- ♦ **identification** *n.* A person's placing an investigated individual organism into one of the classes of an already existing taxonomic classification (Mayr 1982, 147).

syn. determination
cf. classification
- ♦ **²identification** *n.* An animal's connection, or relationship, to a group or family (Heymer 1977, 90).

Comment: This behavior may promote group cohesion if coupled with social consciousness (Heymer 1977, 90).

- ♦ **identified-neuron chauvinist** *n.* One who claims that the way to understand animal behavior is to study animal neurophysiology (Dawkins 1986, 98). *Comment:* Identified-neuron chauvinists debate with those who hold a black-box view of behavior, *q.v.* (Dawkins 1986, 98).
- ♦ **identifior** *n.* A signal component that specifies a certain place and time (Marler 1961 in Wilson 1975, 217).
cf. appraisor
- ♦ **ideology** *n.* The ideas, or manner of thinking, characteristic of an individual or group; especially, the ideas and objectives that influence a whole group, or national culture, shaping especially their political and social procedure (Michaelis 1963). *See* study of: ideology.
- ♦ **idio-** *comb. f.* One's own; peculiar to a person or thing; individual: idiosyncrasy (Michaelis 1963). [*<Greek idios, own, private*]
- ♦ **idioadaptation** See ²evolution: allomorphosis.
- ♦ **idiobiology** See study of: biology: idiobiology.
- ♦ **idiochromosome** See chromosome: idiochromosome.
- ♦ **idioecology** See study of: autecology.
- ♦ **idiogamy** See -gamy: idiogamy.
- ♦ **idiogram** See -type: karyotype.
- ♦ **idioplasm** See germ plasm.
- ♦ **idiotaxonomy** See study of: idiotaxonomy.
- ♦ **idiotherm** See -therm: idiotherm.
- ♦ **idiotypic** *adj.* Referring to sex or sexual reproduction (Lincoln et al. 1985).
syn. sexual
- ♦ **IGS** See external-nontranscribed spacers.
- ♦ **illegitimate receiver** See eavesdropper.
- ♦ **illegitimate signaler** See signaler: illegitimate signaler.
- ♦ **illustrator** See communication: nonverbal communication: illustrator.
- ♦ **illusion** *n.* A person's false perception; a perception that does not correspond with an objective situation (Storz 1973, 123).
- ♦ **anticipatory visual illusion** *n.* A person's initially confusing his searched-for object with its model; *e.g.*, an insect collector's at first perceiving a real leaf as a sought-after leaf butterfly (Krizek 1984, 4). *Comments:* A person who is searching for a particular thing may also confuse it with an object that is not a *bona fide* model of this thing. For example, I have searched for American Bears in a forest and, at first, mistaken stumps for them, or have searched for the

Lilium philadelphicum (Woodland Lily) and initially mistaken a distant *Hemerocallis fulva* (alien Fulvous Daylily) for this species. I am not aware of a term for this kind of visual illusion. However, this seems to be a more general case than described by Krizek (1984). Perhaps his illusion should be called “anticipatory-mimic-visual illusion” and the more general case be called “anticipatory visual illusion.”

“confusion illusion” *n.* A person’s erroneously concluding that another person’s research is sophisticated and important after hearing the person give a complicated, confusing, unclear seminar of the research (pers. obs.).

“irrelevance illusion” *n.* A person’s erroneously concluding that a research area is irrelevant, unimportant, or both because the person has erroneous knowledge of the area, limited knowledge of the area, from no through little intrinsic interest in the area, or a combination of these things (pers. obs.).

Moon illusion *n.* A person’s perceiving that the Moon seems to be much larger when it is near the Earth’s horizon than when it is seen higher in the sky, although the Moon is really the same size (Storz 1973, 173).

Muller-Lyer illusion *n.* An optical illusion in which lines of the same length appear to be of different length to a human observer (Immelmann and Beer 1989, 216).

proofreader’s illusion *n.* A person’s “failure to detect an error in spelling, punctuation, construction, etc.,” because he is familiar with the subject matter; a person’s “tendency to see things ‘as they ought to be’ rather than as they are” (Hinsie and Campbell 1976, 378).

♦ **imagination** *n.* In Insects: The final developmental stage that produces an imago (Lincoln et al. 1985).

♦ **imago** *n.*

1. In Insects: An adult that is sexually developed (Torre-Bueno 1978).
2. In Termites: Usually an adult primary reproductive, rather than other kind of adult (Wilson 1975, 586).

♦ **Imidocloprid** See -cide: pesticide: Imidocloprid.

♦ **imitation, imitative behavior** See learning: social imitative learning.

♦ **imitative foraging** See foraging: imitative foraging.

♦ **imitative resemblances** See mimicry.

♦ **immature** *adj.*

1. Referring to the developmental stages of an organism preceding attainment of sexual maturity (Lincoln et al. 1985).
2. Referring to an incompletely differentiated system (Lincoln et al. 1985).

cf. animal names

♦ **immature behavior** See behavior: immature behavior.

♦ **immigrant** *n.* Referring to an adventive, group, or species, that arrived in a new area without the deliberate agency of Humans, even though it may have been transported accidentally by Humans (Frank and McCoy 1990, 4).

cf. adventive, endemic, indigenous, introduced, pre-cinctive

[Latin *immigrantem* < present participle of *immigrare*, one, who, or that, which migrates into a country as a settler]

♦ **immigration** *n.* An individual’s, or group’s, movement into a new population or geographical region (Lincoln et al. 1985).

n. immigrant

cf. emigration

♦ **immigration curve** See curve: immigration curve.

♦ **immigration rate** See rate: immigration rate.

♦ **immobility response** See response: immobility response.

♦ **immoral** See moral: immoral.

♦ **immunology** See study of: immunology.

♦ **impaling** *n.* In Shrikes (birds): An individual’s pushing a prey onto a thorn (Watson 1910 in Heymer 1977, 33).

v.t. impale

♦ **imperfect** See sexual: unisexual.

♦ **implantation** *n.*

1. A mammal embryo’s embedding into the wall of a uterus prior to fetal development (Curtis 1983, 846).
2. An investigator’s placing a hormone deposit, usually in capsule form, under an animal’s skin or elsewhere in a hormone-manipulation experiment (Immelmann and Beer 1989, 139).

♦ **imposed altruism** See altruism: imposed altruism.

♦ **impregnation** See insemination.

♦ **imprinting** See learning: imprinting.

♦ **inadequate stimulus** See ²stimulus: inadequate stimulus.

♦ **inborn behavior** See behavior: inborn behavior.

♦ **inbreeding** See breeding: inbreeding.

♦ **inbreeding coefficient** See coefficient: coefficient of inbreeding.

♦ **inbreeding depression** *n.* Reduction of fitness and vigor of a normally outbreeding population due to increased homozygosity as a result of inbreeding (Lincoln et al. 1985).

♦ **inbreeding polygyny** See mating system: polygyny: inbreeding polygyny.

♦ **incasement theory** See ³theory: encasement theory.

♦ **incentive** *n.*

1. Something that arouses a person’s feeling, or incites one to action; an exciting cause or motive; an incitement, provocation, spur (Oxford English Dictionary 1972, entries from 1432).

2. An individual animal’s arousal produced by its associating a stimulus with reinforcement (incentive-motivational effects), by not receiving reinforcement, or by its prevention of reaching a goal (Immelmann and Beer 1989, 141).

Note: The meaning of “incentive” varies among authorities (Immelmann and Beer 1989, 141).

syn. appetite (in some contexts, Immelmann and Beer 1989, 141)

adj. incentive

♦ **incertae sedis** *adj.* Referring to a taxon whose broader taxonomic relationships are unknown or undefined (Lincoln et al. 1985).

abbrev. *inc. ced.*, *inc. sed.*

[Latin *incertae sedis*, uncertain seat, uncertain placement]

♦ **incest** *n.* “The crime of sexual intercourse or co-habitation between persons related within the degrees within which marriage is prohibited; sexual commerce of near kindred” (Oxford English Dictionary 1972, entries from 1225).

[Latin *incestus*, impure, unchaste]

- ♦ **incest avoidance, incest taboo** *n.* For example, possibly in some insect species; in some bird and primate species including Humans: An individual's tendency to avoid mating with very close kin (Wilson 1975, 78–79).
cf. social inhibition
Comment: "Incest avoidance" occurs, *e.g.*, in actively mobile animals because their young and parents disperse widely and are unlikely to meet again, because one sex leaves a family group as juveniles, or both (Immelmann and Beer 1989, 141).
- ♦ **incidental** See male: incidental.
- ♦ **incidental learning** See learning: latent learning.
- ♦ **incipient** *adj.* Referring to the initial stage in the development of a structure or event (Lincoln et al. 1985).
- ♦ **incipient species** See ²species: incipient species.
- ♦ **incipient stages of useful structures, the problem of** *n.* The puzzle of how beginning stages of adapted traits could have evolved (Gould 1985a).
- ♦ **incitin** See chemical-releasing stimulus (table).
- ♦ **inciting** *n.* In females of some duck species: An individual's orienting toward her mate, or prospective mate, following him, and simultaneously threatening another conspecific male (Lorenz 1941 in Heymer 1977 86).
- ♦ **inclinometer** See instrument: inclinometer.
- ♦ **included niche** See niche: included niche.
- ♦ **inclusive fitness** See fitness: inclusive fitness.
- ♦ **incompatibility load** See genetic load: incompatibility load.
- ♦ **incomplete block design** See experimental design: incomplete block design.
- ♦ **incomplete dominance** See dominance (genetic): incomplete dominance.
- ♦ **in copulo** *adj.* In the act of copulating, or having sexual intercourse or coition (Torre-Bueno 1978).
cf. copulation
Comment: Torre-Bueno (1978) says that the correct form for an act of copulation is "*in copulo*" not "*in copula*"; however, the latter term is frequently used.
- ♦ **incross** See cross: incross.
- ♦ **incubation** *n.* In most bird species: An individual's sitting on its egg(s) which warms it sufficiently enabling embryonic development (Immelmann and Beer 1989, 142).
syn. brooding
cf. brooding
Comment: Immelmann and Beer (1989, 142) suggest that, for precision, use of "brooding" be restricted to parental care after hatching and "incubation" be restricted to parental care of eggs and hatching eggs.
- ♦ **independent** *adj.*
1. Referring to a variable's not being influenced or controlled by another variable in its data set (Lincoln et al. 1985).
 2. Referring to a datum whose value is not affected by the magnitude of other variables in its set.
n. independence
cf. dependent
- ♦ **independent assortment, law of** See law: Mendel's laws: Mendel's second law.
- ♦ **independent samples** *n.* Pairs, or groups, of data in which the selection of one group in no way affects selection of other groups (Lincoln et al. 1985).
cf. independent

♦ **independent variable** See variable: independent variable.

♦ **index** *n., pl. indexes, indices*

1. A numerical expression of the ratio between one dimension, or magnitude, and another (Michaelis 1963).
2. A number that summarizes one, or more, characteristics of a data set, *e.g.*, a diversity index that indicates the number of species and their relative abundances in a community.

cf. diversity

[Latin *index*, forefinger, sign]

fixation index (*F*) *n.* An index of the heterozygosity reduction expected with random mating at any one level of a population hierarchy (total population, regional aggregate, and subpopulation) relative to another, more inclusive level of the hierarchy (Hartl 1988, 78–81; Hartl and Clark 1997, 117–120).
syn. *F* statistic

Comments: Wright (1921) defined this index to quantify the inbreeding effect of population substructure (Hartl and Clark 1997, 117). *F* "is a useful index of genetic differentiation because it allows an objective comparison of the overall effect of population substructure among different organisms without getting into details of allele frequencies, observed levels of heterozygosity, and so forth." In the equations below, H_R = the average Hardy-Weinberg-equilibrium heterozygosity among a taxon's individuals within regions of a total area; H_S = the average Hardy-Weinberg-equilibrium heterozygosity among the taxon's individuals within randomly mating subpopulations within the regions; and H_T = the average Hardy-Weinberg-equilibrium heterozygosity among a taxon's individuals within its total area (Hartl and Clark 1997, 114–117).

► **F_{RT}** *n.* The proportion of heterozygosity reduction of a taxon's regional aggregates relative to its total combined population; $F_{RT} = (H_T - H_R)/H_T$ (Hartl and Clark 1997, 117).

► **F_{SR}** *n.* The fixation index of a taxon's subpopulations relative to regional aggregates; $F_{SR} = (H_R - H_S)/H_R$ (Hartl and Clark 1997, 117).

► **F_{ST}** *n.* The fixation index of a taxon's subpopulations relative to the total area it occupies; $F_{ST} = (H_T - H_S)/H_T$ (Hartl and Clark 1997, 117).

Comments: F_{ST} has a theoretical minimum of 0 (indicating no genetic divergence between, or among, subpopulations) and maximum of 1 (indicating fixation of alternative alleles in different subpopulations), and it is not expressed in any unit of measure (Hartl and Clark 1997, 118–119). This index is usually much less than 1. F_{ST} values of 0 through 0.05 indicate little genetic differentiation; 0.06–0.15, moderate differentiation; 0.16–0.25, great differentiation; and over 0.25, very great differentiation. Wright (1951 in Slatkin 1987, 791) estimated $F_{ST} \approx 1/(1 + 4Nm)$; where N is the local population size, and m is the average rate of immigration in an "island" model of population structure. The island model assumes that every local population is equally accessible from every other, and it represents the extreme in dispersal over large distances.

Haines index *n.* An index that indicates the potential for a forest fire to grow and spread under given atmospheric conditions (Sanchez and Duggan 2000, 13 May, A5).

Comments: This index takes into account moisture content of the air at 10,000 ft and the stability of the air layer from 10,000 through 18,000 ft above the Earth (Sanchez and Duggan 2000, 13 May, A5). A Haines index value of 2 or 3 means that atmospheric conditions are suitable for controlled burning, provided that surface wind speeds, humidity, and other factors are favorable for such burning. An index of 4 means that controlled burning is risky, and values of 5 or 6 indicate that the chance of a controlled burn's going out of control is high. In May 2000, the U.S. Forest Service started a controlled burn in Bandelier National Monument (6 mi from Los Alamos, NM) although the Haines index was 6. The fire quickly went out of control and scorched 47,000 acres, burning homes, and causing losses of about \$614 million (Clark 2000, 9 November, A18).

index of similarity See coefficient: coefficient of community.

Lincoln index *n.* An index that can be used to estimate a species' local population size: $\hat{N} = an/r$; where \hat{N} is the estimate of the number of individuals in the population (N), n is the total number of individuals in the second captured sample, a is the total number of marked individuals, and r is the total number of recaptured individuals (Southwood 1978, 97).

Comment: Southwood (1978, 92–99) discusses different Lincoln-index-type methods, assumptions of these methods, and other mark-recapture methods.

species-diversity index *n.* An index that indicates the number of species alone in an area or both this number and the species' relative abundances (Southwood 1978, 421).

Comments: Researchers have invented a large number of diversity indices (Southwood 1978, 421). Indices that combine the number of species and their relative abundances in a sample, such as α , D , and H , summarize most of the biological information on diversity of samples (Krebs 1985, 524).

► **α -diversity index** *n.* The number of species within a community or habitat (Southwood 1978, 420).

► **β -diversity index** *n.* A measure of the rate and extent of change in species along a gradient, from one habitat through others (Southwood 1978, 420).

Comments: Lawton et al. 1998 (73) use a modified β -diversity index that quantifies species replacement.

► **diversity index** *n.* An index of taxon diversity (taxon number or taxon number and taxon abundances) (Southwood 1978, 420).

cf. diversity
Comments: Whittaker (1972 in Southwood 1978, 420) classified organism diversity indices as α -diversity, β -diversity, and γ -diversity. Southwood 1978 (420–437) discusses these and many other diversity indices.

► **γ -diversity index** *n.* The number of species in a range of habitats in a geographical areas (e.g., an island) (Southwood 1978, 420).

Comment: γ -diversity is a consequence of the α -diversity of the habitats together with the extent of the β -diversity between them (Southwood 1978, 420).

► **Shannon-Weaver function, H** *n.*

$$H = \sum_{i=1}^S (p_i)(\ln p_i)$$

where H = the information content of a sample (in bits per individual) and also an index of species diversity; S = the number of species; p_i = the proportion of the total sample belonging to the i th species (Krebs 1985, 521).

syn. H' (H prime, Kerr 1999), Shannon index (Maryland Sea Grant 2001), Shannon-Weaver entropy statistic (E), Shannon-Wiener index (Nagarajan and Lea 2001), Shannon-Wiener function (Krebs 1985, 521)

Comments: One can use H to describe variability in a data set such as an organism's behavioral variability when signaling or performing another behavior (Shannon and Weaver 1949 in Wilson 1975, 194, 195), species' variability in abundances, or stimulus variability. For example, in animals, the variability may relate to the information content of a behavior. H is a measure of uncertainty; variability of a sample is positively correlated with H . Maximum $H = \ln S$. For example, maximum H when $S = 10$ is 2.3; 100, 4.6; 1000, 6.9; 10,000, 9.2; 100,000, 11.1; 1,000,000, 13.8. With regard to species diversity studies, this index indicates how difficult it is to predict correctly the species of the next individual collected in a series of collected ones (Krebs 1985, 521). For a given magnitude of S , H approaches maximum H as the abundances of the species approach being equal. Some researchers use \log_2 , instead of \ln , in the equation. [After Claude E. Shannon and Warren Weaver who independently derived H (Nagarajan and Lea 2001). After the mathematician Norbert Wiener, the effective founder of cybernetics, with which information theory is closely linked.]

► **Simpson's Index of Diversity (D)** *n.* One of three indices that is used to quantify the biodiversity of a habitat based on number and abundances of focal species (Krebs 1985, 523; Offwell Woodland & Wildlife Trust, 1998).

Comments: The three indices are explained below. In reporting Simpson's indices of diversity, one should indicate which index was used.

Index 1.

$$D = \sum_{i=1}^S (p_i)^2$$

where p_i = the proportion of individuals of species i in a focal community, and S is its total species number. In this case $0 \leq D \leq (1/S)$. Zero represents infinite diversity and $(1-1/S)$ is minimum diversity. Index 2.

$$D = 1 - \sum_{i=1}^S (p_i)^2$$

where p_i and S are defined as above. In this case $0 \leq D \leq (1-1/S)$. Zero represents no diversity and $(1-1/S)$ is maximum diversity. This D gives relatively little weight to rare species and more weight to the common ones.

Index 3, also known as Simpson's Reciprocal Index.

$$D = 1 / \left[\sum_{i=1}^S (p_i)^2 \right]$$

where p_i and S are defined as above. In this case $1 \leq D \leq S$. One represents the lowest diversity (only one species in the sample), and S is maximum diversity.

species richness *n.* "The absolute number of species in an assemblage or community" (Lincoln et al. 1985).

syn. S(n) (Colwell and Coddington 1994, 104), *ST* (Southwood 1978, 420)

♦ **index species** See ²species: index species.

♦ **indicate** *v.t.* To accept an experimental hypothesis provisionally by rejecting its complementary null hypothesis at a "stipulated- p " of, *e.g.*, ≤ 0.05 , as in: The analysis *indicates* a significant difference between groups.

♦ **indicator** *n.* An organism, species, or community that is characteristic of a particular habitat, or indicative of a particular set of environmental conditions (Lincoln et al. 1985).

See ²species: characteristic species.

♦ **indicator hypothesis of female choice** See hypothesis: hypotheses of female choice: indicator hypothesis of female choice.

♦ **indicator response** See response: indicator response.

♦ **indicator species** See ²species: indicator species.

♦ **indifferent species** See ²species: companion species.

♦ **indigenous** *adj.* Referring to a group, or species, that is native, or aboriginal, to a particular geographic area; contrasted with a group, or species, that is considered to have immigrated from an outside area (given as autochthonous in Tillyard 1926, etc. in Frank and McCoy 1990, 2).

syn. autochthonous, endemic (*erroneously*), native (Frank and McCoy 1990, 4)

cf. adventive, autochthonous, endemic, immigrant, introduced, precinctive

Comment: Frank and McCoy (1990, 4) prefer indigenous to "autochthonous," or "native," because "indigenous" is used more widely in biology than "autochthonous," and they prefer "indigenous" to "native" because "native" has subsidiary English meanings.

[Latin *indigenus*, native]

♦ **indigenous species** See ²species: native species.

♦ **"indirect-benefit hypothesis"** See female-mate-choice hypothesis: "indirect-benefit hypothesis."

♦ **indirect mimicry** See mimicry: indirect mimicry.

♦ **indirect competition** See competition: indirect competition.

♦ **indirect fitness** See fitness: indirect fitness.

♦ **indirect hyperparasitism** See parasitism: hyperparasitism: indirect hyperparasitism.

♦ **indirect life cycle** See life cycle: indirect life cycle.

♦ **indirect mimicry** See mimicry: indirect mimicry.

♦ **indirect role** See role: indirect role.

♦ **indirect selection** See selection: indirect selection.

♦ **indirect spermatophore transmission** *n.* In some myriapod, spider, mite, and salamander species; Apterygote Insects; Scorpions; Springtails; Whipscorpions: A male's depositing a spermatophore on a substrate and inducing a female to pick it up in a way that effects fertilization (Immelmann and Beer 1989, 143).

♦ **indirect tradition** See tradition: indirect tradition.

♦ **individual** *n.* Any physically distinct organism, that has genetic uniqueness; including an identical twin, triplet, etc. or a member of a clone with genetically identical individuals (Wilson 1975, 8).

Comment: Hull (1992) discusses the meaning of "individual."

♦ **bion, biont** See biont.

♦ **morphont** *n.* A morphological individual, *e.g.*, one of many single organisms that makes up a *Physalia physalis* (Portuguese Man-of-war); contrasted with biont (Haeckel in Hull 1992, 184).

♦ **recognized individual** *n.* An individual that is classified by conspecifics according to its kinship (Wilson 1987, 10).

syn. cue bearer

♦ **recognizing individual, discriminating individual** *n.* An individual that responds to appropriate cues by distinguishing kin from nonkin (Wilson 1987, 12).

♦ **individual observation** See observation: individual observation.

♦ **individual courtship flight** See flight: courtship flight: individual courtship flight.

♦ **individual distance** See distance: individual distance.

♦ **individual fitness** See fitness (def. 2).

♦ **individual mimicry** See mimicry: individual mimicry.

♦ **individual odor** See odor: individual odor.

♦ **individual pheromone** See chemical-releasing stimulus: semiochemical: pheromone: individual pheromone.

♦ **individual psychology** See study of: psychology: individual psychology.

♦ **individual recognition** See recognition: individual recognition.

♦ **individual selection** See selection (table).

♦ **individual territory** See territory: individual territory.

♦ **individual variation** See variation: continuous variation.

♦ **individual variety** See variety: individual variety.

♦ **individualistic model** See ⁴model: individualistic model.

♦ **individualized group** See ²group: individualized group.

♦ **individuation** *n.* The development of a single functional unit, *e.g.*, an individual or colony (Lincoln et al. 1985).

♦ **induced ovulator** See ovulation.

♦ **induced plant response to herbivory** See response: induced plant response to herbivory.

♦ **¹induction** *n.*

1. One's inferring, or aiming at, a generality (principle, law) from observation of particular instances of a phenomenon (Michaelis 1963).

2. A conclusion reached by induction (Michaelis 1963).

3. One's relating clues about a phenomenon to construct a hypothesis (Moore 1984, 478).

See inductivism.

cf. deduction, method: inductive method

♦ **²induction** *n.*

1. One tissue's influencing the development, differentiation, growth, or a combination of these traits of another tissue during ontogeny (Curtis 1983, 858; Immelmann and Beer 1989, 145).

- A**
- syn. embryonic induction (Curtis 1983)
2. A specific genetic factor's, environmental factor's, or both kinds of factor's giving rise to a new trait, e.g., behavior that would not occur without these factors during an animal's ontogeny; e.g., an animal's preference that it establishes during imprinting (Immelmann and Beer 1989, 145).
 3. One group of embryonic cells' influencing another adjacent group's development via specific molecules (Campbell et al. 1999, 396).
- Note:* Induction occurs by physical contact between cell groups, chemical signals, or both (Campbell 1996, 983).
cf. behavior: allelomimetic behavior (mood induction); facilitation
- ♦ **inductive method** See method: inductive method.
- ♦ **inductive statistics** See study of: statistics: inductive statistics.
- ♦ **inductivism** *n.* The assertion "that a scientist can arrive at objective, unbiased conclusions only by simply recording, measuring, and describing what he encounters without having any prior hypotheses or preconceived expectations" (Bacon in Mayr 1982, 28).
syn. Baconian inductivism, induction, true Baconian method
cf. induction, method: inductive method
- Comment:* Liebig (1863 in Mayr 1997, 48) convincingly argued against Bacon's inductivism, and Charles Darwin made fun of it. It became derogatory to call someone an inductionist (or "stamp-collector").
- ♦ **induration** *n.*
1. Hardening of rock, or rock material, by heat, pressure, introduction of a pore-filling material (cementation), or a combination of these factors (Lapidus 1987, 192).
 2. Hardening of a soil horizon by chemical action that forms a hardpan (Lapidus 1987, 192).
- ♦ **industrial melanism** *n.* An increase of dark forms of a particular insect species due to natural selection for dark forms over light forms in areas where industrial pollution darkened substrates on which the insects rest (Futuyma 1978, 372).
Comments: For example, in *Biston betularia* (Peppered Moth) industrial pollution in the United Kingdom killed lichens that grew on tree trunks leaving dark, exposed bark, and natural selection favored the melanic form *B. b. carbonaria* over the "typical" pale gray form (Kettlewell 1955 in Futuyma 1978, 358, illustration, 372). During the Industrial Revolution in some areas, the frequency of *B. b. carbonaria* increased from about 1% to over 90%, and had a 50% selective advantage over the pale form. Predation of the pale forms was a major force that reduced their frequency. When European countries reduced their air pollution in the 20th century, the pale form increased in frequency in many areas (Weiner 1994, 273).
- ♦ **industrial psychology** See study of: psychology: industrial psychology.
- ♦ **Indy** See gene: *Indy*.
- ♦ **inert** *adj.* "Inactive, physiologically quiescent" (Lincoln et al. 1985).
- ♦ **inertia hypothesis** See hypothesis: hypotheses of the evolution and maintenance of sex: inertia hypothesis.
- ♦ **inertia, phylogenetic** See phylogenetic inertia.
- ♦ **infant killing, infanticide** See -cide: infanticide.
- ♦ **infantile behavior, infantilism, infantlike behavior** See behavior: infantile behavior.
- ♦ **infauna** See ²community: benthos: endobenthos.
- ♦ **infavoidance** See need: infavoidance.
- ♦ **inferential statistics** See study of: statistics: inferential statistics.
- ♦ **inferior colliculus** See organ: brain: inferior colliculus.
- ♦ **inferior olive** See organ: brain: inferior olive.
- ♦ **infestation** *n.*
1. A parasite's colonization, utilization, or both of a host (Michaelis 1963).
 2. A host's being colonized, utilized, or both, by parasites (Michaelis 1963).
 3. An environment's being colonized, utilized, or both by pests (Lincoln et al. 1985).
- ♦ **infibulation** *n.* A person's stitching a girl's genital lips together so that only urine and menstrual blood can pass through the remaining opening (Dugger 1996, 28 December, 1).
cf. circumcision
Comment: Infibulation can result in highly painful intercourse and childbirth (Dugger 1996, 28 December, 9).
- ♦ **inflow theory** See ³theory: inflow theory.
- ♦ **influent** *n.* Any organism that influences another organism or group of organisms (Lincoln et al. 1985).
- ♦ **information** *n.*
1. A person's acquired, or derived, knowledge; facts; data (Michaelis 1963).
Note: Some workers use "information" with regard to nonhuman animals (Michaelis 1963).
 2. In cybernetics, a signal's, or message's, property by which it quantitatively conveys something unpredictable and meaningful to a receiver, usually measured in bits (Michaelis 1963; Immelmann and Beer 1989, 146).
Note: This sense is used in animal-communication studies.
 3. In development and genetics, instructions, or specifications, for development of a morphological structure or behavioral mechanism (Immelmann and Beer 1989, 147).
cf. communication, message, signal
Comment: Researchers disagree regarding the definition of information (McGregor 1997, 754).
- ♦ **positional information** *n.* The molecular cues that control pattern formation, *q.v.* (Campbell et al. 1999, 397).
- ♦ **information-center hypothesis** See hypothesis: information-center hypothesis.
- ♦ **information theory** See study of: mathematics: cybernetics.
- ♦ **information transfer** *n.*
1. Technically, an increase in an animal's ability to predict what is going to happen next as a result of a given event; the magnitude of one animal's influence on another's behavior (Dawkins 1986, 106, 108).
Note: If there is no influence, no information transfer has occurred (Dawkins 1986, 106, 108).
 2. Colloquially, animals' giving information to each other; in this kind of information transfer, a human observer does not increase his ability to predict what the animals will do next (Dawkins 1986, 110).
Comment: The differences in these two meanings have led to no end of misunderstanding (Dawkins and Krebs 1978, van Rhijn 1980, Hinde 1981 in Dawkins 1986, 110). "Definitions have had an enormous impact on the way people see animal communication. They have affected what we regard as 'communication' and

- 'signals' and whether we see communication as involving any sort of transfer of information" (Dawkins 1986, 110).
- ♦ **infra-** *prefix* "Below, beneath; on the lower part" (Michaelis 1963).
cf. *supra-*
[Latin *infra*]
- ♦ **infradian rhythm** See *rhythm: infradian rhythm*.
- ♦ **infradispersed distribution** See *distribution: underdispersed distribution*.
- ♦ **infragenetic mutation** See ²*mutation: gene mutation*.
- ♦ **infraneuston** See *neuston: hyponeuston*.
- ♦ **infrared-stimulated-luminescence dating** See *method: dating method: infrared-stimulated-luminescence dating*.
- ♦ **infrasound** See ¹*sound: infrasound*.
- ♦ **infraspecific** *adj.* Within a species.
- ♦ **infrequent worker** See *caste: worker: infrequent worker*.
- ♦ **ingesta** *n.* An organism's total intake of substances into its body (Lincoln et al. 1985).
- ♦ **ingestion** *n.* Taking in food; feeding.
- ♦ **ingestive behavior** See *behavior: ingestive behavior*.
- ♦ **ingratitudo** See ²*group: ingratitudo*.
- ♦ **inhabited symbiont** See *symbiont: inhabited symbiont*.
- ♦ **inhabiting symbiont** See *symbiont: endosymbiont*.
- ♦ **inherent mimicry** See *mimicry: inherent mimicry*.
- ♦ **inheritance** *n.*
1. In Humans: An attitude, concept, idea, property, or quality that one obtains from his predecessor(s); heritage (Michaelis 1963).
 2. In organisms: Genetic information transmitted to a descendant from its ancestor(s), parent(s), or both (Lincoln et al. 1985).
cf. *law: Mendel's laws; theory: Mendel's theory of inheritance*
 3. In some vertebrate species and Humans: Learned information that individuals pass down from generation to generation.
cf. *inheritance: cultural inheritance, tradition*

A CLASSIFICATION OF INHERITANCE

- I. Genetic inheritance
 - blending inheritance
 - cytoplasmic inheritance
 - delayed-Mendelian inheritance
 - hard inheritance
 - inheritance of acquired characters
 - maternal inheritance
 - Mendelian inheritance
 - multifactorial inheritance
 - multiple-gene inheritance
 - qualitative inheritance
- II. Nongenetic inheritance (= cultural inheritance)

blending inheritance *n.*

1. Gene fusion during fertilization (Mayr 1982, 644, 779).

Notes: This concept opposes the idea that genes remain separate entities in zygotes and individual

organisms (theory of particulate inheritance). Early workers proposed blending inheritance due to first generation (F_1) hybrids' having most of their characters intermediate between their two parental species and second generation hybrids' being much more variable, decreasing the obviousness of Mendelian segregation. Nägeli was one of the few post-Darwinian biologists to accept a theory of pure blending inheritance. Darwin appears to have accepted a mixed theory composed of blending inheritance and particulate inheritance (Mayr 1982, 644, 779).

2. Inheritance in which parental traits appear to blend in their offspring, with no apparent segregation in subsequent generations (Lincoln et al. 1985).

syn. blending concept of heredity, blood theory of heredity, paint-pot theory of heredity (Mayr 1982, 644, 779)

cf. ³*theory: Mendel's theory of particulate inheritance, theory of pure blending inheritance*

chromosomal inheritance See *inheritance: Mendelian inheritance*.

cytoplasmic inheritance *n.* Non-Mendelian heredity that involves replication and transmission of extrachromosomal genetic information found in organelles (e.g., mitochondria, chloroplasts) or in intracellular parasites (e.g., viruses) (Mayr 1982, 732; King and Stansfield 1985).

cf. *inheritance: maternal inheritance, Mendelian inheritance; system: inheritance-of-acquired-characteristics system*

delayed-Mendelian inheritance *n.* A phenotypic character's being shown one generation after the gene(s) involved entered a family line, e.g., coiling direction in *Limnaea* snails (Mayr 1982, 789).

hard inheritance *n.* Inheritance in which genetic material is constant and changeable only through a sudden and radical alteration — a mutation; contrasted with soft inheritance (Mayr 1982, 584, 667).

inheritance of acquired characters *n.*

1. An imprecise term that refers to the belief that either an organism's environment, its use versus disuse of particular parts, or both affect the genetically heritable qualities of its characters (Mayr 1982, 687).

cf. *inheritance: soft inheritance*

2. An organism's obtaining a character during its life time that it transmits to its offspring (Lenski and Mittler 1993, 189).

Notes: A temperate virus can convert a bacterium into a lysogen, wherein the virus is integrated into the host's chromosome (Lenski and Mittler 1993, 189). In this state, the virus synthesizes a protein that confers immunity to further infections and immunity is inherited.

cf. *character: acquired character; Lamarckism; inheritance: soft inheritance; system: inheritance-of-acquired-characteristics system*

Comment: Inheritance of acquired characters is an exception to strict neo-Darwinism (Lenski and Mittler 1993, 189). Inheritance of acquired characters also usually includes "the postulate of modifiability of genetic material by general climatic and other environmental conditions (Geoffroyism) or by nutrition directly, without peripheral (phenotypic) characters necessarily serving as intermediaries" (Mayr 1982, 687).

maternal inheritance *n.* Inheritance that is determined by cytoplasmic factors (e.g., mitochondria,

chloroplasts) that are carried by female gametes (Lincoln et al. 1985).

syn. cytoplasmic inheritance, matrilinear inheritance, maternal transmission

Mendelian inheritance, chromosomal inheritance *n.* Inheritance of traits through nuclear chromosomes (Lincoln et al. 1985).

cf. inheritance: cytoplasmic inheritance

multifactorial inheritance *n.*

1. Inheritance involving phenotypic characters controlled by the integrated action of multiple independent genes (Lincoln et al. 1985; Tanksley 1993, 206).

2. An additive effect of two, or more, genes, on a single phenotypic character (Campbell et al. 1999, 250).

syn. multigenic inheritance, polyfactorial inheritance, polygenic inheritance

Comments: In Humans, there is multifactorial inheritance of skin color, which appears to be controlled by three separately inherited genes (Campbell et al. 1999, 250).

multiple-gene inheritance *n.* Inheritance of a trait that is controlled by more than one gene (Lincoln et al. 1985).

particulate inheritance See ³theory: Mendel's theory of particulate inheritance.

polyfactorial inheritance, polygenic inheritance See inheritance: multifactorial inheritance.

Polygenic inheritance See inheritance: multifactorial inheritance.

qualitative inheritance *n.* The inheritance of phenotypic characters that show discontinuous variation and are mainly controlled by only one, or a few, genes; contrasted with quantitative inheritance (Lincoln et al. 1985).

quantitative inheritance *n.* The inheritance of phenotypic characters that show continuous variation and are controlled by several interacting genes; contrasted with qualitative inheritance (Lincoln et al. 1985).

soft inheritance *n.* "Inheritance during which nuclear genetic material is not constant from generation to generation but may be modified by the effects of an organism's environment, by use or disuse, or other factors;" contrasted with hard inheritance (Mayr 1982, 959).

cf. hypothesis: directed-mutation hypothesis; inheritance: inheritance of acquired characters; Lamarckism

Comment: The final disproof of soft inheritance came in the 1950s when molecular geneticists demonstrated that information acquired by proteins cannot be transmitted back to nucleic acids (Mayr 1982, 552, 793).

◆ **inheritance of acquired characters** See inheritance: inheritance of acquired characters.

◆ **inheritance-of-acquired-characteristics system** See ¹system: inheritance-of-acquired-characteristics system.

◆ **inheritance, theory of** See ³theory: Mendel's theory of inheritance.

◆ **inhibition** *n.*

1. Something's (especially a physiological process) being prevented, hindered, or checked (Oxford English Dictionary 1972, entries from 1621).

2. A checking or restraining; especially a person's self-imposed restriction on his own behavior (Michaelis 1963).

3. Blockage of a behavior through certain endogenous, or exogenous, stimuli, or a simultaneous activation of another behavior that is incompatible with this first behavior (Heymer 1977, 85; Immelmann and Beer 1989, 148).

cf. behavior: displacement behavior

4. A temporary reduction in activity of a neuron, neuron group, or effector organ due to influences from other neurons or neuron groups (Heymer 1977, 85; Immelmann and Beer 1989, 148).

behavioral inhibition *n.* Blockage of the performance of a particular behavior due to specific external, or internal, stimuli or by simultaneous activation of another behavior tendency incompatible with the first behavior (Immelmann and Beer 1989, 148).

cf. behavior: displacement behavior

disinhibition *n.* Removal of the inhibition of a top-priority activity on a second-priority activity which allows this latter activity to be displayed (McFarland 1985, 389).

cf. hypothesis: disinhibition hypothesis

killing inhibition *n.* Inhibition of serious injury, or rival killing, in intraspecific fights by appeasement gestures, submissive postures, and other behaviors (Heymer 1977, 174).

lateral inhibition *n.* A process in an animal's visual system that enhances its perception of edges of retinal images (Gould 1982, 101–102; Immelmann and Beer 1989, 245).

neural inhibition *n.* Activity suppression of a neuron, neuron group, or an effector organ by influences from other neurons or neuron groups (Immelmann and Beer 1989, 148).

social inhibition *n.* One animal's suppressing a specific behavior of another, e.g., appeasement behavior that inhibits aggression of a conspecific in *Canis lupus* (Gray Wolf) (Immelmann and Beer 1989, 276).

Comment: A form of social inhibition is psychological castration, *q.v.*

◆ **inhibition of killing** See inhibition: killing inhibition.

◆ **inhibitory pheromone** See chemical-releasing stimulus: semiochemical: pheromone: inhibitory pheromone.

◆ **initial friction** *n.* The phenomenon that the strongest possible and complete expression of a behavior pattern is reached only after it has passed through lower stages (Lorenz 1939 in Heymer 1977, 28). [term expropriated from the physical sciences]

◆ **injurious fight** See fight: damaging fight.

◆ **injury-feigning display** See display: injury-feigning display.

◆ **innate** *adj.*

1. In genetics, referring to differences in genetic character between two members of the same species that have been raised in the same environment, e.g., a morphological or behavioral character (Verplanck 1957).

Notes: This is a widely used definition. Blue or brown eyes are not "innate," but the difference in eye color between two persons is "innate." "Innate" cannot be properly applied to behavior as synonymous with "unlearned" or "inborn." Where "innate behavior" has appeared in past literature, it should

- be read as “unlearned behavior” or “species-specific behavior” (Verplanck 1957).
2. Referring to a trait that is “inborn, hereditary, genetically inherited” (Immelman and Beer 1989, 148–149).
 3. Referring to a trait that is ontogenetically developed without any environmental, or experiential, shaping influence; e.g., an unlearned behavior (Immelman and Beer 1989, 149).
- cf.* behavior: innate behavior, instinct
- ♦ **innate behavior** See behavior: innate behavior, instinctive behavior.
- ♦ **innate-behavior pattern** See pattern: fixed-action pattern.
- ♦ **innate-language-acquisition device** *n.* In Humans: The innate combination of the deep structure, drive to learn language, its predictable learning-time course, and linguistic phoneme categories (Chomsky in Gould 1982, 538).
- cf.* deep structure (of language)
- ♦ **innate-releasing mechanism (IRM)** See mechanism: releasing mechanism: innate-releasing mechanism.
- ♦ **innate-releasing mechanism modified by experience** See mechanism: releasing mechanism: innate-releasing mechanism: innate-releasing mechanism modified by experience.
- ♦ **innate-releasing schema** *n.* The central (internal) correlate of stimuli, effective in eliciting a behavior, that enables an animal to show selective responsiveness to stimuli (von Uexküll 1957 in Immelman and Beer 1989, 150).
- Comment:* The innate-releasing schema, now an obsolete concept, is the historical antecedent of the innate releasing mechanism (Immelman and Beer 1989, 150).
- ♦ **Innendienst** *n.* In social insects: Work inside a nest (Wilson 1975, 412).
- cf.* *Außendienst*
- ♦ **innovation** *n.* A significant, new adaptation (Ruse 1993, 55).
- See behavior: innovative behavior.
- Comments:* Some biologists do not accept the concept of innovation (Ruse 1993, 55). Other biologists support ideas including the possibility that an innovation opens the way to occupying a new niche or seizing an already occupied one; innovations might be mainsprings of macroevolution; and a paradigmatic example of innovations might be endothermal homeothermy (Ruse 1993, 55).
- ♦ **input load** See load: input load.
- ♦ **inorganic** See organic: inorganic.
- ♦ **inorganic compound** See compound: organic compound.
- ♦ **inquiline** *n.*
 1. In Humans: A sojourner or lodger; an indweller (Oxford English Dictionary 1972, entries from 1641).
 2. In some animal species: An individual that lives in the nest, or abode, of another, e.g., “cuckoo-flies” in insect galls or certain kinds of insects in ant nests (Oxford English Dictionary 1972, entries from 1879).

Note: This is an obsolete definition.

 2. In some animal species: An individual that lives in the nest, or abode, of another, e.g., “cuckoo-flies” in insect galls or certain kinds of insects in ant nests (Oxford English Dictionary 1972, entries from 1879).
 3. An organism that habitually lives within the body space of another organism, but does it no harm (Froese and Pauly 2001).

Note: Fish inquilines include species that live inside sponges and those that live inside sea cucumbers (Froese and Pauly 2001).

adj. inquiline

cf. guest; hospite; parasitism: social parasitism: inquiline

Comments: Inquilines may use their hosts’ food; some are obligate social parasites of their hosts (Wilson 1975, 354, 587).

[Latin *inquilinus*, lodger < *in-*, in + *colere*, to dwell]

♦ **inquilinism** See parasitism: social parasitism: inquiline

♦ **insect collecting** See collecting: insect collecting.

♦ **insect society** See ²society: insect society.

♦ **insect-wing origination, hypotheses of** See hypothesis: hypotheses (“theories”) of the origin of insect wings.

♦ **insectivore** See -vore: insectivore.

♦ **insemination** *n.* An animal’s sperm introduction into another’s genital tract by copulation or indirect spermatophore transmission (Lincoln et al. 1985; Immelman and Beer 1989, 150).

syn. impregnation

♦ **traumatic insemination** *n.* In bed bugs, strepsipteran insects: A male’s piercing a female’s body wall with his aedeagus and injecting sperm into her haemocoel (Thornhill and Alcock 1983, 326).

♦ **insertion sequence (IS)** See transposable element: insertion sequence.

♦ **insessorial** See -orial: insessorial.

♦ **insight** *n.*
 1. A person’s understanding, or the faculty to understand the “hidden nature” of something (Oxford English Dictionary 1972, entries from 1580).
 2. An individual animal’s apprehension of relationships among stimuli or events (Köhler 1925 in McFarland 1985, 347); in problem solving, an individual’s sudden grasp of problem relationships leading to its solution; “aha” experience (Storz 1973, 128).

cf. behavior: innovative behavior; learning: insight learning

♦ **insight learning** See learning: insight learning.

♦ **in situ conservation** See conservation: *in situ* conservation.

♦ **in situ hybridization** See method: *in situ* hybridization.

♦ **insolation** *n.* “Exposure to solar radiation” (Lincoln et al. 1985).

♦ **inspection behavior** See behavior: inspection behavior.

♦ **instability** See ²stability: instability.

♦ **instantaneous evolution** See ²evolution: instantaneous evolution.

♦ **instantaneous-growth rate** See rate: instantaneous-growth rate.

♦ **instantaneous sampling** See sampling technique: instantaneous sampling.

♦ **instantaneous speciation** See speciation: instantaneous speciation.

♦ **instar** *n.*
 1. An individual arthropod “between two successive molts embracing a portion of the somatic growing phase, eclosion from the egg being purposely equated with a molt” (Carlson 1983).
 2. The stage of an arthropod between two successive molts (Michaelis 1963).

cf. stadium, stage

[Latin *instar*, form, likeness]

first instar *n.* The larval instar between eclosion from an egg and molting into a second instar.
syn. first larval instar (if pupae, adults, or both are considered to be instars)

Comment: “Second instars,” “third instars,” etc. occur between the first and last molts of a species.

last instar *n.* The larval instar between a molt and pupation.

syn. final instar, last larval instar (if pupae, adults, or both are considered instars)

♦ **instinct** *n.*

1. An individual animal’s innate propensity that manifests itself in “acts that appear to be rational, but are performed without conscious design or intentional adaptation of means to ends; also the faculty supposed to be involved in this operation (formerly often regarded as a kind of intuitive knowledge)” (Oxford English Dictionary, 1972, first entry 1595).

Note: The Oxford English Dictionary (1972) indicates that instincts are to be found especially in less derived animals.

2. A source of forces that govern animal behavior and are designed by God in such a way as to make behavior adaptable (Descartes in McFarland 1985, 362).

3. An individual animal’s motivational force of behavior (Hutcheson 1728 in McFarland 1987, 309).

4. One of an individual animal’s irrational and compelling sources of conduct, that orients it towards its goals; there are many instincts, most with corresponding emotions, such as: flight and fear, repulsion and disgust, curiosity and wonder and pugnacity and anger (McDougall 1908 in McFarland 1987, 309).

5. In animals: “A hierarchically organized nervous mechanism which is susceptible to certain priming, releasing, and directing impulses of internal as well as external origin, and which responds to these impulses by coordinated movements that contribute to the maintenance of the individual and the species” (tentative definition of Tinbergen 1951, 112, who later modified his views about the theory to which this definition relates).

6. In animals: An inborn, behavioral mechanism that manifests itself in an ordered movement sequence (= fixed-action pattern) that is activated by specific stimulation of a releasing mechanism that controls discharge of an associated drive (Immelmann and Beer 1989, 151).

Note: When “instinct” is currently used, it tends to connote this meaning (Immelmann and Beer 1989, 151).

cf. behavior: innate behavior, instinctive behavior

Comments: Instincts are often named based on their function, e.g., “aggressive instinct” or “reproductive instinct;” Lorenz (1981, 211–212) warns that such naming does not explain instincts, rather it challenges physiological analysis. According to Immelmann and Beer (1989, 151), “instinct” is by far the most controversial term in ethology. It was and is used and understood differently by different scientists.” Some so-called instincts have been found to have learned components. [Latin *instinctus*, instigation, impulse]

closed instinct *n.* An instinct that appears in completely functional form and is closed to modification by learning; instincts include fixed-action patterns of some authors (Alcock 1979).

cf. learning: open-instinct learning

Comment: One might consider a closed instinct to be an instinct in the strict sense.

♦ **instinct model** See ⁴model: instinct model.

♦ **instinct-training interlocking** *n.* The reciprocity between an animal’s genome and experience in its behavioral development resulting in the intermeshing of innate and acquired behavioral components (Immelmann and Beer 1989, 153).

[introduced by Lorenz (1937) as drive-training interlocking (Immelmann and Beer 1989, 153)]

♦ **instinctive** *adj.*

1. Referring to “instinct,” *q.v.*
2. Often referring to a behavior that is “genetically inherited and independent of experience in its ontogeny.”

syn. innate (according to some workers, but others distinguish between “innate” and “instinctive”)

Note: Like “innate,” the term “instinctive” is often “confounded by the mischief of ambiguity,” with its “genetic and ontogenetic senses assumed to imply one another” despite their lack of logical entailment. Both words should be handled with care” (Immelmann and Beer 1989, 152).

cf. behavior: innate behavior, instinctive behavior; innate; instinct

♦ **instinctive activity** See activity: instinctive activity.

♦ **instinctive-behavior pattern** See behavior pattern: instinctive-behavior pattern.

♦ **instinctive movement** See pattern: fixed-action pattern.

♦ **instrument** *n.*

1. A tool, or implement, especially one used for exacting work (Michaelis 1963).
2. An apparatus used for measuring or recording (Michaelis 1963).

bat detector, ultrasound detector *n.* An instrument that translates bat sounds (audible squeaks and squeals and ultrasounds) into audible and distinguishable patterns (Allen 1996, 639).

Comment: A bat detector is invaluable in surveys of bat species and in learning about their echolocation (Allen 1996, 639).

C/N-continuous-flow-isotope-ratio mass spectrometer (CFIRMS) *n.* An instrument used to obtain carbon and nitrogen abundances and their stable isotope ratios (Ben-David et al. 1998, 48).

evaporation pan *n.* A broad, shallow, water-filled pan of standard size used to obtain an estimate of evaporation (Allaby 1994)

Comment: The U.S. Weather Bureau uses a class A pan, 122 cm in diameter and 25 cm deep (Allaby 1994). One estimates evaporation by monitoring the amount of water in an evaporation pan.

Fieldranger 6500 *n.* A device used by foresters for measuring distance along any walked route (Quammen 2000, 8; illustration, 11).

Comments: The Fieldranger 6500 contains topofil (= string) that pays out behind a walker and counts traversed footage (Quammen 2000, 8). Each spool of topofil is 6 km long.

gene gun *n.* A mechanical device that propels genes into cells under high pressure (Gura 2000, 807; Homeyer 2003, SP12).

Comment: A gene gun is powered by high-pressure helium and shoots gold-covered DNA, or RNA, sequences into cells at about the speed of sound (Homeyer 2003, SP12). Researchers use gene guns

to change organism characteristics, such as flower color.

hygrothermograph *n.* An instrument that records both air temperature and humidity on separate traces (Allaby 1994).

syn. thermo-hygrograph (Allaby 1994)

inclinometer *n.* An instrument used to measure elevation of one point compared to another (Ben-David et al. 1998, 49).

light-level geolocator *n.* An instrument that measures visible light and stores light data that can be used to determine past locations of the device (inferred from Stutchbury et al. 2009, 896).

Comments: Some geolocators measure visible-light intensity every 60 sec and record a maximum light reading every 10 min (Stutchbury et al. 2009, supplemental material). In analyzing recorded data from a geolocator, researchers use the TransEdit (British Antarctic Survey) software to determine the Sun's elevation with regard to particular light threshold levels. The BirdTracker software can determine latitude and longitude of a bird from the light readings.

◆ **lysimeter** *n.*

1. An instrument that determines the solubility of a substance (Michaelis 1963).
2. An instrument used for direct estimation of evapotranspiration typically from a vegetated block of soil to which a researcher adds a measured amount of water and from which he measures the amount of water lost as run-off, percolation, or both, while statistically controlling for organism growth as it is appropriate (Allaby 1994, 238).
3. An instrument used for direct estimation of substances that exit soil containing soil organisms (inferred from Neilsen et al. 2001, 1724).

Note: Neilsen et al. (2001, 1724) used microlysimeters (200-mL capacity) to measure CO₂ and N₂O evolution and NH₄⁺ and NO₃⁻ leaching from soil samples.

4. An instrument for measuring the quantity of water in a block of usually undisturbed soil or rate of downward water movement through a block of such soil or to collect percolated water for quality analysis (National Weather Service 2008).

[Greek *lysis*, a loosening; *metron*, measure]

precipitation gauge *n.* An instrument used for measuring the amount of water (in all forms) falling at a recording site (inferred from Goodison 1978, 1542).

cf. instrument: rain gauge

Comment: Researchers have used many kinds of precipitation gauges including the Fisher and Porter Precipitation Gage, MSC Nipher Shield Snow Gauge (= Canadian Standard Gauge), Universal (= Belfort) Precipitation Gauge (Goodison 1978, 1542).

radio transmitter *n.* An instrument that sends radio signals to a receiver (Allen 1996, 639).

Comments: Researchers place radio transmitters on animals, including bats, birds bears, and Cougars, to track them in their natural environments (Allen 1996, 639; Stutchbury et al. 2009, supplemental material). Some radio transmitters are as light as 1.6 g.

rain gauge *n.* A gauge used for measuring the amount of rainfall (Allaby 1994).

cf. instrument: precipitation gauge

Comments: A rain gauge is usually made of copper or polyester (Allaby 1994). It has a tapering funnel of standard dimensions that allows the rainwater to

collect in an enclosed bottle, or cylinder, for subsequent measurement. A researcher places a rain gauge in open ground with its funnel rim up to 30 cm above the ground surface. Manufacturers calibrate some rain gauges to give direct readings of rainfall amount. Other rain gauges require researchers to calculate rainfall from the depth of water in the funnel and its dimensions.

recording rain gauge *n.* A rain gauge that measures the amount of precipitation by determining its weight (inferred from Adams et al. 1994, 3).

Comment: This gauge can record how much precipitation falls and when it falls (Adams et al. 1994, 3).

Secchi disc *n.* A disc used to measure relative clarity and turbidity of water (www.fishbase.org).

syn. Secchi disk

Comment: There are different models of Secchi discs (Minnesota Pollution Control Agency 2005). The standard Secchi disc is 20 cm in diameter and has two black and two white opposing quadrants. The Secchi disc reading is the average of the depth at which the disc disappears from sight when one lowers it by a rope into the water and the depth at which it reappears when one raises it in the water (www.fishbase.org).

[after Fr. Pietro Angelo Secchi (1818–1878), scientific advisor to the Pope and astrophysicist, who invented the Secchi disc]

standard rain gauge *n.* A rain gauge that collects rain and snow (inferred from Adams et al. 1994, 3).

water-level recorder *n.* An instrument that measures water level in a stream over time (inferred from Adams et al. 1994, 3).

◆ **instrumental communication** See communication: instrumental communication.

◆ **instrumental conditioning, instrumental learning** See learning: conditioning: trial-and-error conditioning.

◆ **insular** *adj.*

1. Of, like, or referring to islands (Michaelis 1963).
2. Referring to an organism that dwells on an island (Michaelis 1963).
3. Referring to an organism that has a restricted, or limited, habitat or range (Lincoln et al. 1985).

cf. precinctive

◆ **insular endemic** See ²species: endemic species: insular endemic.

◆ **insulin** See hormone: insulin.

◆ **insulin signaling** See signaling: cell signaling: insulin signaling.

◆ **integration, law of** See oligomerization.

◆ **intelligence** *n.*

1. A person's faculty of understanding; perceiving and comprehending meaning; mental quickness; active intellect (Oxford English Dictionary 1972, entries from 1390; Michaelis 1963).
2. An animal's capacity to adjust its behavior in accordance with changing conditions (Romanes 1882 in McFarland 1985, 505).
3. An individual animal's associating stimuli (Thorndike 1911, 20–23).
4. A person's ability to adapt to new situations, and to learn from experience (Michaelis 1963).
5. A person's inherent ability to seize the essential factors of a complex matter (Michaelis 1963).
6. An animal's learning ability (Wilson 1975, 473).

Note: This general definition is a commonly used by animal behaviorists.

7. In more derived primates: An individual's ability to show reasoning or insight learning (Wilson 1975, 381).

cf. awareness and associated terms, learning
Comments: Possibly, the majority view of intelligence is "a collection of capacities, including perceptiveness, imagination, memory, mental and behavioral flexibility, problem-solving ability, and ability to assess situations in the light of past experience" (Immelmann and Beer 1989, 153). Howard Gardner (in Page 1986, H2) hypothesizes that people have seven intelligences including: "bodily-kinesthetic intelligence," "linguistic intelligence," "logical-mathematical intelligence," "musical intelligence," "perception-of-self intelligence," and "spatial intelligence." Many philosophers and researchers adamantly deny that "intelligence" exists (Page 1986, H3). "Intelligence" has so many connotations, that Jensen (1998, in Plomin 1999, C27) suggested that this word be avoided in scientific discussion.
 [Old French < Latin *intelligentia* < *intelligens*, -*entis*, present participle of *intelligere*, to understand, perceive]

artificial intelligence *n.* A computer's capability to solve a real-world problem (McCarthy 1952 in Tierney 1983).

emotional intelligence *n.* A person's being socially graceful and having the ability to read his own feelings, control his own impulses and anger, calm himself down, and maintain a resolve and hope in the face of setbacks (Goleman 1995, 6).

Comments: A person with both a high IQ and emotional intelligence has a competitive edge over others without these traits (Goleman 1995, 6).

[P. Salovey and J. Mayer (1990) formulated the first systematic definition of emotional intelligence (Goleman 1995, 6).]

general-cognitive ability (g) *n.* Operationally, the composite score created by factor analysis that represents what diverse measures of Human cognitive abilities, such as information-processing speed, memory, spatial ability, and verbal ability, have in common (Plomin 1999, C25, C27).

syn. general intelligence

Comments: Tests of spatial ability moderately correlate with tests of verbal ability, and memory tests more modestly correlate with spatial and verbal tests (Plomin 1999, C25, C27). "Factor analysis (an unrotated first principal component) creates a composite that weights each test by its overall correlation with all other tests." General-cognitive ability appears to be heritable, and is a highly controversial quantitative trait.

♦ **intelligence quotient (IQ)** *n.* A person's "intellectual age" divided by his chronological age multiplied by 100; IQ usually does not exceed 160 (Michaelis 1963).

Note: What a particular IQ test actually measures is debatable; further, IQ tests that measure a person's naive and native, education-independent, culture-free intelligence might be impossible to design (Gould 1982, 530–531).

syn. , IQ, I.Q., *iQ*, *IQ*.

cf. test: IQ test

♦ **intelligent design (ID), intelligent-design theory** See ³theory: intelligent-design theory.

♦ **intense competition** See competition: intense competition.

♦ **intensity** *n.* Usually, a measure of the amplitude, or frequency, of an organism's self-caused movement;

a measure of an organism's tendency to show a behavior, e.g., the intensity of incubation based on the strength of an extraneous stimulus that is required to interrupt it (Hinde 1970, 204).

♦ **intensity of sexual selection** *n.* The amount of sexual selection on males with sexual selection defined as the variance in number of mates per male (Wade and Arnold 1980, 446).

♦ **intent, intention** *n.*

1. A person's specific aim or purpose; plan; proposal (Oxford English Dictionary 1972, entries from 1225; Michaelis 1963).

2. In *Loxodonta africana* (African Elephants), possibly *Cervus elaphus* (Red Deer), and *Elaphurus davidianus* (Pere David's Deer): An individual's aim, e.g., intention to fight, which it may communicate to another individual (Poole 1989, 140).

cf. behavior: intentional behavior, intentionality

♦ **intention movement** See behavior: intention movement.

♦ **intentional behavior** See behavior: intentional behavior.

♦ **intentional system** See ²system: intentional system.

♦ **intentionality** *n.*

1. In Humans, possibly other vertebrates: One's "planning, or undertaking, action in pursuit of subjectively held aims or goals" (Immelmann and Beer 1989, 153).

Note: Poole's (1989) data indicate that African Elephants show intentionality.

2. Philosophically, "propositional attitudes: all mental states that refer to a content of some sort — that are about something;" e.g., believing, wanting, hoping, knowing, understanding, and wanting (Immelmann and Beer 1989, 154).

cf. behavior: intentional behavior; deceit; intention

♦ **inter-** *prefix*

1. With each other; together (Michaelis 1963).

2. Mutual; mutually (Michaelis 1963).

3. Between (the units signified) (Michaelis 1963).

4. Occurring or situated between (Michaelis 1963). [Latin *inter-* < *inter*, between, among]

♦ **interaction** *n.*

1. An encounter between, or among, animals in which each responds to the other's presence (Immelmann and Beer 1989, 155).

2. An interrelationship between an animal and its environment that usually involves its environment's affecting the animal more than vice versa (Immelmann and Beer 1989, 155).

♦ **²interaction** *n.* In statistics, the joint effects of two, or more, independent variables over and above their independent effects on a dependent variable(s) that causes a portion of the variance in an analysis of variance (ANOVA) (Sokal and Rohlf 1969, 344).

Comment: In a case where the independent variables W and X affect the dependent variable Y, there is an "interaction" if Y's magnitude is affected by how W and X vary with regard to one another; e.g., if both W and X increase, then Y decreases; if W increases while X decreases then Y increases; or if W decreases while X increases then Y decreases.

♦ **interbreeding** See breeding: interbreeding.

♦ **intercalated association, intercalated association neuron, intercalated commissural neuron, intercalated neuron** See cell: neuron: interneuron.

- ♦ **intercistronic complementation** See complementation: intercistronic complementation.
- ♦ **intercompensation** *n.* When the environment changes and relieves pressure of a density-dependent population's controlling factor(s) and a population increases in size until it reaches a second equilibrium level where another factor(s) halts it (Wilson 1975, 90); e.g., if the leading factor, such as food shortage, is eliminated, then a second factor (e.g., disease) takes over.
Comment: "This compensation follows a sequence that is peculiar to each species" (Wilson 1975, 587).
- ♦ **intercross** See cross: intercross.
- ♦ **interdemic selection** See selection: interdemic selection.
- ♦ **interdependent association** See symbiosis: mutualism.
- ♦ **interdigital gland** See gland: interdigital gland.
- ♦ **interest in participation with a copulating pair** *n.* A nonpaired, conspecific animal's being attracted to a courting, or copulating, pair and participating in sexual behavior with it, e.g., in swans when a second female simultaneously performs courtship movements with the paired female or in some kinds of beetles when one, or more, other males simultaneously attempt to copulate with the same female, sometimes resulting in males holding one another's dorsums (Petzold 1964 in Heymer 1977, 119; Barrows and Gordh 1978, 341).
cf. copulation
- ♦ **interference** *n.*
 1. For example, in Oystercatchers (birds): One individual's reversible and more-or-less immediate decrease in food-intake rate due to an increase in density of conspecific individuals (Ens and Goss-Custard 1984, 217).
Notes: A focal individual's interactions with conspecifics, not food depletion, reduces the food-intake rate (Ens and Goss-Custard 1984, 217). "Interference" may be extended to any situation in which the cost of foraging per prey obtained is increased by the presence of the other individuals. Examples of interference mechanisms are alerting prey to the presence of predators, increased costs of foraging due to simultaneous pursuits of the same prey individuals, increased local movements as a result of contacts with conspecifics, and prey stealing (= kleptoparasitism) (Ens and Goss-Custard 1984, 217).
 2. One population's limiting the access of another population to a shared resource (Lincoln et al. 1985).
cf. competition: contest competition
- ♦ **interference competition** See competition: contest competition.
- ♦ **interfertile** *adj.* Referring to organisms that are capable of interbreeding (Lincoln et al. 1985).
- ♦ **intergenic** See -genic: intergenic.
- ♦ **intergenic spacers** See external-nontranscribed spacers.
- ♦ **intergenerational conflict** See ³conflict: intergenerational conflict.
- ♦ **intergradation** *n.* A transitional, or intermediate, form of something (e.g., a population) (Michaelis 1963).
n. intergrade
- ♦ **primary intergradation** *n.* The occurrence of intermediates developed *in situ* in a zone of contact between two phenotypically distinct populations (Lincoln et al. 1985).

- ♦ **secondary intergradation** *n.* Hybridization that occurs between two phenotypically distinct populations along a zone of secondary contact (suture zone) (Lincoln et al. 1985).
- ♦ **intergradation zone** See zone: intergradation zone.
- ♦ **intergrade** See -grade: intergrade.
- ♦ **intergroup dominance** See dominance (social): intergroup dominance.
- ♦ **intermediate DNA** See nucleic acid: deoxyribonucleic acid: intermediate DNA.
- ♦ **intermediate host** See ³host: intermediate host.
- ♦ **intermittent drift** See drift: genetic drift.
- ♦ **internal balance** See ³adaptation: ¹evolutionary adaptation: coadaptation.
- ♦ **internal chronometer, internal clock** See clock: endogenous clock.
- ♦ **internal selection** See selection: internal selection.
- ♦ **internal stimulus, internal stimulation** See ²stimulus: internal stimulus.
- ♦ **internal validity** See validity: internal validity.
- ♦ **International Code of Zoological Nomenclature (ICZN)** *n.* A set of rules for naming animals (Minelli 1999, 462).
Comments: Researchers first established the ICZN in 1961 (Minelli 1999, 462). It replaced the *Règles internationales de la nomenclature zoologique* which replaced the Series of Propositions for Rendering the Nomenclature of Zoology Uniform and Permanent (*syn.* Strickland Code). Workers published the fourth edition of the ICZN in 2000.
- ♦ **Internationale Paläoklima-Datenbank, International Paleoclimate Database** See database: *Internationale Paläoklima-Datenbank*.
- ♦ **interneuron, internuncial neuron** See cell: neuron: interneuron.
- ♦ **Internet, Net** *n.* A network of computer networks, basically composed of computers and cables through which packets of information move (Anderson 1994, 900; www.w3.org/People/Berners-Lee, 2000).
Comments: Vint Cerf and Bob Khan first defined the "Internet Protocol" (IP) in 1973 by which packets are sent on from one computer to another until they reach their destinations (www.w3.org/People/Berners-Lee, 2000). The Internet began running in 1983; it delivers information from a source to its destination often in under 1 second.
- ♦ **interobserver reliability** See reliability: interobserver reliability.
- ♦ **interoception** See modality: chemoreception.
- ♦ **interoceptive senses** See modality: interoceptive senses.
- ♦ **interoceptor** See ²receptor: interoceptor.
- ♦ **interplanetary dust** See cosmic dust.
- ♦ **interrenal glands** See gland: interrenal glands.
- ♦ **interrupted swimming** See swimming: interrupted swimming.
- ♦ **intersegmental glands** See gland: intersegmental glands.
- ♦ **intersex** See sex: intersex.
- ♦ **intersexual selection** See selection: epigamic selection.
- ♦ **interspecies** See ²species: interspecies.
- ♦ **interspecies tradition** See tradition: interspecies tradition.
- ♦ **interspecific** See -specific: interspecific.

- ◆ **interspecific aggression** See aggression: interspecific aggression.
- ◆ **interspecific communication** See communication: interspecific communication.
- ◆ **interspecific competition** See competition: interspecific competition.
- ◆ **interspecific dominance** See dominance (ecological): interspecific dominance.
- ◆ **interspecific fostering** See fostering: interspecific fostering.
- ◆ **interspecific hybrid** See ²species: interspecies.
- ◆ **interspecific rearing** See fostering.
- ◆ **interspecific releaser** See ²stimulus: releaser: interspecific releaser.
- ◆ **interspecific selection** See selection: interspecific selection.
- ◆ **interspecific symbiosis** See symbiosis: interspecific symbiosis.
- ◆ **interspecific tertiary hyperparasitism** See parasitism: hyperparasitism: interspecific tertiary hyperparasitism.
- ◆ **interstitial fauna** See fauna: meiofauna.
- ◆ **interval analysis** See method: interval analysis.
- ◆ **interval scale** See scales of measurement: interval scale.
- ◆ **intervarietal hybrid** See hybrid: intervarietal hybrid.
- ◆ **intervening variable** See variable: intervening variable.
- ◆ **in-the-head variable** See variable: intervening variable.
- ◆ **intimidation** *n.*
 1. A person's intimidating, or making someone else afraid; one's condition of being intimidated; one's use of threats, or violence, to force, or restrain, another person from a particular action or to interfere with his free exercise of his political, or social, rights (Oxford English Dictionary 1972, entries from 1658).
 2. An individual animal's effective threat against another that can involve visual signals, vocal signals, scentmarking, the mere presence of a dominant animal in a dominance hierarchy, or a combination of these things (Immelmann and Beer 1989, 157).

cf. behavior: threat
- ◆ **intra-** *prefix* Within; inside of (Michaelis 1963). [Latin *intra*, within]
- ◆ **intracellular receptor** See ²receptor: intracellular receptor.
- ◆ **intracistronic complementation** See complementation: intracistronic complementation.
- ◆ **intrademic selection** See selection: intrademic selection.
- ◆ **intrageneric isolation** See isolation: ecological isolation.
- ◆ **intragenic** See -genic: intragenic.
- ◆ **intragenic mutation** See ²mutation: gene mutation.
- ◆ **intragenic recombination** See gene conversion.
- ◆ **intralaminar nucleus** See organ: brain: intralaminar nucleus.
- ◆ **intraneous** *n.* Referring to individuals of a species that occur near the center of their species' distribution (Lincoln et al. 1985).
cf. extraneous
- ◆ **intraobserver reliability** See reliability: intraobserver reliability.

- ◆ **intrapopulational variant** See variety.
- ◆ **intrexual aggression** See aggression: intrexual aggression.
- ◆ **intrexual selection** See selection: epigamic selection.
- ◆ **intrexual territory** See territory: introsexual territory.
- ◆ **intraspecific** See -specific: intraspecific.
- ◆ **intraspecific aggression** See aggression: intraspecific aggression.
- ◆ **intraspecific behavior** See behavior: intraspecific behavior.
- ◆ **intraspecific competition** See competition: intraspecific competition.
- ◆ **intraspecific mimicry** See mimicry: automimicry.
- ◆ **intraspecific-nest parasitism** See parasitism: nest parasitism.
- ◆ **intraspecific symbiosis** See symbiosis: intraspecific symbiosis.
- ◆ **intraspecific-tertiary hyperparasitism** See parasitism: hyperparasitism: intraspecific-tertiary hyperparasitism.
- ◆ **i-Tree** See program: i-Tree.
- ◆ **intrinsic character** See character: intrinsic character.
- ◆ **intrinsic competitive ability** *n.* "The ability of an individual to inflict costs on an opponent during an aggressive interaction" (Wittenberger 1981, 617).
- ◆ **intrinsic-isolating mechanism** See isolating mechanism: intrinsic-isolating mechanism.
- ◆ **intrinsic-primary-social dominance** See dominance (social): intrinsic-primary-social dominance.
- ◆ **intrinsic rate of increase, *r*** See rate: *r*.
- ◆ **intrinsic selection pressure** See selection pressure: intrinsic selection pressure.
- ◆ **introduced** *adj.* Referring to an adventive species that arrived in a new area due to the deliberate agency of a Human(s) (e.g., a biocontrol agent, crop plant, farm animal, or ornamental plant) (Frank and McCoy 1990, 4).
syn. exotic, immigrant (Sailer 1978 in Frank and McCoy 1990, 4, who prefer not to use these synonyms)
cf. adventive, endemic, immigrant, indigenous, pre-cinctive
- ◆ **introduction** *n.* A species' movement into an area which it did not previously occupy (New 2009, 168).
cf. restocking, restoration, translocation
- ◆ **re-introduction** *n.* A person's introducing a species into a site where it formerly occurred, often as part of a conservation program (New 2009, 168).
- ◆ **introgession, introgressive hybridization** *n.* The incorporation of the genes of one species into the gene pool of another species as a result of successful hybridization of the two species and backcrossing of the hybrid with one of its parental species [coined by Anderson 1949 in Mayr 1982, 284; Kim and Rieseberg 1999, 965].
syn. introgressive evolution (Weiner 1994, 241)
cf. leakage
Comments: Introgression occurs in some Darwin's Finch species (Weiner 1994, 241). Kim and Rieseberg (1999, 965) discuss evidence for the movement of adaptations across species barriers through introgression in nature, including the case of *Helianthus annuus* ssp. *texanus*.

neutral introgession *n.* Introgession, *q.v.* of a neutral marker(s), *q.v.* (inferred from Kim and Rieseberg 1999, 965).

♦ **intromission** *n.*

1. A male's inserting his copulatory organ into a female's genital orifice and genital chamber.

Note: The Oxford English Dictionary (1972) includes a reference on "organs of intromission" from 1836–1839.

2. For example, in some rat species, a male's briefly inserting his penis into a female's vagina (Dewsbury 1978, 77).

cf. coition, coitus, copulation, copulation series, ejaculation, mating, sexual intercourse

[Latin *intromissus*, past participle of *intromittere* < *intro-*, within + *mittere*, to send]

♦ **intromittent organ** See organ: copulatory organ: aedeagus, penis.

♦ **intron** *n.* In Archaea and Eukarya: A portion of a split gene (composed of DNA) that is included in the gene's RNA transcript (heterogeneous nuclear RNA), but is excised in the process of making mature messenger RNA from the heterogeneous nuclear RNA; contrasted with exon (Curtis 1983, 340; King and Stansfield 1985).

cf. gene: split gene; hypothesis: "introns-early hypothesis," "introns-late hypothesis;" nucleic acid: deoxyribonucleic acid: junk DNA

Comments: Different kinds of split genes have from 1 to about 30 introns (King and Stansfield 1985). Genes in some introns appear to function in ribosome assembly and controlling chromosomes (Nowak 1994b). An intron gene (XIST) seems to stop activity of X chromosomes. Gene regulation by introns might have enabled the evolution of more complicated genomes in Eukaryotes and their evolution into multicellular organisms (Mattick 1994 in Strickberger 1996, 169). [from intervening sequences of DNA, Curtis (1983, 338); coined by Walter Gilbert (Travis 1993)]

♦ **introspection** *n.*

1. A person's looking within, or into, his own mind; his examination of his own thoughts, feelings, or mental state (Oxford English Dictionary 1972, entries from 1695).
2. A person's attending to the content of his own experience which can be an important means of understanding behavior of other persons (Immelman and Beer 1989, 158).

Note: Introspection as it is related from a Human through a nonhuman is generally excluded as part of an objective study of behavior of nonhumans (Immelman and Beer 1989, 158).

cf. study of: psychology: behaviorism

♦ **intrusion** See ²group: intrusion.

♦ **intuition** *n.* In Humans: The ability to know something without conscious reasoning (Vogel 1997, 1269; Bechara et al. 1997, 1293).

Comment: Many cognitive psychologists think intuition may be based on memories of past emotions (Vogel 1997, 1269).

cf. organ: brain: ventromedial prefrontal cortex

♦ **invasibility** *n.* "The relative freedom with which an immigrant species can invade an established community" (Lincoln et al. 1985).

♦ **invasion** *n.* The mass movement, or encroachment, of organisms from one area into another (Lincoln et al. 1985).

n. invader

♦ **inventive behavioral combinations** See behavior: innovative behavior.

♦ **inventory** *n.* A list of things, with the description and quantity of each (Michaelis 1963).

cf. database (Appendix 4)

All Taxon Biological Inventory (ATBI) *n.* A survey of all species in a particular area (Colwell and Coddington 1994, 103; Pickering 2001).

Comment: Discover Life in America is making a comprehensive study of all organisms of the Great Smoky Mountain National Park, U.S., which has about 100,000 species (Pickering 2001).

Arthropods of La Selva Inventory (ALAS Inventory) *n.* An effort to survey all arthropod species of La Selva Biological Station, Costa Rica (Colwell and Coddington 1994, 115; Yoon 1995, 11 July, C4).

♦ **inversion** *n.* A chromosome segment that has been turned through 180° with the result that the segment's gene sequence is reversed with respect to that of the rest of the chromosome (King and Stansfield 1985).

Comments: "Inversions arise when a chromosome breaks in two places and reattaches with the orientation of the middle segment reversed" (Wittenberger 1981, 617).

paracentric inversion *n.* An inversion in Eukaryans that does not include the centromere region of a chromosome (Rieger et al. 1991).

syn. heterobrachial inversion (Mayr 1982, 603)

Comment: The sunflower *Helianthus annuus* has paracentric inversions (Kim and Rieseberg 1999, 966).

pericentric inversion *n.* An inversion in Eukaryans that includes the centromere region of a chromosome (Rieger et al. 1991).

syn. homobrachial inversion (Mayr 1982, 603)

♦ **inversion polymorphism** See -morphism: polymorphism: inversion polymorphism.

♦ **inversion race** See ¹race: inversion race.

♦ **invertebrate zoology** See study of: zoology: invertebrate zoology.

♦ **investigation** *n.* A detailed inquiry; a systematic examination (Morris 1982).

Michigan Gradient Study *n.* A long-term environmental study of ecosystem processes in northern hardwood forests started in 1987 (Schneider et al. 2002).

Comment: This Study involves researchers from four universities who investigate key variables along the climatic-pollutant gradient which extends 500 km from Southern Michigan through Northwestern Upper Michigan (Schneider et al. 2002).

investigating behavior See behavior: investigating behavior.

♦ **investment** *n.*

1. A person's purchasing something from which he expects to obtain interest or profit, especially property, stocks, or shares, in order to hold them for his, or her, accrual of dividends, interest, or profits (Oxford English Dictionary 1972, entries from 1613 as a verb).
2. An individual organism's using its resources for a particular function that precludes their being used for other functions.

altruism investment *n.* Any investment by an organism in its relative(s) that increases the relative's chance of surviving (and hence reproductive success) at the cost of the organism's ability "to invest" in more of its own offspring (Dawkins 1977).

- parental investment** *n.* A parent's investment in "an individual offspring that increases the offspring's chance of surviving (and hence reproductive success) at the cost of the parent's ability of investing in other offspring" [coined by Trivers 1972, 139].
Comments: Parental investment includes any investment that benefits offspring, *e.g.*, metabolic investment in primary sex cells and feeding and guarding young; parental investment does not include effort expended in finding and obtaining a mate (Trivers 1972, 139). McFarland (1985, 130) suggests that this definition is useful, but "suffers from the implication that past investment can influence future behavior." The metaphors of sociobiology, *e.g.*, "investment," "cost," "benefit," and "tradeoff," revive Charles Darwin's analogy between evolutionary biology and economics (Immellmann and Beer 1989, 215).
- **maternal investment** *n.* A mother organism's investment in her offspring.
- **nonshareable-parental investment** *n.* A form of parental investment that parents cannot give to one offspring without reducing their ability to rear other offspring (Wittenberger 1981, 618); contrasted with shareable-parental investment.
- **paternal investment** *n.* A father's investment in his offspring.
- **shareable-parental investment** *n.* "A form of parental investment that can be given to one concurrent offspring without reducing the amount of parental care that can be given to other concurrent offspring" (Wittenberger 1981, 621; Lazarus and Inglis 1986, 1791); contrasted with nonshareable-parental investment.
- ♦ **inviability** *n.* A measure of the number of individuals that fail to survive in one cohort, or group, relative to another (Lincoln et al. 1985).
- ♦ **invitation signal** See signal: invitation signal.
- ♦ **invitation to mate** *n.* A female animal's behavior and body postures that lead to mating (Heymer 1977, 127).
- ♦ **inviting mimicry** See mimicry: inviting mimicry.
- ♦ **in vitro mutagenesis** See method: *in vitro* mutagenesis.
- ♦ **ion** *n.* An electrically charged atom, molecule, or radical (Michaelis 1963).
c.f. molecule
Comment: The dissolution of an electrolyte, or the action of electric fields, high temperatures, various forms of radiation, or other means, produces an ion by adding, or removing, an electron(s) (Michaelis 1963). [Greek *ion*, neuter of *iōn*, present participle of *ienai*, to go]
- ♦ **ion-channel receptor** See ²receptor: ion-channel receptor.
- ♦ **ion-channel ionic pulse** *n.* A melting snow pack's release of an elevated amount of an ion(s) (ammonium, nitrate, sulfate, or a combination of these molecules) into melt-water (Williams et al. 2002, 186).
- ♦ **ion pump** *n.* A structure in the plasma membrane of an animal cell that maintains osmotic equilibrium within the cell by reducing the intracellular ion concentration so that it matches the osmolarity of the environment (Gerhart and Kirschner 1997, 13).
- ♦ **iota link** See link: iota link.
- ♦ **IQ, IQ., I.Q., IQ., IQ.** See intelligence quotient.
- ♦ **IQ test** See test: IQ test.
- ♦ **IRM** See mechanism: innate releasing mechanism.
- ♦ **Iron Pyrite** See mineral: Iron Pyrite.

- ♦ **"Iron Pyrite aggregation"** See organized structure: "Iron Pyrite aggregation."
- ♦ **irrelevant behavior** See behavior: displacement behavior.
- ♦ **irreversibility** *n.* An animal's marked persistence and stability of object preference established during its imprinting (Immellmann and Beer 1989, 158).
Comment: Not all imprinting is irreversible (Immellmann and Beer 1989, 158).
- ♦ **irreversibility law or rule** See law: Dollo's law.
- ♦ **irritability** See sensitivity.
- ♦ **irruption** *n.* An irregular, abrupt increase in population size, or density, typically associated with favorable environmental changes and often resulting in a population's mass movement (Lincoln et al. 1985).
- ♦ **IS** See transposable element: insertion sequence.
- ♦ **isauxesis** See -auxesis: heterauxesis: isauxesis.
- ♦ **island biogeography, theory of** See ³theory: island biogeography, theory of.
- ♦ **island model** See ⁴model: island model.
- ♦ **island-model migration** See gene flow: island-model migration.
- ♦ **island tameness** *n.* An animal's showing no fear of Humans upon first encounter with us, at least until they have deleterious experiences with us, *e.g.*, in Elephants (Gould 1982, 284).
- ♦ **iso-, is-** *comb. f.* "Equal; the same; identical" (Michaelis 1963).
 [Greek *isos*, equal]
- ♦ **isoalleles** See allele: isoalleles.
- ♦ **isochromic mimicry, isomorphous mimicry** See mimicry: androchromatic mimicry.
- ♦ **isocline** *n.* A line on a graph that represents a single numerical value, *e.g.*, an isocline of zero population growth on Lotka-Volterra population phase-plane graph (Molles 2002, 311).
- ♦ **isocoenoses** See ²community: isocoenoses.
- ♦ **isocommunity** See ²community: isocommunity.
- ♦ **isodemic line** See deme: isodeme.
- ♦ **isoenzyme** See enzyme: isozyme.
- ♦ **isogametic** See -gametic: isogametic.
- ♦ **isogamous** See -gamous: isogamous.
- ♦ **isogamy** See -gamy: isogamy.
- ♦ **isogene** See gene: isogene.
- ♦ **isogenic** See isogenic: isogenic.
- ♦ **isogenesis** See -genesis: isogenesis.
- ♦ **isogenic** See -genic: isogenic.
- ♦ **isogenous** See -genous: isogenous.
- ♦ **isogonous hybrid** See hybrid: isogonous hybrid.
- ♦ **isolate** *n.* A population, or group of populations, that is geographically, ecologically, or otherwise separated from other populations, and in which interbreeding occurs (Lincoln et al. 1985).
- ♦ **isolating mechanism** See mechanism: isolating mechanism.
- ♦ **isolation** *n.* Two, or more, populations that are separated and are prevented from interbreeding by extrinsic (premating) mechanisms including geographical and temporal barriers and species discrimination or intrinsic (postmating) mechanisms, including gamete death, gamete incompatibility, hybrid inviability, and hybrid sterility (Lincoln et al. 1985; Noor 1997b, 809).
- ♦ **ecological isolation** *n.*
1. Isolation due to an ecological barrier (Lincoln et al. 1985).
 2. "A premating isolation" (Lincoln et al. 1985).
- syn.* intragenetic isolation

- ethological isolation** *n.* Isolation due to a behavioral mechanism(s) (Mayr 1963 in Noor 1997b, 809).
- geographic isolation, geographical isolation** *n.* Isolation due to geographical landmarks, such as a body of water, or mountain, that prevents movement of individuals (Mayr 1982, 565).
- **minogeographical isolation** *n.* Isolation of domestic animals by Humans to breed new strains (Mayr 1982, 414).
- intrageneric isolation** See isolation: ecological isolation.
- mechanical isolation, mechanical incompatibility** *n.* Isolation that results from structural incompatibility of male and female reproductive organs that prevents pollination or copulation (Lincoln et al. 1985).
cf. hypothesis: hypotheses of divergent evolution of animal genitalia
- misogamy, sexual isolation** See isolation: reproductive isolation.
- physiological isolation** See isolation: reproductive isolation.
- reproductive isolation** *n.* Isolation due to behavior and physiological barriers that prevent fertilization between species (Mayr 1982, 565) or incipient species (Immelmann and Beer 1989, 253).
syn. misogamy, sexual isolation (Immelmann and Beer 1989, 253), physiological isolation (Romanes in Mayr 1982, 565)
- **premating isolation** *n.* Reproductive isolation due to extrinsic factors that are effective before mating or fertilization, including ecological, ethological, geographical, mechanical, and temporal isolating mechanisms (Lincoln et al. 1985).
- **postmating isolation** *n.* Reproductive isolation due to extrinsic factors that are effective after mating or fertilization, including all postmating and prezygotic isolating mechanisms (Lincoln et al. 1985).
- **sexual isolation** *n.* Reproductive isolation due to an animal's not mating, or mating infrequently, with heterospecific individuals (inferred from Noor 1997a, 809).
Comments: Sexual isolation appears to be the most important and widespread form of reproductive isolation in animals (Mayr 1963 in Noor 1997b, 809).
- spatial isolation** *n.* Isolation due to spatial separation of populations that leads to their reproductive isolation (Lincoln et al. 1985).
- ♦ **isolation concept of species** See ²species (def. 18).
- ♦ **isolation experiment** See experiment: deprivation experiment.
- ♦ **isomer** *n.* One of a group of organic molecules that have the same molecular formula but different structures and hence different properties, *e.g.*, the straight and branched isomers of butane (Campbell et al. 1999, 52, illustration) or fructose and glucose (D. A. M. MacKay, pers. comm.).
Comment: Isomers of the same compound may have different effects on an organism (Campbell et al. 1999, 52).
- enantiomer** *n.* An isomer that is a mirror image of another isomer, *e.g.*, the left- and right-handed enantiomers L-DOPA and D-DOPA (Campbell et al. 1999, 52, illustration).
Comments: Enantiomers are important in pharmaceutical products (Campbell et al. 1999, 52). For a given compound the enantiomers may not be equally

effective. In the case with thalidomide, a drug prescribed to thousands of pregnant women in the 1960s, one enantiomer produced the desired sedative effect, but the other caused birth defects.

- geometric isomer** *n.* An isomer that has the same covalent partnership(s) of another isomer but has a different spatial arrangement (Campbell et al. 1999, 52).

Comments: The inflexibilities of double bonds in isomers produce geometric isomers (Campbell et al. 1999, 52). The subtle differences in shape of geometric isomers can markedly affect their biological activities. For example, the biochemistry of human vision involves a light-induced change in rhodopsin from one of its geometric isomers to another.

- structural isomer** *n.* An isomer that differs in covalent arrangements of its atoms, or location of double bonds, compared to another isomer(s) (Campbell et al. 1999, 52).

Comments: The number of structural isomers increases greatly as size of carbon skeletons of molecules increases (Campbell et al. 1999, 52). Butane with its 4 carbons has two structural isomers; a compound with 8 carbons and 18 hydrogens, 14 isomers; and a compound with 20 carbons and 42 hydrogens, 266,319 isomers.

- ♦ **isomerogamy** See -gamy: isomerogamy.
- ♦ **isometric growth, isometry** See -auxesis: heterauxesis: isauxesis.
- ♦ **isomorphous mimicry** See mimicry: androchromatic mimicry.
- ♦ **isoparthenogenesis** See parthenogenesis: isoparthenogenesis.
- ♦ **isophage** See -phage: isophage.
- ♦ **isophenogamy** See -gamy: isophenogamy.
- ♦ **isophenous, isophenic** *adj.*

1. Referring to organisms' sharing similar phenotypic effects (Lincoln et al. 1985).
2. Referring to something's producing similar phenotypic effects (Lincoln et al. 1985).

- ♦ **isostasy** *n.* "Essential permanence of continents and oceans in their present positions" (Michener 1987, 449).

cf. hypothesis: continental drift; plate tectonics
Comment: This concept is not currently accepted by geologists.

- ♦ **isosymbiosis** See symbiosis: isosymbiosis.
- ♦ **isotelic** *adj.* Referring to factors that produce, or tend to produce, the same effect (Lincoln et al. 1985).
syn. homoplastic (Lincoln et al. 1985)

- ♦ **isotope** *n.* A molecule of an element that has one, or more, additional neutrons (Campbell et al. 1999, 25).
Comments: In nature, an element occurs as a mixture of its isotopes (Campbell et al. 1999, 25). Ninety-nine percent of carbon is carbon-12 (^{12}C). Most of the remaining 1% is carbon-13 (^{13}C) and the rare carbon-14 (^{14}C) also occurs. Carbon-14 is radioactive and decays, forming nitrogen.

- radioactive isotope** *n.* An isotope that is unstable and may spontaneously decay into another element giving off particles and energy (Campbell et al. 1999, 25).

- cf.* $\delta^{15}\text{N}$, $\delta^{13}\text{C}$
Comments: Carbon-14 is radioactive and decays to form nitrogen (Campbell et al. 1999, 25). Researchers employ radioactive isotopes in many kinds of research.

- ♦ **isozoic** See -zoic: isozoic.

♦ **isozyme** See enzyme: isozyme.

- ♦ **issue** See feces.
- ♦ **Istwert** *n.* The actual parameter value in a feedback circuit, *q.v.*
[German]
- ♦ **Isua Rocks** See formation: Isua Rocks.
- ♦ **iterative adaptation** See ²evolution: iterative evolution.
- ♦ **iterative homology** See homolog: iterative homology.
- ♦ **itero-** *comb.f.* Repeating (Michaelis 1963).
[Latin *iteratus*, past participle of *iterare*, to repeat < *iterum*, again]
- ♦ **iteroparity** See -parity: iteroparity.
- ♦ **iteroparous** See -parous: iteroparous.

j

- ♦ **J** See unit of measure: joule.
- ♦ **jackknife** See statistical test: jackknife.
- ♦ **jackknife-after-bootstrap** See statistical test: jackknife-after-bootstrap.
- ♦ **Jack Pine plain, Jack Pine barren** See habitat: Jack-Pine plain.
- ♦ **Jacobson's organ** See organ: Jacobson's organ.
- ♦ **jade** See rock: jade.
- ♦ **James-Lange theory** See ³theory: James-Lange theory.
- ♦ **Janus word** See contranym.
- ♦ **Japan Prize** See award: Japan Prize.
- ♦ **jargon** *n.*
 1. “The inarticulate utterance of birds, or a vocal sound resembling it; twittering, chattering” (Oxford English Dictionary 1972, entries from 1386).
 2. “A jingle or assonance of rimes” (Oxford English Dictionary 1972, entries from 1570).
 3. “Unintelligible or meaningless talk or writing; nonsense, gibberish. (Often a term of contempt for something the speaker does not understand)” (Oxford English Dictionary 1972, entries from 1340).
 4. “A conventional method of writing or conversing by means of symbols otherwise meaningless; a cipher, or other system of signs having an arbitrary meaning” (Oxford English Dictionary 1972, entries from 1594).
 5. Specialized or technical language of a profession (Gowaty 1983).

cf. language
v.i. jargon
[Old French *jargon*, chatter, prattle, talk, warbling of birds]
- ♦ **Jasper Ridge Global Change Experiment** See experiment: Jasper Ridge Global Change Experiment.
- ♦ **jealousy** *n.*
 1. A person’s solicitude, or anxiety, for the preservation, or well-being of something; his “vigilance in guarding a possession for loss or damage” (Oxford English Dictionary 1972, entries from 1387).
 2. A person’s state of mind that arises from his suspicion, apprehension, or knowledge of rivalry (Oxford English Dictionary 1972, entries from 1303).
 3. In *Papio anubis* (Anubus Baboons): An individual’s stopping a friend, *q.v.*, from associating with a potential rival (Smuts 1987, 43).

Comment: We do not know what “emotional feelings” might be involved in baboon, or any other nonhuman, jealousy.
- ♦ **jerk dance** See dance: jerk dance.
- ♦ **JHs** See hormone: juvenile hormones.
- ♦ **John von Neuman Theory Prize** See award: John von Neuman Theory Prize.
- ♦ **joint nesting** See nesting: joint nesting.
- ♦ **joking behavior** See behavior: joking behavior.
- ♦ **jordanon** *n.* A microspecies, race, or other infraspecific group (Lincoln et al. 1985).
cf. ¹race, ²species
- ♦ **Jordan’s law** See law: Jordan’s law.
- ♦ **jostling dance, jostling run** See dance: jostling dance.
- ♦ **joule** See unit of measure: joule.
- ♦ **joy** See facial expression: joy.
- ♦ **JRGCE** See experiment: Jasper Ridge Global Change Experiment.
- ♦ **J-shaped distribution** See distribution: J-shaped distribution.
- ♦ **jug** See ²group: jug.
- ♦ **jumping gene** See gene: mobile genetic element.
- ♦ **jungle** See ²community: jungle.
- ♦ **junk DNA** See nucleic acid: deoxyribonucleic acid: junk DNA.
- ♦ **Jurassic Coast** See place: Jurassic Coast.
- ♦ **Jurassic Park** See film: Jurassic Park.
- ♦ **just-so story** *n.* A hypothetical account of why a particular trait of an organism is adaptive (Thornhill and Alcock 1983, 12).
cf. adaptationist program
Comment: Stephen Jay Gould uses this term, which is derived from Rudyard Kipling’s 1902 book *Just So Stories* to refer to such accounts in a humorous, possibly deprecating, way; however, logical just-so stories can be considered to be working hypotheses (Thornhill and Alcock 1983, 12).
- ♦ **justification** *n.* The procedures by which hypotheses, or theories, are “tested and validated” (Mayr 1997, 51).
See confabulation.
- ♦ **juvenile** See animal names: juvenile.
- ♦ **juvenile adaptation** See ³adaptation: ²evolutionary adaptation: juvenile adaptation.
- ♦ **juvenile behavior** See behavior: juvenile behavior.
- ♦ **juvenile characteristic** See character: juvenile characteristic.
- ♦ **juvenile coloration** See dress: juvenile dress.
- ♦ **juvenile dress** See dress: juvenile dress.
- ♦ **juvenile group** See ²group: juvenile.
- ♦ **juvenile hormones** See hormone: juvenile hormones.
- ♦ **juvenile song** See animal sounds: song: juvenile song.

K

- ♦ **K** See carrying capacity.
- ♦ **kairomone** See chemical-releasing stimulus: semiochemical: kairomone.
- ♦ **kakogenesis** See -genesis: cacogenesis.
- ♦ **kakogenic** See -genic: dysgenic.
- ♦ **kamikaze sperm** See gamete: sperm: kamikaze sperm.
- ♦ **Kant's dictum** *n.* “Only so much genuine science can be found in any branch of the natural sciences as it contains mathematics” (Mayr 1982, 39).
Comment: Mayr (1982, 39) disputes this view.
- ♦ **kappa factor** See factor: kappa factor.
- ♦ **karyallogamy** See -gamy: karyallogamy.
- ♦ **-karyo, -kary, -caryo** *comb.f.* Referring to a cell nucleus, especially to changes that take place within it (Oxford English Dictionary 1972).
[Greek *karyon*, nut, kernel]
- ♦ **karyogamete** *n.* A gamete's nucleus (Lincoln et al. 1985).
- ♦ **karyogamy** See -gamy: karyogamy.
- ♦ **karyogenetic** See -genetic: karyogenetic.
- ♦ **karyogram** See -gram: karyogram.
- ♦ **karyokinesis** See kinesis: karyokinesis; mitosis.
- ♦ **karyological** *adj.* Referring to a cell's nucleus, especially its chromosomes (Lincoln et al. 1985).
- ♦ **karyology** See study of: cytology.
- ♦ **karyomite** See chromosome.
- ♦ **karyomitosis** See mitosis.
- ♦ **-karyon** *cf.* -karyo
- hemikaryon** *n.* A haploid cell (Lincoln et al. 1985).
adj. hemikaryotic
- synkaryon** *n.* A zygote nucleus that is formed from the fusion of gametic nuclei (Lincoln et al. 1985).
- ♦ **-karyote** *adj.* -otic
- eukaryote, eucaryote** *n.*
1. A cell with its chromosomes in a distinct nucleus separated from cytoplasm by a double membrane and defined cytoplasmic organelles (Curtis 1983, 84).
 2. An organism that is composed of one, or more, eukaryotic cells (Lincoln et al. 1985).
cf. -karyote: prokaryote
adj. eucaryotic, eukaryotic
[Greek *eu*, true + *karyon*, kernel in reference to a cell nucleus]
- prokaryote, procaryote** *n.*
1. A cell with a single chromosome and no distinct nucleus separated from cytoplasm by a double membrane (Mayr 1982, 959; Curtis 1983, 84).
2. An organism (*e.g.*, bacterium or cyanobacterium) that is composed of a prokaryotic cell (Lincoln et al. 1985).
cf. -karyote: eukaryote
adj. prokaryotic, protokaryotic, protocaryotic [Greek *pro*, before + *karyon*, kernel, in reference to no cell nucleus]
- ♦ **karyotype** See -type, type: karyotype.
- ♦ **karyotypic orthoselection** See selection: orthoselection.
- ♦ **Kasper-Hauser** *n.* An animal that is reared under conditions of severe experience deprivation that denies it the opportunity to learn things necessary for its normal behavioral development (Immelmann and Beer 1989, 163).
cf. behavior: abnormal behavior; experiment: deprivation experiment; hospitalism
[after Kaspar Hauser, a foundling child who suddenly appeared in Nuremberg in 1882 (Immelmann and Beer 1989, 163)]
- ♦ **Kasper-Hauser experiment** See experiment: deprivation experiment.
- ♦ **kata-** See cata-.
- ♦ **katabolism** See metabolism: catabolism.
- ♦ **katadromous** See -dromous: catadromous.
- ♦ **katagenesis** See ²evolution: catagenesis.
- ♦ **katharobic** *adj.* Referring to an organism that inhabits pure water, or water of very low organic content (Lincoln et al. 1985).
- ♦ **keeping-up-with-the-Joneses** See learning: social-imitative learning.
- ♦ **kennel** See ²group: kennel.
- ♦ **kenophobia** See -phobia: agoraphobia.
- ♦ **keratinophile** See ¹phile: keratinophile.
- ♦ **keraunophobia** See -phobia: keraunophobia.
- ♦ **ketone** See molecule: ketone.
- ♦ **key character** See character: key character.
- ♦ **K extinction** See ²extinction: K extinction.
- ♦ **key gene** See gene: oligogene.
- ♦ **key stimulus** See ²stimulus: releaser.
- ♦ **keystone mutualist** See symbiont: keystone mutualist.
- ♦ **keystone predator, keystone species** See ²species: keystone species.
- ♦ **keystone-predator model** See ⁴model: keystone-predator model.
- ♦ **K horizon** See soil horizon: K horizon.
- ♦ **kidnapping** *n.* For example, in *Corcorax melanorhamphos* (White-winged Choughs): One group's

“convincing” a recently fledged young to join it by displaying to it (Heinsohn 1991, 1098).

See parasitism: social parasitism: slavery.

♦ **killing, killing behavior** See behavior: killing behavior.

♦ **killing frost** See frost: killing frost.

♦ **killing inhibition** See inhibition: killing inhibition.

♦ **kilocron** See unit of measure: cron: kilocron.

♦ **kin** *n.*

1. A person's relatives by blood, collectively; his family; kinfolk (Michaelis 1963).

2. An organism's genetic relatives (Michaelis 1963).

3. *adj.* Related by blood; consanguineous (Michaelis 1963).

4. Similar in one, or more, ways; kindred; alike (Michaelis 1963).

[Old English *cyn*. Akin to kind.]

collateral kin *n.* Kin that lie on different branches of a genealogical tree below a particular bifurcation, *e.g.*, siblings (Brown 1987, 298).

cf. kin: lateral kin

lateral kin *n.* Kin that lie on the same branch of a genealogical tree, *e.g.*, parents and their offspring (Brown 1987, 298).

cf. kin: collateral kin

♦ **kin altruism** See altruism: kin altruism.

♦ **kin recognition** See recognition: kin recognition.

♦ **kin selection, kin-selection theory** See selection: kin selection; ³theory: kin selection.

♦ **kindle** See ²group: kindle.

♦ **kinematic graph** See graph: kinematic graph.

♦ **kinesics** See study of: kinesics.

♦ **-kinesis** *comb. f.* A movement, motion (Michaelis 1963).

[Greek *kinesis*, motion]

akinesis See behavior: defensive behavior; playing dead.

cytokinesis *n.* Cytoplasm division that usually follows mitosis or meiosis (Lincoln et al. 1985).

karyokinesis *n.* Nuclear division (Lincoln et al. 1985).

See mitosis.

cf. -kinesis: cytokinesis

► **psychokinesis (PK)** *n.* A person's direct psychological effect upon a physical object that is not explainable by muscular or glandular response (Storz 1973, 213).

► **telekinesis** *n.* Causation of changes in the physical environment by unusual means, *e.g.*, a table's moving due to a human spiritualistic seance (Storz 1973, 273).

Comment: Telekinesis is probably not a real phenomenon (Storz 1973, 273).

♦ **kinesis** *n.* An organism's change in rate of random movement (linear or angular velocity) as a result of stimulus intensity, but not stimulus direction; kinesis is distinguished from taxis, *q.v.* (Immelmann and Beer 1989, 164).

syn. phobotaxis (not an appropriate synonym as explained by Immelmann and Beer 1989, 307)

adj. kinetic

cf. taxis

Comments: Two principle forms of kinesis are klinokinesis and orthokinesis (Immelmann and Beer 1989, 164). Fraenkel and Gunn (1961) describe kineses in addition to those that I list below.

barokinesis *n.* Kinesis in response to barometric pressure (Lincoln et al. 1985).

chemokinesis *n.* Kinesis in response to chemical stimulus (Lincoln et al. 1985).

hygrokinesis *n.* Kinesis in response to a humidity change (Lincoln et al. 1985).

hygroklinokinesis *n.* Klinokinesis in response to humidity (Lincoln et al. 1985).

hygroorthokinesis *n.* Orthokinesis in response to humidity (Lincoln et al. 1985).

klinokinesis *n.* For example, in a planarian species: Kinesis in which an individual's turning rate and magnitude vary with stimulus quality; *e.g.*, when stimulation is adverse, an individual changes its direction repeatedly and through wide angles; when stimulation is more favorable, it continues in a particular direction until stimulation becomes less favorable, then it changes its direction again (Fraenkel and Gunn 1961, 18, 45; Immelmann and Beer 1989, 164). *syn.* avoiding reaction, trial-and-error behavior (Immelmann and Beer 1989, 164)

Comments: In reexamining kinesis, Benhamou and Bovet (1989, 376) replace the spatio-temporal concept of rate of change of direction in klinotaxis with a purely spatial concept of sinuosity that expresses the amount of turning associated with a given path length. This redefinition is meant to separate the effects of orthokinesis (a purely temporal measure of speed of travel along a track) and those of klinokinesis (redefined as a purely spatial concept) and, therefore, lead to a better understanding and use of these concepts (Budenberg 1991, 156). However, Budenberg's analyses of insect tracks indicates that Fraenkel and Gunn's (1940) definition of klinokinesis should not be replaced with the spatio-temporal concept.

orthokinesis *n.* For example, in woodlice: Kinesis in which an individual's locomotion rate varies with stimulus quality; when stimulation is adverse, it moves ahead quickly; when stimulation is more favorable, it slows down; and when stimulation is favorable, it stops its forward movement (Gunn et al. 1937 in Fraenkel and Gunn 1961, 15; Fraenkel and Gunn 1961, 18; Immelmann and Beer 1989, 164). *cf.* kinesis: klinokinesis

photokinesis *n.* In a bacterium species: Kinesis in response to light (Engelmann 1882, 1883 in Fraenkel and Gunn 1961, 17).

statokinesis *n.* Movement associated with an organism's maintaining its equilibrium (Lincoln et al. 1985).

♦ **kinesophobia** See -phobia: kinesophobia.

♦ **kinesthesia, kinesthetic sense** See modality: kinesthesia.

♦ **kinesthetic learning** See learning: kinesthetic learning.

♦ **kinetics** See study of: physics: kinetics.

♦ **kinetophile** See ²species: kinetophile.

♦ **king** See caste: king.

♦ **kingram** See -gram: kingram.

♦ **kinopsis** *n.* For example, in large-eyed-ant species: A form of communication in which visual perception of another individual in motion excites and attracts conspecifics (Wilson 1975, 202, 587; Lincoln et al. 1985).

♦ **kinship** *n.*

1. A person's relation to another by descent; consanguinity (Oxford English Dictionary 1972, entries from 1833).

2. Two, or more, individual organisms' possession of a recent common ancestor; being genetically related (Wilson 1975, 587).
Comment: Kinship is precisely measured by the coefficient of kinship and coefficient of relationship, *q.v.* (Wilson 1975, 587).
- ♦ **kinship component** See fitness: indirect fitness.
- ♦ **kinship selection** See selection: kin selection.
- ♦ **kintergarten** See ²group: kintergarten.
- ♦ **kip** See ²group: kip.
- ♦ **Kirbyan mimicry** See mimicry: Kirbyan mimicry.
- ♦ **kiss** *n.*
1. A person's touch, or caress, of some object with his lips (while compressing and separating them) (Oxford English Dictionary 1972, entries from *ca.* 1000).
Note: A kiss can be a token of affection, or greeting, or an act of reverence (Oxford English Dictionary 1972).
syn. osculation (Oxford English Dictionary 1972)
 2. Two prairie dogs' touching lips with their mouths open and teeth exposed (Wilson 1975, 473).
 3. In *Macaca arctoides* (Stump-tailed Macaques): An individual's placing its lips on another's mouth, often with some licking and smelling (Waal 1989, 161).
Note: Kissing also occurs in *Pan paniscus* (Bonobos) and *P. troglodytes* (Chimpanzees) (Waal 1989, 40, 199).
[Old English *cyssan*]
- ♦ **cloacal kiss** *n.* In Birds: A male's and female's bringing their cloacal glands together during copulation (Dewsbury 1978, 77).
cf. copulation, mating
- ♦ **French kiss** *n.* In Humans and *Pan paniscus* (Bonobos): Open-mouth kissing with one primate's putting its tongue into the mouth of the other (Waal 1989, 199).
- ♦ **kiss feeding** See feeding: kiss feeding.
- ♦ **kiss-squeak** See animal sounds: kiss-squeak.
- ♦ **Kitty Todd Nature Preserve** See place: Kitty Todd Nature Preserve.
- ♦ **klado-** See clado-.
- ♦ **kladogenesis** See -genesis: cladogenesis.

- ♦ **kleptobiosis** See symbiosis: kleptobiosis.
- ♦ **kleptoparasitism** See parasitism: cleptoparasitism.
- ♦ **klinokinesis** See -kinesis: klinokinesis.
- ♦ **klinotaxis** See taxis: klinotaxis.
- ♦ **kneading** See ³treading.
- ♦ **knee-jerk reflex** See reflex: knee-jerk reflex.
- ♦ **knephoplankton** See plankton: knephoplankton.
- ♦ **Knight-Darwin law** See law: Knight-Darwin law.
- ♦ **knob** See ²group: knob.
- ♦ **knophobia** See -phobia: cynophobia.
- ♦ **knot** See ²group: knot.
- ♦ **koino-** See coeno-.
- ♦ **kollaplankton** See plankton: kollaplankton.
- ♦ **koprophagous** See -phagous: coprophagous.
- ♦ **kormogene association** See ²group: association: kormogene association.
- ♦ **kormogene society** See ²society: kormogene society.
- ♦ **Koschevnikov's gland** See gland: Koschevnikov's gland.
- ♦ **Krebs cycle** See biochemical pathway: Krebs cycle.
- ♦ **kremastoplankton** See plankton: kremastoplankton.
- ♦ **Krogh's law** See law: Krogh's law.
- ♦ **Kromismus** See cannibalism: cronism.
- ♦ **K-r spectrum** *n.* A linear continuum of reproductive strategies with K and r species representing the extremes (Lincoln et al. 1985).
- ♦ **krummholz** See ²community: krummholz.
- ♦ **K-selected species** See ²species: K-selected species.
- ♦ **K selection, K selection** See selection: K selection.
- ♦ **K strategist, K-strategist** See ²species: K-selected species.
- ♦ **K-strategy** See strategy: K-strategy.
- ♦ **K value** See carrying capacity.
- ♦ **kybernetics** See study of: mathematics: cybernetics.
- ♦ **kymatology** See study of: kymatology.
- ♦ **Kyoto Protocol** See treaty: Kyoto Protocol.

♦ **lability, evolutionary lability** *n.* “The ease and speed with which particular categories of traits evolve;” e.g., territorial behavior is usually highly labile, and maternal behavior much less so (Wilson 1975, 587).

♦ **labor** See ²group: labor.

♦ **labyrinth** *n.*

1. In Vertebrates: Part of an animal's inner ear, consisting of semicircular canals and otolith organs (saccules and utricles) and containing mechanoreceptors that register an animal's body position: tilting, turning, acceleration, and deceleration (Immelman and Beer 1989, 169).

syn. membranous labyrinth, vestibular organ (Immelman and Beer 1989, 169)

2. A maze used in behavioral experiments (Immelman and Beer 1989, 169).

♦ **¹lactation** *n.* The period during which milk is produced by a mammal (Michaelis 1963).

♦ **²lactation** *n.* A female mammal's feeding a young at her breast (Michaelis 1963).

♦ **³lactation** *n.* Milk formation and secretion in mammals (Cowie et al. 1951).

cf. milking, suckling.

Comment: Cowie et al. (1951) clarify terminology used in lactational physiology.

PARTS OF LACTATION^a

- A. milk secretion
- B. milk removal
 - 1. passive withdrawal
 - 2. milk ejection

^a Cowie et al. (1951)

milk ejection *n.* The effect of alveolar contraction reflexly elicited by a suckling stimulus in mammary glands distended with secretion (Cowie et al. 1951). *cf.* nursing, suckling

Comments: Milk ejection involves the movement of some alveolar secretion into the sinus, or cistern, thereby producing a rise in intramammary pressure (called let-down or draught). Milk ejection may, or may not, involve milk passage to the exterior of a mammary gland (Cowie et al. 1951, who propose that “let-down,” “hold-up,” and “draught” no longer be used).

milk secretion *n.* Synthesis of milk by alveolar-epithelium cells and milk passage from these cell's cytoplasm into the alveolar lumen (Cowie et al. 1951).

passive withdrawal *n.* “The removal of sinus (or cistern) milk which at low intramammary pressure can be brought about by the action of suckling or milking or by cannulation without the intervention of the special contractile tissue of the mammary glands” (Cowie et al. 1951).

♦ **lactogenic hormone** See hormone: prolactin.

♦ **ladder of nature** See *scala naturae*.

♦ **lag-growth phase** See phase: lag growth phase.

♦ **lag load** See ²evolutionary lag.

♦ **lagena** *n.* In Birds and Frogs: An organ in an animal's inner ear that seems to be involved with balance rather than hearing (Smith and Takasaka 1971; D. B. Quine, pers. comm.).

♦ **Lagerstätten effect** See effect: Lagerstätten effect.

♦ **lalophobia** See -phobia: lalophobia.

♦ **Lamarck's first law** See law: Lamarck's first law.

♦ **Lamarck's second law** See law: Lamarck's second law.

♦ **Lamarckian** *n.* A person who adheres to Lamarckism, *q.v.* (Oxford English Dictionary 1972, entries from 1846 as an adjective).

adj. Lamarckian

neo-Lamarckian *n.* One of a group of biologists that was most influential in the 1880s and 1890s and that attacked with great hostility Weismann's revolutionary rejections of soft inheritance (Mayr 1982, 540, 701, 882).

Comment: Orthodox Darwinians of the time continued to accept Darwin's occasional reliance on the effects of use and disuse, *q.v.* (Mayr 1982, 540, 701, 882). [coined by Packard 1884 in Mayr 1982]

♦ **Lamarckism** *n.*

1. Jean Baptiste de Lamarck's views of evolution which include the idea that an individual's efforts that satisfy “needs” play an important role in modifying the individual, an organ is strengthened by use and weakened by disuse (the principle of use and disuse, Lamarck's first law, *q.v.*), and acquired characters are inheritable (Lamarck's second law, *q.v.*) (Mayr 1982, 354).

2. The evolutionary mechanism of inheritance of acquired characteristics popularized through Lamarck's influence (Bowler 1992, 188).

Notes: Biologists have included a number of distinct biological processes within the general framework of Lamarckism; all depend upon the assumption that characters acquired by adult organisms can somehow be transmitted to their offspring and, ultimately, can

be incorporated into their species' genetic makeup (Bowler, 1992, 188).

syn. autogenesis, Lamarckian evolution, the theory of soft inheritance (Mayr 1982, 359)

cf. Lysenkoism; Michurinism; ¹system: inheritance-of-acquired-characteristics system

Comments: "Relatively few of Lamarck's ideas were entirely new." The "popularity of Lamarckian ideas eventually became an impediment" that "helped to delay for some 75 yr after 1859 the general acceptance of the Darwinian explanatory model and of hard inheritance" (Mayr 1982, 360). Lamarckism was popular with many biologists and was a major rival of Darwinism before the rise of genetics (Bowler, 1992, 188). "The orthodox view today is that this theory is completely wrong" being incompatible with the central dogma of genetics (Dawkins 1982, 289).

[after Jean Baptiste Pierre Antoine de Monet de Lamarck, 1744–1829, French biologist]

♦ **lambda link** See link: lambda link.

♦ **land-bridge hypothesis** See hypothesis: land-bridge hypothesis.

♦ **Landau index** *n.* A measurement of the strength of a dominance hierarchy (Landau 1965 in Wilson 1975, 294).

♦ **landmark** *n.* A natural object used by an animal that employs topographical orientation, *e.g.*, a solitary tree, or group of trees used by Western Honey Bees or a corner gas station used by a person (Heymer 1977, 109).

♦ **landmark-based mental map** See cognitive map.

♦ **landmark learning** See learning: landmark learning.

♦ **land mine** *n.* An explosive mine that a person usually places just below soil surface (Morris 1982).

Comment: Land mines are common in many countries including Afghanistan, Cambodia, China, Croatia, Kashmir, Libya, Sri Lanka, Thailand, and Vietnam (Mydans 2001). These mines have killed thousands of mammals including *Bubalus bubalis* (Water Buffalo), *Camelus* sp. (camels), some gazelle and goat spp., Humans, *Moschus* spp. (musk deer), *Panthera tigris* (Tigers), *Pseudois* sp. (blue sheep) and other sheep spp., some ursid spp. (bears), and *Uncia uncia* (Snow Leopards).

♦ **language** *n.*

1. "The whole body of words and of methods of combination of words used by a nation, people, or race; a 'tongue'" (Oxford English Dictionary 1972, entries from 1290).

2. A person's method of transferring his thoughts, feelings, wants, etc., in ways besides using words (Oxford English Dictionary 1972, entries from 1606).

3. In nonhuman animals: Inarticulate sounds (Oxford English Dictionary 1972, entries from 1601).

cf. jargon

4. In Humans: "Words or the method of expressing them for the expression of thought" (Oxford English Dictionary 1972, entries from 1599).

5. In Humans: A noninstinctive method of communicating ideas, emotions, and desires by means of a system of voluntarily produced symbols (Sapir 1921, 8).

6. In Humans: A set of plurisituational consigns restricted in the ways in which they may be combined; behavior having five characteristics: (1) plurality of signs, (2) signs that have a common meaning

to a number of interpreters, (3) signs (comsigns) that are producible by members of the interpreter-family and have the same meaning to both producers and interpreters, (4) signs that are relatively constant in their meaning in all situations in which they appear (plurisituational signs), and (5) signs that are interconnected in some ways and not in others, making a variety of complex sign-processes (Morris 1946).

7. In Humans: Behavior that has these 13 design features: a "vocal-auditory channel," "rapid fading" ("transitoriness"), "broadcast transmission," and "directional reception," "interchangeability" (a speaker of language can reproduce any linguistic message he can understand), total feedback, specialization (serves no function except as a message), "semanticity," "arbitrariness," "discreteness," "displacement," "productivity," and "traditional transmission" (Hockett 1960).

Note: These traits exist on continua (Hockett and Altmann 1968).

8. "A communications system that permits the exchange of new, unanticipated information" (Lieberman 1973, 59).

9. In Humans: Language (def. 8) that "makes use of 'encoded' speech to achieve a rapid transfer of information" (Lieberman 1973, 59).

syn. true language (Lieberman 1973, 59)

10. Nonhuman animal communication, called "animal language" or "animal speech" primarily in nonscientific writing (Immelman and Beer 1989, 169).

syn. communication (of some authors)
cf. dance-language communication, metacommunication, semiotic

Comments: According to Gardener and Gardener (1969), "language" cannot be distinguished from "communication" in *Pan troglodytes* (Chimpanzees). Human "vocalizations that may have abstract meanings are subject to inflections and variations of syntax such as may distinguish between tenses and between moods" (Medawar and Medawar 1982). "Language," like many other kinds of behavior, is on a continuum being present from nonhuman animals through Humans (McFarland 1987, 336).

♦ **Ameslan** *n.* American Sign Language that involves gestures of one's hand and arm and that has been taught to *Pan troglodytes* (Chimpanzees) (Gardner and Gardner 1971 in McFarland 1985, 492).

cf. Yerkish

[portmanteau from *American Sign Language*]

♦ **paralanguage** *n.* Signals separate from words used to supplement or to modify human language (Wilson 1975, 556).

♦ **sign language** *n.* Human communication using nonverbal means, largely hand movements, *e.g.*, used by Plains Indians in North America to communicate with tribes that speak other languages or communication used by deaf persons (Michaelis 1963).

♦ **La Niña** *n., pl. Las Niñas* Above average surface cooling of water and high air pressure in the South Pacific; contrasted with El Niño (Suplee 1997, 21 September, A1).

syn. El Viejo (Suplee 1997, 1 September, A1)

Comments: Las Niñas often follow Los Niños (Suplee 1997, 21 September, A1).

♦ **Lansing effects** See effect: Lansing effects.

♦ **lapidocole** See -cole: lapidocole.

♦ **larder** *n.*

1. A room, or cupboard, where a person stores food articles (Michaelis 1963).
 2. "The provisions of a household" (Michaelis 1963).
 3. A particular location where an animal; e.g., *Apis mellifera* (Western Honey Bees) or *Tamias striatus* (Eastern Chipmunks), stores many food items (inferred from Vander Wall 1990, 3; Clarke and Kramer 1994, 299).
cf. cache; hoarding; food hoarding; larder hoarding [Anglo-French larder, Old French *lardier* < Medieval Latin *lardarium*, originally a storehouse for bacon < *lardum*, lard]
- ◆ **larder hoarding** See hoarding: food hoarding; larder hoarding.
- ◆ **larva** See animal names: larva; caste: reproductive: nymph.
- ◆ **larviparity** See parity: larviparity.
- ◆ **larviparous** See -parous: larviparous.
- ◆ **larvivore** See -vore: larvivore.
- ◆ **Lascaux Cave, Lascaux II** See place: Lascaux Cave.
- ◆ **Lasker Medical Research Awards** See award: Lasker Medical Research Awards.
- ◆ **last instar, last larval instar** See instar: last instar.
- ◆ **late-season-mimic-scarcity hypothesis** See hypothesis: late-season-mimic-scarcity hypothesis.
- ◆ **latebricole** See -cole: latebricole.
- ◆ **latency** *n.*
 1. The time interval between a stimulus' occurrence and an animal's response to it, e.g., its behavior or nerve impulse (Immelmann and Beer 1989, 171).
syn. reaction time (Immelmann and Beer 1989, 171)
 2. In learning, the time interval between a conditional and an unconditional stimulus or between an animal's operant response and its reinforcement (Immelmann and Beer 1989, 171).
- ◆ **latent allele** See allele: recessive allele.
- ◆ **latent homology** See homology: latent homology.
- ◆ **latent learning** See learning: latent learning.
- ◆ **latent period** See time: reaction time.
- ◆ **lateral inhibition** See inhibition: lateral inhibition.
- ◆ **lateral kin** See kin: lateral kin.
- ◆ **Latin-square design** See experimental design: Latin-square design.
- ◆ **laugh, laughing, laughter** See animal sounds: laugh.
- ◆ **laughter** See ²group: laughter.
- ◆ **laurophile** See ¹-phile: laurophile.
- ◆ **Lausen** See grooming: *Lausen*.
- ◆ **law** *n.*
 1. In science and philosophy, a theoretical principle deduced from particular facts, applicable to a defined group, or class, of phenomena, and expressible by the statement that a particular phenomenon always occurs if certain conditions are present (Oxford English Dictionary 1972, entries from 1665).
syn. law of nature, natural law (Oxford English Dictionary 1972) dictum, concept, hypothesis, rule, universal law (according to some biological writers, Lincoln et al. 1985)
 2. Any generally accepted rule, procedure, or principle that governs a specified area of conduct, field of activity, body of knowledge, and so forth (Michaelis 1963).

3. In mathematics, a rule, or formula, that governs a function or operation (Michaelis 1963).
4. "A logical general statement that is directly or indirectly open to observational confirmation or falsification, and that can be employed in explanations and predictions" (Mayr 1997, 62).

cf. axiom, doctrine, dogma, effect, fact, hypothesis, principle, rule, theorem, theory, truism

Comments: Physics and chemistry have laws, but not biology, because so-called "biological laws" probably always have exceptions (Mayr 1982, 37–45, 846). The term "law" is often used loosely to refer to a biological hypothesis, or concept, by many authors as is evident from entries in this book. It seems preferable to use the terms "concept," "generality," "generalization," "principle," or "rule" instead of "law" in biology. Below, I list terms with "law" in them, regardless of their statuses as actual laws. Many of the laws of physics could simply be considered to be "facts" of nature (Mayr 1997, 62).

[Old English *layu* < Old Norse *lag*, something laid or fixed]

all-or-none law *n.* In physiology, once a specific stimulus threshold has been reached, any stimulus can release no more than a certain transmittable excitation (action potential) which represents its maximum-response value ("all"); below this value, no excitation transmission occurs ("none") (Bowditch 1871 in Heymer 1977, 27).

Allee effect, Allee principle, Allee law *n.* The density of a population of organisms varies according to the spatial distribution of its individuals (degree of aggregation), and both overcrowding and undercrowding may be suboptimal (Lincoln et al. 1985).

cf. density dependence

Allen's law See rule: Allen's rule.

Arber's law *n.* Any structure disappearing from a phylogenetic lineage during evolution is never regained by descendants of that line (Lincoln et al. 1985).

cf. law: Dollo's law

Baker's law *n.* In plants, autogamy is a prerequisite for establishment of long-distance migrants (Baker 1955 in Faegri and van der Pijl 1979, 136).

biogenetic law, biogenic law, biogenesis *n.* "Ontogeny is a concise and compressed recapitulation of phylogeny, conditioned by laws of heredity and adaptation" (Haeckel 1866 in Mayr 1982, 474); during its ontogeny an organism passes through the morphological stages of its ancestors (Haeckel 1866 in Mayr 1982, 117).

syn. fundamental law of biogenesis, Haeckel's law, law of recapitulation, ontogeny recapitulates phylogeny, recapitulation, theory of recapitulation (Mayr 1982, 117, 215, 474)

cf. -genesis: biogenesis; ¹heterochrony; repetition

Comment: Haeckel based his law on the Meckel-Serrès law (*q.v.*); and Müller (1864) independently came to a similar conclusion. The "biogenetic law" is not true, but was immensely popular and successful from about 1870 to 1900. "It led to a splendid flowering of comparative embryology and was responsible for many spectacular discoveries" (Mayr 1982, 474). The phenomenon that "ontogeny partially recapitulates phylogeny" in many animal species is true.

Brook's law See law: Dyar's law.

capacity laws *n. pl.* Concepts of learning that Tolman related to different kinds of learning in many kinds of organisms (listed in Hinde 1970, 576–577).

Castle's law See law: Hardy-Weinberg law.

Cope's law, Cope's rule *n.* Possibly in some cnidarian, brachiopod, mollusc, echinoderm, and vertebrate taxa: The widespread tendency of certain groups to evolve toward species of larger physical sizes through geological time (Cope 1885a,b,c; Stanley 1973, 1; Wilson 1975, 347).

syn. Depéret's rule (Simpson 1953, 252, in Stanley 1973, 2)

Comment: Depéret (1907), rather than Cope, concisely formulated this rule according to Stanley (1973, 1–2) who also explains that Cope's rule is “more fruitfully viewed as describing evolution from small size rather than toward large size.” From late 1800s until the 1970s, many paleontologists thought that Cope's rule was based on reliable data (Zimmer 2004, D4). In the 1970s, many paleontologists started to challenge Cope's rule, saying that researchers had not tested alternate hypotheses. Evolutionist Stephen J. Gould dismissed Cope's rule as a “psychological artifact.” However, A. Purvis and D. Hone found that Cope's rule applied to dinosaurs, and J. Alroy found that the rule applies to North American mammals over the past 80 Ma. Many phyletic lines have evolved smaller species over time, rather than larger ones. Humans are counteracting Cope's rule by hunting large species (e.g., large flightless birds, North American mammals, or whales) to extinction or near extinction.

[after Edward Drinker Cope (1840–1897), 19th-century American paleontologist]

Depéret's rule See law: Cope's law.

disharmony law *n.* The logarithm of a dimension of any part of an animal is proportional to the logarithm of its body length (Lincoln et al. 1985).

Dollo's law (of irreversibility), Dollo's rule *n.* Structures that have been lost in evolution can never be reacquired exactly in the same way (Mayr 1982, 609).

syn. irreversibility rule, law of irreversibility, uniquely-evolved-character concept (Mayr 1982, 609; Lincoln et al. 1985)

cf. law: Arber's law

Dyar's law, Dyar's rule, Brook's law *n.*

For example, in lepidopterans, hymenopterans, coleopterans, and other kinds of insects: Head width increases in a regular geometric progression through a series of larval instars, (Lincoln et al. 1985).

Endangered Species Act (ESA) *n.* A law passed by the U.S. in 1973 to protect endangered species, subspecies, and their isolated populations from becoming extinct (Kenworthy 1995, 24 January, A3).

Comments: Biologists, conservationists, developers, politicians, and others have debated the exact intent and power of this law. Some people have criticized the ESA, saying that it ignores human economic needs in favor of absolute protection of often obscure organisms (Kenworthy 1995, 24 January, A3; 30 June, A19). The ESA has been one of the environmental movement's principal means for stopping nature-harming activities including dam building, livestock grazing on public lands, logging, and suburban sprawl (Grunwald 2001, A1). This Act is not favored by property-rights activists, some of whom have argued that the Act “values obscure bugs and bushes over human beings and economic growth.”

Environment Protection and Biodiversity Conservation Act of 1999 (EPBC Act) *n.*

Australia's central piece of environmental legislation which provides a legal framework to protect and manage nationally and internationally important biota, ecological communities, and heritage places (Australian Government Department of the Environment, Water, Heritage and the Arts 2010).

Fechner's Law *n.* $S = k \log I$; where S is an animal's subjective perception of the magnitude of a stimulus, I is stimulus intensity, and k is a constant (McFarland 1985, 206).

cf. law: Weber's law

[after Gustav Fechner, 1801–1887]

Flora and Fauna Guarantee Act 1988 *n.* An act of the Victorian Government, Australia, designed to protect genetic material, habitats, and species, prevent extinction and allow maximum genetic diversity within the State of Victoria for perpetuity (New 2009, 208, Victorian Government 2009).

Comments: This Act is the first Australian legislation to deal with such issues (Victorian Government 2009). This Act specifically excludes pathogenic bacteria and viruses from protection. One may list a species and threatening process under the Act.

Fraser-Darling law See effect: Fraser-Darling effect.

fundamental law of biogenesis See law: biogenetic law.

Galton's law of filial regression *n.* Offspring of superior genotypes tend to revert to the average genotype for their species (Lincoln et al. 1985).

syn. filial regression (Lincoln et al. 1985)

Galton's law of ancestral inheritance *n.* The genetic contribution of an ancestor of a sexually reproducing, diploid organism is reduced by 50% each generation; that is, an offspring obtains half of its genes for each parent, one-fourth of its genes from each grandparent, one-eighth of its genes from each great grandparent, etc. (Galton in Mayr 1982, 784–785).

syn. Galton's law, law of ancestral heredity (Lincoln et al. 1985)

cf. coefficient of relatedness

Comments: This rule also contains these ideas which are weaknesses: it was purely descriptive and does not really provide any causal explanation; it does not permit predictions; it proposes blending inheritance which does not explain the production of homozygous recessive individuals from heterozygous grandparents. “Galton's law” had to be abandoned before “Mendelism” was universally accepted (Galton in Mayr 1982, 784–785).

Gloger's law *n.*

1. Animal colors are darker in warm climates and lighter in cold ones (Emlen 1973, 59).

Note: This does not appear to be a true generality (Emlen 1973, 59).

2. Among homeothermic animals, populations that live in warm, humid areas are more heavily pigmented than populations in cool, dry areas; pigments are typically black in the former areas and red and yellow in the latter areas and generally reduced in cool areas (Lincoln et al. 1985).

syn. Gloger's rule (Emlen 1973, 59; Lincoln et al. 1985); pigmentation rule (Lincoln et al. 1985)

Haeckel's law, Haeckel's laws of heredity See law: biogenetic law.

Haldane's law *n.* In hybrids between species, or varieties, the sex that is absent, rare, or sterile, is the usually the heterogametic sex (*e.g.*, females in birds and lepidopterans or males in *Drosophila* and mammals) (Rieger et al. 1991).

syn. Haldane's rule

[after J. B. S. Haldane, geneticist]

Hardy-Weinberg law *n.* A population is not evolving (that is its allele frequencies do not change from generation to generation) unless the allele frequency is affected by genetic drift (due to chance regarding which organisms mate, remain in a population, or both), immigration (resulting in gene flow), mutation, natural selection, or nonrandom mating (Hardy 1908 and Weinberg 1908 in Hartl 1980, 94).

syn. Castle's law, genetic equilibrium, square law (Lincoln et al. 1985), Hardy-Weinberg-equilibrium principle (Mayr 1982, 553), Hardy-Weinberg model (Hartl 1980, 94), Hardy-Weinberg theorem (Campbell 1996, 419)

Comments: This principle demonstrates that meiosis and recombination alone do not alter gene frequencies (Lincoln et al. 1985).

[after the scientists G. H. Hardy and W. Weinberg who each derived this Hardy-Weinberg equation independently and published papers on it in 1908 (Hartl 1980, 94)]

Hofacker-and-Sadler's law *n.* An older male parent crossed with a younger female produces more sons than a younger male crossed with an older female (Lincoln et al. 1985).

Hopkin's bioclimatic law *n.* The generalization that in temperate North America, life-history events tend to occur with an average delay of 4 days for each degree of latitude northward, 5° of longitude eastward, and 122 m of altitude; in spring and early summer and corresponding earliness occurs in late summer and autumn (Lincoln et al. 1985).

irreversibility law, irreversibility rule See law: Dollo's law.

Jordan's law, Wagner's law *n.*

1. The closest relatives of a species are found immediately adjacent to it and isolated from it by a geographical barrier (Lincoln et al. 1985).
2. In some fish species: Conspecific individuals develop more vertebrae in a cold environment than in a warm one (Lincoln et al. 1985).

Knight-Darwin law *n.* The concept that animals tend not to interbreed (Lincoln et al. 1985).

cf. outbreeding: maximum outbreeding; hypothesis: optimal-outbreeding hypothesis

Krogh's law *n.* The rate of a biological process, or event, is directly correlated with temperature (Lincoln et al. 1985).

Lamarck's first law *n.* An organ is strengthened by use and weakened by disuse; unused organs tend to disappear (Mayr 1982, 354).

syn. principle of use and disuse (Mayr 1982, 354)

cf. Lamarckism

Comment: Persons from Hippocrates (*ca.* 460–370 BC) to Lamarck (19th century) believed in this "law," and belief in it is part of present folklore (Mayr 1982, 304, 355).

Lamarck's second law *n.* Acquired characters are passed on through inheritance (Mayr 1982, 354). *cf.* Lamarckism.

law of acceleration *n.* The sequence of development of organs and structures in an organism's

ontogeny is directly related to their importance to it (Lincoln et al. 1985).

law of conservation of energy See law: laws of thermodynamics: first law of thermodynamics.

Law of Constant of Extinction See law: law of extinction.

law of contiguity *n.* An animal may associate two, or more, events that occur close enough together (Storz 1973, 60).

Comment: According to many hypotheses, contiguity is the basis on which learning takes place (Storz 1973, 60).

law of development See law: von-Baer's laws.

law of dominance See law: Mendel's laws: Mendel's third law.

law of effect *n.* Reinforcement has a substantial influence on learning (Thorndike 1898 in Dewsbury 1978, 22).

law of energy dispersal See law: laws of thermodynamics: second law of thermodynamics.

law of extinction *n.* The rule that the probability of extinction within a taxon remained constant through evolutionary time (Van Valen 1973, 1).

syn. Law of Constant Extinction (Benton 1985, 52)

cf. hypothesis: Red Queen hypothesis

Comments: Exceptions to this rule are discussed by Van Valen (1973, 10). His explanation for this rule is that various species within a community maintain constant ecological relationships relative to each other, and these relationships themselves are evolving and cause a relatively constant extinction rate within a taxon.

law of heterogeneous summation *n.* Independent and heterogeneous features of a stimulus situation are additive in their effects upon an animal's behavior (Seitz 1940 in Tinbergen 1951, 81).

[Seitz (1940) coined this as *Reizsummenregel* which is German for law of heterogeneous summation. Tinbergen (1951, 81) translated this as "heterogeneous summation."]

law of independent assortment See law: Mendel's laws: Mendel's second law.

law of integration See oligomerization.

law of irreversibility See law: Dollo's law.

law of parsimony *n.* The logical principle that one should assume no more causes, or forces, than are necessary to account for the facts (Hamilton 1837, Morgan 1890 in the Oxford English Dictionary 1972). *cf.* Morgan's canon; Ockham's razor; principle: parsimony

Comments: One hypothesis is more parsimonious than another if it postulates fewer processes, entities, or events of some specified type than does its rival. A more parsimonious hypothesis is standardly said to be simpler. The principle of phylogenetic parsimony is "the idea that derived similarities are evidence of relationship and ancestral similarities are not" (Sober 1992, 249).

law of recapitulation See law: biogenetic law.

law of the minimum *n.* A species' minimal requirement of any particular factor is the ultimate determinate in controlling its distribution or survival (Lincoln et al. 1985).

syn. Liebig's law (Lincoln et al. 1985)

law of relativity of ecological valency *n.* A species's range of tolerance is not constant throughout its range but varies with variations in environmental factors (Lincoln et al. 1985).

law of segregation See law: Mendel's laws: Mendel's first law.

law of the unspecialized *n.* The phenomenon that unspecialized taxa, rather than specialized ones, of all geological periods generally have been capable of adapting to new conditions in geological time (Cope 1896, 173–179 in Stanley 1972, 11).

law of tolerance *n.* An organism's distribution is limited by its tolerance to the fluctuation of a single factor (Lincoln et al. 1985).

laws of thermodynamics

► **first law of thermodynamics** *n.* “Energy can be changed from one form to another, but it cannot be created or destroyed” (Curtis 1983, 158).

syn. law of conservation of energy (Odum et al. 1988, 13)

Comment: The total energy of any system plus its surroundings remains constant despite change in the energy's form (Curtis 1983, 158).

► **second law of thermodynamics** *n.* “In all energy exchanges and conversions, if no energy leaves or enters the system under study, the potential energy of the final state will always be less than the potential energy of the initial state” (Curtis 1983, 160).

syn. law of energy dispersal (Odum et al. 1988, 13), time's arrow (Curtis 1983, 160)

Liebig's law See law: law of the minimum.

loi de balancement *n.* The concept that “the amount of material available during development is limited so that, if one structure is enlarged, another one has to be reduced in order to maintain an exact equilibrium” (Geoffroy 1818 in Mayr 1982, 463).

syn. struggle of parts (Roux in Mayr 1982, 463)

Marine Mammal Protection Act (MMPA) *n.* A U.S. law, passed in 1972 and reauthorized in 1994, that established a moratorium, with certain exceptions, on the taking of marine mammals in U.S. waters and by U.S. citizens on the high seas, and on importing of marine mammals and marine mammal products into the U.S. (http://www.nmfs.noaa.gov/prot_res/laws/MMPA/MMPA.html, 2001, which provides much detailed information about this Act).

Comments: To “take” statutorily means “to harass, hunt, capture, or kill, or attempt to harass, hunt, capture or kill any marine mammal” (http://www.nmfs.noaa.gov/prot_res/laws/MMPA/MMPA.html, 2001). Under the 1994 amendments, the U.S. Congress statutorily defined and divided the term “harassment” to mean any act of pursuit, torment, or annoyance which has the potential to injure a marine mammal or marine mammal stock in the wild (= level A harassment); or has the potential to disturb a marine mammal or marine mammal stock in the wild by causing disruption or behavioral patterns, including, but not limited to, breathing, breeding, feeding, migration, nursing, or sheltering (= level B harassment).

Meckel-Serrès law *n.* The concept of the Meckel-Serrès school that there is a parallelism between the stages of animal ontogeny and the stages of the *scala naturae* (Mayr 1982, 472).

cf. biogenesis

[after Meckel's work (1821) and Serrès' work (1860) in Mayr (1982, 472).]

Comment: “The Meckel-Serrès law was often grossly misrepresented” in post-Darwinian days.

Mendel's laws, Mendel's three laws *n. pl.*

Gregor Mendel's three principles of genetics: his first, second, and third laws (Mayr 1982, 721).

cf. genetic segregation; ³theory: Mendel's theory of inheritance

► **Mendel's first law** *n.* In sexual organisms, two members of an allele pair, or pair of homologous chromosomes, separate during gamete formation and each gamete receives only one member of a pair (Lincoln et al. 1985).

syn. law of segregation (Lincoln et al. 1985)

► **Mendel's second law** *n.* Random distribution of alleles to gametes results from random orientation of chromosomes during meiosis (Lincoln et al. 1985).

syn. law of independent assortment (Lincoln et al. 1985)

► **Mendel's third law** *n.* A dominant allele rather than a recessive allele(s) (Lincoln et al. 1985).

syn. law of dominance (Lincoln et al. 1985)

Meyrick's law See law: Dollo's law.

Murphy's law *n.*

1. United States slang, “If there are two or more ways to do something, and one of those ways can result in a catastrophe, then someone will do it” Murphy (1949 in www.hithere.com/murphy/origin.html, 2000).

[after the U.S. engineer Edward A. Murphy, Jr., who stated this idea (www.hithere.com/murphy/origin.html, 2000)]

2. United States slang, “the principle that whatever can possibly go wrong will” (Michaelis 1963).

Notes: This is actually not the original Murphy's law, but “Finagle's Law of Dynamic Negatives” (www.hithere.com/murphy/origin.html, 2000). Science fiction author Larry Niven popularized this law in several stories depicting a frontier culture of asteroid miners; this “Belter” culture professed a religion that was a running joke involving the worship of the dread god Finagle and his mad prophet Murphy. Peter W. Pappas lists many amended versions of Murphy's law, some which he originated.

3. Bills of birds in populations that inhabit islands are longer than those in conspecific populations on the mainland (Lincoln et al. 1985).

Natural Conservation Act 1980 *n.* An Australian “Act to make provision for the protection and conservation of native animals and native plants, and for the reservation of areas for those purposes” (Australian Capital Territory, 2009).

natural law *n.* A regularity of nature that persons may use as a binding principal that offers “a cosmic backing for the transition from *is* to *ought*” (Collins 1959 in Futuyma 1986, 8).

cf. law

Nature Conservation and Amenity Lands

(Northern Ireland) Order 1985 *n.* A law that includes the establishment, management, and maintenance of nature reserves in Northern Ireland (Office of Public Sector Information 2009).

pigmentation rule See law: Golger's rule.

Red-Queen law See hypothesis: Red-Queen hypothesis.

Rensch's laws, Rensch's rules *n.*

1. In cold climates, populations of mammals have larger litters and birds have larger clutches than conspecific populations in warmer climates (Lincoln et al. 1985).

2. Birds have shorter wings and mammals have shorter fur in warmer climates compared to colder ones (Lincoln et al. 1985).
- syn.* wing rule (Lincoln et al. 1985)
3. Races of land snails in colder climates have brown shells and those in warmer climates have white shells (Lincoln et al. 1985).
4. Thickness of land-snail shells is positively associated with strong sunlight and arid conditions (Lincoln et al. 1985).

cf. rule: ecogeographical rule

Schwerdtfeger's law of compensation and moderation *n.* A limiting factor seldom operates in isolation but is influenced by the simultaneous action of other factors (Lincoln et al. 1985).

square law See law: Hardy-Weinberg law.

Van-Valen's law See law: law of extinction.

von Baer's laws *n. pl.* Four main concepts proposed by von Baer (1828) to take the place of the idea of a parallelism between ontogeny and level of organization in animals (*scala naturae*): (1) the more general characters of the large group of animals to which an embryo belongs appear earlier in its development than the more special characters; (2) the less general kinds of animals develop from the more general kinds, until the most derived appear; (3) every embryo of a given animal kind becomes separated from all other states of other definite forms instead of passing through them; and (4) fundamentally, the embryo of a higher form resembles the embryo of another animal kind, but not its adult (Mayr 1982, 473–475).

cf. -genesis: biogenesis

syn. law of development

Wallace's law *n.* “Every species has come into existence coincident both in space and time with a pre-existing closely allied species” (Wallace 1855 in Mayr 1982, 419).

Weber's law *n.* ΔI divided by I equals a constant (K) (Weber's function); where I = the magnitude of a standard stimulus and ΔI = the increment in stimulus intensity required to produce a just noticeable difference in intensity (Weber 1934 in McFarland 1985, 206).

cf. law: Fechner's law; study of: physics: psychophysics, physiology: psychophysics

Comment: In general, “Weber's law” holds true for intermediate (normal) stimulus-intensity ranges, but tends to break down at range extremes (McFarland 1985, 207).

[after E. H. Weber, German physiologist]

Wildlife and Countryside Act 1981 *n.* A British act that “covers protection of wildlife (birds, and some animals and plants), the countryside, National Parks, and the designation of protected areas, and public rights of way” (Joint Nature Conservation Committee 2009).

Comments: This Act “consolidates and amends existing national legislation to implement the Convention on the Conservation of European Wildlife and Natural Habitats (Bern Convention) and Council Directive 79/409/EEC on the Conservation of Wild Birds (Birds Directive) in Great Britain” (Joint Nature Conservation Committee 2009). This Act received royal assent on 30 October 1981, went into force in incremental steps, and has many amendments.

wing rule See law: Rensch's laws.

Yarrell's law *n.* The strength of the influence of a domestic breed, or geographical variety, in cross breeding is positively correlated with its age (in generations) (Mayr 1982, 692).

[coined by C. R. Darwin after William Yarrell, one of his animal breeder friends from whom he might have obtained this generalization. Darwin admitted that this phenomenon does not always occur (Mayr 1982, 692).]

Yerkes-Dodson law *n.* An animal's “optimum motivation for a learning task decreases with increased complexity of the task” (Hinde 1970, 220).

♦ **Lcyc** See gene: Lcyc.

♦ **LD₅₀, LD50** *n.* The lethal dose of a toxin that causes 50% of a test group of organisms to die (Ware 1983, 284).

Comments: LD₅₀s are expressed as mg of toxicants ingested by a mammal per kg of body weight (Ware 1983, 284). LD₅₀s for Western Honey Bees are expressed as µg per bee (Johansen 1977, 182).

♦ **L-DOPA** See drug: L-DOPA.

♦ **leader** *n.* An animal that practices leadership (*q.v.*)

♦ **leadership** *n.*

1. A person's dignity, position, or office of a leader, especially of a political party; also, his ability to lead (Oxford English Dictionary 1972, entries from 1834).
2. An individual animal's leading other members of its society when its group progresses from one place to another (Wilson 1975, 311, 588); an individual's ability to influence the movement pattern of its group as it goes from place to place (Dewsbury 1978, 96).
3. For example, in *Pan troglodytes* (Chimpanzees): An animal's initiating its group movement (Wilson 1975, 546).

Comment: In many primate troops, females are leaders (Dewsbury 1978, 96).

♦ **leaf litter** See litter.

♦ **leakage** *n.* The natural incorporation of genes of one species into the gene pool of another species (Mayr 1982, 284).

♦ **leaky gene** See allele: hypomorphic allele.

♦ **learned helplessness** See learning: learned helplessness.

♦ **learning** *n.*

1. A person's receiving instruction or acquiring knowledge (Oxford English Dictionary 1972, entries from year 897).
2. In Animals: “A central nervous process causing more or less lasting changes in the innate behavioural mechanism under the influence of the outer world” (provisional definition of Tinbergen 1951, 142, made with his indication of the difficulty of defining learning).

Notes: This definition is restrictive because it excludes “animals” without nerves, e.g., protozoans. Most, if not all, animal species learn.

3. In Animals: Any systematic behavioral change, whether or not it is adaptive, is desirable for certain purposes or is in accordance with any other such criteria (Bush and Mosteller 1955, 4, in Dyal and Corning 1973).

4. In Animals: The process that “manifests itself by adaptive changes in individual behavior as a result of experience” (Thorpe 1956, 55, in Dyal and Corning 1973, 3).

Note: This is a widely used concept of learning. Mpitsos et al. (1978, 497), Lorenz (1981 in Immelmann

- A
- and Beer 1989, 171), and Alcock (1975, 66–67) give similar definitions.
5. In Animals: “The organization of behaviour as a result of individual experience” (Thorpe 1956, 55, in Dyal and Corning 1973, 4).
 6. A relatively permanent increase in an individual animal’s “response strength that is based on previous reinforcement and that can be made specific to one out of two, or more, arbitrarily selected stimulus situations” (Miller 1967 in Dyal and Corning 1973, 4). *Note:* This definition excludes most instances of habituation, sensitization, and pseudoconditioning.
 7. A system’s having an output (response) to a given test input stimulus pattern that is a function of the system’s total previous input-output pattern of which the test input was a part (Eisenstein 1967 in Dyal and Corning 1973, 4).
 8. An individual animal’s behavioral change that results after its association of particular stimuli and responses, *i.e.*, associative learning (Mpitsos, 1978, 497).
 9. In Animals: Very broadly, “a change in behavior that occurs as the result of practice” (Dewsbury 1978, 320).
 10. An individual animal’s relatively permanent changes other “than those due to maturation or senescence, fatigue, or sensory adaptation (themselves all hard to define)” (Hinde 1982, 175).

syn. learned behavior

Comments: Dyal and Corning (1973), Dewsbury (1978), and Hinde (1982) discuss problems with defining learning. Dyal and Corning (1973, 5) suggest that it could be useful to drop the term “learning” and replace it with “behavioral plasticity,” “nervous-system plasticity,” or “behavioral modification” based on experience. Separating “learning” from “physiological maturation” can be difficult. “Learning” includes an animal’s habit formation due to “conditioning,” information acquisition, and information storage in memory; learning mechanisms in different kinds of animals are likely to be profoundly different (Immelmann and Beer 1989, 171–172). Different workers often use different classifications of learning (Thorpe 1956 in Hinde 1970, 577–583; Thorpe 1963; Alcock 1984). Below, I give definitions of some of the named kinds of learning. Some of these named kinds are not discreet from other kinds.

alternation learning *n.* Learning in which an animal must alternate (*e.g.*, left, right, left, right, etc.) its response in successive trials in order to select the correct sample stimulus (Dewsbury 1978, 331).

associative learning See learning: conditioned learning.

autoinstruction See learning: programmed learning.

automated teaching See learning: programmed learning.

avoidance learning *n.* An animal’s learning to keep away from a particular stimulus (Dewsbury 1978, 325).

► **active-avoidance learning** *n.* For example, in some frog and toad species: Avoidance learning in which an animal must make an appropriate response if it is not to be exposed to an aversive stimulus” (Dewsbury 1978, 325).

► **passive-avoidance learning** *n.* For example, in a land-snail and a toad species: Avoidance learning in which an individual stops showing a previously

shown response due to an aversive stimulus (Dewsbury 1978, 327).

becoming accustomed, habit formation *n.*

An animal’s associating certain key stimuli with a “multitude of other stimulus configurations” and then responding to these key stimuli only when they occur with the stimulus configurations (Lorenz 1981, 272). *cf.* learning: habituation

[German *angewöhnen*, to become accustomed to something that, during the process, becomes more and more indispensable (Lorenz 1981, 272)].

behaviorally silent learning *n.* Learning during which an animal shows no outward behavior changes that indicate learning is taking place (Dickinson 1980 in McFarland 1985, 351).

concept learning *n.* An animal’s learning to identify and use the attributes that objects, or situations, have in common (Storz 1973, 55).

conditioned learning, conditional learning, conditioning *n.* For example, in Annelida, Arthropoda, Cnidaria, Platyhelminthes, Vertebrata: “The process of acquisition by an animal of the capacity to respond to a given stimulus with the reflex reaction proper to another stimulus (the reinforcement) when the two stimuli are applied concurrently for a number of times” (1948 Round Table Conference on nomenclature in animal behavior in Thorpe 1963, 80; Dyal and Corning 1973).

syn. associative learning

cf. association

Comments: According to Verplanck (1957), there are as many kinds of conditioning as there are sets of conditioning operations. Perhaps conditioning can be subdivided into “classical conditioning” and “operant conditioning;” however, drive-reduction theorists argue that both kinds of conditioning inevitably occur whichever procedure one follows and that the only distinction that can be made is in terms of which one of several responses is observed. Other workers prefer to admit that conditioned responses of both types can be observed in the same animal at the same time as a function of the same reinforcing stimulus. Conditioning also refers to the procedure used to elicit a subject’s conditioned response. Scientists disagree whether conditioning occurs in Protozoa (Dyal and Corning 1973, 117). Dyal and Corning (1973, 15–21) describe “alpha conditioning,” “associative backward conditioning,” “beta conditioning,” “classical conditioning,” “delta conditioning,” and “differential conditioning.” Below, are definitions for only some of the many described kinds of “conditioning.” Larvae of *Manduca sexta* (Tobacco Hornworm) conditioned to an odor aversion show the same aversion as adults (Blackiston et al. 2008, 1736e). Such associative learning also occurs in some ant, beetle, *Drosophila*, and parasitic-wasp species. *Cyprinus carpio* (Koi) at the U.S. Arboretum swim to a feeding area when they see people in the area and raise their mouths above the water surface and open their mouths (fig. 27).

► **approximation conditioning** *n.* Operant conditioning of an unusual performance that is taught to a subject in steps, *e.g.*, to train a Domestic Dog to jump up against a wall, an experimenter may first reinforce a head turn, then one, or more, steps toward the wall, and so on (Verplanck 1957).

Comment: The timing of the reinforcements is critical: they must follow a reinforced response within a second or so (Verplanck 1957).

► **avoidance conditioning** *n.*

1. Conditioning in which a subject's response prevents an experimenter from administering a negatively reinforcing stimulus which would otherwise occur shortly after the onset of a conditioned stimulus, CS (Verplanck 1957).
- Note:* Some workers classify "avoidance conditioning" as operant conditioning under intermittent reinforcement (Verplanck 1957).
2. An animal's coming to avoid a stimulus that it initially found neutral, or even sought, due to its associated aversive experience (fright, pain, nausea) with the stimulus (Immelmann and Beer 1989, 25).

syn. avoidance learning (Roper and Redston 1987, 739)

active-avoidance conditioning *n.* Avoidance conditioning in which an animal learns to make a response toward an avoided stimulus (Dyal and Corning 1973, 13).

passive-avoidance conditioning *n.* Avoidance conditioning in which an animal learns to inhibit making a response toward an avoided stimulus (Dyal and Corning 1973, 13).

► **classical conditioning** See Pavlovian conditioning.

► **counterconditioning** *n.* Conditioning in which a subject learns to give a second and conflicting response to a conditioned, or discriminative, stimulus of a response that is reinforced (Verplanck 1957).

► **escape conditioning** *n.* Operant conditioning in which a subject's successive responses repeatedly terminate a negative reinforcement (Verplanck 1957).

cf. behavior: escape behavior

► **higher-order conditioning** *n.* Conditioning in which a stimulus-response correlation of a classical-conditioning situation serves as an unconditioned stimulus for a new second-order conditioned response and so on (Verplanck 1957).

► **instrumental conditioning, instrumental learning** See learning: conditioning: trial-and-error conditioning.

► **negative conditioning, negative reinforcement** *n.* An investigator's use of aversive stimulation, such as electric shock, to change an animal's behavior (Immelmann and Beer 1989, 198).

cf. reinforcement

► **operant conditioning** *n.*

1. Laboratory conditioning "in which an operant response (*q.v.*) is followed on a proportion of occasions by a reinforcer (*q.v.*)" (Hinde 1982, 280).

2. Laboratory conditioning in which an animal actively associates a new behavior with reduction of one of its needs or some other sought after circumstance (Immelmann and Beer 1989, 56).

syn. learning by result, trial-and-error learning, shaping (Immelmann and Beer 1989, 57)

Comments: Most cases of training are operant conditioning. Learning similar to operant conditioning occurs in nature (Immelmann and Beer 1989, 56).

► **Pavlovian conditioning** *n.* For example, in many animal species, including Humans and rats: Conditioning in which an organism elicits a conditional response (which was at first an unconditional response) toward a conditional stimulus (Dewsbury 1978, 322; MacQueen et al. 1989, 83).

syn. classical conditioning (Hinde 1982, 278), conditioned reflex II, conditioned response II, operant conditioning, respondent conditioning, type-S conditioning, type-1 conditioning. Only some of these may be precise synonyms according to Verplanck (1957).

cf. autoshraping

Comment: In a typical classical-conditioning experiment, an investigator, or circumstance, presents an "unconditional stimulus, UCS," to an organism which then shows an "unconditional response, UCR," to this stimulus. Then, the organism is presented with a second stimulus, "the potential conditional stimulus, CS," that does not reliably elicit the UCR, at about the same time as the UCS for a number of trials. After these paired presentations, the organism shows a "conditional response, CR," toward the CS. The CR is identical, or similar, to the UCR.

[after Ivan I. Pavlov, Russian scientist credited with the discovery of this kind of conditioning]

► **perceptual learning** *n.* Learning in which an organism perceives stimuli as more distinct, or differentiated, through experiencing these stimuli repeatedly; contrasted with associative learning (Zentall 1993, 834).

► **preimaginal conditioning** *n.* An individual's retaining learning through metamorphosis from a larva into an adult (Barron and Corbet 1999, 621).

Comment: Barron and Corbet (1999) did not find preimaginal conditioning in *Drosophila melanogaster*.

► **pseudoconditioning** *n.*

1. In some annelid and cephalopod species, many vertebrate species: "The strengthening of a response to a previously neutral stimulus through the repeated elicitation of the response by another stimulus without paired presentation of the two stimuli" (Marquis née Kimble 1961 in Dyal and Corning 1973, 9).

2. An animal's increased probability of eliciting a particular response due to a neutral stimulus "as a consequence of repeated elicitation of its response by the stimulus it is already associated with, but without the contingent relationship between the two stimuli that obtains in true conditioning" (Immelmann and Beer 1989, 236).

syn. sensitization (Storz 1973, 211)

cf. learning: conditioning: sensitization; sensitization

Comment: Dyal and Corning (1973, 10–11) describe "pseudoconditioning type S," "pseudoconditioning type R," and "pseudoconditioning type SR."

► **rapid-food-avoidance conditioning** *n.* For example, in some bird, rat, slug, and toad species; Humans: an individual's waiting a specific period after eating a new food, and if it becomes sick after eating it, it never eats it again (Gould 1982, 264).

► **sensitization** *n.* The increase in the strength of a reflex that was originally evoked by a conditional stimulus through its conjunction with an unconditional stimulus and response (Dyal and Corning 1973, 9).

syn. alpha conditioning (Dyal and Corning 1973, 9)

cf. learning: conditioning: pseudoconditioning

Comment: "Sensitization" differs from conventional conditioning in that the strengthened response is appropriate to the conditional stimulus not the

unconditional one (Hilgard and Marquis née Kimble 1961 in Dyal and Corning 1973, 9).

► **trial-and-error learning** *n.* An animal's "development of an association, as the result of reinforcement during appetitive behaviour, between a stimulus or a situation and an independent motor action as an item in that behavior when both stimulus and motor action precede the reinforcement and the motor action is not the inevitable inherited response to the reinforcement" (Thorpe 1951 in Thorpe 1963, 88), *e.g.*, a toad's learning to avoid eating a toxic millipede after experiencing it (Alcock 1975, 67).

syn. conditioned reflex I, conditioned response I, instrumental conditioning, instrumental learning (Spence 1956 in Dyal and Corning 1973, 22), operant conditioning (Immelman and Beer 1989, 57) *Comment:* Dyal and Corning (1973, 22–29) describe 12 kinds of instrumental conditioning: "controlled appetitive instrumental conditioning," "controlled aversive instrumental conditioning," "free appetitive instrumental conditioning," "free aversive instrumental conditioning," "controlled appetitive differential instrumental conditioning," "controlled aversive differential instrumental conditioning," "free appetitive differential instrumental conditioning," "free aversive differential instrumental conditioning," "controlled appetitive choice learning," "controlled aversive choice learning," "free appetitive choice learning," and "free aversive choice learning."

contextual learning *n.* Learning that affects sound usages and comprehension; contrasted with vocal learning (Janik and Slater 1997, 59).

Comment: Species that show contextual learning include many bird species, *Canis familiaris* (Domestic Dogs), *Cavia porcellus* (Guinea-pigs), *Felis catus* (Domestic Cats), Humans and other primate species, a sea-lion species, *Tursiops* sp. (bottlenose dolphin), and some rat species (many references in Janik and Slater 1997, 59).

discrimination learning *n.* An animal's learning to tell the difference between two stimuli (McFarland 1985, 214).

cf. learning; conditioning; trial-and-error learning

Comment: Dyal and Corning (1973, 22) divide "discrimination learning" into differential "conditioning" (= "successive discrimination learning") and "choice learning."

empathic learning *n.*

1. An animal's learning to avoid a particular object because it has either observed a second animal learn to avoid the object or has established a social relationship with an animal that avoids the object (Klopfer 1957, 61).

2. "Unrewarded learning that occurs when one animal watches the activities of another" (Lincoln et al. 1985).

cf. social imitation

escape learning *n.* An animal's learning to remove itself from a noxious, or unpleasant, situation; *e.g.*, a human child's learning to run away from a yard where a vicious Domestic Dog has tried to attack him (Storz 1973, 90).

cf. learning; conditioning; avoidance conditioning

exploratory learning *n.* An animal's learning new information about its environment that it tends to use primarily later in its life, *e.g.*, a mouse's memorizing landmarks around its nest and later using this

knowledge to take the fastest route back to its nest when a predator threatens it (Alcock 1979, 79). *syn.* exposure learning (Hinde 1982, 279)

facilitation *n.* The "most primitive" kind of learning in which an animal improves its behavior by performing it (Lorenz 1981, 263), *e.g.*, a young chicken's improving its pecking aim (Hess 1956 in Lorenz 1981, 264).

cf. facilitation

facultative learning *n.* Learning that is not essential to an animal's life; for example, individual recognition, learning derived from exploration and play behavior, and many of the "extraneous" things that Humans learn (Immelman and Beer 1989, 172).

cf. learning; obligate learning

Comment: The distinction between facultative and obligate learning is not hard and fast (Immelman and Beer 1989, 172).

habituation *n.*

1. For example, in some fungus species, single nerve fibers, Protozoa, and species in all animal phyla: An organism's learning not to respond to stimuli that are not significant in its life (Humphrey 1933 in Thorpe 1963, 60).
2. The waning of the probability, or amplitude, of an individual's unconditioned response as a function of repeated presentation of an effective stimulus (Spencer 1966 in Dyal and Corning 1973, 7).
3. In multicellular animals: An individual's showing a waning response with respect to a repeated stimulus, or a sequential series of similar stimuli (Lorenz 1981, 265).

Note: Habituation is thought to involve both peripheral and central nervous systems in animals with more complex nervous systems (Lorenz 1981, 265).

syn. adaptation (not a preferred synonym according to Verplanck 1957), stimulus adaptation (Lorenz 1981, 265)

cf. ³adaptation: ¹physiological adaptation: sensory adaptation; habituation; learning: conditioning: becoming accustomed; sensitization; stimulus generalization

Comments: For example, a *Hydra* shows "habituation" to turbulent water of a brook (Lorenz 1981, 265). Some workers consider "habituation" to be a simple form of learning; others argue that no new association is formed during "habituation" (Immelman and Beer 1989, 127). Thompson and Spencer (1966 in Dyal and Corning 1973, 6–8) advance nine criteria as constituting an operational definition of habituation.

► **dishabituation** *n.* An animal's sudden recovery of its response that was just previously a habituated one (Dewsbury 1978, 322).

imitation See learning: social-imitative learning.

imprinting *n.*

1. Something's impressing, or fixing, itself in a person's mind, or memory; formerly often a person's impressing something on his own mind; considering, or remembering, something carefully (Oxford English Dictionary 1972, verb entries from 1374).

2. An individual animal's learning to respond to a sign stimulus (= releaser) only at a particular time (= sensitive period) of its life and often retaining this response throughout its life, *e.g.*, a Jackdaw's imprinting on other Jackdaws as social companions, a young precocial bird's imprinting on its mother, or a mother goat's imprinting on the odor of her young (Spalding 1872 and Heinroth 1910,

1911, in McFarland 1985, 366; Lorenz 1935 and Hess 1973 in Heymer 1977, 131).

syn. Prägung (Lorenz 1935 in Tinbergen 1951, 150)
v.t. imprint

cf. gene imprinting

Comments: “There is little that can be said by way of defining imprinting that cannot be challenged or queried” (Sluckin 1967, 15). Gould (1982, 63) suggests that animals may stop responding to releasers of objects upon which they have imprinted after they start responding to a suite of characters of these objects. Through the years, workers have debated on whether imprinting is irreversible, whether it is learning, etc. McFarland (1985) suggests that imprinting is not a unique kind of learning without components of other kinds of learning. Immelmann and Beer (1989, 140) write that boundaries between imprinting and other kinds of learning are now considered to be less distinct.

► **classical imprinting** *n.*

1. Lorenz's original definition of imprinting which is similar to imprinting (def. 2).
2. A young precocial bird's acquisition of a more, or less, specific attachment to an object without its obtaining a conventional reward such as food or water in the process (Sluckin 1965, 36).

► **egg imprinting** *n.* In birds parasitized by some cuckoo species and *Molothrus ater* (Brown-headed Cowbirds): A parent's imprinting on its own eggs and thus discriminating them from parasite eggs (Gould 1982, 267).

► **erroneous imprinting** *n.* An animal's imprinting on an object other than its natural object, *e.g.*, rarely in ducks and geese when a female whose nesting is disturbed rears the young of the mother of another species that laid eggs in her nest or under experimental conditions when a young animals imprints on an unnatural object (Immelmann and Beer 1989, 90).

syn. malimprinting (Immelmann and Beer 1989, 90)

► **filial imprinting** *n.* In some mammal species; precocial-bird species: A young's imprinting on its parent, or foster parent, which becomes less important to the imprinter as it reaches adulthood; this imprinting often involves a young's following its imprinter (McFarland 1985, 372; Immelmann and Beer 1989, 104).

syn. following-response imprinting (Immelmann and Beer 1989, 104), parent imprinting (Gould 1982, 61)

Comment: Domestic Dog puppies and some birds imprint on Humans as social partners.

► **food imprinting** *n.* For example, in *Gallus gallus* (Domestic Chickens), some insect species with herbivorous larvae; *Mustela putorius* (European Polecats); some snake, tortoise, and turtle species: A young animal's rapidly forming a specific food preference, which may persist from short to long periods (Immelmann and Beer 1989, 110).

Comment: Because this behavior may not last long using “imprinting” in its name is questionable (Immelmann and Beer 1989, 110).

► **habitat imprinting, environmental imprinting** *n.* An animal's imprinting on a specific habitat type while young (Immelmann and Beer 1989, 125).

► **hormonal imprinting** *n.* An animal's hormone-mediated developmental change that occurs early in its development, is very persistent, and is relatively impervious to later reversal, *e.g.*, determination of whether an animal develops male, or female, sexual behavior (Immelmann and Beer 1989, 140).

cf. learning; imprinting; neural imprinting

► **host imprinting** *n.* In some cuckoo species, *Vidua* sp. (widow birds): A female's strong tendency to parasitize the same bird species that reared her (Immelmann and Beer 1989, 136).

Comment: The appropriateness of “imprinting” in this term is not fully understood (Immelmann and Beer 1989, 136).

► **human imprinting** *n.* A hand-reared animal's imprinting on a human caretaker (Immelmann and Beer 1989, 90), *e.g.*, imprinting on a person's hand by a *Minus polyglottis* (Northern Mockingbird) (pers. obs.).

cf. imprinting; erroneous imprinting

► **locality imprinting** See imprinting; place imprinting.

► **neural imprinting** *n.* A developmental change in an animal's central nervous system that occurs early in its development, is very persistent, and is relatively impervious to later reversal (Immelmann and Beer 1989, 140).

cf. learning; imprinting; hormonal imprinting

► **object imprinting** *n.* An animal's imprinting on a biologically inadequate object, *e.g.*, a member of the wrong species or a moving box (Lorenz 1935 in Heymer 1977, 123).

cf. response: following response

► **offspring imprinting** *n.* For example, in *Capra aegagrus hircus* (Domestic Goats), *Larus argentatus* (Herring Gulls), *Ovis aries* (Domestic Sheep), *Streptopelia risoria* (Ring Doves): A parent's imprinting on its young (Gould 1982, 61).

► **olfactory imprinting** *n.* An animal's place imprinting involving chemoperception (Immelmann and Beer 1989, 222).

► **parent imprinting** See learning: imprinting; filial imprinting.

► **place imprinting, home imprinting, locality imprinting, site imprinting** *n.* In some fish and bird species, possibly Humans: Imprinting on a particular geographical region using phenomena including chemoperception and stellar orientation (Immelmann and Beer 1989, 222).

► **sexual imprinting** *n.* For example, in *Gallus gallus* (Domestic Chickens), *Columba livia* (Rock Doves), some duck species, *Taeniopygia guttata* (Zebra Finches): Imprinting on a conspecific, or other object, as an object selected as a mate (Lorenz 1935 in Heymer 1977, 131; Immelmann 1972 in Gould 1982, 267; Immelmann and Beer 1989, 267).

► **song imprinting** *n.* An animal's imprinting on its species-specific song (Immelmann and Beer 1989, 140, 282).

cf. learning; song learning

► **species imprinting** *n.* An animal's imprinting on its own species (Gould 1982, 61).

insight learning *n.*

1. For example, in Humans, *Pan troglodytes* (Chimpanzees), possibly in *Apis mellifera* (Western Honey Bees): An individual's producing “a new adaptive response as a result of insight,” its apprehension of relationships between (among)

- particular things (Thorpe 1963, 121; Hinde 1970, 582; Gould and Gould 1988, 221).
2. An animal's mastering a new task, or solving a new "problem," without the help of pre-programmed innate responses and without previously having attempted the task or the solution to the problem (Heymer 1977, 60); an animal's learning in which it associates stimuli that are within its "mind;" a "mental trial-and-error" learning in which solutions to a problem "come in a flash."

syn. innovation (Immelmann and Beer 1989, 151)
cf. aha experience, behavior: innovative behavior, insight

Comments: "Insight learning" derives from Gestalt psychology, especially Köhler's (1925) study of ape intelligence (Immelmann and Beer 1989, 151). Immelmann and Beer (1989, 150) report that "insight learning" is a little used term today because it carries a connotation of consciousness; "innovative behavior" (= "innovation") is used instead. Mackintosh (in McFarland 1987, 344) questions Köhler's interpretations of his Chimpanzee experiments.

instinct See instinct.

instrumental learning See learning: trial-and-error learning.

kinesthetic learning *n.* Learning in which an animal remembers to perform specific movements or place its body parts in specific positions (Immelmann and Beer 1989, 165).

cf. method: putting-through method; modality: kinesthesia

landmark learning *n.* For example, *Apis mellifera* (Western Honey Bees), some digger-wasp species; Humans: An individual's learning the position and other attributes of a landmark (Tinbergen and Kruyt 1938, Frisch 1967, etc. in Gould 1987, 35).

latent learning *n.*

1. An animal's "association of indifferent stimuli or situations without patent reward" (Konorski in Thorpe 1963, 101).
2. An animal's being exposed to a situation with no immediate beneficial, or harmful, contingency, and later being able to use this experience in obtaining a reward or avoiding hurt; *e.g.*, rats with prior access to a maze master it more quickly than rats new to the maze when an investigator reinforces their arrival at a goal box (Immelmann and Beer 1989, 171).

syn. incidental learning (Storz 1973, 126)
[i]coined by Blodgett in Thorpe (1963, 101)]

learned helplessness *n.* An animal's learning that it can do nothing to improve a situation (Maier and Seligman 1976 in McFarland 1985, 351).

localized learning *n.* An animal's often species-specific tendency to learn some things much more readily than others (Tinbergen 1951, 145).

obligate learning *n.* Learning that is essential to an animal's life; *e.g.*, imprinting or learning about predator defense and obtaining food (Immelmann and Beer 1989, 172).

cf. learning: obligate learning

Comment: The distinction between "facultative learning" and "obligate learning" is not hard and fast (Immelmann and Beer 1989, 172).

observational learning See learning: empathic learning.

oddity learning *n.* An animal's learning to select an odd symbol from a group of symbols (McFarland 1985, 509).

cf. test: oddity test

prenatal learning *n.* For example, in *Gallus gallus* (Domestic Chickens), a guillemot species, some mammal species: An animal's learning that occurs prior to its birth or hatching (Immelmann and Beer 1989, 231).

programmed learning, programmed instruction, autoinstruction, automated teaching *n.* A person's self-instructed learning with use of textbooks, mechanical apparatuses, various kinds of audiovisual devices, etc. (Storz 1973, 21).

reversal learning *n.* Learning in which a conditioned response is caused to be wrong such that an animal's previously incorrect response becomes a correct one due to experimental design (Bittermann 1965 in Heymer 1977, 184).

cf. test: reversal test

sensitization See learning: conditioning: sensitization.

song learning *n.* For example, in *Melospiza georgiana* (Swamp Sparrows) and *Zonotrichia albicollis* (White-throated Sparrows): An individual's learning its species-specific communication during a sensitive period (Alcock 1979, 69; Gould 1982, 268–274).

social-imitative learning, social imitation, imitative learning, imitation *n.* In some vertebrate species: An animal's learning in which it modifies its behavior by mimicking other animals, usually conspecifics; *e.g.*, sweet-potato washing and placer mining of wheat grains in *Macaca fuscata* (Japanese Macaques) (Kawai, 1965a in Wilson 1975, 170), mobbing a particular kind of bird by other kinds of birds, loss of island tameness, hammering or stabbing shellfish by oyster catchers (birds), or cooking traditions in Humans (Gould 283–287).

syn. aping, cultural learning (Gould 1982, 285), keeping-up-with-the-Joneses, modeling, social learning (Storz 1973, 124), monkey-see-monkey-do behavior

cf. behavior: allelomimetic behavior; cultural exchange; Imo (Animalia, Appendix 1); innovation; social facilitation

Comments: Social-imitative learning is common in Humans, and besides cooking traditions, it includes dressing and speaking styles. Children, especially teenagers, are very style conscious. For example, in parts of the U.S., children wanted specific styles of backpacks and wore them in specific ways, using both straps over their shoulders and keeping them low so that they touched their buttocks (Salmon 1997, A1).

► **mate-choice copying** *n.* Social-imitative learning in which an animal chooses a mate that it sees a conspecific of its same sex choose; *e.g.*, in *Poecilia reticulata* (Guppies) (Dugatkin 1998, 323; Dugatkin and Godin 1998, 60) and *Tetrao tetrix* (Black Grouse) (Alatalo in Dugatkin and Godin 1998, 60).

trial-and-error learning See learning: conditioning: trial-and-error learning.

true imitation *n.* For example, in some primate species: An individual's "copying of a novel or otherwise improbable act or utterance, or some act for which there is clearly no instinctive tendency" (Thorpe 1963, 135), *e.g.*, learning a particular song dialect by a bird or learning to wash potatoes by *Macaca fuscata* (Japanese Macaques) (Wilson 1975, 51).

verbal learning See study of: verbal learning.

vocal learning *n.* In some bird and mammal species: An individual's learning a sound(s); its modifying a vocalization(s) as a result of experience with another individual's vocalization; contrasted with contextual learning (Janik and Slater 1997, 59).
Comment: Species that show vocal learning include Humans, some hummingbird and parrot species, Megaptera novaeangliae (Humpback Whales), Oscine Songbirds, *Phoca vitulina* (Harbor Seals) (references in Janik and Slater 1997). These authors also report the possibility of vocal learning in some bat species and other primate, seal, and whale species and discuss hypotheses regarding functions of vocal learning.

vocal mimicry, vocal mocking *n.* For example, in Humans, *Mimus polyglottis* (Northern Mockingbirds), some parrot species, *Phoca vitulina* (Harbor Seals), *Tursiops* sp. (bottlenose dolphins): Social-imitative learning in which an individual imitates vocalizations of another species (Immelmann and Beer 1989, 139; Janik and Slater 1997, 62, 64).

syn. vocal imitation (Janik and Slater 1997, 64)
cf. mimicry: vocal mimicry

♦ **learning capacity** *n.* An animal's ranges and limits of what, when, and how it can learn; thus, the kinds of experience it can register and store, the kinds of behavior it can acquire, the associations of stimuli and responses it can make, the amount of learned information that it can store at any one time, its ability to retain effects of experience, unlearn associations, and replace associations with new ones (Immelmann and Beer 1989, 172–173).

♦ **learning disposition** *n.* An organism's predetermined, presumably genetically-based learning capacity that governs its potential for information uptake and analysis (Buchholtz 1973, Rensch 1973 in Heymer 1977, 110; Immelmann and Beer 1989, 173–174).

cf. dimension of preparedness, equipotentiality assumption

♦ **learning-program schedule** *n.* In some bird species: A young male's imitating only the song of his father (Nicholai 1959 in Heymer 1977, 111).

♦ **learning set** *n.* An animal's improvement over a series of discrimination problems (Harlow 1949 in McFarland 1985, 508).

♦ **learning theory** See ³theory: learning theory.

♦ **learning to learn** *n.* An animal's generalized improvement in its ability to solve a class of problems that results from working on some of the particular problems from the class (Storz 1973, 147).

♦ **lease** See ²group: lease.

♦ **leash** See ²group: leash.

♦ **Lebenskraft** *n.* A hypothetical special vital force found in life that is distinct from forces studied by physicists (Mayr 1997, 9–10).

syn. Entelechie, élan vital (Mayr 1997, 9–10)

cf. vitalism

♦ **Lebensspur** See fossil: trace fossil.

♦ **lecithotrophic** See -trophic: lecithotrophic.

♦ **-lectic** *comb. f.* Referring to choosing, gathering, or both.

[Greek *lectos*, choose, gather]

cf. -phage: monophage-oligophage-polyphage continuum; -tropy

comb. f. for nouns -lecty

Comments: Workers use “-lectic” (*syn.* trophic) to signify animal species' relationships to flowers, and

A CLASSIFICATION OF “-LECTIC” WITH REGARD TO THE NUMBER OF PLANT SPECIES, GENERA, AND FAMILIES A BEE SPECIES USES FOR POLLEN^a

KIND OF -LECTIC	NUMBER OF SPECIES USED FOR POLLEN	NUMBER OF GENERA USED FOR POLLEN	NUMBER OF FAMILIES USED FOR POLLEN
monolectic	1	1	1
oligolectic	2–10	2–3	2–3
polylectic	> 10	> 3	> 3

^a Lectar is classified by the number of species, genera, or families used for pollen.

²-phile (*q.v.*) to signify flower relationships to kinds of animals. Loew (1884) originally coined “-tropy” for this usage; Robertson used “-lecty” (Faegri and van der Pijl 1979, 45). Researchers define “-lectic” with regard to the number of taxa a bee species uses for pollen (Michener 1974, Faegri and van der Pijl 1979, Nichols 1989, O'Toole and Raw 1991) and oil (Faegri and van der Pijl 1979). The table above is a suggestion for designating kinds of bee-flower “-lectic” associations.

eulectic See -tropic: eutropic.

hemilectic See -tropic: hemitropic.

monolectic *adj.*

- Referring to a flower-visiting animal species, *e.g.*, a bee, that obtains one kind of resource, *e.g.*, pollen or nectar, from only one plant species or a group of closely related plant species (Faegri and van der Pijl 1979, 46–48).

syn. monotropic (Faegri and van der Pijl 1979, 46–48)

- Referring to a bee that obtains pollen from only one plant species (Nichols 1989).

cf. -lectic: oligolectic, polylectic; -phage: monophage

Comments: Researchers determine “-lecty” with regard to kind of resource obtained, number of plant sources used, and taxonomic relatedness of the sources. For example, a *Centris* bee species is monolectic with regard to *Calceolaria* for oil, but polylectic with regard to other species for pollen and nectar (Faegri and van der Pijl 1979, 46). Bees usually use many plant species as nectar sources; therefore, researchers do not use monolectic, oligolectic, and polylectic with regard to nectar collecting. Because “monolecty” grades into “polylecty,” for precision, it is useful to consider a “monolectic species” to be one that uses one species of plant or one genus; an “oligolectic species,” that uses two through 10 plant species, two through three genera, or both; and a “polylectic species,” one that uses over 10 plant species, over three genera, or both.

oligolectic *adj.*

- Referring to a bee species that gathers pollen from only a few plant species or genera (Michener 1974, 373).

- Referring to a flower-visiting animal species, *e.g.*, a bee, that obtains one kind of resource, *e.g.*, pollen, from a group of closely related taxa (Faegri and van der Pijl 1979, 46–48).

3. Referring to a bee species that gathers pollen from only a few closely plant species or genera (O'Toole and Raw 1991, 185).

syn. oligotropic (Faegri and van der Pijl 1979, 46–48)
cf. -lectic: monolectic, polylectic

Comment: See the comments for monolectic.

polylectic *adj.*

1. Referring to a bee species that gathers pollen from many plant species or genera (Michener 1974, 373).

2. Referring to a flower-visiting animal species, *e.g.*, a bee, that obtains one kind of resource, *e.g.*, pollen, from many plant taxa (Faegri and van der Pijl 1979, 46–48).

syn. polytropic (Faegri and van der Pijl 1979, 46–48)
cf. lectic: monolectic, oligolectic

Comment: See the comments for monolectic.

♦ **Lee-Boot effect** See effect: Lee-Boot effect.

♦ **leimocole** See -cole: leimocole.

♦ **leishmaniasis disease** See disease: leishmaniasis.

♦ **leisure behavior** See behavior: leisure behavior.

♦ **leghemoglobin** See molecule: leghemoglobin.

♦ **'lek** *n.*

1. In *Tetrao urogallus* (Western Capercaillies): An individual's gathering or congregating (Oxford English Dictionary 1972, entries from Darwin 1871).

2. In some animal species: Individual's "collective performance" at a lek site (Hjorth 1970, 201).

3. In some animal species: A cluster of displaying males that females visit only for mating purposes (Wittenberger 1981, 618; Gosling and Petri 1990, 272).

cf. incidental, mating system: pure-dominance polygyny, ⁴model: hotspot model, regular

participle lekking

[Swedish *leka*, to play, game, sport]

♦ **²lek** *n.* In many animal species: A communal display area, often used for many seasons, where males congregate and attract and court females that come to the males as part of their mate-seeking behavior (Selous 1907 in Heymer 1977, 113; Armstrong 1947; Lack 1968; Wilson 1975, 331, 468, 588; Emlen 1976; Stiles and Wolf 1979, 1; Gosling 1987, 620; Cockburn and Lee, 1988, 43; Immelmann and Beer 1989, 174).

See mating system: polygyny: pure: dominance polygyny.

syn. arena (Hjorth, 1970, 201), court, male-courtship arena, territorial breeding ground (Leuthold 1966, 219)

cf. court, mating system: pure-dominance polygyny, territory: pairing territory

past participle lekking

Comments: Leks occur in many insect species including some bee and some empidid-fly species and Hawaiian Picture-wing Fruit Flies; *Rana catesbeiana* (American Bull Frogs); some mammal species including *Antechinus* sp. (*Antechinus*), *Damaliscus korrigum* (Topi), *Hypsipathus monstrosus* (Hammer-headed Bats), *Kobus kob thomasi* (Uganda Kob), *Kobus leche* (Lechwe); and bird species including some birds-of-paradise, Bowerbirds, Grouse, some hummingbird species, many manakin species, *Meleagris gallopavo* (Turkeys), Pheasants, and *Philomachus pugnax* (Ruffs). Copulation may occur in, or out of, lek sites, depending on the species.

booming field *n.* The lek site of *Tympanuchus cupido* (Greater Prairie-chickens) (Wilson 1975, 169).

classical lek *n.* A lek with densely clustered male display sites (Phillips 1990, 555).

dispersed lek *n.* For example, in some carpenter-bee species, some bird species: A lek with dispersed male display sites (Marshall and Alcock 1981; Phillips 1990, 555).

syn. exploded lek (Phillips 1990, 555)

true lek *n.* A lek that is removed from the nesting and feeding areas of an animal species (Mayr 1935, Armstrong 1947, and Lack 1968 in Wilson 1975, 331). *syn.* arena (Wilson 1975, 331)

♦ **³lek** *v.i.* In some grouse species: To congregate (Oxford English Dictionary 1972, entries from 1884).

♦ **"lek hypothesis"** See hypothesis: firefly-flash-synchronization hypotheses: "lek hypothesis."

♦ **lek-mating system** See mating system: polygyny: pure: dominance polygyny.

♦ **lentic, lenitic** *n.* Referring to habitats with static, calm, or slow-moving water (Lincoln et al. 1985). *cf.* lotic

♦ **lepe** See ²group: lepe.

♦ **lepidophage** See -phage: lepidophage.

♦ **lepidopterid** *adj.* Referring to moth- and butterfly-pollinated flowers (Lincoln et al. 1985). *cf.* ²-phile: lepidopterophile

♦ **lepidopterophile** See ²-phile: lepidopterophile.

♦ **leptin** See hormone: leptin.

♦ **leptokurtic distribution** See distribution: leptokurtic distribution.

♦ **leptology** See study of: leptology.

♦ **leptophenic population** See population: leptophenic population.

♦ **Lequesne's-uniquely-derived-character concept** See uniquely-derived-character concept.

♦ **lesion** See ablation.

♦ **lestobiosis** See symbiosis: lestobiosis.

♦ **let-down** See ³lactation: milk ejection (Comments).

♦ **lethal character** See character: lethal character.

♦ **lethal-equivalent value** *n.* "The mean number of harmful genes carried by each member of a population multiplied by the mean probability that each gene will cause genetic death when homozygous" (Lincoln et al. 1985).

♦ **Lethal hybrid rescue** See allele: *Lethal hybrid rescue*.

♦ **lethal trait** See character: lethal character.

♦ **lethargy** *n.*

1. A person's torpor, inertness, or apathy (Oxford English Dictionary 1972, entries from 1380).

2. An individual animal's showing a slow, or relatively slow, response to an external stimulus (Lincoln et al. 1985).

adj. lethargic

♦ **leucocytic pyrogen** See pyrogen: leucocytic pyrogen.

♦ **leucoplast** See organelle: amyloplast.

♦ **level** *n.*

1. A relative place, degree, condition, or stage; a plane, such as a high level of development (Michaelis 1963).

2. A position in the vertical dimension, *e.g.*, the level in the canopy of a tropical rain forest (Michaelis 1963).

3. In statistics, a category of an independent variable (= main effect), *e.g.*, a category of nutrient enhancement such as nitrogen, phosphorous, or potassium. *cf.* effect: main effect

♦ **leverage advantage** *n.* For example, in some gull species: A winning individual's incurring a fitness cost in a conflict that is less than its opponent would incur if it were to win [coined by Hand (1986, 207)].

♦ **leverage cost** See cost: leverage cost.

♦ **leveret** See animal names: leveret.

♦ **Lex-Heinze mood** *n.* A female animal's resistance to mating (Heymer 1977, 111).

cf. coy

♦ **L horizon** See soil horizon: L horizon.

♦ **Lbr** See allele: *Lethal hybrid rescue*.

♦ **library** *n.* A collection of books, magazines, pamphlets, etc.; especially, one arranged to facilitate reference (Michaelis 1963).

Comment: In gene libraries, each book is a clone of DNA molecules (Campbell et al. 1999, 370).

[Old French *librarie* < Latin *librarium* < *liber*; *libri*, book]

♦ **cDNA library** *n.* A genomic library of copy DNA molecules that a researcher produces by cloning cDNA that corresponds to individual mRNA species from an organism's cell(s) (Rieger et al. 1991; Campbell et al. 1999, 370).

Comments: A researcher constructs a cDNA library by synthesizing a double-stranded DNA copy from the mRNA populations and integrates these cDNA molecules into a restriction-enzyme site of a cloning vector (Rieger et al. 1991). This library represents the mRNA sequences expressed in the cell type from which it is derived. A researcher uses this library for the study of tissue, or stage-specific, gene expressions.

♦ **Digital Morphology (DigiMorph) Library** *n.* Part of U.S. National Science Foundation Digital Libraries Initiative, that creates and shares two-dimensional and three-dimensional visualizations of the internal and external structure of biological specimens, including fossils (Digimorph.org 2010).

Comments: Researchers generate the visualizations using a high-resolution x-ray computed tomographic (x-ray CT) scanner at the University of Texas, Austin, Texas (Digimorph.org 2010).

♦ **genomic library** *n.*

1. A collection of recombinant DNA molecules that represent an individual organism's genome (King and Stansfield 1985).
2. A gene bank that consists of a set of independent clones that, statistically, contains the entire genome of an organism among the recombinant DNA molecules (Rieger et al. 1991).

Note: The recombinant DNA molecules are recombinant-plasmid clones (= "books"), or phage clones (= "books"), each carrying copies of a particular segment from one particular genome (Campbell et al. 1999, 370). A researcher constructs and screens a complete genome library as a starting point for isolating specific genes (Rieger et al. 1991). The genome library of eukaryotes includes both single-copy and repetitive DNA sequences.

syn. genome library (Rieger et al. 1991), genomic bank (King and Stansfield 1985)

♦ **lichenicole** See -cole: lichenicole.

♦ **lichenology** See study of: lichenology.

♦ **lichenophile** See ^l-phile: lichenophile.

♦ **lie** *n.*

1. A person's act of lying; a false statement made with the intent to deceive; a criminal falsehood (Oxford English Dictionary 1971, entries from 900).

2. False information given by an individual animal, not necessarily given with use of its subjective consciousness; *e.g.*, a bird's giving a hawk signal that causes other birds to flee and leave all the food for the liar (Dawkins 1976, 68).

cf. deception

♦ **Liebig's law (of the minimum)** See law: law of the minimum.

♦ **life** *n.*

1. An individual animal's condition, or attribute, of living, or being alive; opposed to death (Oxford English Dictionary 1972, entries from *ca.* 1200).

cf. living
