Notes: Mayr (1982, 53) stated that life cannot be defined because "there is no special substance, object, or force that can be identified with life. The process of living (*q.v.*) however, can be defined according to Mayr (1982, 53). Mayr (1997, 20–23) discusses many distinguishing characteristics of life.

2. Living organisms, collectively (Michaelis 1963).

Notes: Tiny bits of elemental carbon in 3,800-Ma-old and older rocks of western Greenland have carbon isotopic compositions that suggest the presence of life on Earth at this time (Holland 1997, 38).

[Old English *lif*]

♦ **life cycle** See cycle: life cycle.

♦ **life expectancy** *n.* The mean time period that an organism is expected to survive at any given point in its life cycle (Lincoln et al. 1985).

♦ **life history** *n.*

1. All stages through which an organism passes between its birth and death (Willson 1983, 2).
2. The significant features of an organism's life cycle with particular reference to strategies that influence its survival and reproduction (Lincoln et al. 1985).

Comment: White et al. (2000, 878) define "aggregative life history" and "circumnatal life history" with regard to Fruit Flies (Tephritidae).

♦ **life-history pattern** *n.* "The way resources are allocated to survival, growth, and reproduction at each age throughout a typical individual's life" (Wittenberger 1981, 618).

cf. principle: principle of allocation

♦ **life-history-strategy game** See game (table).

♦ **life-history theory** See ³theory: life-history theory.

♦ **life-long pair bond** See bond: life-long pair bond.

♦ **life span** *n.* The maximum, or mean, duration of the life of an individual or group of organisms (Lincoln et al. 1985).

syn. longevity (Lincoln et al. 1985)

See longevity.

♦ **life table** *n.* A table that shows the proportion of like-aged individuals surviving to each age and the reproductive rate of surviving individuals at each age (Wittenberger 1981, 618).

cf. population structure

♦ **lifetime monogamy** See mating system: monogamy: lifetime monogamy.

♦ **ligand** See molecule: ligand.

♦ **Liger** See hybrid: Ligon.

♦ **light** *n.*

1. In Humans: Radiant energy that emanates from the sun, very hot bodies, fire, etc. and can be seen with one's eyes (Oxford English Dictionary 1972, entries from *ca.* 1000).

- A**
2. In many animal species: The sensation produced by stimulation of an individual's vision organs and brain visual centers (Michaelis 1963).
syn. luminous energy (Michaelis 1963)
- Comments:* Humans see light from violet to red. Some bee and other arthropod species and some hummingbird species also see ultraviolet. Organisms perceive infrared as heat. Some snake species use their pit organs to detect prey by their infrared emission in darkness.
- visible light** *n.* The part of solar radiation from wavelengths 380 through 780 nm (Lincoln et al. 1985).
- ♦ **light adaptation** See ³adaptation: ¹physiological adaptation: light adaptation; ²physiological adaptation (comment).
- ♦ **light gap** *n.* An area of increased sunlight that results from a tree's falling in forest (Hubbell et al. 1999, 554).
- ♦ **light-level geolocator** See instrument: light-level geolocator.
- ♦ **light stress** See stress: light stress.
- ♦ **light trap** See trap: light trap.
- ♦ **light year** See unit of measure: year: light year.
- ♦ **lignicole** See -cole: lignicole.
- ♦ **ligniperdous** *adj.* Referring to organisms that destroy wood (Lincoln et al. 1985).
- ♦ **lignivore** See -vore: lignivore.
- ♦ **lignophile** See ¹-phile: lignophile.
- ♦ **Ligon** See hybrid: Ligon.
- ♦ **lilapsophobia** See -phobia: lilapsophobia.
- ♦ **life zone** See region: life zone.
- ♦ **Lim1** See gene: *Lim1*.
- ♦ **limacology** See study of: limacology.
- ♦ **limicole** See -cole: limicole.
- ♦ **limiphage, limophage** See -vore: limivore.
- ♦ **limit cycle** See cycle: limit cycle.
- ♦ **limiting factor** See factor: limiting factor.
- ♦ **limivore** See -vore: limivore.
- ♦ **limnetic** *n.* A stickleback species that feeds in the water column, not on the bottom of a lake; contrasted with benthic (Weiner 1995, 31).
- ♦ **limnicole** See -cole: limnicole.
- ♦ **limnium** See ²community: limnium.
- ♦ **limnobiology** See study of: biology: limnobiology.
- ♦ **limnobiont** See biont: limnobiont.
- ♦ **limnobios** See biosis: limnobiosis.
- ♦ **limnodophile** See ¹-phile: limnodophile.
- ♦ **limnology** See study of: limnology.
- ♦ **limnophile** See ¹-phile: limnophile.
- ♦ **limnoplankton** See plankton: limnoplankton.
- ♦ **limophage** See -vore: limivore.
- ♦ **limp posture** See posture: limp posture.
- ♦ **Lincoln index** See index: Lincoln index.
- ♦ **line** See ²group: line.
- ♦ **LINE** See nucleotide element: long-interspersed nucleotide element.
- ♦ **lineage, line** *n.* A line of common descent (Lincoln et al. 1985).
- ♦ **lineage group** See ²group: lineage group.
- ♦ **lineal** *adj.* Referring to a relationship among a series of causes, or arguments, such that the sequence does not come back to the starting point (Bateson 1979, 242).
- ant.* recursive
- ♦ **linear curve** See curve: linear curve.
- ♦ **linear-dominance hierarchy** See hierarchy: linear-dominance hierarchy.
- ♦ **linear regression curve** See curve: regression curve: linear regression curve.
- ♦ **line graph** See bar graph: line graph.
- ♦ **lingulation** *n.* An adult bee's holding a droplet of nectar, or honey water, on the upper surface of its proboscis while extending and retracting it, thus alternately spreading the liquid as a film and letting it contract into a droplet again [coined by Barrows 1976a, 116].
syn. tongue-lashing behavior (in *Apis mellifera*, Western Honey Bees; Winston 1987, 120)
- Comment:* A bee might use this behavior to cool itself or its nest.
- ♦ **link** *n.* A connecting part either in a material, or immaterial, sense; a thing that serves to establish, or maintain, a connection; "a member of a series or succession; a means of connection or communication" (Oxford English Dictionary 1972, entries from before 1584).
- ♦ **gamma link** *n.* A dichotomously branching link in a food chain that involves two predators feeding on one prey species (Lincoln et al. 1985).
- ♦ **iota link** *n.* "A direct unbranching link in food web, between a prey species and its unique predator or parasite" (Lincoln et al. 1985).
- ♦ **lambda link** *n.* A dichotomously branching link in a food web involving one predator that feeds on two prey species (Lincoln et al. 1985).
- ♦ **linkage** *n.*
1. Genes' being located on the same chromosome (Wittenberger 1981, 618).
Note: The closeness of linkage depends on how near to each other genes are on the same chromosome (Wittenberger 1981, 618).
 2. "The association of certain genes owing to their location on the same chromosome" (Mayr 1982, 958).
- ♦ **sex linkage** *n.* The location of a gene, or character, on a sex chromosome (Lincoln et al. 1985).
adj. sex-linked
- ♦ **linkage disequilibrium** *n.*
1. The association of alleles at different loci at frequencies higher than expected from random combinations of their frequencies in gametes, or individual organisms, of a population (Dawkins 1982, 289; Rieger et al. 1991).
 2. The nonrandom association of alleles at different loci in a population (Tanksley 1993, 211).
syn. epistatic selection, gametic excess, gametic phase unbalance (Rieger et al. 1991), gametic disequilibrium (Dawkins 1982, 289)
- Comments:* Researchers often regard linkage disequilibrium as evidence for natural selection (Rieger et al. 1991). Causes of linkage disequilibrium are epistatic selection, genetic drift due to small population size, genetic hitchhiking, and population mixing or migration. Linkage disequilibrium should be nearly zero in a large, random-mating population without selection.
- ♦ **linkage group** See ²group: linkage group.
- ♦ **linkage map** See map: linkage map.
- ♦ **linked character** See character: linked character.
- ♦ **linked extinction** See ²extinction: linked extinction.
- ♦ **linked genes** See genes: linked genes.
- ♦ **Linnaean hierarchy** See hierarchy: Linnaean hierarchy.

- ◆ **Linnaean species, Linnaeon** See ²species: Linnaean species.
- ◆ **Linnaean system (of nomenclature)** See system: Linnaean system (of nomenclature).
- ◆ **lip smacking, lipsmacking** See animal sounds: lip smacking.
- ◆ **lip-, lipo-** *comb. f.* Fat; fatty (Michaelis 1963). [Greek *lipos*, fat]
- ◆ **lipid** See molecule: lipid.
- ◆ **lipogenesis** See -genesis: lipogenesis.
- ◆ **lipopalingenesis** See -genesis: lipopalingenesis.
- ◆ **liposome** See organized structure: liposome.
- ◆ **lipoxenous** See -xenous: lipoxenous.
- ◆ **lipoxeny** See -xeny: lipoxeny.
- ◆ **liptocoenosis** See -coenosis: necrocoenosis.
- ◆ **lithodomous** See -domous: lithodomous.
- ◆ **lithology** See study of: lithology.
- ◆ **lithophage** See -phage: lithophage.
- ◆ **lithophile** See ¹-phile: lithophile.
- ◆ **lithosere** See ²succession: lithosere.
- ◆ **lithosphere** See -sphere: lithosphere.
- ◆ **lithotomous** See -domous: lithodomous.
- ◆ **lithotroph** See ²succession: lithotroph.
- ◆ **litter** *n.* The accumulation of plant material on the ground, including branches, leaves, reproductive parts, and twigs (Wimmer et al. 1993, 2184; Allaby 1994). See ²group: litter.
syn. ground litter (Wimmer et al. 1993, 2184), leaf litter (Reardon 1995, 4), L-layer (Allaby 1994)
- ◆ **litterfall** *n.* The amount of litter (*q.v.*) that falls to the ground per unit time (inferred from DeLucia et al. 1999, 1177, 1178).
- ◆ **"live-plant shredders"** See ²group: functional feeding group: "live-plant shredders."
- ◆ **living** *n.*
 1. In Humans: One's being alive, animate; not dead (Oxford English Dictionary 1972, entries from before 1325; Michaelis 1963).
 2. An object's possessing these attributes: complexity and organization, chemical uniqueness, quality, variability leading to individual uniqueness, inherited genetic programming acted upon by natural selection, and indeterminacy (Mayr 1982, 53–59). Mayr (1997, 22) lists the capacities of living organisms: a capacity for change at both the genetic and phenotypic levels, evolution, growth and differentiation via a genetic program, metabolism, self-regulation, self-replication, and response to stimuli.
cf. life, organism (Appendix 1)

Comments: Curtis (1983, 18–19) provides a suite of characteristics that distinguish living things (= organisms) from nonliving ones which is similar to Mayr's (1982) list; in addition to his list, Curtis includes homeostasis, growth and development, transformation of environmental energy from one form to another, and response to stimuli. Viruses seem to possess all of these characteristics except homeostasis and transformation of environmental energy from one form to another; therefore, some (perhaps many) researchers do not classify them as organisms.
- ◆ **living fossil** See fossil: living fossil.
- ◆ **Lizzie-Borden evolution, Lizzie-Borden syndrome** See ²evolution: Lizzie-Borden evolution.
- ◆ **L-litter** See litter.
- ◆ **Lloyd Morgan's canon** See Morgan's canon.
- ◆ **load** See genetic load.
- ◆ **lobtail** See behavior: lobtail.

- ◆ **local** *n.*
 1. Referring to an insect species with a relatively large population in a very restricted area (New 2009, 28).
 2. Referring to a plant species with a relatively large population in a restricted area, small populations spread over a wide area, or some intermediate combination of these distribution patterns (Leigh et al. 1984 in New 2009, 28).
- ◆ **local-character species** See ²species: local-character species.
- ◆ **local enhancement** *n.* An animal's directing its attention toward some object, or place, in its environment due to its observing how others are directing their attention with regard to this thing, *e.g.*, an animal's finding its way to a food source more quickly if it sees others looking for the source (Immelman and Beer 1989, 175).
Comment: In "local enhancement," each animal finds its own way by trial and error, even though it finds its goal more readily by watching other animals; "local enhancement" is distinguished from "facilitation," *q.v.* (Immelman and Beer 1989, 175).
- ◆ **local-mate competition (LMC)** See competition: local-mate competition.
- ◆ **locale-odor hypothesis, local-odor theory** See hypothesis: locale-odor hypothesis.
- ◆ **local regulator** See regulator: local regulator.
- ◆ **local signaling** See signaling: cell signaling: local signaling.
- ◆ **locality** *n.* The geographic position of an individual, population, or collection (Lincoln et al. 1985).
- ◆ **locality imprinting** See learning: imprinting: place imprinting.
- ◆ **localization** *n.* An animal's ability to discriminate where a stimulus comes from or the area of its body that is being stimulated (Storz 1973, 149).
- ◆ **localized learning** See learning: localized learning.
- ◆ **local species** See ²species: local species.
- ◆ **lochmium** See ²community: lochmium.
- ◆ **lochmocole** See -cole: lochmocole.
- ◆ **lochmodium** See ²community: lochmodium.
- ◆ **lochmodophile** See ¹-phile: lochmodophile.
- ◆ **lochmophile** See ¹-phile: lochmophile.
- ◆ **lock** *n.* For example, in *Canis familiaris* (Domestic Dogs), *Canis lupus* (Gray Wolves), and *Ochrotomys nuttalli* (Golden Mice): A mechanical tie between a male's penis and a female's vagina during copulation (Dewsbury 1978, 79).
- ◆ **lock-and-key hypothesis** See hypothesis: hypotheses of divergent evolution of animal genitalia: lock-and-key hypothesis.
- ◆ **locking antlers** *n.* In some deer species: Agonistic behavior in males that fight with lowered heads and interlocked antlers (Heymer 1977, 77).
- ◆ **locomotion** *n.* An animal's self-caused movement from one place to another (Oxford English Dictionary 1972, entries from 1646).
cf. drifting, movement, saltation
Comments: "Locomotion" is characterized by an animal's rhythmic movements of its extremities and limbs; *e.g.*, crawling, flying, running, and swimming in insects; cantering, flying, galloping, stepping, trotting, swimming, and flying in mammals; slow galloping (or hopping) in lagomorph species; loping and trotting in canids; runnings, trotting, and walking in Humans (Heymer 1977, 77). Position-changing movements

(e.g., tentacle waving of some cnidarian species and arthropod species) of sedentary animals and drifting are not included in locomotion (Immelman and Beer 1989, 176). Some authors call some forms of invertebrate locomotion “walking.”

bipedal locomotion *n.* An animal’s locomotion that involves its using only its two hindlegs.

cf. biped

Comments: Many animal species including birds, Humans, and *Pan troglodytes* (Chimpanzees) show bipedal locomotion. *Pan paniscus* (Bonobos) walks on their hindlegs when carrying food and other objects (Waal and Lanting 1997, 24, illustration).

cross-gait *n.* For example, in Ungulates: Locomotion in which the front and rear leg of each side of an animal move in opposition to each other; progression of an anterior limb occurs when a corresponding rear leg is on the ground (Heymer 1977, 106).

cf. pacing

Comment: Humans have a cross-gait-like locomotion (Heymer 1977, 106).

digitigrade locomotion *n.* Locomotion characteristic of digitigrades, *q.v.* (Eisenberg 1981, 508).

flight See flight.

pacing *n.* A mammal’s locomotion in which both legs on one side of its body are moved forward simultaneously (Heymer 1977, 128).

cf. cross-gait

Comment: Pacing is the usual form of locomotion in some antelope species, Elephants, Giraffes, and *Tylopodes* (Heymer 1977, 128).

pinnigrade locomotion *n.* Locomotion by swimming using flippers as paddles (Lincoln et al. 1985).

plantigrade locomotion *n.* Locomotion characteristic of plantigrades, *q.v.* (Eisenberg 1981, 508).

richochetal locomotion *n.* Locomotion characteristic of saltigrades, *q.v.* (Eisenberg 1981, 508).

swimming See swimming.

stilt-walking *n.* In *Amphioctopus marginatus* (Veined Octopuses): An individual’s cumbersome walking in which it rests its body in about one-half of a Coconut Palm shell, extends its tentacles over the edge of the shell, and ambulates on its tentacle tips (Finn et al. 2009, R1069).

cf. tool use

♦ **locomotory stimulant** See chemical-releasing stimulus: stimulant: locomotory stimulant.

♦ **locus** See gene locus.

♦ **lodge** *n.* For example, in *Castor fiber* (Eurasian Beavers) and *Lutra lutra* (Eurasian Otters): An individual’s den or lair (Oxford English Dictionary 1972, entries from 1567).

See ²group: lodge.

♦ **loess** See statistical test: regression: loess.

♦ **loft** See ²group: loft.

♦ **lofting** See display: wing display: lofting.

♦ **log-growth phase** See phase: log-growth phase.

♦ **log-linear curve** See curve: species-accumulation curve: non-asymptotic-species-accumulation curve: log-linear curve.

♦ **log-log curve** See curve: species-accumulation curve: non-asymptotic-species-accumulation curve: log-log curve.

♦ **log-normal curve** See curve: rank-abundance curve: log-normal curve.

♦ **log-normal distribution** See distribution: log-normal distribution.

♦ **“log-phase hypothesis”** See hypothesis: hypotheses regarding the origin of the Cambrian explosion: “log-phase hypothesis.”

♦ **logical behaviorism** See behaviorism.

♦ **logical division** See downward classification.

♦ **logical empiricism** See empiricism: logical empiricism.

♦ **logical positivist** *n.* A philosopher (including Carnap, Feigl, Reichenach, and Schlick) who developed logical empiricism (*q.v.*) in the 1920s and 1930s (Mayr 1997, 49).

♦ **logical prediction** See prediction: logical prediction.

♦ **logistic** *adj.* Of or pertaining to arithmetical calculation.
[Medieval Latin *logisticus* < Greek *logistikos* < *logizesthai*, to reckon < *logos*, word, calculation]

♦ **logistic growth** *n.*

1. “Growth, especially in the number of organisms constituting a population, that slows steadily as the entity approaches its maximum size” (Wilson 1975, 588).
2. Growth that follows a sigmoid course with initial gradual growth (lag growth phase), rapid growth (exponential growth phase), and then slow growth (stationary growth phase) as a population, or system, reaches its maximum size or carrying capacity (Lincoln et al. 1985).

cf. exponential growth

♦ **logistic-population-growth curve** See curve: logistic-population-growth curve.

♦ **-logous**

orthologous *adj.*

1. Referring to homologous structures of organisms determined by a common ancestral gene present in their most recent common ancestor; contrasted with paralogous (Lincoln et al. 1985).
2. Referring to genes (= orthologs, orthologues) that arose from the same common ancestral gene; contrasted with paralogous (Gorr and Kleinschmidt 1993, 76).

Note: Examples of orthologous genes are the gene for the amphibian juvenile form of β -hemoglobin and the gene for β -hemoglobin found in adult bony fish and fleshy finned fish (including the Coelacanth) (Gorr and Kleinschmidt 1993, 75–76). These genes apparently evolved from a β -hemoglobin gene present in vertebrates about 400 Ma ago.

cf. gene: ortholog

Comment: An ortholog often takes over the function of its precursor gene in the species of origin, and thus tends to be conserved (Theißen 2002, 741). In contrast, young paralogs have redundant functions, which is an evolutionary unstable situation. In the long run, paralogs often either diverge functionally or all but one paralog version is lost.

paralogous *adj.*

1. Referring to homologous structures that arose by gene duplication and evolved in parallel within a single line of descent; contrasted with orthologous (Lincoln et al. 1985).
2. Referring to genes (= paralogs, paralogues) in a group of related organisms that did not arise from the same common ancestral gene; contrasted with orthologous (Gorr and Kleinschmidt 1993, 76).

Note: Examples of paralogous genes are the gene for the amphibian adult form of β -hemoglobin and the

gene for β -hemoglobin found in adult bony fish and fleshy finned fish (including the coelacanth) (Gorr and Kleinschmidt 1993, 75–76). The fish genes apparently evolved from the juvenile form of a β -hemoglobin gene present in vertebrates about 400 Ma ago. The amphibian gene apparently evolved from the adult form of a β -hemoglobin gene present in vertebrates about this same time.

cf. gene: paralog

♦ **loi de balancement** See law: *loi de balancement*.

♦ **L1** See transposable element: L1.

♦ **lonely wolf** *n.*

1. A single individual of a social species, e.g., an old bull Elephant (Immelmann and Beer 1989, 176); a single individual that leaves its social group for a brief to an extended period (Immelmann and Beer 1989, 273).

2. A solitary animal (Immelmann and Beer 1989, 176).

♦ **long-distance signaling** See signaling: cell signaling: long-distance signaling.

♦ **longevity** *n.* “The duration through geological times of a species and all of its descendants” (Wilson 1992, 363).

See lifespan.

♦ **long-interspersed nucleotide element** See nucleotide element: long interspersed nucleotide element.

♦ **longitudinal study** *n.* A research method that involves following one subject over an extended period (Storz 1973, 149).

♦ **long-term memory** See memory: long-term memory.

♦ **long-term memory potentiation (LTP)** *n.* A functional change at certain synapses that seems to be directly related to memory storage and learning (Campbell 1996, 1022).

Comment: An LTP is enhanced by a postsynaptic cell to an action potential (Campbell 1996, 1022).

♦ **long-term optimality** See optimality: long-term optimality.

♦ **long-term pair bond** See bond: long-term pair bond.

♦ **long-term potentiation** *n.* A process that makes nerve cells more readily respond the next time that an animal uses them (Lemonick 1999, September 13, 58).

Comment: This process is important in learning and memory processes (Lemonick 1999, September 13, 58).

♦ **loose school** See ²group: school: loose school.

♦ **lophium** See ²community: lophium.

♦ **lophophile** See ¹-phile: lophophile.

♦ **lophophore** See organ: lophophore.

♦ **lordosis** *n.*

1. A person's anterior curvature of his spine that causes convexity in front and abnormal hollow in one's back (Oxford English Dictionary 1972, entries from 1704).

2. In many mammal species including rats and Domestic Swine: A stereotyped posture that a female assumes as a male mounts her, consisting of her arching her back spreading her legs sideways and extending them, lifting her tail, and pointing her head forward and downward (Dewsbury 1978, 77, 136; Forsyth 1985, 28; Immelmann and Beer 1989, 176).

syn. lordosis reflex (Immelmann and Beer 1989, 176)

adj. lordotic

[New Latin < Greek *lordosis* < *loros*, bent backward]

♦ **Lorenz's hydraulic model, Lorenz's hydraulic model of behavior, Lorenz's-hydraulic model of behavior regulation** See ⁴model: Lorenz's hydraulic model.

♦ **Los Niños** See *El Niño*.

♦ **Lost City meteorite** See meteorite: Lost City meteorite.

♦ **low diversity** See diversity: low diversity.

♦ **lost call** See animal sounds: call: distress call.

♦ **lot** See ²group: lot.

♦ **lotic** *adj.* Referring to habitats of fast-running water such as rivers and streams (Lincoln et al. 1985). *cf.* lentic

♦ **Lotka-Volterra-competition model** See model: Lotka-Volterra-competition model.

♦ **low-cost altruism** See altruism: low-cost altruism.

♦ **lower** See ancestral.

♦ **LTP** See long-term memory potentiation.

♦ **lucicole** See -cole: lucicole.

♦ **lucibufagin** See molecule: lucibufagin.

♦ **luciferase** See enzyme: luciferase.

♦ **luciferin** See molecule: luciferin.

♦ **luciferous** *adj.* Referring to an object that brings, produces, or emits light (Michaelis 1963). *cf.* bioluminescent

♦ **lucifugal, lucipetal, luciphilous, photophilic** *adj.* Referring to an organism that thrives in open, well-lit habitats; contrasted with lucifugous (Lincoln et al. 1985).

n. luciphile, luciphily

♦ **lucifugous, photophobic** *adj.* Referring to an organism that is intolerant of light; contrasted with lucifugal (Lincoln et al. 1985).

cf. -phobe: photophobe

♦ **luciphile** See ¹-phile: luciphile.

♦ **luciphilous** See lucifugal.

♦ **Ludwig effect, Ludwig hypothesis, Ludwig's theorem, Ludwig's theory** See hypothesis: Ludwig hypothesis.

♦ **luminescence** See bioluminescence.

♦ **lumper** *n.* One of “the majority of taxonomists who prefers a rather large, comprehensive taxa, as being better able to express relationship and reducing the burden on the memory” (Mayr 1982, 240).

ant. splitter

♦ **lunar rhythm** See rhythm: lunar rhythm.

♦ **luring song** See animal sounds: song: luring song.

♦ **lute** See ²group: group: lute.

♦ **luteinizing hormone** See hormone: luteinizing hormone.

♦ **luticole** See -cole: luticole.

♦ **luxuriance** *n.* The part of hybrid vigor that is non-adaptive and does not increase an organism's fitness (Lincoln et al. 1985).

♦ **ly.** See unit of measure: year: light year.

♦ **Lyellian-survivorship curve** See curve: Lyellian-survivorship curve.

♦ **lying-out period** See period: lying-out period.

♦ **lygophile** See ¹-phile: lygophile.

♦ **Lysenkoism** *n.* The doctrine of T. D. Lysenko and his followers that rejects the gene theory of inheritance in favor of inheritance of acquired characters that are responses to environmental factors and assimilated into an organism's genome and transmitted to its offspring (Michaelis 1963; Lincoln et al. 1985).

syn. neo-Lamarckism (Lincoln et al. 1985)
cf. Lamarckism; Michurinism; ¹system: inheritance-of-acquired-characteristics system
Comment: The Soviet Union adopted Lysenkoism as official policy from 1948 through 1963 as a result of

"political demagoguery and experimental fabrications by Lysenko and his supporters" (Bowler, 1992, 188; Strickberger 2000, 26).
[after T. D. Lysenko, Soviet agronomist]
◆ **lysimeter** See meter: lysimeter.

m

- ♦ **Ma** See unit of measure: Ma.
- ♦ **MacAlpine Hills 88105 meteorite** See meteorite: MacAlpine Hills 88105 meteorite.
- ♦ **macarthur** See units of measure: macarthur.
- ♦ **MacArthur-Hamilton-Leigh principle** See principle: MacArthur-Hamilton-Leigh principle.
- ♦ **MacArthur Prize** See award: MacArthur Prize.
- ♦ **MacClade** See program: MacClade.
- ♦ **Mach band** *n.* A narrow strip along the edge of a border between light and dark that seems brighter, or darker, than larger areas to which it belongs to a person due to lateral inhibition in his nervous system (Gould 1982, 101).
- ♦ **machine** *n.* Any combination of interrelated parts that use, or apply, energy to do work; especially, a mechanical unit with, or without, a driving motor, made to do a particular kind of work (Michaelis 1963).
- high-throughput-DNA sequencer** *n.* A machine that amplifies DNA fragments and determines their sequences using slab-gel, or capillary, electrophoresis (Lee and Lee 2000, 171).
cf. study of: genomics
Comments: This machine is an innovation that enabled rapid growth in genomics (*q.v.*) (Lee and Lee 2000, 171). The Institute for Genomic Research (TIGR, U.S.), used this machine to sequence *Haemophilus influenzae* (Pfeiffer's Bacillus, *q.v.*).
- squeeze machine** *n.* A machine with a headrest, hydraulic controls, and inflatable cushioned sides that puts pressure on a person's body (Raver 1997, 5 August, C1).
Comments: Autistic people reduce their anxiety and relax by using this machine (Raver 1997, 5 August, C1). Temple Grandin, an autistic scientist, who is hypersensitive to touch, invented this machine.
- ♦ **machismo** See display: machismo.
- ♦ **macraneer** See male: macraneer.
- ♦ **macro-, macr-** *comb. f.*
 1. In pathology, enlarged or overdeveloped (Michaelis 1963).
 2. Large, or long, in size or duration; great (Michaelis 1963).

[Greek *makros*, large]
- ♦ **macrobenthos** See ²community: benthos: macrobenthos.
- ♦ **macrobiota** See biota: macrobiota.
- ♦ **macrobiotic** See biotic: macrobiotic.
- ♦ **macrodichopatric** See -patric: dichopatric.
- ♦ **macroevolution** See ²evolution: macroevolution.
- ♦ **macroevolutionist** See evolutionist: macroevolutionist.
- ♦ **macrogamete** See gamete: macrogamete.
- ♦ **macrogamy** See -gamy: hologamy.
- ♦ **macrogenesis** See ²evolution: punctuational evolution, saltational evolution.
- ♦ **macrogyné** See caste: queen: macrogyné.
- ♦ **macrohabitat** See habitat: macrohabitat.
- ♦ **macromorphology** See morphology: macromorphology.
- ♦ **macromutation** See allele: macromutation; ²mutation: macromutation.
- ♦ **macromutationism** See hypothesis: macromutationism.
- ♦ **macroparapatric** See parapatric: macroparapatric.
- ♦ **macrophage** See -phage: macrophage.
- ♦ **macrophylogenesis** See ²evolution: macroevolution.
- ♦ **macrophytophage** See -phage: macrophytophage.
- ♦ **macroplankton** See plankton: macroplankton.
- ♦ **macrosomatic** See -somatic: macrosomatic.
- ♦ **macrospecies** See ²species: macrospecies.
- ♦ **macrosymbiont** See symbiont: macrosymbiont.
- ♦ **macrotaxonomy** See taxonomy: beta taxonomy.
- ♦ **macrotherm** See therm: megatherm.
- ♦ **macrothermophile** See ¹-phile: thermophile: macrothermophile.
- ♦ **macrothermophyte** See therm: megatherm.
- ♦ **macrozoogeography** See study of: geography: macrozoogeography.
- ♦ **magnet effect** See effect: magnet effect.
- ♦ **magnetic-field orientation** See taxis: geomagnetotaxis.
- ♦ **magnetic-resonance imaging** See method: magnetic-resonance imaging.
- ♦ **magnetite** See mineral: magnetites.
- ♦ **magnetoreception** See modality: magnetoreception.
- ♦ **magnification process** See process: magnification process.
- ♦ **main effect** See effect: main effect.
- ♦ **"mainland-island metapopulation"** See population: metapopulation: "mainland-island metapopulation."
- ♦ **maintenance** *n.* Organism survival activities such as water regulation, movement, avoidance of predation and disease, baseline (nongrowth) metabolism, and resistance to competitors (Willson 1983, 5).
cf. principle: principle of allocation

- ♦ **meiosis** See meiosis.
- ♦ **major community** See ²community: major community.
- ♦ **major cost of sex** See cost: major cost of sex.
- ♦ **major-domo stroll** See display: major-domo stroll.
- ♦ **major gene** See gene: oligogene.
- ♦ **major-histocompatibility-complex genes** See gene: major-histocompatibility-complex genes.
- ♦ **major pollinator** See pollinator: major pollinator.
- ♦ **major quantitative-trait locus (major QTL)** See gene locus: major quantitative-trait locus.
- ♦ **major-tropical-wilderness area** See place: major-tropical-wilderness area.
- ♦ **major worker** See caste: worker: major worker.
- ♦ **make anosmic** *v.t.* To cause an organism to lose its sense of olfaction [coined by Cheal, pers. comm. 1985].
cf. anosmize
- ♦ **malacogamous** See ²-phile: malacophile.
- ♦ **malacology** See study of: malacology.
- ♦ **malacophile** See ²-phile: malacophile.
- ♦ **Malaise trap** See trap: Malaise trap.
- ♦ **malaria** See disease: malaria.
- ♦ **malaxation** See mastication.
- ♦ **male, ♂** *n.* In bisexual, or dioecious, species: a sperm-producing individual (Lincoln et al. 1985).
cf. caste: ergatandromorph; female
- ♦ **complemental male** See male: parasitic male.
- ♦ **drone** *n.* In social bees: A male bee, especially a male *Apis* or *Bombus* (Torre-Bueno, 1989).
cf. caste: queen
- ♦ **ergatomorphic male, ergatoid male** See caste: ergatandromorph.
- ♦ **incidental** *n.*
 1. In many lekking and territorial species including some bee, bird, dragonfly, and grasshopper species, and Ruffs (birds): A male that does not have a territory and invades the territory of a conspecific male (Hogan-Warburg 1966 in Wilson 1975, 319; Barrows 1976b).
 2. A animal that visits a lek, but does not successfully hold a place on a lek, *q.v.* (Robel 1967 in Hjorth 1970).

syn. interloper, satellite male (Immelmann and Beer 1989, 258)
cf. male: regular

Comment: "Satellite male" originally referred only to male Ruffs (birds) (Immelmann and Beer 1989, 258).
- ♦ **macraner** *n.* A male of the larger form in an ant species with two sizes of males; contrasted with micraner (Hölldobler and Wilson 1990, 640).
- ♦ **micraner** *n.* A male of the smaller form in an ant species with two sizes of males; contrasted with macraner (Hölldobler and Wilson 1990, 640).
- ♦ **nanander, nannander** *n.* A dwarf male (Lincoln et al. 1985).
- ♦ **parasitic male, complementary male** *n.* For example, in some angler-fish species: A tiny male that lives as a parasite attached to its mates body and typically has well developed reproductive organs but an otherwise degenerate body form (Gould 1982b).
- ♦ **peripheral male** *n.* In many animal species: A smaller male, that uses an alternative mating tactic that parasitizes the mating effort of a larger, dominant male (van den Berghe et al. 1989, 875).

Comments: A peripheral male can reduce the fitness of a dominant male (van den Berghe et al. 1989, 875). Some incidentals are peripheral males.

- ♦ **regular, territory-holding male** *n.* A male animal that is well established on a lek, *q.v.* (Robel 1967 in Hjorth 1970).
cf. incidental, lek; male: incidental
- ♦ **satellite male** See male: incidental.
- ♦ **male-assistance monogamy** See mating system: monogamy: male-assistance monogamy.
- ♦ **male care** See care: male care.
- ♦ **male mate choice** See mate choice: male mate choice.
- ♦ **male parthenogenesis** See parthenogenesis: androgenesis.
- ♦ **mal imprinting** See learning: imprinting: mal imprinting.
- ♦ **mammalogy, mammalology** See study of: mammalogy.
- ♦ **management guild** See guild: management guild.
- ♦ **mandibular gland** See gland: mandibular gland.
- ♦ **manduction** See mastication.
- ♦ **mane** *n.*
 1. The long hair along the top and sides of the neck of, *e.g.*, an *Equus ferus caballus* (Domestic Horse) or male *Panthera leo* (Lion) (Morris 1982).
Notes: A Lion's mane length signals fighting success with other males (West and Packer 2002, 1339). Darkness of a Lion's mane indicates higher nutrition and testosterone levels. Lion manes are probably not direct products of female mate selection.
 2. The feathers on the back of the neck and head of some pigeons (Morris 1982).
- ♦ **mangrove** See ²community: mangrove.
- ♦ **manipulation** *n.*
 1. A person's operating on, or manipulating, another person, or thing, with dexterity, especially with disingenuous implication, unfair management or treatment (Oxford English Dictionary 1972, entries from 1828).
 2. An individual animal's altering the behavior of another animal to its own advantage (Krebs and Dawkins 1984 in Dawkins 1986, 129).

Comment: Signaling is sometimes construed as a form of manipulation (Immelmann and Beer 1989, 179).
- ♦ **parental manipulation** *n.* A parent's adjusting, or manipulating, its parental investment, particularly by reducing the reproduction of certain progeny in the interests of increasing the parent's own inclusive fitness via other offspring (Brown 1987, 305).
Comment: "Variance enhancement," *q.v.*, is very similar to "parental manipulation," but it differs from it mainly by emphasizing variance and de-emphasizing "adroit or skillful management; fraudulent or deceptive treatment" which Alexander (1974) implies in the concept of "parental manipulation" (Brown 1987, 305).
- ♦ **manipulative experiment** See experiment: manipulative experiment.
- ♦ **Mann-Whitney-Wilcoxon-U statistic** See statistical test: multiple-comparisons test: planned-multiple-comparisons procedure: Mann-Whitney-Wilcoxon-U statistic.
- ♦ **manometabolous metamorphosis** See metamorphosis: manometabolous metamorphosis.

♦ **map** *n.*

1. A representation of any region, *e.g.*, of the Earth's surface, drawn on a plane surface; a chart (Michaelis 1963).
2. Anything that resembles a map in form, purpose, or both (Michaelis 1963).

chromosome map, cytogenetic map, fine-structure map, gene map, genetic-linkage map See map: genetic map.

genetic map *n.*

1. The representation of the genetic distance that separates nonallelic gene loci in a linkage structure (= the genes of one linkage group or chromosome) that is deduced from genetic-recombination experiments (King and Stansfield 1985, Rieger et al. 1991).

syn. chromosome map (Rieger et al. 1991), cytogenetic map, linkage map (King and Stansfield 1985), genetic-linkage map (Jasny 1991)

Note: This map is measured in centimorgans (cM) over small distances; 1 cM is equivalent to a 1% chance of recombination (Jasny 1991).

2. The arrangement of mutational sites (= alleles) of a particular gene that is deduced from genetic-recombination experiments (King and Stansfield 1985, Rieger et al. 1991).

syn. fine-structure map, gene map (Rieger et al. 1991)

Comments: Genetic maps for most species are linear and unbranching (Rieger et al. 1991). They are circular for bacteria and bacteriophages. Thomas Hunt Morgan's student Alfred H. Sturtevant developed the method for constructing genetic maps (Campbell et al. 1999, 267). Researchers have produced molecular linkage maps that cover entire genomes for many organisms including Humans, mice, rats, and several plant species (Tanksley 1993, 210).

physical map *n.* A map of the linear order of genes that is determined by methods other than genetic recombination and whose distances between landmarks (*e.g.*, clones, restriction endonuclease sites, or specific loci) are expressed in kilobases (King and Stansfield 1985; Jasny 1991).

species-density map *n.* A map with isobars that shows numbers of species of a selected taxon (taxa) in a particular part of the world through all of the world (inferred from Colwell and Coddington 1994, 102).

transcript map *n.* A map of transcripts on well-defined DNA segments (inferred from the definition of transcript mapping in Rieger et al. 1991).

Comment: Transcription mapping permits the fine mapping of RNA transcripts with the same level of accuracy as the mapping of restriction endonuclease cleavage sites on DNA (Rieger et al. 1991).

♦ **MAP** See action pattern: modal-action pattern; satellite: Microwave Anisotropy Probe.

♦ **map unit** See unit of measure: centimorgan.

♦ **MAPMAKER 3.0** See program: MAPMAKER 3.0.

♦ **MAPMAKER/QTL** See program: MAPMAKER/QTL.

♦ **maquis** See habitat: maquis.

♦ **Marburg Virus** See virus: Marbury Virus.

♦ **marginal species** See ²species: marginal species.

♦ **Marine Mammal Protection Act** See law: Marine Mammal Protection Act.

♦ **marisma** See habitat: mudflat: marisma.

♦ **marker** *n.* A gene, molecule, or DNA sequence used to locate a gene(s) on an individual's genome

(Tanksley 1993, 205–209; Rensberger 1995, 8 November, H1).

hypervariable marker *n.* A genetic marker that involves many rare alleles and that enables a researcher to identify most of the individuals in a population as genetically distinct individuals (inferred from Hamilton and Rand 1996, 249, 255).

microsatellite marker *n.* Microsatellite DNA used to locate another gene(s) in a genome (Tanksley 1993, 208).

See nucleic acid: deoxyribonucleic acid: satellite DNA: microsatellite DNA.

molecular marker *n.* An individual molecule, or DNA sequence, used to locate another gene(s) in a genome (Tanksley 1993, 208).

Comment: Examples of molecular markers include allozymes, isozymes, RAPD markers, RFLP markers, and VNTR markers (Tanksley 1993, 207–209). Many of these markers are phenotypically neutral (*i.e.*, show no effect on an individual's phenotype) and provide an unbiased way to estimate the phenotypic effect of a polygene in question.

monogenetic marker See marker: single-gene marker.

neutral marker, neutral molecular marker *n.* A marker composed of a DNA sequence on which there is no natural selection acting (inferred from Kim and Rieseberg 1999, 965).

cf. introgression: neutral introgression

randomly-amplified-polymorphic-DNA marker (RAPD marker) (RAP id MARK er) *n.* A marker used for measuring molecular divergence of DNA (inferred from Hartl and Clark 1997, 327).

single-gene marker *n.* An individual gene used to locate another gene(s) in a genome (Tanksley 1993, 206).

Comment: Single-gene markers include the gene for plant dwarfism and the gene for seed-coat pigmentation in beans (Tanksley 1993, 206).

syn. monogenetic marker

variable-number-of-tandem-repeats-polymerase chain reaction marker (VNTR marker) *n.* A marker that involves variable-number-of-tandem-repeats-polymorphic DNA, *q.v.*, and used for measuring molecular divergence of DNA (inferred from Hamilton and Rand 1996, 249; Hartl and Clark 1997, 327, 398).

♦ **restriction-fragment-length-polymorphism marker (RFLP marker)** (RIF-lip MARK er) *n.*

A restriction-fragment-length polymorphism used as a marker in genetics (Campbell et al. 1999, 373).

Comment: Researchers use RFLPs as markers in variants in a population (Campbell et al. 1999, 373). By the late 1980s, researchers produced RFLP linkage maps for several organisms (Tanksley 1993, 210).

♦ **marking** See behavior: marking behavior.

♦ **marking drumming** See animal sounds: marking drumming: drumming; behavior: marking behavior: marking drumming.

♦ **Markoff chain** See chain: Markoff chain.

♦ **Markoff process** See process: Markoff process.

♦ **mark-release-recapture method** See method: mark-release-recapture method.

♦ **marriage** *n.*

1. A man's and woman's being husband and wife; a relation between married persons; spouseshood; wedlock (Oxford English Dictionary 1972, entries from 1297).

2. In nonhuman animals, e.g., the Kittiwake Gull and Mongolian Gerbil: Pair bonding (Wilson 1975, 331). See bond: pair bond.
- ♦ **Marsden's effect** See effect: Marsden's effect.
- ♦ **marsh** See habitat: marsh.
- ♦ **mashing** See behavior: mashing.
- ♦ **masking experiment** See experiment: masking experiment.
- ♦ **masking gene** See gene: masking gene.
- ♦ **mass communication** See communication: mass communication.
- ♦ **mass extinction** See ²extinction: mass extinction.
- ♦ **mass provisioning** See provisioning: mass provisioning.
- ♦ **mass selection** See selection: artificial selection.
- ♦ **mast** *n.* The fruit of Oaks, Beeches, and other trees, when it is used as swine food (Michaelis 1963).
cf. masting
[Old English *mæst*, mast, fodder]
- ♦ **mast year** See unit of measure: year: mast year.
- ♦ **master gene** See gene: master gene.
- ♦ **master limiting factor** See factor: master limiting factor.
- ♦ **mastication, manduction, malaxation** *n.* Chewing (Lincoln et al. 1985).
- ♦ **masting** *n.* A tree species' producing a very large fruit, or seed, crop in a particular year subsequent to its producing no, or a small, crop in the preceding year(s) (Kricher & Morrison 1988, 302).
cf. year: mast year
Comments: Masting trees include *Carya* (Hickories); *Fagus grandifolia* (American Beech); *Juglans nigra* (Black Walnuts); *Pinus edulis* (Pinyon Pines); *Pinus strobus* (White Pines); *Quercus* (Oaks); and some dipterocarp, *Abies* (fir), and *Picea* (spruce) species (Harlow and Harrar 1958; Kricher and Morrison 1988, 302–303, 308; Blundell 1999, 32; Brown et al. 2001, 64). American Beech masts every 2–3 yr and its masting is synchronous over large areas. Populations of mast consumers (e.g., the Blue Jay, Eastern Chipmunk, Eastern Gray Squirrel, White-footed Mouse, and White-tailed Deer) may increase temporarily after mast years (Kricher and Morrison 1988, 302; Ostfeld et al. 1996, 234). Masting is possibly a tree species' adaptation to seed predation because there are often more fruits produced in mast years than their predators can consume. Food shortages after mast years might cause some bird species to migrate to new locations. Oak masting can increase the number of mammals used as hosts by *Ixodes scapularis* (Deer Ticks) which transmits Lyme disease (Line 1996, C1; Ostfeld et al. 1996, 324).
- ♦ **masturbation** *n.* In some primate species including male *Pan troglodytes* (Chimpanzees), juvenile male and female *Pongo borneo* (Orangutans), and male and female Humans: An individual's self-stimulation of its genital organs, usually with its hands, often to orgasm in Humans (Hinsie and Campbell, 1976; Smith 1984, 623, 633).
syn. onanism (not preferred by Storz 1973, 183), self-abuse, self-pollution (Oxford English Dictionary, entries from 1857 for Humans)
n. masturbator
v.i., v.t. masturbate
cf. genito-genital rubbing; onanism; *Retrojection*: sexual *Retrojection*
Comments: Mutual homosexual and heterosexual masturbation occurs in Humans (Smith 1984, 636).

- [origin unclear, possibly *mastiturbārī*, virile member + disturbance (Oxford English Dictionary 1972)]
- ♦ **matching experiment** See experiment: matching experiment.
- ♦ **mate choice** *n.* In many species, including some bullhead-fish, *Drosophila*, finch, and pika species: An individual's preference of one conspecific over others, as a copulatory partner, or gene donor, to its offspring (Darwin 1871, 211; Fisher 1958, 158–159; Bateson 1983, ix; Bisazza and Marconato 1988, 1352; Clayton 1988, 1589; Brandt 1989, 118; Noor 1996, 1205).
syn. mate preference (Noor 1996, 1205)
cf. hypothesis: hypotheses of female mate choice; species discrimination
Comment: To avoid confusion Bateson (1983, ix) does not use "mate selection" as a synonym of "mate choice."
- ♦ **female copying** *n.* Female mate choice in which a female imitates the mate choice of another female (Shuster and Wade 1991, 1071).
- ♦ **female mate choice** *n.* For example, in some bird, *Drosophila* and other insect species and Humans: Intersexual selection in which females choose particular males as mates over other males (Dewsbury 1978, 300; Thornhill and Alcock 1983; Latimer and Sippel 1987, 887; Alatalo et al. 1990, 244; Noor 1996, 1205).
syn. female choice, female preference (Alatalo 1990, 244)
cf. selection: epigamic selection
- ♦ **male mate choice** *n.* For example, in some *Drosophila* and salamander species and Humans: A male's preference for a particular kind of female versus another kind (Verrell, 1988, 1086).
- ♦ **mate competition** See competition: mate competition.
- ♦ **mate conflict** See ³conflict: mate conflict.
- ♦ **mate desertion** *n.* In many amphibian, fish, mammal, and reptile species and some bird species: An individual's leaving its mate and its offspring to be reared by its abandoned mate (Dewsbury 1978, 302; Beissinger and Snyder 1987, 477; Lazarus 1990, 672).
syn. desertion (Dewsbury 1978, 302)
Comment: This behavior is expected to occur if the abandoner can increase its fitness by leaving (Dewsbury 1978, 302).
- ♦ **ambisexual mate desertion** *n.* In some bird species: Mate desertion by either sex (Kendeigh 1941, etc. in Beissinger and Snyder 1987, 477).
- ♦ **mate guarding, mate-guarding behavior** See behavior: mate-guarding behavior.
- ♦ **mate-guarding monogamy** See mating system: monogamy: mate-guarding monogamy.
- ♦ **mate recognition** See recognition: mate recognition.
- ♦ **materialism** *n.* Democritus', Thomas Hobbes', and others' doctrine that there are no supernatural, or immaterial, forces that affect organisms — only physico-chemical forces are in play; however, organisms have many characteristics that are without parallel in inanimate objects (Mayr 1982, 52; McFarland 1985, 361).
cf. associationism, rationalism
- ♦ **maternal** *adj.* Referring to, or derived from, a female parent.
cf. paternal
- ♦ **maternal behavior** See care: parental care: maternal care.

- ♦ **maternal-benefit polyandry** See mating system: polyandry: maternal-benefit polyandry.
- ♦ **maternal care** See care: maternal care.
- ♦ **maternal-effect genes** See gene: maternal-effect genes.
- ♦ **maternal family** See family: maternal family.
- ♦ **maternal half sister** See sister: half sister: maternal half sister.
- ♦ **maternal inheritance** See inheritance: maternal inheritance.
- ♦ **maternal investment** See investment: parental investment: maternal investment.
- ♦ **maternal-sex determination** See sex determination: maternal-sex determination.
- ♦ **mathematical model** See ⁴model: mathematical model.
- ♦ **mathematical-population ecology** See study of: ecology: mathematical-population ecology.
- ♦ **mathematical-population genetics** See study of: genetics: mathematical-population genetics.
- ♦ **mathematics** See study of: mathematics.
- ♦ **matinal** *adj.* Referring to the morning (Lincoln et al. 1985).
cf. crepuscular, diurnal, nocturnal, pomeridianus
- ♦ **mating** *n.*
 1. In Humans: Marrying (Oxford English Dictionary 1972, entries from 1621).
 2. In some animals, especially birds: A person's pairing individuals for breeding (Oxford English Dictionary 1972, entry from 1875).
 3. For example, in many uni- or multicellular animals: Individual's merging, or practicing, hologamy (Heymer 1977, 103).
 4. For example, in gametes: A pair's fusing together.
syn. associating, copulating, conjugating, consorting, courting, inseminating
See copulation for a discussion of mating synonyms.
cf. behavior: reproductive behavior; breeding; copulation
v.t., v.t. mate
[Middle Low German <*gemate*< *ge-*, together + *mat*, meat, food; probably akin to meat]
- ♦ **assortative mating** *n.* In many animal species: Nonrandom pairing of individuals that resemble each other in one, or more, phenotypic traits; the tendency of individuals to choose mates that resemble themselves (Dawkins 1982, 284).
syn. assortative pair formation (Immelmann and Beer 1989), endogamy, homogamous mating, homogamy, positive assortative mating
cf. learning: imprinting: sexual imprinting; mating: disassortative mating, negative assortative mating (Wilson 1975, 80, 579)
Comment: Immelmann and Beer (1989, 21) summarize possible benefits of assortative mating.
- **assortative mating by size** *n.* A correlation between the body sizes of mating males and females in a population in the absence of inbreeding (Lewontin et al. 1968 in Crespi 1989, 981, who discusses the five sources of potential ambiguity of this definition).
- **negative-assortative mating** *n.* The tendency of individuals to choose mates that do not resemble themselves (Dawkins 1982, 284).
- ♦ **disassortative mating** *n.* The nonrandom pairing of individuals that differ from each other in one, or more, phenotypic traits (Wallace 1968 in Wilson 1975, 80, 319, 582).

- syn.* exogamy, heterogamous mating (Lincoln et al. 1985)
- cf.* mating: assortative mating and its synonyms, random mating
- ♦ **homosexual mating** See copulation: homosexual copulation.
- ♦ **panmixia, panmixis** See mating: random mating; mixis: panmixus.
- ♦ **positive assortative mating** See mating: assortative mating.
- ♦ **random mating** *n.* Mating within a population without regard to genotypes, or phenotypes, of mates (Lincoln et al. 1985).
See mixis: panmixus.
syn. panmixia, panmixis (Lincoln et al. 1985)
- ♦ **sib mating, adelphogamy** *n.* Mating of siblings (Lincoln et al. 1985).
- ♦ **mating continuum** *n.* An aggregate of interbreeding individuals that systematically exchange genes (Lincoln et al. 1985).
- ♦ **mating dance** See dance: mating dance.
- ♦ **mating effort** See effort: reproductive effort: mating effort.
- ♦ **mating group** See ²group: mating group.
- ♦ **mating march** *n.*
 1. In Mammals, especially some ungulate species: A male's following a female closely, or in direct bodily contact, before copulation; the male moves stiffly, hence the term "march" (Immelmann and Beer 1989, 180).
 2. In species with indirect spermatophore transmission (e.g., Pseudoscorpions and Scorpions): A male's and female's grasping one another with their chelate pedipalps (pincers) and running back and forth until the male deposits his spermatophore, and the female gets it into her genital opening (Immelmann and Beer 1989, 180).
- ♦ **mating mistake** *n.* For example, in some fruit-fly (Tephritidae) species: An individual's attempt to mate with any insect other than a conspecific individual of the opposite sex (White et al. 2000, 892).
cf. behavior: homosexual behavior
- ♦ **mating pheromone** See chemical-releasing stimulus: semiochemical: pheromone: mating pheromone.
- ♦ **mating plug** *n.* In some insect, mammal, and reptile species: An object left in a female's genital chamber after mating by a male that may stop her sperm leakage, further copulations, or both (Wilson 1975, 321).
syn. copulatory plug (Dickinson and Rutowski 1989, 154)
Comments: A mating plug can be a secretion from a male's accessory glands (in insects such as some dytiscid beetle and lepidopteran species), part of a male's abdomen (e.g., in a ceratopogonid fly and the Western Honey Bee), coagulated seminal fluid (in some bat, marsupial, and rat species and Hedgehogs), and so forth (Wilson 1975, 321). In a checkerspot butterfly, a mating plug impedes copulation (Dickinson and Rutowski, 1989, 154).
- ♦ **mating position** *n.* The spatial relationship of a conspecific male and female during copulation (Lavigne and Holland 1969, 3).
cf. posture: wheel posture
- ♦ **end-to-end mating position** *n.* For example, in many lepidopteran and some firefly and robber-fly species: A mating position in which a male and female rest, or fly, with their anterior ends in opposite directions (Lavigne and Holland 1969, 3; 32, illustration).

Comment: Figure 8 shows a pair of the firefly *Photinus pyralis* (Linnaeus, 1767) in an end-to-end mating position with the female's facing upwards.

male-beside-female mating position *n.* For example, in some robber-fly species: A mating position in which a male's longitudinal axis is about 30° with regard to his mate's longitudinal axis (Lavigne and Holland 1969, 4; 28, illustration).

male-over-female mating position *n.* For example, in the *Popillia japonica* (Japanese Beetle); Praying Mantids; many bee and ladybird species; and some robber-fly species: A mating position in which a male perches on his mate's dorsum (Lavigne and Holland 1969, 3; 37, illustration; Barrows and Gordh, 1978, 341).

♦ **mating site** *n.* A place when members of the opposite sex copulate (Thornhill and Alcock 1983, 182). *syn.* encounter site, rendezvous place (Barrows 1976a)

♦ **mating stimulant** See chemical-releasing stimulus: stimulant: mating stimulant.

♦ **mating system** *n.*

1. Mating patterns in an animal population, including extent of inbreeding, possible pair-bonding, individual's numbers of simultaneous mates, and distribution of parental care within a mated pair (Lincoln et al. 1985; Immelmann and Beer 1989, 180).

Notes: Emlen and Oring (1977) classify mating systems of birds and mammals; Thornhill and Alcock (1983) classify male mating systems in insects; and Kirkendall (1983) classifies mating systems of Ambrosia and Bark Beetles.

2. An archaeabacterium gene-transfer system involving a donor and recipient individual (Rosenshine et al. 1989, 1387).

3. Mating patterns in plants (Hamilton and Rand 1996, 255).

cf. breeding, lek

SOME CLASSIFICATIONS OF MATING SYSTEMS

I. Classification by focal organisms based on number of mates and other criteria including number of serial mates, number of simultaneous mates, extent of inbreeding, and amount of maternal and paternal care given to offspring

A. monogamy

1. anonymous monogamy
2. female-enforced monogamy
3. male-assistance monogamy
4. mate-assistance monogamy
5. mate-guarding monogamy
6. perennial monogamy (= life-time monogamy)
7. serial monogamy (*syn.* serial polygamy of some authors)

B. polygamy

1. bigamy
 - a. opportunistic bigamy
 - b. usurpatory bigamy
2. oligogyny
3. contemporaneous polygamy
4. facultative polygamy
5. polybrachygamy (= promiscuity)
 - a. broadcast promiscuity
 - b. overlap promiscuity
6. serial polygamy
7. simultaneous polygamy

8. polyandry
 - a. convenience polyandry
 - b. fraternal polyandry
 - c. genetic-benefit polyandry
 - d. mate-defense polyandry
 - e. maternal-benefit polyandry (= prostitution polyandry)
 - f. serial polyandry (*syn.* serial monogamy)
 - g. simultaneous polyandry
 - h. sperm-replenishment polyandry
9. polygynandry
10. polygyny
 - a. female-defense polygyny
 - b. harem polygyny
 - c. inbreeding polygyny
 - d. lek polygyny
 - e. multimale polygyny
 - f. pure-dominance polygyny
 - g. resource-defense polygyny
 - h. scramble-competition polygyny
 - (1) explosive-mating assemblage polygyny
 - (2) prolonged-searching polygyny
 - i. simultaneous polygyny
 - j. territorial polygyny
 - k. unimale polygyny
11. polygyny-polyandry

II. Classification by number of sexes

- A. bipolar mating system
- B. multipolar mating system

III. Classification by actual, or supposed, influencing ecological factors

- A. brachygamy
- B. colonial mating system
- C. inbreeding polygyny
- D. tachygamy

bigamy *n.* For example, in *Troglodytes* sp. (Tropical House Wrens): A male's copulating with two females (Freed 1986, 1895).

Comment: Freed (1986) describes "opportunistic bigamy" and "usurpatory bigamy."

bipolar mating system *n.* A mating system that involves two genders, either of gametes alone or both individual organisms and gametes (Bell 1982, 503).

cf. mating system: multipolar mating system

brachygamy *n.* In some ambrosia-beetle (Curculionidae) and bark-beetle (Scolytidae) species: A mating system related to a gallery system made by one female in which pair bonds are of variable duration, but do not usually last during an oviposition period that a female takes to lay her entire brood [Greek *brachy*, short; *gamos*, marriage, coined by Kirkendall (1983 after Selander 1972)].

colonial mating system *n.* In some ambrosia-beetle (Curculionidae) and bark-beetle (Scolytidae) species: A mating system related to a galley system made by more than one female in which more than one males mate with several to many females [coined by Kirkendall 1983].

monarsenous mating system See mating system: polygamy.

monogamy *n.*

1. A mating system in which individuals have only one mate during the production of at least one brood, and both parents almost always rear young together (Wilson 1975, 315, 327, 589; Immelmann and Beer 1989, 189; Alcock 1993, 447).

Notes: Monogamy occurs in some beetle, bird, crab, crown-shrimp, desert-woodlouse, and mammal species. Mammals with monogamy include most canid species, some agouti and dikdik species, Gibbons, Humans, Marmosets, many mustelid species, five species of New World Monkeys, and *Oreotragus oreotragus* (Klipspringers). In many bird species males are “monogamous” in the sense that they each pair-bond with one mate and give parental assistance, but they are also polygynous because they obtain extrapair copulations (Alcock 1993, 451).

2. A mating system in which “breeding adults of both sexes pair with only one mate at a time, with the duration of pair bonding lasting for a substantial fraction of the breeding season” (Wittenberger 1981, 618).
3. A mating system in which a male ordinarily copulates (and has reproductive success) with only one female during his life if he is short-lived, or during an entire breeding season if he is long-lived, depending on his species (Thornhill and Alcock 1983, 81).
4. For example, in some halictine-bee species, possibly many other hymenopteran species, and the Screwworm Fly: A female insect’s mating only once in her lifetime (Barrows 1976a; Alcock et al. 1978). *cf.* bonding
5. In some ambrosia-beetle (Curculionidae) and bark-beetle (Scolytidae) species: A mating system related to a gallery system made by one female in which a male stays during the entire oviposition period that his mate takes to lay one brood of eggs (Kirkendall 1983).

Note: Monogamy may be “permanent monogamy” or “serial monogamy” [coined by Kirkendall 1983].

Comment: There are few purely monogamous bird species (Ford 1983 and McKinney et al. 1984 in Freed 1986, 1894).

[French *monogamie* < Late Latin *monogamia* < Greek < *mono*, single + *gamos*, marriage]

► **anonymous monogamy** *n.* In *Ciconia ciconia* (White Storks), Swallows, and Swifts: Monogamy that is maintained due to partners’ being attached to the same nesting spot (*Ortstreu*) after returning from separate parts of their overwintering region (Immelman and Beer 1989, 189).

► **female-enforced monogamy** *n.* Monogamy that occurs because a dominant female stops subordinate females from copulating with her mate, e.g., *Canis lupus* (Gray Wolves) (Alcock 1993, 447).

► **life-time monogamy** See mating system: perennial monogamy.

► **male-assistance monogamy** *n.* Monogamy in which a male remains with his mate and this elevates her reproductive output (Thornhill and Alcock 1983, 234).

► **mate-assistance monogamy** *n.* Monogamy in which an animal remains with its mate and elevates its reproductive effort; e.g., in many bird species (Alcock 1993, 447).

► **mate-guarding monogamy** *n.* Monogamy in which a male remains with his mate and prevents her from copulating with other males (Thornhill and Alcock 1983, 234).

► **monandry** *n.* A female’s tendency to mate with only a single male.

cf. mating system: monogamy: monogyny [*< mono-* + Greek *andros*, man]

► **monogyny** *n.* A male’s tendency to mate with only a single female (Wilson 1975, 589).

cf. -gyny: monogyny; mating system: monogamy: monandry [*mono-* + Greek *gynē*, woman]

► **perennial monogamy, life-time monogamy** *n.* For example, in *Aphelocoma coerulescens* (Florida Scrub Jays), *Meriones unguiculatus* (Mongolian Gerbils), *Perisoreus infaustus* (Siberian Jays), Swans, and some Humans: Monogamy in which mates are pairbonded throughout their lives (Wilson 1975, 327, 454; Griesser and Ekman 2005, 349).

cf. mating system: monogamy: serial monogamy

► **serial monogamy** *n.* For example, in some bird and mammal species, *Homarus americanus* (American Lobsters), and some Humans: An individual’s having only one mate at a time in a series of mates over its lifetime (Wittenberger 1979 and Wittenberger and Tilson 1980 in Cowan and Atema 1990, 1120; Cowan and Atema 1990, 1199).

cf. mating system: monogamy: perennial monogamy: polygamy: serial polygamy

Comment: “Serial monogamy” is a confusing term. Some workers consider it to be synonymous with serial polygamy (Davies 1991, 281).

monothelious mating system See mating system: polyandry.

multipolar mating system *n.* A mating system that involves three, or more, genders of isogametes (Bell 1982, 510).

cf. mating system: bipolar mating system

oligogyny *n.* The mating of one male with a few females (Lincoln et al. 1985).

overlap promiscuity See mating system: polybrachygamy: overlap promiscuity.

panogamy *n.* A mating system in which female rats change mates during a copulation series (M. K. McClintock, pers. comm.).

polyandry *n.*

1. For example, in *Apis mellifera* (Western Honey Bees), *Gallinula mortierii* (Tasmanian Native-hens), *Jacana* spp. (Jaçanas), *Prunella modularis* (Dunnocks), and some Humans: A female’s having more than one male as a mate (Wilson 1975, 327; Alcock 1993, 456) which may cooperate in raising brood (Wilson 1975, 592).

Note: For example, *Apis mellifera* queens mate with an average with 17 drones (Adams et al. 1977 in Frumhoff and Schneider 1987, 255). Animals that are both polyandrous and polygynous include giant water bugs, many fishes with parental care, and Tinamous (bird) (Alcock 1993, 456).

2. A mating system in which a female copulates and has reproductive success with more than one male during her entire life, or an entire breeding season, whether or not she is pair bonded to any of her mates (Thornhill and Alcock 1983, 81).

3. “A mating system characterized by a behavioral bond between one breeding female and two or more males breeding with her” (Brown 1987, 305). *syn.* monothelious mating system (Lincoln et al. 1985)

cf. mating system: polygyny, polygyny

► **convenience polyandry** *n.* In some insect species: Polyandry in which a female avoids the costs of trying to prevent superfluous copulations by simply allowing males to mate with her instead of resisting their matings (Thornhill and Alcock 1983, 462).

► **fraternal polyandry** *n.* A rare form of marriage, not uncommon in Tibet, in which two, or more, brothers marry the same woman simultaneously; all brothers are sexual mates of the woman, and her children consider all of the brothers as their fathers (Goldstein 1987).

► **genetic-benefit polyandry** *n.* In some insect species: Polyandry in which a female replaces sperm of a genetically inferior mate with those of a genetically superior one, or in which she adds sperm from a genetically different mate to her sperm supply, thus increasing genetic variability of her offspring (Thornhill and Alcock 1983, 462).

► **mate-defense polyandry** *n.* For example, in *Phalaropus lobatus* (Red-necked Phalarope): polyandry in which a female guards her male mates from other females (Alcock 1993, 459).

► **maternal-benefit polyandry, prostitution polyandry** *n.* In some insect species: Polyandry that involves a female's obtaining nutrition or other material resources, reduction of the risk of predation, reduction of competition for a resource, protection from other sexually-active males, or a combination of these things (Thornhill and Alcock 1983, 462).

► **serial polyandry** *n.* Polyandry in which a female has pair-bonded mates one after another (Wilson 1975, 327).

cf. mating system: polyandry; simultaneous polyandry; polygyny; polyandry

► **simultaneous polyandry** *n.* Polyandry in which a female has more than one pair-bonded mate at about the same time (Wilson 1975, 327).

cf. mating system: polyandry; serial polyandry

► **sperm-replenishment polyandry** *n.* In some insect species: Polyandry in which a female mates with more than one male, enabling her to add to an inadequate, or depleted, sperm supply (Thornhill and Alcock 1983, 462).

polybrachygamy *n.*

1. Nonrandom polygamy without pair bonds (Selander 1972 in Wilson 1975, 327).
2. In Crotaphaginiae Birds and *Pan troglodytes* (Chimpanzees): A mating system in which "males and females do not form long-term pair associations and individuals of at least one sex frequently mate with more than one individual of the opposite sex each reproductive season" (Wilson 1975, 451, 546; Wittenberger 1981, 620).

syn. promiscuity (Wilson 1975, 327)

Comments: "Polybrachygamy" does not necessarily imply that animals concerned do not discriminate among potential mates. The boundaries among "promiscuity," "polygamy," and mating within "one-male mating systems" ("harems") are blurred (Immelmann and Beer 1989, 235).

► **broadcast promiscuity** *n.* For example, in some sponge species: Sexual reproduction in which male and female gametes are released into their parents' surrounding medium, where fertilization takes place; ordinarily, "gamete release occurs in some coordinated manner and may involve large numbers of individuals of both sexes" (Wittenberger 1981, 613).

► **hierarchical promiscuity** *n.* A mating system that occurs in multi-male social groups where a male's sexual access to receptive females is affected by his status in his social hierarchy (Wittenberger 1981, 616).

► **overlap promiscuity** *n.* A mating system in which individual males and females live in overlapping home ranges and come together only briefly for the purpose of mating (Wittenberger 1981, 619).

► **polygamy** *n.* For example, in *Gasterosteus aculeatus* (Three-spined Sticklebacks) and many mammal and weaverbird species: An individual's having more than one mate, as part of its normal life cycle (Wilson 1975, 327), which may all cooperate in raising brood (Wilson 1975, 592).

syn. monarsenous mating system (Lincoln et al. 1985)

cf. mating system: polyandry, polybrachygamy, polygynandry, polygyny

► **contemporaneous polygamy** See polygyny: simultaneous polygyny.

► **facultative polygamy** *n.* In some songbird species: Polygamy in which a male has two, or even more, mates as circumstances allow (Immelmann and Beer 1989, 226).

► **serial polygamy** *n.* Polygamy in which an animal has pair-bonded mates one after another, rather than simultaneously (Wilson 1975, 327).

cf. mating system: monogamy; serial monogamy; polyandry; serial polyandry; polygamy: simultaneous polygamy; polygyny: serial polygyny

► **simultaneous polygamy** *n.* Polygamy in which an animal has more than one pair-bonded mate at about the same time (Wilson 1975, 327).

cf. mating system: polyandry: simultaneous polyandry; polygamy: serial polygamy; polygyny: serial polygyny

► **polygynandry** *n.* For example, in some bird species: A mating system with behavioral bonds between two, or more, breeding females and two, or more, males breeding with them (Brown 1987, 305).

cf. mating system: polyandry, polygamy

polygyny *n.*

1. A male's mating with two, or more, females (Wilson 1975, 327, 592).
2. A male's mating with more than one female with which he cooperates to some extent in rearing young (Wilson 1975, 592).

3. A mating system in which a male copulates and has reproductive success with more than one female, whether or not he is pair-bonded to any of his mates (Thornhill and Alcock 1983, 81, 85).

Note: This is the most common form of mating system in animals (Thornhill and Alcock 1983, 81, 85).

4. A mating system of a population, or species, in which a reasonable percentage (5–10%) of mature males copulate and have reproductive success with more than one female (Thornhill and Alcock 1983, 82).

cf. mating system: polyandry, polygamy, polygynandry

► **female-defense polygyny** *n.* For example, in a horseshoe-crab species, some insect species, and *Rana sylvatica* (Wood Frogs): Polygyny in which some males prevent others from gaining access to mates by defending groups of females or a series of individual females (Thornhill and Alcock 1983, 234; Alcock 1993, 460–462).

Comments: In its strict sense, female-defense polygyny involves a male's defending more than one female that he actually inseminated (pers. obs.).

► **harem polygyny** *n.*

1. Polygyny in which one adult male controls exclusive sexual access to a social group of two, or more, breeding females, usually by means of aggressive behavior (Wilson 1975, 327; Baird and Liley 1989, 817).
syn. “one-male-social-unit polygyny”
2. In some ambrosia-beetle (Curculionidae) and bark-beetle (Scolytidae) species: A mating system related to a gallery system made by more than one female in which a male mates with more than one female to which he is pair-bonded simultaneously or sequentially; this includes bigamy (Kirkendall 1983).

cf. harem

► **lek polygyny** *n.* For example, *Dama dama* (Fallow Deer), *Gallinago media* (Great Snipe), *Hypsipnathus monstrosus* (Hammer-headed Bats), *Manacus manacus* (White-bearded Manakins), and *Tetrao tetrix* (Black Grouse): Polygyny which involves a lek, a group of small territories that each contains a male, but no group of females or any resource of value to a potential female mate except for a male's genes (Alcock 1993, 470–471).

cf. lek

Comments: In lek polygyny, females visit males' territories for the sole purpose of becoming inseminated (Alcock 1993, 470).

► **mate-defense polyandry** *n.* For example, in the *Phalaropus lobatus* (Red-necked Phalaropes): Polyandry in which a female guards her male mates from other females (Alcock 1993, 459).

► **inbreeding polygyny** *n.* In some ambrosia-beetle (Curculionidae) and bark-beetle (Scolytidae) species: A mating system related to a gallery system made by a mother beetle in which her few sons fertilize many daughters (Kirkendall 1983).

cf. mating system: polygyny; harem polygyny; tachygamy

► **mate-defense polyandry** *n.* For example, in *Phalaropus lobatus* (Red-necked Phalaropes): Polyandry in which a female guards her male mates from other females (Alcock 1993, 459).

► **pure-dominance polygyny** *n.* In some insect species: A polygynous mating system in which some males gain access to mates by excluding others from particular “symbolic” mating territories that are preferred by discriminating females; in this system males defend a perch on a landmark site or a waiting site on the periphery of a dispersed resource area (Stiles and Wolf 1979, 1).

syn. lek, lek-mating system (Stiles and Wolf 1979, 1; Phillips 1990, 555), lek polygyny

cf. lek

► **resource-defense polygyny** *n.* For example, in the *Aepyceros melampus* (Impala), *Vicugna vicugna* (Vicuñas), and some African antelope, damselfly and honeyguide (bird) species: Polygyny in which some males prevent others from gaining access to mates by defending resources that attract receptive females; in this system, males defend resources as they occur *in situ* or resources that they collect (and might) prepare for females (Thornhill and Alcock 1983, 234; Alcock 1993, 464–465).

► **scramble-competition polygyny** *n.* In a *Photinus* (firefly) species and *Spermophilus tridecemlineatus* (Thirteen-lined Ground Squirrels): Polygyny in which males make no effort to defend individual

exclusive mating territories, but instead attempt to outrace their competitors to receptive females (Thornhill and Alcock 1983, 234).

► **explosive-mating-assemblage polygyny** *n.*

In some insect species, a horseshoe-crab species, and *Rana sylvatica* (Wood Frogs): Polygyny in which receptive females are abundant for a very brief time during which mating is frequent (Thornhill and Alcock 1983, 234; (Alcock 1993, 469).

► **prolonged-searching polygyny** *n.* In some insect species: Polygyny in which receptive females are “evenly distributed” or male competitors cause a high rate of interferences in a male's mate acquisition (Thornhill and Alcock 1983, 234).

► **serial polygyny** *n.* Polygyny in which a male has pair-bonded mates one after another (Wilson 1975, 327).

cf. mating system: polyandry; serial polyandry; polygamy: serial polygamy; polygyny: simultaneous polygyny

► **simultaneous polygyny** *n.* Polygyny in which a male has more than one pair-bonded mate at about the same time (Wilson 1975, 327).

syn. contemporaneous polygamy (Palmer 1955)

cf. mating system: polyandry; simultaneous polyandry; polygamy: simultaneous polygamy; polygyny: serial polygyny

► **territorial polygyny** *n.* For example, in *Agelaius phoeniceus* (Red-winged Blackbirds): A “mating system in which males defend resource-based territories and commonly form pair bonds with more than one concurrent mate” (Wittenberger 1981, 622).

► **polygyny-polyandry** *n.* In some vertebrate species: A “mating system in which males are regularly polygynous and females are regularly polyandrous within the same population” (Wittenberger 1981, 619).

promiscuity See mating system: polybrachygamy.

tachygamy *n.* In some ambrosia-beetle (Curculionidae) and bark-beetle (Scolytidae) species: A mating system related to a gallery system made by one female “in which no lasting pair bond is formed — males that stay at all after copulation leave before oviposition gets underway” [Greek, *tachys*, rapid, swift; *gamos*, marriage, union; coined by Kirkendall (1983)].

♦ **mating territory** See territory: mating territory.

♦ **mating type** See -type, type: mating type.

♦ **matorral** See habitat: maquis.

♦ **matri-** *comb. f.* Mother (Michaelis 1963).

cf. patri-

[Latin *mater*, *matris*, mother]

♦ **matriarchy** See ²group: matriarchy.

♦ **matricliny** *n.* An offspring's having a greater inherited resemblance to its mother than its father (Lincoln et al. 1985).

cf. patricliny

adj. matriclinic, matrilineal, matriclinous, matrilinear, metroclinal (Lincoln et al. 1985)

♦ **matrifocal** *adj.* Referring to a society in which most of the activities and personal relationships are centered on mothers (Wilson 1975, 317, 588).

Comment: Most animal societies are matrifocal (Wilson 1975, 317, 588).

♦ **matrilineal** *adj.*

1. Referring to a maternal line (Michaelis 1963).

- A**
2. Referring to things passed from a mother to her offspring, *e.g.*, access to a territory, or status, within a dominance system (Wilson 1975, 588).
syn. maternal
cf. patrilineal
- ♦ **matrilineal inheritance** See inheritance: matrilineal inheritance.
- ♦ **matrix** *n., pl. matrices, matrixes*
 1. In mathematics, a rectangular array of numbers, or terms, enclosed within parentheses, or double vertical bars, to facilitate study of relationships (Michaelis 1963).
 2. A table of information.
[Latin *matrix*, womb, breeding animal < *mater*; *matris*, mother]
- amino-acid-substitution matrix** *n.* A table that compares the number of amino-acid substitutions between sets of selected taxa (inferred from Doolittle 1996, 471, 474).
- **BLOSUM substitution matrix, BLOSUM table** *n.* An amino-acid-substitution matrix (Henikoff and Henikoff 1993 in Doolittle 1996, 474).
- **Dayhoff-PAM-250 matrix, PAM-250 matrix** *n.* An amino-acid-substitution matrix (Schwartz and Dayhoff 1978 in Doolittle 1996, 474).
- **Gonnet-Cohen-Benner matrix, GCB matrix** *n.* An amino-acid-substitution matrix (Gonnet et al. 1992 in Doolittle 1996, 474).
- ♦ **matrix collinearity** See multicollinearity.
- ♦ **matrix mutation** See ²mutation: matrix mutation.
- ♦ **matromorphic** See -morphic: matromorphic.
- ♦ **matrone** See chemical-releasing stimulus: matrone.
- ♦ **maturation** *n.*
 1. A person's, or his faculties', becoming fully grown or developed (Oxford English Dictionary 1972, entries from 1616).
 2. An individual organism's becoming fully grown or developed (Oxford English Dictionary 1972, entries from 1664); attaining sexual maturity (Lincoln et al. 1985).
 3. An individual animal's seasonal recurrence of reproductive behavior, *e.g.*, nest building or singing, that is separate from the initial growth of its underlying neural mechanisms (Tinbergen 1951 in Immelmann and Beer 1989, 181).
 4. Gamete differentiation (Lincoln et al. 1985).
 5. The increasing complexity, or precision, of an individual animal's behavior that occurs during its growth to sexual maturity and is not learned from prior experience, *e.g.*, a bird's flying without practice (Heymer 1977, 143; Immelmann and Beer 1989, 180–181).
- ♦ **maxillation** *n.* A yellowjacket wasps' chewing up a prey insect before presenting it to a larva (Akre 1995, 25).
- ♦ **maximum-homology hypothesis** See hypothesis: maximum homology hypothesis.
- ♦ **maximum-likelihood method** See method: maximum-likelihood method.
- ♦ **maximum-population-growth rate** See rate: maximum-population-growth rate.
- ♦ **maximum-power principle** See principle: maximum-power principle.
- ♦ **maze** *n.* A system of adjoining passageways used to study animals' learning capabilities (Immelmann and Beer 1989, 181).
- T-maze** *n.* A T-shaped maze.
- Y-maze** *n.* A Y-shaped maze.
- Y-maze globe** *n.* An apparatus used to measure turning tendency in some insect species; a Y-maze globe comprises six pieces of a thin, flat material that are joined at four points to make four Y-junctions (Hassenstein 1959 in Hinde 1970, 204).
Comment: An insect suspended by its dorsum holds onto the globe with its legs (Hassenstein 1959 in Hinde 1970, 204).
- ♦ **maze experiment** See experiment: maze experiment.
- ♦ **Mb** See unit of measure: megabasepair.
- ♦ **MCID Elite®** See program: MCID Elite®.
- ♦ **meadow** See habitat: meadow.
- ♦ **mean, sample mean, \bar{X}** *n.* The arithmetic average of a sample (Siegel 1956, xvi).
syn. arithmetic mean, average, \bar{Y} (Sokal and Rohlf 1969, 42)
cf. mode, parameter
Comment: Sokal and Rohlf (1969, 43–44) also define "geometric mean" and "harmonic mean."
- ♦ **trimmed mean $\bar{x}, \{\bar{x}\}$** *n.* The mean of a central part of a data set; *e.g.*, $\bar{x} \{0.25\}$ is the average of the middle 50% of a data set (Efron and Tibshirani 1991, 390).
Comment: A trimmed mean can be substantially more accurate than a mean from a data set with a long-tailed probability distribution (Efron and Tibshirani 1991, 390).
- ♦ **mean-body temperature** See temperature: mean-body temperature.
- ♦ **mean-phenotypic value** See value: mean-phenotypic value.
- ♦ **mean r** See factor: dilution factor.
- ♦ **mean radiant temperature** See temperature: mean-radiant temperature.
- ♦ **meaning** See analysis: message-meaning analysis.
- ♦ **measurement** *n.*
 1. A person's using an instrument to measure anything (Michaelis 1963).
 2. A person's assigning numbers to observations and observations to categories in a scientific investigation (Lehner 1979, 109).
- See scales of measurement.
- ♦ **measurement error** See error: measurement error.
- ♦ **mechanical communication** See communication: mechanical communication.
- ♦ **mechanical-conflict-of-interest hypothesis** See hypothesis: hypotheses of divergent evolution of animal genitalia: mechanical-conflict-of-interest hypothesis.
- ♦ **mechanical incompatibility, mechanical isolation** See isolation: mechanical isolation.
- ♦ **mechanical-physical theory of evolution** See ³theory: mechanical-physical theory of evolution.
- ♦ **mechanics** See study of: physics: mechanics.
- ♦ **mechanism** *n.* The process, or technique, by which something works or produces an action or effect (Michaelis 1963).
See ³theory: mechanistic theory.
- acquired-releasing mechanism (ARM)** See mechanism: releasing mechanism.
- central-excitatory mechanism (CEM)** *n.* A mechanism that is receptive to sensory stimuli and hormone influences and dispatches impulses to neural circuits of a behavior pattern (Beach 1942 in Tinbergen 1951, 123).

compensatory mechanism *n.* A postulated central (cerebral) mechanism that can adjust for interim changes in the external environment by directing an animal's behavioral responses (Frisch 1965 in Heymer 1977, 191), *e.g.*, in scout bees that change their dances with the Sun's movement in ways that convey correct information about the direction of a new nesting site.

hysteresis mechanism *n.* An animal's mechanism that causes a delay between its receiving a stimulus and responding (Toates and Oatley 1970 in McFarland 1985, 458).

isolating mechanism *n.* "Any agent that hinders the interbreeding of groups of individuals" (Dobzhansky 1937, 230 in Mayr 1982, 274); an agent that causes isolation, *q.v.*

Comment: Brown (1975, 404–405) lists some kinds of isolating mechanisms which are not included here.

► **behavioral-isolating mechanism** See mechanism: isolating mechanism: sexual-isolating mechanism.

► **biological-isolating mechanism** *n.* "Biological properties of individuals which prevent the interbreeding of populations that are actually or potentially sympatric" (Mayr 1963, 91, in Mayr 1982, 274), *e.g.*, an incompatible behavior during courtship or a physiological barrier that prevents zygote formation if insemination occurs.

cf. mechanism: isolating mechanism: geographical-isolating mechanism

Comment: "An occasional individual in an otherwise perfectly good species may hybridize. In other words, isolating mechanisms can only provide the integrity of populations, but not of every last single individual" (Mayr 1963, 91, in Mayr 1982, 274).

► **ethological-isolating mechanism** See mechanism: isolating mechanism: sexual-isolating mechanism.

► **extrinsic-isolating mechanism** *n.* Any environmental barrier that isolates potentially interbreeding populations (Lincoln et al. 1985).

cf. mechanism: isolating mechanism: intrinsic-isolating mechanism

► **geographical-isolating mechanism** *n.* A physical part of the environment that prevents the interbreeding of populations; *e.g.*, a mountain chain, river, or ocean (Mayr 1982, 274).

See isolating mechanism.

syn. locomotor-isolating mechanism (Brown 1975, 404)

► **intrinsic-isolating mechanism** *n.* Any of an organism's genetically determined factors that prevents interbreeding between individuals of sympatric species (Lincoln et al. 1985).

cf. mechanism: isolating mechanism: extrinsic-isolating mechanism

► **postzygotic-isolating mechanism** *n.* An isolating mechanism that prevents interbreeding between two, or more, populations after zygote formation (Lincoln et al. 1985).

syn. post-mating-isolating mechanism (Brown 1975, 404)

► **prezygotic-isolating mechanism** *n.* An isolating mechanism that prevents interbreeding between two, or more, populations before fertilization or zygote formation (Lincoln et al. 1985).

syn. pre-mating-isolating mechanism (Brown 1975, 404)

► **sexual-isolating mechanism, behavioral-isolating mechanism, ethological-isolating mechanism** *n.* An organism's behavior that prevents heterospecific interbreeding (Brown 1975, 404).
syn. behavioral-isolating mechanism (Brown 1975, 404)

releasing mechanism (RM) *n.*

1. All of an animal's postulated central-nervous-system mechanisms, not including motor mechanisms, that play an important part in releasing one of its responses (Heymer 1977, 27).

2. All of an animal's sensory and neural components that contribute to its filtering incoming stimuli and, hence, determining that only relevant stimuli trigger its behavior (Immelman and Beer 1989, 251).
Comment: Schleidt (1962 in Heymer 1977, 27) notes that "releasing mechanism" should be used whenever one does not know whether a connection between a stimulus and response is originated by a phylogenetic or ontogenetic adaptation.

► **acquired-releasing mechanism (ARM)** *n.* A releasing mechanism that an organism obtains in adapting to a certain situation during its ontogeny (Heymer 1977, 57); this involves its learning releasing stimuli (Immelman and Beer 1989, 251).

cf. mechanism: releasing mechanism: innate-releasing mechanism

Comment: This term should be used only if experiments demonstrate that the response in question cannot be released by an innate releasing mechanism (Schleidt 1962 in Heymer 1977, 57).

► **innate-releasing mechanism (IRM)** *n.*

1. An animal's hypothesized "special sensory mechanism" that releases its reactions in response to a "certain set of sign stimuli" and "is responsible for its susceptibility to such a very special combination of sign stimuli" [coined by Tinbergen 1951, 42, which is his free translation of the German term *das angeborene auslösende Schema* of von Uexküll and Lorenz].

2. A hypothesized locus in an animal's central nervous system on which sign stimuli act to release fixed-action patterns (Lorenz 1950; Tinbergen 1950 in McFarland 1985, 364).

cf. acquired mechanism: acquired-releasing mechanism

Comments: With further research, workers found that behavioral control stems not so much from actions of IRMs, but from filtering processes that occur along afferent pathways (Dewsbury 1978, 21). This term should be used only if the presence of an IRM has been demonstrated in individuals that have been isolated from the sign stimulus in question (Heymer 1977, 19). "IRM" is now used as a term less freely (Immelman and Beer 1989, 251).

innate-releasing mechanism modified by experience (IRME) *n.* An IRM that is modified by ontogenetic adaptation to a certain situation, either by habituation, sensitization, learning, or a combination of these factors (Schleidt 1962 in Heymer 1977, 57).

♦ **mechanist** *n.* One who holds that natural phenomena can be explained by the laws of chemistry and physics (Oxford English Dictionary 1972, entry from 1668; Mayr 1982, 835).

cf. ³theory: mechanistic theory

- atomistic mechanist** *n.* One who believes that manifestations of life originate through the assembly of appropriate configurations of atoms as did Lucretius (99–55 B.C.), a follower of Epicurus (Mayr 1982, 90).
- ♦ **mechanistic theory** See ³theory: mechanistic theory.
- ♦ **mechanistic world picture, mechanistic world view** *n.* Galileo's view that developed from and is similar to essentialism, *q.v.*, that was spread by Descartes in particular (Mayr 1982, 38, 97).
- ♦ **mechanoreception** See modality: mechanoreception.
- ♦ **Meckel-Serrès law** See law: Meckel-Serrès law.
- ♦ **Medawar-Williams hypothesis of senescence** See hypothesis: Medawar-Williams hypothesis of senescence.
- ♦ **meddling** *n.*
 1. A person's taking part, dealing, managing; now only in a bad sense, a person's taking part officially in other's affairs; interfering (Oxford English Dictionary 1972, entries from 1374).
 2. An individual organism's interfering with its rival's activities, *e.g.*, a barnacle's growing over and destroying its rival or a male salamander's disrupting the courtship of another male (Huntingford and Turner 1987, 6).*cf.* aggression, competition
- ♦ **media worker** See caste: worker: media worker.
- ♦ **medical psychology** See study of: psychology: medical psychology.
- ♦ **medroxyprogesterone acetate** See drug: medroxyprogesterone.
- ♦ **mega-** (**M**) *prefix* Large, great, greater than usual, used to denote a unit $\times 10^6$ (Lincoln et al. 1985).
- ♦ **megabase** See unit of measure: megabasepair.
- ♦ **Megadiverse Countries** See place: Megadiverse Countries.
- ♦ **megaevolution** See ²evolution: macroevolution.
- ♦ **megafauna** See fauna: megafauna.
- ♦ **megaflora** See flora: megaflora.
- ♦ **megagamete** See gamete: megagamete.
- ♦ **megagametogenesis** See -genesis: megagametogenesis.
- ♦ **megajoule** See unit of measure: Joule: megajoule.
- ♦ **megaloplankton** See plankton: megaloplankton.
- ♦ **megaplankton** See plankton: megaplankton.
- ♦ **Megatransect** See transect: Megatransect.
- ♦ **megistotherm** See therm: megatherm.
- ♦ **meiny, meinie** See ²group: meiny.
- ♦ **meio-** *prefix* Smaller, less than (Lincoln et al. 1985).
- ♦ **meiobenthos** See ²community: benthos: meiobenthos.
- ♦ **meiofauna** See fauna: meiofauna.
- ♦ **meiosis** *n.* Two successive divisions of a diploid nucleus that precede the formation of haploid gametes, or meiospores, each of which contains one of each pair of the homologous chromosomes of their parent cell (Lincoln et al. 1985).
syn. gametogenesis, maiosis, meiotic division, miosis, prokaryogamety, reduction division
adj. meiotic
cf. mitosis, sexual reproduction
- ♦ **gametic meiosis** *n.* In most animal species: Meiosis that immediately precedes gametogenesis (Margulis et al. 1985, 73).
- zygotic meiosis** *n.* In many fungus species: Meiosis that immediately follows zygote formation (Margulis et al. 1985, 73).
- ♦ **meiotic cost** See cost: meiotic cost.
- ♦ **meiotic division** See meiosis.
- ♦ **meiotic drive** See ²drive: meiotic drive.
- ♦ **meiotic-drive load** See genetic load: meiotic-drive load.
- ♦ **meiotic-drive locus** See allele: meiotic-drive locus.
- ♦ **meiotic parthenogenesis** See parthenogenesis: automictic parthenogenesis.
- ♦ **meiotic sex** See sexual reproduction: eukaryotic sex.
- ♦ **meiotic thelytoky** See parthenogenesis: automixis.
- ♦ **melangeophile** See ¹-phile: melangeophile.
- ♦ **melanophore** *n.* For example in Octopi; Squid; and some fish, frog, and toad species: A cell that contains melanin and expands and contracts under neuropeptide control (Curtis 1983, 786).
- ♦ **meliphage** See -vore: mellivore.
- ♦ **meliphagous** *adj.* Referring to an organism that feeds on honey (Lincoln et al. 1985).
syn. mellisugous, mellisugent, mellivorous
cf. -vore: mellivore
- ♦ **melittology** See study of: melittology.
- ♦ **melittophile** See ²-phile: melittophile.
- ♦ **melliferous** *adj.* Honey producing.
- ♦ **mellissophobia** See -phobia: apiphobia.
- ♦ **mellivore** See -vore: mellivore.
- ♦ **melotope** *n.* A habitat that has "specific characteristics that affect sound transmission within it" (Immelmann and Beer 1989, 182).
cf. acoustic window
- ♦ **membrane potential** See potential: membrane potential.
- ♦ **membranous labyrinth** See labyrinth: membranous labyrinth.
- ♦ **membranous droplet** See organized structure: membranous droplet.
- ♦ **meme** *n.* A replicator, or unit, of cultural transmission; a unit of imitation (Dawkins 1977, 206); "a unit of cultural inheritance, hypothesized as analogous to the particulate gene, and as naturally selected by virtue of its 'phenotypic' consequences on its own survival and replication in the cultural environment" (Dawkins 1982, 290).
cf. gene
Comments: Some researchers dismiss the concept of meme (S. J. Gould, H. A. Orr); others value this concept (S. Blackmore, D. Dennett) (Kher 1999, 53). [coined by Dawkins (1977), Latin *imitatio*, -onis, imitation]
- ♦ **meme pool** See pool: meme pool.
- ♦ **memory** *n.*
 1. A person's faculty for remembering something; his capacity for retaining, perpetuating, or reviving a thought of things past (Oxford English Dictionary 1972, entries from 1340).
 2. A person's act, or instance, of remembering; a representation in his memory; a recollection (Oxford English Dictionary 1972, entries from 1842).
 3. In animals, except Mesozoa and Porifera: An individual's capacity to store experience-derived information in and subsequently retrieve information from its nervous system (Foffa 1968, etc. in Heymer 1977, 74).

cf. genetic memory, long-term memory potentiation
episodic memory *n.* A person's memory of past situations (inferred from Hall 1998, 30).

explicit memory *n.* For example, in Humans: A consciously-remembered memory; contrasted with implicit memory (Lemonick 1999, 13 September, 56–57).

syn. declarative memory (Lemonick 1999, 13 September, 57)

Comment: Explicit memory contains subsystems that handle faces, names, parts of speech, shapes, sounds, and textures.

fact memory *n.* A person's memory of information, such as a phone number or another person's face; contrasted with skill memory (Campbell 1996, 1021).

flashbulb memory *n.* A person's recall of defining moments in his life; *e.g.*, what he was doing when he heard about the shooting of President J. F. Kennedy (Hall 1998, 30).

implicit memory *n.* For example, in Humans: Memory that one retains from an earlier practice session without consciously remembering it; contrasted with explicit memory (Lemonick 1999, 13 September, 56–57).

syn. nondeclarative memory (Lemonick 1999, 13 September, 57)

Comments: For example, the person H. M., who cannot form most kinds of new memories, shows implicit memory (Brenda Milner (1962) in Lemonick 1999, 13 September, 56–57). Associative learning and habituation are parts of implicit memory.

long-term memory *n.* For example, in some *Drosophila* species, Western Honey Bees, and Humans: Memory that lasts long enough so that it is not obliterated due to a disturbance (Gould 1982, 261); memory stored for days through years or even a lifetime; contrasted with short-term memory (Immelmann and Beer 1989, 183).

Comment: About 100 genes are involved in long-term memory in *Drosophila* (Tim Tully in Hall 1998, 33).

priming *n.* A person's unconscious recall of short visual, or auditory, cues (Hall 1998, 30).

short-term memory *n.* For example, in *Apis mellifera* (Western Honey Bees), some *Drosophila* species, and Humans: Memory that can be obliterated within a few minutes of learning due to a disturbance (Gould 1982, 261); memory stored for a few seconds to up to a few hours; contrasted with long-term memory (Immelmann and Beer 1989, 183).

cf. memory: working memory

skill memory *n.* A person's memory of motor activities that he learns by repetition without consciously remembering specific information, *e.g.*, trying on shoes, riding a bicycle, or walking (Campbell 1996, 1021–1022).

Comments: Skill memories are difficult to unlearn (Campbell 1996, 1022).

topographic memory *n.* Memory of locations, or sites, that is part of migratory, or homing, behavior (Heymer 1977, 127).

working memory *n.* "A brain system that provides temporary storage and manipulation of the information necessary for such complex cognitive tasks as language comprehension, learning, and reasoning" (Baddeley 1992, 556).

cf. memory: short-term memory

Comments: Working memory can be divided into three subcomponents: the "central executive," "visuospatial sketch pad," and "phonological loop" which are defined by Baddeley (1992). The concept of "working memory" has increasingly replaced the concept of "short-term memory" (Baddeley 1992, 256).

♦ **memory system** See system: memory system.

♦ **memory trace** See -gram: engram.

♦ **menagerie** See ²group: menagerie.

♦ **Mendel's laws** See law: Mendel's laws.

♦ **Mendel's theory of inheritance** See ³theory: Mendel's theory of inheritance.

♦ **Mendel's theory of particulate inheritance** See inheritance.

♦ **Mendel's three laws** See law: Mendel's laws.

♦ **Mendelian** *n.*

1. One who accepts Gregor Johann Mendel's theory of inheritance, *q.v.* (Oxford English Dictionary 1972, entries from 1901; Mayr 1982, 716).

2. One who accepts genetic findings from 1900 through 1915 (Mayr 1982, 716).

Note: Because Mendel did not promote these new findings, then he, himself, was not a Mendelian in this sense (Mayr 1982, 716).

3. An evolutionist who uses "the particulateness (discontinuity) of genetic factors as evidence for the importance of saltational processes in evolution, particularly in the origin of species" (Mayr 1982, 541).

Note: "Mendelians" believed in typological species and were concerned with frequencies of genes in closed gene pools. By and large, they ignored the existence of populations, the problems of the multiplication of species, the origin of higher taxa, origin of evolutionary novelties, and ultimate causations for genetic change in natural populations (Mayr 1982, 541–542). "Evolutionists" were mainly in two camps after 1900: the "Mendelians" and the "naturalists," *q.v.* (Mayr and Provine, 1980 in Mayr 1982, 541). From 1900 to 1906 the Mendelians opposed the biometricians, *q.v.* (Mayr 1982, 778).

syn. experimental geneticist

cf. Mendelianism

♦ **Mendelian character** See character: Mendelian character.

♦ **Mendelian chromosome theory** See ³theory: chromosome theory.

♦ **Mendelian cross** See cross: Mendelian cross.

♦ **Mendelian genetics** See study of: genetics: Mendelian genetics.

♦ **Mendelian inheritance** See ³theory: Mendel's theory of inheritance, inheritance.

♦ **Mendelian population** See ²population: Mendelian population.

♦ **Mendelian ratio** See ratio: Mendelian ratio.

♦ **Mendelian trait** See character: Mendelian character.

♦ **Mendelianism** *n.*

1. A period from 1900 through about 1909 which "was preoccupied with evolutionary controversies and doubts as to the universal validity of Mendelian inheritance" (Mayr 1982, 731–732).

Note: This period was dominated by Bateson, de Vries, and Johannsen, who have often been designated as "the early Mendelians." "Mendelism" conveys different meanings to different persons, depending on what aspect of Mendelism one wants to emphasize (Mayr 1982, 731–732).

- A**
2. To geneticists, a period in which particulate inheritance was confirmed and hardness of inheritance emphasized (Mayr 1982, 731–732).
3. To evolutionists, “a period in which utterly erroneous ideas about evolution and speciation were promulgated by leading geneticists and during which mutation pressure was considered far more important than selection, ideas which resulted in the alienation of the naturalists” (Mayr 1982, 731–732).
- ♦ **Mendelism** *n.* Inheritance in accordance with the chromosome theory of heredity (Lincoln et al. 1985). *syn.* particulate inheritance (Lincoln et al. 1985) *cf.* inheritance
- ♦ **MendelWeb** See study of: genetics (comments).
- ♦ **menopause** *n.* The period in a woman’s life when menstruation ceases; contrasted with perimenopause and surgical menopause (Wallis 1995, 50). *cf.* post-menopausal zest
- Comments:* The average age of menopause in the U.S. is 51 (Wallis 1995). Hot flashes, night sweats, vaginal dryness, and other symptoms of estrogen “withdrawal” occur around menopause when a woman’s ovaries produce less and less estrogen.
- ♦ **perimenopause** *n.* The transitional period between a woman’s “fertile period” and her menopause (Wallis 1995, 49).
- Comments:* In the U.S., perimenopause occurs in women from age 35 through their early 50s (Brody 1998, 27 January, C7). Symptoms of perimenopause include menstrual irregularity, drier skin, dropping estrogen levels in blood, hair’s becoming more brittle and sparser under arms and between legs, hot flashes, loss of concentration, mood swings, vaginal dryness, and possible loss of libido (Wallis 1995, 49; Brody 1998, 27 January, C7).
- ♦ **surgical menopause** *n.* Human menopause caused by removal of a woman’s uterus and ovaries (Wallis 1995, 50).
- ♦ **mensurative experiment** See experiment: mensurative experiment.
- ♦ **mental** *adj.*
1. Of or pertaining to a person’s mind or intellect (Oxford English Dictionary 1972, entries from *ca.* 1425).
 2. Referring to something that is carried on in a person’s mind (Oxford English Dictionary 1972, entries from 1526); especially without the aid of written symbols: mental calculations (Michaelis 1963).
 3. Relating to a person’s mind as an object of study; concerned with the phenomena of mind (Oxford English Dictionary 1972, entries from *ca.* 1820).
- [French < Late Latin *mentalis* < Latin *mens*, *mentis*, mind]
- ♦ **mental chronometry** See -metry: mental chronometry.
- ♦ **mental experience** *n.* An animal’s possible “thoughts about objects and events that are remote in time and space from the immediate flux of sensations” (Griffin 1976, 5).
- syn.* mental image (Griffin 1976, 5)
- Comment:* Griffin (1976) does not state that nonhuman animals definitely have mental experiences.
- ♦ **mental gland** See gland: mental gland.
- ♦ **mental image** See mental experience.
- ♦ **mental map** See cognitive map.
- ♦ **mentality** *n.*
1. That which is the nature of a person’s mind or mental action (Oxford English Dictionary 1972, entries from 1691); mental faculties or experiences (Michaelis 1963).
2. A person’s “intellectual quality, intellectuality” (Oxford English Dictionary 1972, entries from 1856); intellectual capacity or power (Michaelis 1963).
3. An animal’s having a declarative representation, *q.v.* (McFarland 1985, 356).
- cf.* mind
- Comment:* McFarland does not state that nonhumans definitely have mentalities.
- ♦ **mercy call** See animal sounds: call: mercy call.
- ♦ **merdicole** See -cole: fimicole.
- ♦ **merdivore** See -vore: merdivore.
- ♦ **meristic variable** See variable: discontinuous variable.
- ♦ **Merkwelt** See -welt: Merkwelt.
- ♦ **mero-, mer-** *prefix* Part, incomplete, partial (Michaelis 1963). [Greek *meros*, a part, division]
- ♦ **merogamodeme** See deme: merogamodeme.
- ♦ **merogamy** See -gamy: merogamy.
- ♦ **merohermaphroditic population** See population: merohermaphroditic population.
- ♦ **merohyponeuston** See neuston: merohyponeuston.
- ♦ **merological method** See method: merological method.
- ♦ **meromorphosis** See -morphosis: meromorphosis.
- ♦ **meroneuston** See neuston: meroneuston.
- ♦ **meroparasitism** See parasitism: meroparasitism.
- ♦ **meropelagic** See pelagic: meropelagic.
- ♦ **meroplankton** See plankton: meroplankton.
- ♦ **merostasis** See ²heterochrony: merostasis.
- ♦ **Mertensian mimicry** See mimicry: Emsleyian mimicry.
- ♦ **mesarch succession, mesosere** See ²succession: mesarch succession.
- ♦ **meso-, mes-** *comb.f.*
1. Situated in the middle (Michaelis 1963).
 2. “Intermediate in size or degree” (Michaelis 1963).
- cf.* pro-, meta- [Greek *mesos*, middle]
- ♦ **mesobenthos** See ²community: benthos: mesobenthos.
- ♦ **mesobiota** See biota: mesobiota.
- ♦ **mesochthonophile** See ¹-phile: mesochthonophile.
- ♦ **mesoderm** See organ: -derm: mesoderm.
- ♦ **mesoglea** (MES o glee ah) *n.* The middle layer of a cnidarian’s body wall (Barnes 1974, 88).
- Comments:* Mesogleas range from a thin, noncellular membrane to a thick, fibrous, jellylike, mucoid material with, or without, wandering amoebocytes (Barnes 1974, 88).
- ♦ **mesokurtic distribution** See distribution: mesokurtic distribution.
- ♦ **mesolithion** *n.* Organisms inhabiting rock cavities (Lincoln et al. 1985).
- ♦ **mesolithophage** See -phage: lithophage (*Comment*).
- ♦ **mesology** See study of: ecology.
- ♦ **mesophenic population** See ²population: mesophenic population.
- ♦ **mesophile** See ¹-phile: mesophile.
- ♦ **mesoplankton** See plankton: mesoplankton.

- ♦ **mesoplastic** See morphic: mesomorphic.
- ♦ **mesopredator release** *n.* An increase in the number of smaller predators that results from removal of larger predators in a particular area (Crooks and Soulé 1999, 563; Sæther, 1999, 510).
Comment: For example, in Western U.S., removal of large predators, such as *Canis latrans* (Coyotes), results in an increase of smaller predators (Common Raccoon, Domestic Cat, Gray Fox, Striped Skunk, and Virginia O'possum) which in turn results in a reduction in numbers of scrub birds (Crooks and Soulé 1999, 563; Sæther, 1999, 510).
- ♦ **mesopsammon** *n.* Organisms living in interstitial spaces of a sandy sediment (Lincoln et al. 1985).
syn. psammon (Lincoln et al. 1985)
- ♦ **mesosoma** *n.* In Insects: The middle of the three major divisions of an individual's body (Wilson 1975, 588).
cf. metasoma, prosoma
Comment: In most insect species, "mesosoma" is the strict equivalent of a thorax, but in more derived Hymenoptera it includes the propodeum, the first segment of the abdomen fused to the thorax (Michener 1944 in Michener 1974, 6).
- ♦ **mesosphere** See -sphere: mesosphere.
- ♦ **mesotherm, mesothermophyte** See therm: mesotherm.
- ♦ **mesothermophile** See ¹-phile: thermophile: mesothermophile.
- ♦ **mesotroph** See -troph-: mesotroph.
- ♦ **message** *n.*
1. A communication that is transmitted through a human messenger or other agency to a human; an oral, or written, communication from one person to another (Oxford English Dictionary 1972, entries from 1297).
 2. The type of information that is transmitted from one individual organism to another during communication (Storz 1973, 169).
cf. information, signal
- ♦ **message categories** *n. pl.* The 12 groups into which 10 through 50 displays of vertebrate species are classified (Smith 1969a in Wilson 1975, 217).
- ♦ **message-meaning analysis** See analysis: message-meaning analysis.
- ♦ **message set** *n.* A group of species-specific communicatory signals, typically ranging from 15 to 45 signals (Dewsbury 1978, 99).
- ♦ **messenger RNA** See nucleic acid: ribonucleic acid: messenger RNA.
- ♦ **met** See gene: *met*.
- ♦ **meta-, met-** *prefix*
1. "Changed in place or form; reversed; altered" (Michaelis 1963).
 2. Anatomically, zoologically, "behind; after; on the farther side of; later; often equivalent to post- or dorsi" (Michaelis 1963).
 3. "With; alongside" (Michaelis 1963).
 4. "Beyond; over; transcending" (Michaelis 1963).
cf. pro-, meso-
[Greek *meta*, after, beside, with]
- ♦ **metabiosis** See symbiosis: metabiosis.
- ♦ **metabolism** *n.*
1. A cell's, or organism's, producing living matter from nutritive matter (Oxford English Dictionary 1972, entries from 1878); all of a living organism's synthetic and degradative biochemical processes (Lincoln et al. 1985).
 2. Ecological energetics: respiration, *q.v.* (Lincoln et al. 1985).
cf. metamorphosis
See metastasis.
- ♦ **anabolism** *n.* Metabolism that involves an organism's manufacture of complex substances from less complex ones which results in energy utilization (Lincoln et al. 1985).
- ♦ **bradymetabolism** *n.* The low basal-metabolism levels of reptiles and other nonavian and nonmammalian animals relative to those of birds and mammals of the same body size and at the same tissue temperature; contrasted with tachymetabolism (Bligh and Johnson 1973, 944).
syn. cold bloodedness (an unsatisfactory synonym that is falling into disuse, Bligh and Johnson 1973, 944)
Comments: "Bradymetabolism" differs from "poikilothermy" because the latter signifies conformity of body and ambient temperatures and not all bradymetabolic species are temperature conformers, *q.v.*; however, some are ectothermic temperature regulators (Bligh and Johnson 1973, 944).
[Greek *bradus*, slow, sluggish; *metabole*, change]
- ♦ **catabolism, katabolism** *n.* Metabolism that involves an organism's degradation of complex substances into less complex ones which results in energy liberation (Lincoln et al. 1985).
- ♦ **tachymetabolism** *n.* The high basal-metabolism levels of birds and mammals compared to those of reptiles and nonavian and nonmammalian animals of the same body weight and at the same tissue temperature; contrasted with bradymetabolism (Bligh and Johnson 1973, 954).
syn. warm bloodedness (Bligh and Johnson 1973, 944)
[Greek *takhus*, fast; *metabole*, change]
- ♦ **metabolous** *adj.* Referring to a pattern of development that includes a metamorphosis (Lincoln et al. 1985).
- ♦ **-metabolous** See metamorphosis.
- ♦ **metacentric chromosome** See chromosome: metacentric chromosome.
- ♦ **metachrosis** *n.* An animal's ability to change color (Lincoln et al. 1985).
cf. color change, coloration
- ♦ **metacommunication** See communication: meta-communication.
- ♦ **metacyclic** *adj.* Referring to a parasite's life-cycle state that infects its definitive host, *q.v.* (Lincoln et al. 1985).
- ♦ **metafemale** See female: metafemale.
- ♦ **metagamic** See -gamic: metagamic.
- ♦ **metagamic sex determination** See sex determination: metagamic sex determination.
- ♦ **metagamy** See -gamy: metagamy.
- ♦ **metagenesis** See alternation of generations, -genesis: diogenesis.
- ♦ **metahermaphroditic population** See ¹population: metahermaphroditic population.
- ♦ **metamere** *n.* A segment, somite (Michaelis 1963); one of a group of an animal's repeated body parts, *e.g.*, an insect's thoracic and abdominal segments, or a vertebrate's pair of spinal nerves.
Comments: Metameres occur in phyla including Annelida, Arthropoda, Chordata, and Onychophora, Pogonophora.
[Greek *meta*, with; *mere*, part, division]

♦ **metamerism** *n.* In some cnidarian species, some platyhelminth species, Annelids, Arthropods, and Chordates: An individual's having its body divided into a linear series of similar parts, segments, or metameres; metamerism is primarily a mesodermal phenomenon; body-wall musculature and sometimes coeloms are the primary segmental divisions (Barnes 1974, 63, 233, 434; Strickberger 1990, 281).

cf. homology: serial homology

Comments: Metamerism is involved with a tendency for secondary reduction in forms that adapt to new conditions; metamerism may have evolved in chordates as an adaptation for undulatory swimming and in annelids as an adaptation for burrowing (Barnes 1974, 63, 233, 434). Strickberger (1990, 281) discusses hypotheses regarding the origin of metamerism.

♦ **metamorphosis** *n.*

1. A change in an individual organism, or its parts, during which it develops from an immature to an adult; especially in insects, a change, or series of changes, that certain insects undergo that results in complete alterations of their forms and habits (Oxford English Dictionary 1972, entries from 1665).
2. An organism, or other thing, that is metamorphosed (Michaelis, 1963).

adj. metamorphic

cf. animal names

Comment: Especially dramatic examples of metamorphosis include a tadpole's developing into an adult toad, or frog, and a caterpillar's developing into a moth or butterfly. Insect metamorphosis can be classified primarily as "ametabolous metamorphosis," "hemimetabolous metamorphosis," "paurometabolous metamorphosis," "holometabolous metamorphosis," and "hypermetabolous metamorphosis."

[Latin < Greek *metamōrphosis*, *metamorphoein*, to transform < *meta-*, beyond + *morphe*, form]

♦ **ametabolous metamorphosis** *n.* In Collembola (Springtails) and Thysanura (Bristletails and Silverfish): Metamorphosis in which immatures gradually develop adult characters through a series of molts (Lincoln et al. 1985).

syn. ametabolous development, ametabolic development, ametabolism, ametaboly, anamorphosis, gradual metamorphosis

♦ **anamorphosis** See metamorphosis: ametabolous metamorphosis.

♦ **hemimetabolous metamorphosis** *n.* For example, in Ephemeroptera (Mayflies), Odonata (Damselflies and Dragonflies), and Plecoptera (Stoneflies): Metamorphosis in which aquatic immatures eventually develop external wing structures and gradually develop adult characters through a series of molts and a final molt in which an immature transforms into an aerial adult that looks markedly different than an immature, showing a distinct naiad (larval) and adult stage (Borror et al. 1989, 797).

syn. hemimetabolous development, hemimetabolic development, hemimetabolism, hemimetaboly, hemimetamorph, heterometabolic metamorphosis, incomplete metamorphosis, simple metamorphosis (Lincoln et al. 1985)

♦ **heremetabolic metamorphosis** *n.* Metamorphosis with a "resting" phase at the end of a larval (nymphal) stage (Lincoln et al. 1985).

♦ **heterometabolic metamorphosis** See metamorphosis: hemimetabolous metamorphosis, paurometabolous metamorphosis.

♦ **holometabolous metamorphosis** *n.* For example, in Coleoptera (Beetles), Diptera (Flies), Hymenoptera (Hymenopterans), Lepidoptera (Lepidopterans), and Neuroptera (Neuropterans): Metamorphosis with a distinct larval, pupal, and adult stage, in which wings develop inside the body of a larva (Borror et al. 1989, 67–69).

syn. complete metamorphosis, holometabolous development, holometabolic development, holometabolism, holometaboly, holometamorphosis, holometamorphy (Lincoln et al. 1985)

♦ **hypermetabolous metamorphosis** *n.* For example, in Coelioxys bees, Meloidae (Blister Beetles), and Strepsiptera (Twisted-wing Parasites): Holometabolous metamorphosis in which a first instar is active, seeks out a host or shows other specific activities, and as a later instar is more sedentary, primarily feeding and metamorphosing (Borror et al. 1989, 69).

syn. hypermetabolous development, hypermetabolic development, hypermetabolism, hypermetaboly, hypermetamorphy (Lincoln et al. 1985)

♦ **manometabolous metamorphosis** *n.* In some insect species: Metamorphosis in which a minor, or very gradual, change occurs without a resting stage (Lincoln et al. 1985).

♦ **paurometabolous metamorphosis** *n.* For example, in Hemiptera (Hemipterans) and Orthoptera (Orthopterans): Metamorphosis in which immatures eventually develop external wing structures and gradually develop adult characters through a series of molts, showing a distinct larval (or nymphal) and adult stage with adults not appearing dramatically different than larvae (Borror et al. 1989, 66–67).

syn. heterometabolic metamorphosis, incomplete metamorphosis, paurometabolous development, paurometabolic development, paurometabolism, paurometaboly, paurometamorph, paurometabolic metamorphosis, simple metamorphosis (Lincoln et al. 1985).

♦ **metamps** See ²species: metamps.

♦ **metandric hermaphrodite** See hermaphrodite: protogynous hermaphrodite.

♦ **metanal gland** See gland: metanal gland.

♦ **metaphysical behaviorism** See behaviorism: metaphysical behaviorism.

♦ **metaphysical Darwinism** See Darwinism.

♦ **metaphysical philosophy** See study of: philosophy: metaphysical philosophy.

♦ **metaphysics** See study of: philosophy: metaphysics.

♦ **metaplasia** See -plasia: metaplasia.

♦ **metapleural gland** See gland: metapleural gland.

♦ **metapopulation** See ¹population: metapopulation.

♦ **metapsychology** See study of: psychology: metapsychology.

♦ **Metasequoia Flora** See ²community: *Metasequoia* Flora.

♦ **metasoma** *n.* The posterior of the three principal divisions of an insect's body (Wilson 1975, 588).

cf. prosoma, mesosoma

Comment: In most insect groups, "metasoma" is the strict equivalent of the abdomen; in more derived Hymenoptera, it is composed of all but the first segment ("propodeum") which is fused with the thorax and has essentially become part of the "mesosoma" (Michener 1944 in 1974, 6).

♦ **metastasis** *n.*

1. Transference of a bodily function, pain, disease, morbid matter, etc., from one part, or organ, to

- another (Oxford English Dictionary 1972, entries from 1586).
2. An organism's transferring chemical compounds into other compounds in assimilation (Oxford English Dictionary 1972, entries from 1875).
 3. Transportation of pathogens in a host's body (Lincoln et al. 1985).

Comment: Some workers restrict "metastasis" to an organism's change of nonliving matter to living matter; some synonymize "metastasis" with "metabolism," *q.v.* (Oxford English Dictionary 1972).

- ◆ **metastitism** See cannibalism: metastitism.
- ◆ **metatarsal gland** See gland: metatarsal gland.
- ◆ **metathetely** See ²heterochrony: neoteny: hysterotely, metathetely.
- ◆ **metatroph** See -troph-: metatroph.
- ◆ **metazoan** See -zoan: metazoan.
- ◆ **meteorite** *n.* A recovered fragment of a meteoroid that survived its passage through Earth's atmosphere (Mitton 1993).

Comments: People usually name meteorites after places where they fall (Mitton 1993), and have found thousands of meteorites. A remarkable meteorite collection is on display at the U.S. Museum of Natural History. I define a few of the many known meteorites below.

A CLASSIFICATIONS OF METEORITES^a

- I. Iron meteorites (irons)
 - A. core-iron meteorites (types: IC, IIAB, IIC, IID, IIF, IIIAB, IIIE, IIIF, IVA, IVB, ungrouped)
 - B. non-core-iron meteorites (types: IAB-IIICD, IIE, ungrouped)
- II. Stony-Iron meteorites (stony irons)
 - A. mesodiderite meteorites
 - B. pallasite meteorites (types: Eagle Station Group, main group)
 - C. ungrouped meteorites (including the Bencubbin Group)
- III. Stone meteorites (stones)
 - A. achondrite meteorites
 1. aubrite meteorites
 2. HEDS meteorites (types: eucrite meteorites, diogenite meteorites, howardite meteorites)
 3. lunar meteorites
 4. martian meteorites
 5. ureilite meteorites
 - B. chondrite meteorites
 1. carbonaceous chondrite meteorites (types: CI, CM, CO, CR, CV)
 2. enstatite chondrite meteorites (types: EH, EL)
 3. ordinary chondrite meteorites (types: H, L, LL)

^a exhibit, U.S. Museum of Natural History (2002). Researchers often shorten the names of the kinds of meteorites, *e.g.*, achondrites, core irons, mesodiderites, pallasites, or ureilites.

Allen Hills 84001 meteorite *n.* A stone, achondrite, Martian meteorite of calcium-poor Pyroxenite; that fell in Allen Hills, Victoria Land, Antarctica; and that might contain nanobacterium fossils about 3.5 Ma old (Gibbs and Powell 1996, 20, 22; McKay et

al. 1996, 924; Wilford 1996, 8 August, illustrations; exhibit, United States Museum of Natural History, 2002).

syn. ALH 84001 meteorite

Comments: This 4.2-lb meteorite formed about 4.5 Ma ago, landed in Antarctica about 13,000 yr ago. A researcher found it in 1984, and it contains gas similar to gas of the current Martian atmosphere and macroscopic black-and-white circles embedded in a dark matrix which McKay et al. (1996, 924) interpreted as possible microbe fossils. Other researchers dispute McKay et al.'s (1996) interpretation.

Allende meteorite *n.* A primitive type of meteorite (a carbonaceous chondrite) that fell to Earth in Northern Mexico in 1969 as thousands of fragments (exhibit, U.S. Museum of Natural History, 2002)

Comment: This meteorite contains diamonds that are older than our Solar System, and is likely to be the oldest thing that you are likely to see (exhibit, U.S. Museum of Natural History, 2002).

carbonaceous chondrite *n.* A stony meteorite that bears carbon (Mitton 1993).

Comments: Some carbonaceous chondrites contain abiotically produced hydrocarbon compounds (Browne 1996, 8 August, D20). About 85% of meteorites that fall to Earth are chondrites (exhibit, U.S. Museum of Natural History, 2002). The rocky planets in our Solar System are formed from aggregated chondrites.

[Greek *chondros*, grain, after constituent particles in a chondrite]

EETA 79001 meteorite, Elephant Moraine

79001 meteorite *n.* A meteorite that crystallized 175 Ma ago and was ejected from Mars, presumably by an asteroid impact, 600,000 yr ago, and that might contain traces of Martian life (Wilford 1996, 1 November, A12).

Comment: This meteorite is considered to be the "Rosetta stone" of the meteoritic fragments found in Elephant Moraine, Victoria Land, Antarctica and thought to be Martian because it contains trapped gases that are almost identical in composition to atmospheric samples gathered by the Viking Spacecraft in 1976 (Wilford 1996, 1 November, A12). Meteorite 79001 has isotope ratios that match those contained in the oldest Earth fossils (Sawyer 1996, 1 November, A3). Since 1969, researchers found over 1,700 meteorites in Elephant Moraine where glacial movement concentrates them (exhibit, U.S. Museum of Natural History, 2002).

Lost City meteorite *n.* A stony chondrite (ordinary, H) from the Asteroid Belt that fell in 1970 in Cherokee County, Oklahoma, U.S. (exhibit, U.S. Museum of Natural History, 2002).

MacAlpine Hills 88105 meteorite *n.* A stony chondrite (lunar anorthositic breccia) found in Victoria Land, Antarctica in 1988 (exhibit, U.S. Museum of Natural History, 2002).

Comment: A meteorite impact ejected this chondrite from the Moon 300,000 yr ago (exhibit, U.S. Museum of Natural History, 2002). This meteorite is similar to rocks that astronauts collected in the lunar highlands in 1969.

Murchison meteorite *n.* A 200-lb carbonaceous chondrite meteorite from the asteroid belt that contains amino acids, carbonate compounds, many other kinds of organic compounds, and water (Gibbs and

Powell 1996, 20, 22; exhibit, U.S. Museum of Natural History, 2002).

Comments: The Murchison meteorite fell on Murchison, Australia, in 1969 (Zimmer 1995, November, 76). This meteorite indicates that organic compounds can be made in space abiotically. Pieces of this meteorite are at the Australian National University, Canberra, and the Smithsonian Institution, U.S.

Nakhla meteorite *n.* An achondrite meteorite (Martian calcium-rich Pyroxenite), about 1.3 Ga old and found in 1991 in Alexandria, Egypt, that another meteorite blasted from Mars about 10 Ma ago (exhibit, U.S. Museum of Natural History, 2002).

Comment: This specimen is imbedded in plastic and the public may touch this piece of Mars (exhibit, U.S. Museum of Natural History, 2002).

Peekskill meteorite *n.* A stone, ordinary H chondrite that fell in Westchester County, New York, U.S., in 1992 (exhibit, U.S. Museum of Natural History, 2002).

Comments: This meteorite hit an automobile and demolished its trunk (exhibit, U.S. Museum of Natural History, 2002). A video at the U.S. Museum of Natural History shows this meteorite's path based on several amateur videos taken of its path.

Shejoty meteorite *n.* A Martian stony achondrite meteorite, found in 1865 in Bohar, India (exhibit, U.S. Museum of Natural History, 2002).

Comments: This meteorite is Martian basalt and contains gas whose composition matches Mars' atmosphere (based on sampling by the Viking Space Probe) (exhibit, U.S. Museum of Natural History, 2002). A meteorite impact trapped Martian gas in this rock that it flung into space.

♦ **meteorology** See study of: meteorology.

♦ **methane** See molecule: methane.

♦ **methanotroph** See -troph-: methanotroph.

♦ **method** *n.* The procedures, or techniques, used in, or characteristic of, a particular field of knowledge, thought, practice, etc. (Michaelis 1963).

See -metry.

cf. model, seven deadly sins in the study of behavior
advocacy method of developing science *n.*

A method that involves "Author X posing a hypothesis to account for a certain phenomenon, selecting and arranging his evidence in the most persuasive manner possible. Author Y then rebuts X in part or in whole, raising a second hypothesis and arguing his case with equal conviction. Verbal skill now becomes a significant factor. Perhaps at this stage author Z appears as an *amicus curiae*, siding with one or the other or concluding that both have pieces of the truth that can be put together to form a third hypothesis — and so forth *seriatim* through many journals and over years of time" (Wilson 1975, 28).

Comment: Often the advocacy method muddles through to the answer. But at its worse, it leads to schools of thought that encapsulate logic for a full generation. This method "has been pursued remorselessly by many writers in the reconstruction of human social evolution" (Wilson 1975, 28).

behavioristic method *n.* The objective method (Tinbergen 1951, 6).

bioclimatic modeling *n.* A method that includes finding correlations among a species' climatic and distribution factors to characterize its suitable climatic regime and to predict where the regime might be

found elsewhere, in the future, or both, in conjunction with climate-change models (New 2009, 115).

brain stimulation *n.* An investigator's use of microelectrodes with weak electrical current to stimulate specific parts of an animal's brain, elicit particular behaviors or change motivation, and thereby, help demonstrate the roles of these brain parts in behavioral regulation; *e.g.*, in some insects, crustaceans, birds, and mammals (Immelmann and Beer 1989, 35).

character-data methods *n.* Methods used for constructing dendograms that consist of taxa that share derived characters (Mayr and Ashlock 1991, 275, 291–312).

chemical-degradation method *n.* A method used for determining the DNA sequences of cDNAs (Niesbach-Klösgen et al. 1987, 214).

chromosome walking *n.* A technique for making physical maps of chromosomes that uses cloned gene sequences and probes (Campbell et al. 1999, 376).

[after "walking along" (= sequencing) a chromosome starting at a known gene or other sequence (Campbell et al. 1999, 377)]

cladistic method See study of: systematics: cladistic systematics.

comparative method *n.* An experimental method that assumes one, or more, factors that could logically cause a certain effect if their occurrence is significantly correlated with this effect; *e.g.*, if two factors are males that can identify females which are about to become receptive and receptive females are rare, and these factors are significantly correlated with the presence of males guarding females that are about to become receptive, then the two factors are likely to cause the mate guarding (Thornhill and Alcock 1983, 24).

cf. method: observational method

Comment: Aristotle founded this method (Mayr 1982, 88), and G. J. Romanes is generally credited with formalizing its use in studying animal behavior (Drickamer and Vessey 1982, 18).

computed tomography (CT) *n.* An imaging technique, used for studying an animal's bodily functions, that produces images of a series of thin X-ray sections through a body (Campbell et al. 1999, 987).

cf. method: magnetic-resonance imaging, positron-emission tomography

Comments: A CT machine slowly moves a body as an X-ray source circles around it and illuminates successive sections of it from many angles (Campbell et al. 1999, 987). A computer then produces high-resolution video images of the sections. A researcher can study the images from individual sections or as sections combined into various three-dimensional views. A CT is especially useful for detecting ruptured blood vessels on a vertebrate's brain.

computed axial tomography (CAT, CT, CT scan) *n.* A radiographic imaging method that uses computer-generated processing and produces a three-dimensional image of the inside of an object from a large series of two-dimensional X-ray images that are taken around a single axis of rotation (Merriam Webster Online 2010).

cf. Library: Digital Morphology (DigiMorph) Library
syn. body-section röntgenography, computerized axial tomography, computerized tomography (Merriam Webster Online 2010)

Comments: A CT machine slowly moves a body as an X-ray source circles around it and illuminates successive sections of it from many angles (Campbell et al. 1999, 987). A computer then produces high-resolution video images of the sections. A researcher can study the images from individual sections or as sections combined into various three-dimensional views. A CT is especially useful for detecting ruptured blood vessels on a vertebrate's brain. Modern scanners allow CT scans to be reformatted into different planes and even into volumetric, or three-dimensional, representations of structures. People frequently use CT scans in medical work, but they also use this method for nonmedical biological and paleontological specimens. Figure 28 is a CAT scan of a transverse section of my torso which shows my sternum (white oval in the central top area of the figure) and a former, large, life-threatening embolism (gray, saddle-shaped) in my pulmonary arteries (white, upside-down V shape), which developed while I worked on this book.
[tomography < Greek *tomos*, slice; *graphein*, to write]

conditioned-suppression technique *n.* A method used to ascertain a Rock Dove's odor discrimination in which an investigator trains the bird to perform a learned operant task (such as key pecking) until the bird reaches a stable performance level and then presents a stimulus and delivers an electric shock to the bird a short time later, the bird soon ceases key pecking when the stimulus is repeated even though the investigator continues to shock it after the stimulus is presented. The investigator then varies stimulus parameters to determine whether or not the bird's responding is suppressed and, thereby, determines its sensory capabilities (Henton et al. 1966 in Dewsbury 1978, 176–177).

cf. method: tracking

cross-fostering See *fostering: cross-fostering*.

CT See *method: computed axial tomography*

CT sereolithography *n.* A technique that scans the outer body of a vertebrate and produces a replica of its bones (Menon 1995, 57).

dating method *n.* A technique used for determining the age of things including fossils, geological strata, meteorites, minerals, rocks, and subfossils.

► **infrared-stimulated-luminescence dating** *n.* A dating method that dates feldspar (Holden 1997, 1268).

► **radioactive dating** *n.* A dating method that estimates the age of a stratum and its associated fossil(s) from the amount of a radioactive isotope and its disintegration product in the stratum, fossil(s), or both (Strickberger 2000, 94).

syn. radiodating (Michaelis 1963)

Comments: Radioactive isotopes used for dating include carbon 14, potassium 40, rubidium 87, samarium 147, thorium 232, and uranium 232, 234, and 235 (Strickberger 2000, 95).

► **radiocarbon dating** *n.* A radioactive dating method that uses carbon 14 which disintegrates into nitrogen 14.

Comment: Carbon 14 has a half-life of 5,730 yr and is used for dating objects less than 50,000 yr old, such as charcoal in a Pleistocene campfire (Strickberger 2000, 95).

► **radiodating** See *method: dating method: radioactive dating*.

► **thermoluminescence (TL)** *n.* A dating method that determines the age of Quartz (Holden 1997, 1268).

Comments: This method gauges how long Quartz-containing rock has been buried from the number of electrons trapped in defects of Quartz crystals (Holden 1997, 1268). These electrons build up at a regular rate but are wiped out by sunlight. The Quartz in windblown sand, associated with other objects, can be used to date these objects.

deductive method *n.*

1. Reasoning from the general to the particular using a mathematical logic in structure of thought (Descartes in Mayr 1982, 38, 40).
2. Reasoning from the general to the particular; also, reasoning from stated premises to conclusions formally or necessarily implied by such premises (Michaelis 1963).
3. Formulation of theories, or hypotheses, from which singular testable statements (predictions) are deduced (Lincoln et al. 1985).

syn. deduction

cf. method: inductive method

delayed-reaction method, delayed-response method *n.* A method originally used to test an animal's ability to retain an "idea;" it employs a multiple-choice apparatus with one door indicated by an either conditioned or unconditioned stimulus. The animal is not allowed to react while the stimulus is present but only at a particular time after the stimulus is removed; and then animal's maximum reaction delay is used as an indication of its memory (Tinbergen 1951, 9).

Comment: Some researchers have criticized this method (Tinbergen 1951, 9).

dendrochronology, tree-ring chronology *n.* A method of dating using annual tree rings (Lincoln et al. 1985).

detrended-correlation analysis (Decorana, DCA) *n.* A method that graphs relative positions of sites, with known organism compositions, in ordination space; the graphed site positions reflect differences in community structure (Hill 1996a and Hill and Gauch 1980 in Didham 1997, 59).

dideoxy-chain-termination method *n.* A method used for determining the DNA sequences of cDNAs (Niesbach-Klösgen et al. 1987, 214).

discriminant-function analysis *n.* A statistical method that classifies observations into one of two, or more, groups using a new variable that is computed from one, or more, continuous independent variables or classification variables that alone are not adequate to group the observations (Sokal and Rohlf 1969, 488–489; Helwig and Council, 1979, 181).

cf. analysis: discriminant-function analysis

distance methods *n.* Methods used for determining the similarity, or distance, of taxa from each other (Mayr and Ashlock 1991, 275, 284–291).

DNA fingerprinting *n.* A DNA-analysis technique used to ascertain an animal's possible genetic relationship to a presumed parent or sibling (Lewin 1989, 1550) or to match a person's, or other organism's, DNA with a DNA sample (Campbell et al. 1999, 382).

Comment: This technique produces a DNA fingerprint, DNA bands resulting from electrophoresis (Campbell et al. 1999, 382, illustration). This technique uses

microsatellite analysis, or RFLP analysis by Southern blotting, and requires samples as small as only about 1000 cells. Lewin (1989) indicates some problems with this technique.

DNA-microarray assay *n.* A technique for detecting and measuring the expression of thousands of genes at one time (Campbell et al. 1999, 379).

electrophoresis *n.* A technique that separates mixtures of organic molecules based on their different rates of travel in an electric field (Lincoln et al. 1985).

► **gel electrophoresis** *n.* Electrophoresis used to separate kinds of nucleic acids or proteins (Campbell et al. 1999, 372–373).

► **high-resolution electrophoresis** *n.* Electrophoresis used to separate proteins in a strong electric field and stain them for identification (Wilson 1975, 71).

Comment: This process has revealed a far larger amount of genetic polymorphism in organisms than geneticists had once believed possible (Wilson 1975, 71).

► **starch-gel electrophoresis** *n.* Electrophoresis used to separate kinds of proteins, first employed by Markert in evolutionary studies (Mayr 1982, 576).

Comments: A researcher separates the proteins by placing them in a gel and exposing them to an electric field. Depending on their sizes and electrical qualities, the kinds of proteins move different distances in the gel and thus can be separated. This technique is a boon to evolutionary studies because it enables one to ascertain the level of heterozygosity of individuals and populations without having to do breeding experiments. This technique also has weaknesses as discussed by Mayr (1982, 576).

electroporation *n.* A method, in which a researcher gives brief electrical pulses to a solution containing a cell(s) that introduce DNA into the cell (Campbell et al. 1999, 370).

Comment: Electroporation creates temporary holes in a cell's plasma membrane through which DNA can enter (Campbell et al. 1999, 370).

evolutionary method See study of systematics.

factor analysis *n.* A statistical method that, in biology, aims to resolve complex relationships into the interaction of fewer and simpler factors and isolate and identify causal factors behind biological correlations (Sokal and Rohlf 1969, 542).

cf. analysis: principle-components analysis

Fourier analysis *n.* "A technique that attempts to approximate a time series like the [animal] extinction record by a combination of sine and cosine curves" (Kerr 1984).

[after Jean Baptiste Joseph Fourier, French mathematician and physicist]

Free-air CO₂ enrichment (FACE) *n.* A method for increasing CO₂ in the field for research purposes that involves releasing CO₂-enriched air around the perimeter of a circular plot (Pinter 2001; Shaw et al. 2002, p. 1988).

Comments: Scientists from the USDA Agricultural Research Service and Brookhaven National Laboratory developed the FACE method (Pinter 2001). It allows a researcher to avoid artifacts caused by growing test plants in enclosed chambers with elevated CO₂. Natural patterns of wind disperse the CO₂ across an experimental outdoor area. However, blowers used to inject CO₂ can exert subtle effects on an area's microclimate similar to the way that wind machines protect orchards from frost.

gas-chromatography-mass-spectrometric analytical method

n. A separation method for trace compounds that involves their sequential separation by gas chromatography and subsequent specific identification by mass spectroscopy (D. A. M. Mackay, pers. comm.).

syn. GC-mass-spec, GC-mass-spectrometric analytical method, GC-MS (Harrahy 1994, 519)

Comments: For example, this method can be used as a means of detecting the amount of the pesticide diflubenzuron in, or on, leaves without having to purify this chemical (Wimmer et al. 1993, 2184, 2192). This method uses heat-induced breakdown of diflubenzuron during gas chromatography and mass spectrometry by using deuterated diflubenzuron as an internal standard (Wimmer et al. 1993). The great sensitivity and selectivity of mass spectrometry permits rapid analysis of complex leaf extracts without derivatization, or purification, of the pesticide.

high-throughput DNA sequencing *n.* A fast, relatively inexpensive, means of sequencing DNA which first sequences DNA and leaves discovery of its function for future study (Wood 1999, 2 January).

cf. machine: high-throughput-DNA sequencer

Comment: This method costs about \$2,000 to sequence a single gene (Wood 1999, 26 January).

holological method *n.* A study of a system's totality that concentrates on the whole's operation rather than specific contributions of component parts (Lincoln et al. 1985).

cf. method: merological method

hypothetico-deductive method *n.* One's testing a hypothesis "by determining whether the deductions drawn from it conform to observation" (Mayr 1981, 29; Futuyma, 1986, 6).

Comment: *On the Origin of Species* ... (Darwin 1859) is a classical work using this method.

in situ hybridization *n.* A technique in which a researcher base-pairs a radioactive probe with complementary sequences in denatured DNA of intact chromosomes on a microscope slide (Campbell et al. 1999, 374).

Comment: Researchers use this technique for locating genes on chromosomes (Campbell et al. 1999, 374).

in vitro mutagenesis *n.* A technique that can be used to introduce specific changes into the sequence of a cloned gene (Campbell et al. 1999, 379).

inductive method, induction *n.* "A scientific method involving the formulation of universal statements, such as hypotheses or theories, from singular statements such as empirical observations or experimental results" (Lincoln et al. 1985).

cf. induction, inductivism, method: deductive method

interval analysis *n.* A method for detecting a quantitative-trait locus (QTL), *q.v.*, that simultaneously analyzes sets of linked markers with regard to their effects on quantitative traits (Tanksley 1993, 212–213).

cf. method: single-point analysis

magnetic-resonance imaging (MRI) *n.* An imaging technique, used for studying soft tissues *e.g.*, those of a nervous system, that detects faint radio signals from hydrogen nuclei in a tissue (Campbell et al. 1999, 987, illustration).

cf. method: computed tomography, positron-emission tomography

Comments: MRI uses powerful magnets to align hydrogen nuclei in a tissue, and then knocks them out of alignment with a brief pulse of radio waves (Campbell et al. 1999, 987). The nuclei are still under the magnets' influence, and the nuclei spring back into alignments, giving out faint radio signals of their own. The MRI scanner detects the signals, and a computer translates them into an image.

mark-release-recapture method *n.* A method for determining population size and movements of individuals of a species of mobile animal (New 2009, 95).

Comment: Drawbacks of this method include its limited usefulness in populations with low numbers of individuals, difficulty of meeting the method's sampling assumptions, and possible damage caused to delicate animals (New 2009, 95, 198–199). Assumptions of this method include the sampled population does not have emigration and immigration and the probability of capturing all marked individuals is equal.

maximum-likelihood method *n.* A method used for producing a molecular phylogeny (Adachi and Hasegawa 1996 in Tomitani et al. 1999, 161).

merological method *n.* A study of the component parts of a system made to derive a concept of the operation of its whole (Lincoln et al. 1985).

cf. method: hological method

method of multiple working hypotheses *n.*

A procedure used in the hypothetico-deductive method that generates and tests all logical, pertinent hypotheses related to an experiment or phenomenon; contrasted with method of ruling theory and method of working hypothesis (Chamberlin 1890, 92; Uzzell 1984).

Comment: This method is “useful in encouraging an open mind and broadening inquiry” (Uzzell 1984). Currently, many scientists use some form of this method; however, there is controversy about this method and, more broadly, the best way to proceed in scientific investigations (Raup and Chamberlin 1995, 349).

multiple-choice method *n.* A method used for studying memory and perception in which an animal is trained in a choice chamber to choose, *e.g.*, one of several doors marked with a signal, *e.g.*, light bulb; after the animal has mastered its task, it is prevented from exercising its choice as long as the signal is on; and after a time, the animal is again allowed to choose, and the longest period which elapses with a subsequently correct response serves as a measure of performance (Heymer 1977, 193).

Comment: Hunter (1913) developed this method, and its reliability has been questioned by Maier and Schneirla (1935) and Tinbergen (1951) (Heymer 1977, 193).

MRI See method: magnetic-resonance imaging.

neighbor-joining method *n.* A method used for reconstructing phylogenetic trees (Saitou and Nei 1987 in Tomitani et al. 1999, 161).

nonparametric methods for estimating species richness from samples

Comment: These methods include S_1^* , Chao-1; S_2^* , Chao-2; S_3^* , Jackknife-1; S_4^* , Jackknife-2; S_5^* , Bootstrap; S_6^* , Chao and Lee-1; S_7^* , Chao and Lee-2; and Michaelis-Menten equation (Colwell and Coddington 1994, 109–111). These methods vary in how well they estimate species richness with regard to different sample sizes.

Northern blotting *n.* A technique, similar to Southern blotting (*q.v.*) used to identify an RNA sequence(s) (Rieger et al. 1991; Campbell et al. 1999, 375).

syn. Northern-blot analysis (Houghton Mifflin Company 2001), Northern transfer (Rieger et al. 1991)

cf. method: Southern blotting, Western blotting

Comment: In Northern blotting, a researcher transfers mRNA from an agarose gel to a nitrocellulose filter on which it can be hybridized to a complementary radioactive, single-stranded DNA or an RNA probe (Rieger et al. 1991). In some cases a researcher subjects whole mRNA molecules to hybridization analysis, typically to determine whether a particular gene has been transcribed and how much of its mRNA is present.

[A playful coinage after Southern blotting, *q.v.* (Houghton Mifflin Company 2001). Many writers capitalize Northern blotting, making it parallel with Southern blotting.]

nucleic-acid hybridization *n.* A technique in which a researcher base-pairs single-stranded nucleic acid from different nucleic acid molecules (Campbell et al. 1999, 369).

observational method *n.* A method promoted by C. L. Morgan involving the use of only data that are gathered by direct experimentation and observation to make generalizations and develop theories (Drickamer and Vessey 1982, 19).

cf. method: comparative method

omnispective method See study of: systematics.

PET See method: positron-emission tomography.

phenetic method See study of: systematics.

point analysis See method: single-point analysis.

“point-count method” *n.* A method of counting a focal animal that involves a person's counting the number of individuals at locations that are randomly selected or selected with regard to particular environmental attributes affecting the likelihood of the animal's occurrence and abundance (New 2009, 197).

Pollard-Yates Method *n.* A method for estimating the number of individuals of a focal animal by counting the number of individuals within a specified distance on each side of a transect line (Pollard and Yates 1993 in New 2009, 197).

polymerase-chain reaction (PCR) *n.* A method used to amplify minute DNA samples (even one DNA molecule) *in vitro* for DNA sequence analysis (Alberts et al. 1989, 269; Morell 1992a, 1860; Campbell et al. 1999, 371).

Comments: Kary Mullis conceived this method in 1983 for which he won the Japan Prize and the Nobel Prize in 1993 (Dwyer 1993, 8; Appenzeller 1993). This method enables workers to extract genes from fossils, positively identify human remains from bones, identify genes in developing fetuses, determine whether someone is infected with the HIV virus, test for chlamydia (a venereal disease that can cause infertility) from a urine sample, and determine if a man really raped someone (resulting in freeing many men wrongly accused of rape). PCR using chromosomal DNA does not uniquely identify a person, but it can be used to calculate a probability that two people will match in this DNA coincidentally (Cohen 1995, 22). This gene-copying technique has earned hundreds of millions of dollars for its patent holder Hoffmann-LaRoche (Milstein 1994, 655).

polymerase-chain-reaction/restriction-fragment-length-polymorphism analysis (PCR/RFLP) *n.* A method used for identifying mtDNA haplotypes (Simon et al. 2002, 1327)

Popperian method *n.* A scientific method that involves the formulation of general hypotheses, from which singular statements (predictions) are deduced that can be tested; a hypothesis may be falsified, or corroborated, but not proved (Lincoln et al. 1985).
syn. deductive method (Lincoln et al. 1985)
cf. method: deductive method

Comment: The Popperian method was a great rage in the 1950s and 1960s. Many biologists insisted that they were Popperists, even if they did not use the Popperian method (Mayr 1997, 55). Many working biologists use whatever method will most conveniently find the solution to a problem.

positron-emission tomography (PET) *n.* An imaging technique, used for studying the location of a biochemical or physiological process in an animal's body (Campbell et al. 1999, 987, illustration).
cf. method: computed tomography, magnetic-resonance imaging, positron-emission tomography

Comments: In preparation for a PET scan, a researcher injects a solution of the studied molecule, that is labeled with a radioactive isotope, into an animal's bloodstream (Campbell et al. 1999, 987). He uses the isotope in a small quantity that is not dangerous to the animal. For example, if water is being studied in a brain, a researcher uses water labeled with a radioisotope of oxygen that emits positrons. The radioactive water tends to go to the brain's more active areas. This enables one to map areas of the brain that are active when the animal is performing a particular task. The positrons interact with oppositely-charged electrons of the animal's atoms, emit a radiation, and a PET camera detects it. A computer creates a brain map that illustrates active areas of the brain from the camera image. Physicians use PET scans to evaluate brain and heart disorders and certain kinds of cancers.

principal-components analysis *n.* A branch of factor analysis that calculates principal axes through hyperellipsoids and removes the greatest, second greatest, and successively smaller sources of variation as each new axis is calculated (Sokal and Rohlf 1969, 532).

putting-through method *n.* A method that one uses to teach an animal, *e.g.*, a Chimpanzee, specific body movements or placement of its body parts (Immelmann and Beer 1989, 165).

RNA interference (RNAi) *n.* A researcher's injecting double-stranded RNA (dsRNA) into a cell which turns off a gene with the same sequence as the dsRNA (Campbell and Reece 2005, 368).
cf. post-translational gene silencing

Comment: This gene silencing is due to small interfering RNAs (siRNAs) which are RNAs of similar size and function as microRNAs (miRNAs) that bind to complementary sequences in mRNA molecules (Campbell and Reece 2005, 368). Small interfering RNAs form from dsRNAs.

scarification *n.* The method of slitting or softening the outer coat of a seed in order to speed its water uptake and germination (Morris 1982; Brickell and Zuk 1996, 1077).
cf. stratification
v.t. scarify

Comment: People soften outer seed coats by physically abrading them or treating them chemically (Brickell and Zuk 1996, 1077).

single-point analysis *n.* The simplest method for detecting a quantitative-trait locus (QTL), *q.v.* (Tanksley 1993, 211).

syn. point analysis

cf. method: interval analysis

site-directed mutagenesis *n.* A method that produces a mutation in a specific amino-acid coding site (Amato 1993).

Comments: This method is used to reorder amino acids to understand protein function and produce enzymes that are more stable under industrial conditions. Further it raises the prospect of redesigning proteins to have entirely new functions (Amato 1993). Michael Smith developed this technique in the early 1980s and won the Nobel Prize for it in 1993.

Soxhlet method *n.* A method of determining the lipid content of an organism (*e.g.*, a Three-spined Stickleback) (Canolin 1999, 1262).

Southern blotting *n.* A technique that reveals whether a particular sequence is present in a DNA sample and which restriction fragments contain the sequence (Rieger et al. 1991; Campbell et al. 1999, 373).

syn. Southern-blotted analysis (Houghton Mifflin Company 2001), genome blotting, Southern-blotted technique, Southern transfer (Rieger et al. 1991), Southern-blotted hybridization (Niesbach-Klösgen et al. 1987, 214), Southern hybridization (Campbell et al. 1999, 373)

cf. method: Northern blotting, Western blotting

Comment: In Southern blotting, a researcher transfers single-stranded, restricted DNA fragments, separated in an agarose gel, to a nitrocellulose filter (or other binding matrix); analyzes the fragments by hybridization to radioactive, or biotinylated single-stranded, DNA; and detects the hybrids by autoradiography or color change, respectively (Rieger et al. 1991).

[after British biochemist Edwin Maller Southern (1938–) who developed this technique in 1975 (Houghton Mifflin Company 2001)]

stratification *n.* The method of placing seeds in a moist medium to simulate the natural conditions that cause dormant seeds to germinate (Nelson 2008).

cf. scarification

v.t. stratify

Notes: Depending on the plant species, stratification involves a warm, moist treatment; cool, moist treatment; or both (Nelson 2008). The period of stratification should vary with the species of plant.

[stratification < the old practice of stimulating seeds to germinate by placing alternate layers (= stratifications) of moist sand and seeds in a container (Nelson 2008)]

subcloning *n.* A technique that identifies a specific part of a gene, such as its promoter, or removes unwanted DNA segments from a clone (Niesbach-Klösgen et al. 1987, 214; Rieger et al. 1991).

synthetic method See study of: systematics.

“3ST” method *n.* A method used to test the branching order of phylogenetic trees (Kimura 1981 in Niesbach-Klösgen et al. 1987, 214).

titration method *n.* An experimental method involving a model (dummy) whose features are varied in ways that enable an investigator to assess the relative importances of the model's traits (Baerends and Kruijt 1973 in Lehner 1979, 96–97).

tracking *n.* A method used with, *e.g.*, *Columba livia* (Rock Dove), to ascertain an animal's sensory ability that involves two pecking keys, a varying stimulus, and an apparatus that records the bird's response to the stimulus (Blough 1961 in Dewsbury 1978, 178). *cf.* method: conditioned-suppression technique [named after a subject's own "tracking" of its threshold to a stimulus by causing a graph to be plotted automatically by experimental apparatus]

tree-ring chronology See method: dendrochronology.

true Baconian method See inductivism.

two-way indicator-species analysis (TWIN-SPAN) *n.* A polythetic, divisive method of classification used to cluster sites of similar species composition and identify indicator species characteristic of different sites or groups of sites (Hill 1996b in Didham 1997, 59).

Western blotting *n.* A technique that identifies particular protein species (Rieger et al. 1991). *cf.* method: Northern blotting, Southern blotting

Comment: In Western blotting, a researcher transfers proteins from a polyacrylamide gel onto a suitable immobilizing matrix (*e.g.*, a nitrocellulose sheet); and probes the proteins with a specific antibody to identify the proteins (Rieger et al. 1991).

[A playful coinage after Southern blotting, *q.v.* (Houghton Mifflin Company 2001). Many writers capitalize Western blotting, making it parallel with Southern blotting.]

Winkler method *n.* A means of separating soil organisms from leaf litter (Didham 1997, 58).

Comment: In this method, one places a litter sample into a coarse mesh bag which is then suspended inside a large sealed cloth bag. As the litter dries, invertebrates that are sensitive to desiccation move downward through the mesh bag and fall into a jar of alcohol beneath it.

xeriscaping *n.* One's using plants that thrive in a semi-arid climate for landscaping (Reid 2003, A3).

Comments: In the U.S., people are increasingly using xeriscaping, rather than growing high water-requiring plants in their yards and other landscaped areas in view of recent drought conditions in many areas (Reid 2003, A3). People use native grasses (*e.g.*, *Bouteloua gracilis*, Blue Grama Grass and *Helictotrichon semipervirens*, Blue Avena Grass) and other plants that require low amounts of water in xeriscaping. It can help wildlife because people use many native plants and may remove less water from natural areas for watering their plants.

[Greek *xeros*, dry + *scape*, coined by the Denver Water Board in 1981 (Reid 2003, A3)]

♦ **methodological behaviorism** See behaviorism.

♦ **methoprene** See molecule: methoprene.

♦ **methuselah** See gene: *methuselah*.

♦ **metoecious** See -oecism: heteroecism.

♦ **metoxenous** See -xenous: metoxenous.

♦ **-metrics** *cf.* -metry, study of: -metry

biometrics *n.* Use of statistical methods to study organisms (Sokal and Rohlf 1969, 2).

psychometrics *n.* Use of quantitative methods to study human psychology.

zoometrics, zoometry *n.* Use of statistical methods to study animals (Lincoln et al. 1985).

♦ **metroclinal** See matriclinal.

♦ **metromorphy** See -morphy: metromorphy.

♦ **-metrosis** *adj.* -metrotic

haplometrosis, monometrosis *n.* In many social-animal species including most ant species: A single fertile female's, or queen's, founding a colony (Lincoln et al. 1985; Rissing and Pollock 1987, 975).

pleometrosis *n.* In many social-animal species including some ant species: More than one fertile females', or queens', founding a colony (Rissing and Pollock 1987, 975; Hölldobler and Wilson 1990, 641).

♦ **-metry** *comb. f.* "The process, science, or art of measuring" (Michaelis 1963).

See study of: -metry.

cf. method, metrics

[Greek *metria* < *metron*, a measure]

allometry See -auxesis: heterauxesis.

biotelemetry *n.* A method for marking and locating animals involving attaching radio transmitters to them (Lehner 1979, 199–203).

syn. radio tracking (Lehner 1979, 199–203)

chronometry See study of: -metry: chronometry.

ethometry *n.* The quantitative and function analysis of releasing mechanisms and key stimuli [coined by Jander (1968 in Heymer 1977, 65)].

geochronometry See study of: geochronology.

isometry See -auxesis: heterauxesis: isauxesis.

mental chronometry *n.* A technique used, *e.g.*, on pigeons and Humans, to obtain an objective measure of intangible phenomena such as mental representations and which uses the time required to solve a spatial problem as an index of processes involved (Posner 1978 in McFarland 1985, 498).

morphometry, morphometrics *n.*

1. The art, or process, of measuring an object's external form (Oxford English Dictionary 1972, entries from 1856).

2. The methods for the description and statistical analysis of shape variation within and among organism samples and the analysis of shape change as a result of growth, experimental treatment, or evolution (Rohlf and Marcus 1993, 129).

adj. morphometric

Comment: Rohlf and Marcus (1993) also define traditional morphometrics (= multivariate morphometrics) and "new morphometrics."

phenometry *n.* "The quantitative measurement of plant growth, mass, and leaf area" (Lincoln et al. 1985).

photogrammetry *n.* The use of photography as a field technique for quantitative ecological analysis, *e.g.*, in measurements of density taken from photographs (Lincoln et al. 1985).

sociometry *n.* Quantitative description of social relationships within groups, behaviors of group members, and group organizations (Storz 1973, 261; Immelmann and Beer 1989, 280).

cf. -gram: sociogram

zoometry See -metrics: zoometrics.

♦ **meute** See ²group: meute.

♦ **mew call** See animal sounds: call: mew call.

♦ **mews** See ²group: mews.

♦ **Meyrick's law** See law: Dollo's law.

♦ **MHC-dependent odors** See odor: MHC-dependent odors.

♦ **MHC genes** See gene: major-histocompatibility-complex genes.

♦ **Michaelis-Menten Equation** *n.* An equation that relates the velocity of an enzymatic reaction and an enzyme's substrate concentration; the equation that

expresses the characteristic shape of the substrate-saturation curve for an enzyme;

$$v_0 = \frac{V_{\max} [S]}{K_M + [S]}$$

where v_0 = the initial rate of the reaction of an enzyme at a particular concentration of the substrate $[S]$; V_{\max} = maximum rate of the enzymatic reaction; and K_M = the Michaelis-Menten constant of the enzyme for the particular substrate (Lehninger 1982, 215).

[after Leonor Michaelis (1875–1940) and Maud Leonora Menten (1879–1960), who derived this equation in 1913]

♦ **Michigan Gradient Study** See investigation: Michigan Gradient Study.

♦ **micrainer** See male: micrainer.

♦ **micro-, micr-** *comb.f.*

1. Very small, minute, short (Michaelis 1963).
2. Enlarging or magnifying size or volume (Michaelis 1963).
3. Pathologically, abnormally small or underdeveloped (Michaelis 1963).
4. Of a science, depending on, using, or requiring a microscope, *e.g.*, microbiology (Michaelis 1963).
5. In the metric system and in technical usage, one millionth of (a specific unit); *e.g.*, a microvolt or micron, μm (Michaelis 1963).

cf. macro-

[Greek *mikros*, small]

♦ **microzoon** See $^{-1}\text{zoon}$: microzoon.

♦ **microzoophile** See $^{-1}\text{phile}$: microzoophile.

♦ **microzoophobous** *adj.* Referring to organisms that repel small animals (Lincoln et al. 1985).

♦ **mictic** *adj.* In genetics, referring to females that produce offspring of both sexes by apomixis, *q.v.*, or amphigony, *q.v.* (Lincoln et al. 1985).

♦ **mictium** See $^2\text{community}$: mictium.

♦ **midbrain** See organ: brain: midbrain.

♦ **midden** *n.*

1. “A dunghill, manure-heap, refuse-heap” (Oxford English Dictionary 1972, entries from *ca.* 1375).

2. A kitchen midden; a prehistoric refuse heap, or mound, that contains shells, human and animal bones, stone implements, etc. (Oxford English Dictionary 1972, entries from 1851; Michaelis 1963). *syn.* shellheap, shellmound (Oxford English Dictionary 1972)

3. An underground mass of sticks and other detritus produced by a Pack Rat and permeated with its urine (Holden 1992, 155).

Note: Pack Rat middens over 40,000 yr old are known (Holden 1992, 155). Pack Rats deposit many kinds of objects in their nests. Their urine evaporates in a dry climate and crystallizes, gradually enveloping the objects and forming a large, hard clump. Midden study reveals information about past plant communities, cosmic-ray intensity, and carbon dioxide concentration, and that certain human groups disappeared due to their degrading their environments. Hydraxes in Africa and the Middle East also make middens that last for millennia (Jaroff 1992, 61).

[Danish *køtten* + *mødding*, dunghill]

♦ **middle bevy** See $^2\text{group}$: middle bevy.

♦ **middle-repetitive DNA** See nucleic acid: deoxyribonucleic acid: middle-repetitive DNA.

♦ **midocean ridge** *n.* A ridge that is usually submarine and centrally located within an ocean basin (Stanley 1989, 178).

Comment: Midocean ridges are evidence for sea-floor spreading; part of the Mid-Atlantic Ridge is exposed on Iceland (Stanley 1989, 179, 182).

♦ **migrant** *n.* An organism that actively moves from one habitat, or location, to another (inferred from Lincoln et al. 1985).

cf. migration

[Latin *migrans*, *migrant-*, present participle of *migrare*, to migrate]

♦ **diurnal migrant** *n.* A bird species, e.g., *Progne subis* (Purple Martin) that migrates during light hours of the day (Stutchbury et al. 2009, supplemental material).

cf. migrant: nocturnal migrant

Comments: Purple Martins and *Hylocichla mustelina* (Wood Thrushes) migrate more quickly in the spring than in the fall. For example, in spring, a Purple Martin migrated about 7,500 km in 13 days with 4 stopover days moving a mean of 577 km per day (Stutchbury et al. 2009, supplemental material).

♦ **nocturnal migrant** *n.* A bird species, e.g., *Hylocichla mustelina* (Wood Thrush) that migrates during dark hours of the day (Stutchbury et al. 2009, supplemental material).

cf. migrant: diurnal migrant

♦ **migrant selection** See selection: migrant selection.

♦ **migration** *n.*

1. In many organisms including Eels, lacustrine plankton, Salmon; and some antelope, bat, bird, butterfly, and locust species: An organism's, or organism group's, active movement from one habitat, or location, to another excluding its passive travel by wind or water (Lincoln et al. 1985).

Note: Migrations may be one way or round trip (Immelman and Beer 1989, 184).

2. A population's periodic, or seasonal, movement, typically of relatively long distance, from one area, stratum, or climate to another (Lincoln et al. 1985).

3. Any general movement of a population, or individual, that affects its distribution or range (Lincoln et al. 1985).

See gene flow: island-model migration, river-model migration.

cf. dispersion; ²group: migration; movement

♦ **ontogenetic migration** *n.* An animal's occupying different habitats at different stages of its development (Lincoln et al. 1985).

♦ **migration principle** See principle: migration principle.

♦ **migratory restlessness** *n.* A captive bird's migratory activity, that is expressed mainly as hopping, wing flapping, and wing fluttering due to its being unable to fly (Berthold 1971 in Immelman and Beer 1989, 185).

syn. *Zugunruhe* (Immelman and Beer 1989, 185)

♦ **Milenkovitch cycles** See cycle: Milenkovitch cycles.

♦ **milieu** *n.* An organism's, or population's, characteristic environs or surroundings (Lincoln et al. 1985).

♦ **milieu intérieur** See principle: Bernard's dictum.

♦ **military psychology** See study of: psychology: military psychology.

♦ **milk call** See animal sounds: call: milk call.

♦ **milk ejection** See ³lactation: milk ejection.

♦ **milk removal** See ³lactation (table).

♦ **milk secretion** See ³lactation: milk secretion.

♦ **milking** *n.*

1. In Humans: One's extracting milk by handling from the teats of (a Domestic Cattle, Goat, Sheep, etc., rarely a woman) (Oxford English Dictionary 1972, entries from ca. 1000).

See suckling.

2. In *Bos primigenius* (Domestic Cattle) and formerly in women: An individual's giving, or yielding, milk (Oxford English Dictionary 1972, entries from 971). *cf.* lactation: milk ejection; nurse; suckle

3. A milking machine's taking milk from a mammary gland (Cowie et al. 1951).

cf. ³suckling

4. In many ant species: An individual's causing an ant-cow (e.g., an aphid) to secrete honeydew by stroking the ant-cow with antennae (Ross 1985, 51).

cf. honeydew

v.i., *v.t.* milk

♦ **milking stimulus** See stimulus: milking stimulus.

♦ **millicron** See unit of measure cron: millicron.

♦ **millennial** *adj.* Referring to any period of 1,000 yr (Michaelis 1963).

cf. secular

[Latin *mille*, thousand]

♦ **millimacarthur** See unit of measure: macarthur: millimacarthur.

♦ **mimesis** *n.* For example, in the Gelastocoridae (Toad Bugs), *Ocypode quadrata* (Atlantic Ghost Crabs) and some grasshopper, tiger-beetle (Cicindelidae), and spider species: An animal's imitation of the appearance of inanimate objects such as sand (Wickler 1968, 238; pers. obs.).

syn. mimicry (according to some workers)

See mimicry: mimesis.

cf. camouflage, mimicry

♦ **phytomimesis** *n.* An animal's imitation of objects of plant origin (Wickler 1986, 238).

Comment: This is a confusing term (Wickler 1986, 238).

♦ **zoomimesis** *n.* An animal's imitation of objects of animal origin (Wickler 1986, 238).

Comment: This is a confusing term (Wickler 1986, 238).

♦ **mimetic behavior** See behavior: mimetic behavior.

♦ **mimetic polymorphism** See mimicry: mimetic polymorphism.

♦ **mimetic resemblances** See mimicry.

♦ **mimic** *n.*

1. An organism that transmits a signal to a receiver organism that is not advantageous to the receiver (Wickler 1968, 239).

Note: This definition seems to break down when one considers Mertensian mimics and toxic Müllerian mimics.

2. An organism that plagiarizes a model (Pasteur 1982, 169).

v.t. mimic. See gene: mimic

Comment: For kinds of mimics, see mimicry.

♦ **threat mimic** See display: bared-teeth display.

♦ **mimic gene** See gene: mimic.

♦ **“mimic-not-perceived-by-dupe mimicry”** See mimicry: “mimic-not-perceived-by-dupe mimicry.”

♦ **“mimic-perceived-by-dupe mimicry”** See mimicry: “mimic-perceived-by-dupe mimicry.”

♦ **mimicry** *n.*

A CLASSIFICATION OF MIMICRY BASED ON PASTEUR (1982)

- I. Classification by function
 - A. nonprotective mimicry
 - 1. aggressive mimicry (*syn.* offensive mimicry, Peckhamian mimicry according to some authors)
 - 2. aggressive-reproductive mimicry
 - 3. commensalist mimicry
 - 4. mutualistic mimicry
 - 5. parasitic mimicry, including weed-parasitic mimicry
 - 6. reproductive mimicry
 - 7. reproductive-mutualistic mimicry
 - B. protective mimicry (*syn.* defensive mimicry)
 - 1. arithmetic mimicry (*syn.* Müllerian mimicry)
 - 2. Batesian mimicry
 - 3. Emsleyan mimicry
 - 4. Gilbertian mimicry
- II. Classification by changeability
 - A. adjustable mimicry
 - 1. “*ad hoc* mimicry”
 - a. “fast *ad hoc* mimicry”
 - b. “slow *ad hoc* mimicry”
 - 2. “circadian mimicry”
 - 3. “seasonal mimicry”
 - B. developmental mimicry
- III. Classification by number of individual mimics involved
 - A. collective mimicry (*syn.* population mimicry)
 - B. individual mimicry
 - C. social mimicry
- IV. Classification by directness
 - A. direct mimicry
 - B. indirect mimicry
- V. Classification with regard to inherentness
 - A. adventitious mimicry
 - B. inherent mimicry
- VI. Classification by perception, or nonperception, of mimic by dupe
 - A. “mimic-not-perceived-by-dupe mimicry”
 - 1. eucrypsis
 - a. acoustic eucrypsis
 - b. tactile eucrypsis
 - 2. mimesis
 - a. cryptic mimesis
 - (1) aggressive-cryptic mimesis (*syn.* Peckhamian mimicry in some cases)
 - (2) “dead-grass mimesis”
 - (3) “dead-stick mimesis”
 - (4) self-mimesis (*syn.* thanatosis)
 - (5) “soil mimesis”
 - (6) “stone mimesis”
 - b. phaneric mimesis
 - 3. crypsis (*syn.* eucrypsis plus cryptic mimesis)
 - B. “mimic-perceived-by-dupe mimicry”
 - 1. “model-agreeable-to-dupe mimicry”
 - a. Aristotelian mimicry
 - b. Bakerian mimicry
 - c. Batesian Poultonian mimicry
 - d. Batesian Wallacian mimicry
 - e. Dodsonian mimicry
 - f. Kirbyan mimicry
 - g. Nicolaian mimicry
 - h. Pouyannian mimicry
 - i. Wasmannian mimicry

- j. Wicklerian Barlowian mimicry
- k. Wicklerian mimicry
- l. Wicklerian Eisnerian mimicry
- m. Vavilovian mimicry
- 2. “model-disagreeable-to-dupe mimicry”
 - a. Batesian mimicry
 - b. Browerian mimicry
 - c. Emsleyan mimicry
 - d. Gilbertian mimicry
 - e. Wicklerian Guthrian mimicry

VII. Classification by concreteness of the model, “virtual-model mimicry”

- A. “definable-model-virtual-model mimicry”
- B. “nondefinable-model-virtual-model mimicry”

- 1. “Resemblance in external appearance, shapes and colours between members of widely distinct [taxonomic] families” (Bates in Wickler 1968, 46).
Notes: Bates (1861) gives a wide concept of mimicry which he called “deceptive analogies,” “mimetic resemblances,” “mimetic analogies,” and “imitative resemblances” (Pasteur 1982, 173). Pasteur (1982, 172) indicates the different phenomena that many workers included in “mimicry” from 1817 through 1978.
- 2. An unprotected animal species’ “imitation of a protected animal species” (Wickler 1968, 46).
- 3. “The close resemblance of one organism to another which, because it is unpalatable and conspicuous, is recognized and avoided by some predators at some times;” the unpalatable and conspicuous organism is the model and the organism which resembles it is the mimic (Wickler 1968, 46).
- 4. One organism’s sending a false (counterfeit) signal to another organism, *e.g.*, a wolf spider’s looking like sand or a swallowtail caterpillar’s looking like a bird dropping (Wickler 1968, 239, 242; pers. obs.).
Note: There are transitional stages between mimicry and camouflage and mimicry and general standard signal transmission (Wickler 1968, 239, 242).
- 5. An organism’s (the mimic’s) simulating the signal properties of “a second living organism (the model) which are perceived as signals of interest by a third living organism (the operator), such that the mimic gains in fitness as a result of the operator’s identifying it as an example of the model” (Vane-Wright 1976, 1980 in Powell and Jones 1983, 311).
- 6. “The process whereby the sensory systems of one animal (operator) are unable to discriminate consistently a second organism or parts thereof (mimic) from either another organism or the physical environment (the models), thereby increasing the fitness of the mimic” (Wiens 1978 in Powell and Jones 1983, 311).
- 7. “A type of convergent evolution in which one or more species have converged in morphology, chemistry, or behavior, on a part of itself or themselves (automimicry), another living entity, or an inanimate object as a result of selection by an animal” (Powell and Jones 1983, 312).
- 8. A biological system with two, or more, protagonists that perform three roles: model, mimic, and dupe; the model is a living, or nonliving, agent that emits signals; the mimic is an organism that plagiarizes the model; and the dupe is the mimic’s animal enemy, or victim, that perceives the model and is

thus deceived by the mimic's similar signals (Pasteur 1982, 169).

syn. biological mimicry, mimesis, unconscious biological mimicry, Batesian mimicry (restricted synonym) (Pasteur 1982, 169); deceptive resemblances, deceptive analogies, mimetic resemblances, mimetic analogies, imitative resemblances (Bates 1861 in Pasteur 1982)

cf. behavior: allelomimetic behavior, cryptic behavior; camouflage; display: distraction display: rodent run; dupe; mimic; ¹system: mimicry system: model-mimic-dupe-tripartite system

Comments: Different workers include from few to all of these things in the concept of mimicry: eucrypsis, cryptic mimesis, phaneric mimesis, nonprotective homotypy, nonMüllerian homotypy, protective homotypy, and Müllerian homotypy (Pasteur 1982, 172). Pasteur (1982) gives a comprehensive review of "mimicry," modifies many early definitions of kinds of mimicry, gives a classification of mimicry, and coins many new names for kinds of mimicry. He emphasizes that certain kinds of so called "mimicry," *e.g.*, "song mimicry" or "social mimicry," are not necessarily parts of mimicry systems. Many of the kinds of mimicry are defined below.

[Latin *mimicus* < Greek *mimikos* < *mimos*, mime]

adjustable mimicry *n.* Mimicry that is changeable at a certain stage in an organism's life cycle, *e.g.*, endothermic vertebrates that become white in winter or orthopterans that are green in the rainy season and straw-colored in the dry season; contrasted with developmental mimicry, *q.v.* (Pasteur 1982, 177).

ad hoc mimicry *n.* Adjustable mimicry in which a mimic's coloration blends in with its background; contrasted with circadian mimicry and seasonal mimicry (Pasteur 1982, 177).

fast ad hoc mimicry *n.* Adjustable mimicry in which a mimic's coloration quickly changes to match its background, *e.g.*, a cephalopod's changing its color in less than a second (Pasteur 1982, 177).

slow ad hoc mimicry *n.* Adjustable mimicry in which a mimic's coloration slowly changes to match its background, *e.g.*, a flatfish's taking a few hours to change color or some homomorphic arthropods' taking a few days to several weeks (Pasteur 1982, 177).

► **"circadian mimicry"** *n.* Adjustable mimicry that changes daily, *e.g.*, when homochromy, homotypy, or both, change every night and change back every morning; contrasted with seasonal mimicry (Pasteur 1982, 177).

► **"seasonal mimicry"** *n.* Adjustable mimicry that changes with season, *e.g.*, orthopterans that are green during the rainy season and straw-colored during the dry season; contrasted with circadian mimicry (Pasteur 1982, 177).

adventitious mimicry *n.* Mimicry involving a mimic's use of material taken from its environment as occurs in some species of aquatic molluscs, arthropods, and moths and flatfish; contrasted with inherent mimicry (Pasteur 1982, 181).

aggressive mimicry *n.*

1. Resemblance of a prey species (bumble bee) by its predator (a robber fly *Laphria* sp.) that may enable the predator to capture prey more readily (Brower et al. 1960 in Waldbauer and Sheldon 1971, 380; Wickler 1968, 122–123).
2. For example, in Angler Fish, a catfish species, *Macrochelys temminckii* (Alligator Snapping Turtle): Mimicry in which part of a predator mimics food

of its prey; this mimicking part attracts prey to the predator (Wickler 1968, 124–128).

3. Mimicry in which a mimic is a predator, parasitoid, or parasite and is camouflaged or has an attractive, or neutral, appearance to its potential victim (Pasteur 1982, 175).

syn. Peckhamian mimicry [after E. C. Peckham; Pasteur (1982, 176) says this synonym is unacceptable because "aggressive mimicry was known and understood as such long before Peckham's publications."]

cf. femme fatale

Comment: Aggressive mimicry is contrasted with aggressive reproductive mimicry, mutualistic mimicry, parasitic mimicry, reproductive mimicry, reproductive mutualistic mimicry, and commensalist mimicry.

aggressive-reproductive mimicry *n.* Mimicry employed in both aggression and reproduction (Pasteur 1982, 176).

Comment: Aggressive-reproductive mimicry is contrasted with aggressive mimicry, mutualistic mimicry, parasitic mimicry, reproductive mimicry, reproductive-mutualistic mimicry, and commensalist mimicry.

allomimetic behavior See mood induction.

androchromatypic mimicry *n.* In some butterfly and dragonfly species: Mimicry in which mature adult females have mimicking color patterns of mature adult conspecific males [androchromatypic coined by Hilton 1987, 222].

syn. andromorphic mimicry (Johnson 1964 in Hilton 1987, 221), homochrome mimicry, homoeochromatic mimicry, isochromatic mimicry, isomorphous mimicry (Hilton 1987)

cf. coloration: gynochromatypic coloration

Aristotelian mimicry *n.* Mimicry in which a noninjured brooding, or nourishing, bird looks like itself as injured and easy to catch which deflects a predator away from its young (Aristotle and Edmunds 1974 in Pasteur 1982, 190).

[after Aristotle, in *Historia Animalium*]

automimicry *n.*

1. Intraspecific mimicry of one sex by the other or of one life stage by another; *e.g.*, in some monkey species, males imitate female sexual signals, which they appear to employ in appeasement rituals and male mouth-breeder fish *Haplochromis* have egg-mimic spots on their anal fins that attract females prior to fertilization of eggs held in the females' mouths (Wickler 1962, 1967, 1969 in Wilson 1975, 229, 579).
2. An individual's replication of patterns present in conspecific individuals (often of the other sex or of different age classes) at homologous sites, or elsewhere, on its body, *e.g.*, pointed, hooked ears that look like horns in *Antilocapra americana* (Pronghorn Antelopes) (Guthrie and Petocz 1970, 585).

See mimicry: Browerian mimicry.

syn. conspecific mimicry (Little 1983, 300), intraspecific mimicry

► **body self-mimicry** *n.* One body part's acting as a copy of some other part of an animal's anatomy, *e.g.*, genital-region mimicry by chest coloration in female *Theropithecus gelada* (Gelada Baboons); possible buttocks imitation by female human breasts, and possible penis imitation by a male human's swollen nose tips (Morris 1977, 239–244).

Comment: Body self-mimicry may be used in social deceit (Weldon 1985, pers. comm.).

syn. body self-copying

head mimicry *n.* A hypothetical type of mimicry in which an animal's posterior end resembles its anterior end, possibly as a defensive adaptation; contrasted with tail mimicry (Wickler 1968, 74). *cf.* false head; mimicry: "definable-model-virtual-model mimicry"

tail mimicry *n.* A hypothetical type of mimicry in which an animal's anterior end resembles its posterior end, possibly as a defensive adaptation; contrasted with head mimicry (Wickler 1968, 74). *cf.* mimicry: virtual-model mimicry: nondefinable-model-virtual-model mimicry

► **female mimicry** *n.* For example., in some mollusc, insect, and vertebrate species including Humans: Mimicry in which a male animal shows behavior (and sometimes other characters) that are similar to those of a conspecific female (Weldon and Burghardt 1984, 92; Thornhill and Alcock 1983, 372).

syn. transvestism (not preferred)

cf. transvestism

Comments: Subordinate males of the fish *Polycentrus schomburgkii* (leaffish) imitate female color change and behavior as they approach territorial males (Barlow 1967 in Wilson 1975); male Hamadryas Baboons present their rumps to other males (Wilson 1975, 229). In a *Bittacus* sp. (hangingfly), some males mimic females by flying to calling rival males, perching close to them, and stealing a nuptial gift if possible (Thornhill and Alcock 1983, 372).

► **weapon automimicry** *n.* An animal's imitating the defensive parts of its own, or another, species (Guthrie and Petocz 1970; Weldon 1985, pers. comm.).

Bakerian mimicry *n.* Mimicry of nectiferous male flowers by conspecific nectarless female flowers, *e.g.*, in the Caricaceae (Baker 1976 in Pasteur 1982, 190).

Batesian mimicry *n.* Mimicry in which an edible species mimics a less edible one or inedible one (Pasteur 1982, 185), *e.g.*, flies' mimicking stinging Hymenoptera (Wickler 1968, 12–13); contrasted with Müllerian mimicry, *q.v.*

syn. Bates theory of mimicry; cryptic mimicry (Barlow and Wiens 1977, 161 in Pasteur 1982, 185)

cf. mimicry: floral mimicry: deceptive floral mimicry
Comments: In Batesian mimicry, models are not necessarily more common than their mimics, mimics do not necessarily look highly similar to their models, models are not always aposematic or noxious, and models and mimics can be plants as well as animals (Pasteur 1982, 185). Further in Batesian mimicry, mimics and models are of different edibility depending on the species and dupe involved. This relationship ranges from a model's being slightly inedible and a mimic's being slightly less inedible to a dupe to the model's being totally inedible and a mimic's being almost as inedible to a dupe (Pasteur 1982, 193). There are species which are transitional between "Batesian mimics" and "Müllerian mimics" (Rothschild 1963, 159). Further, a single species can be either a "Batesian mimic" or "Müllerian mimic" depending on its interactions with other organisms, but see "comments" under Müllerian mimicry.
 [after Henry Walter Bates, English naturalist, who first described this phenomenon in the Amazon]

► **"classical-Batesian mimicry"** *n.* Batesian mimicry in which a mimetic species does not outnumber its model and appears contemporaneously and sympatrically with its model (Poulton 1890 and Rettenmeyer 1970 in Waldbauer and Sheldon 1971, 379).

Comment: "Classical-Batesian mimicry" contrasts with "Waldbauerian-Batesian mimicry." Many insect species are probably classical-Batesian mimics.

► **"Waldbauerian-Batesian mimicry"** *n.* Batesian mimicry in which a mimetic species is sympatric with its model but is more frequent than it earlier in the warm season (Waldbauer and Sheldon 1971, 379).

Comment: "Waldbauerian-Batesian mimicry" contrasts with "classical-Batesian mimicry." Any species of insects appear to be asynchronous Batesian mimics and support the Waldbauer-Sheldon-late-season-mimic-scarcity hypothesis, *q.v.* (Waldbauer 1985).

[after G. P. Waldbauer, entomologist, and Henry W. Bates, naturalist]

Batesian-Poultonian mimicry *n.* Mimicry of a predator by its prey; *e.g.*, mimicry of a common fossorial wasp by an uncommon grasshopper (Bates 1961 and Poulton 1890 in Pasteur 1982, 189).

[after Henry W. Bates and E. B. Poulton]

Batesian-Wallacian mimicry *n.* Mimicry in which a predaceous-arthropod species resembles its prey species; *e.g.*, a bolas spider's emitting an odor that mimics the female pheromones of two moth species that it attracts and eats (Eberhard 1977 in Pasteur 1982, 188).

Comment: There are also behavioral, acoustic, and other chemical examples and possibly ultrasonic examples of Batesian-Wallacian mimicry (Pasteur 1982, 188).

behavioral mimicry *n.* Mimicry of a model species' behavior, *e.g.*, an *Aspidontus taeniatus* (False Cleaner Fish) mimicking the conspicuous movements of cleaner fish, some beetles' and silverfish's mimicking antennal movements of their ant hosts which results in their being fed by the ants, or young burrowing owls' making a call that sounds like a rattlesnake's rattling (Immelman and Beer 1989, 30).

syn. ethomimicry (Heymer 1977, 118; Immelman and Beer 1989, 93)

cf. mimicry: cleaner mimicry, Wicklerian Eisnerian mimicry

Browerian mimicry *n.* Automimicry in which conspecific individuals mimic each other; *e.g.*, in *Danaus plexippus* (Monarch Butterflies), individuals that are more palatable look like individuals that are less palatable (Brower, 1969 and Brower and Brower, 1972 in Pasteur 1982, 186).

syn. automimicry (Brower 1970; Matthews and Matthews 1978, 332)

cf. mimicry: automimicry

Comment: An individual of the same, or different, sex can be a Browerian mimic (Pasteur 1982, 186).

[after Lincoln P. and Jane V. Z. Brower, biologists, who discovered this phenomenon]

chemical mimicry *n.* One species' mimicking the odor of another organism (inferred from Schiestl et al. 1999, 421).

cf. mimicry: Pouyanian mimicry

classical-Batesian mimicry See mimicry: Batesian mimicry: classical-Batesian mimicry.

cleaner mimicry *n.* Behavioral mimicry that allows an *Aspidontus taeniatus* (False Cleaner Fish) to move near and bite off parts of fins of a fish waiting to be cleaned instead of cleaning it (Wickler 1968 162–176).

cf. mimicry: behavioral mimicry, Wicklerian-Eisnerian mimicry

collective mimicry *n.* Mimicry in which more than one individual conspecific organism performs mimicry which is protective or of unclear significance (Pasteur 1982, 176); *e.g.*, mimicry of a flower inflorescence by a group of fulgorid homopterans (Heymer 1977, 118); contrasted with individual mimicry and social mimicry (Pasteur 1982, 176).

commensalist mimicry *n.* In some ant-ectosymbiont species: An individual's imitating the emitted chemicals of its ant host that causes its host to tolerate its presence (Pasteur 1982, 176).

Comment: Commensalist mimicry is contrasted with aggressive mimicry, aggressive-reproductive mimicry, mutualistic mimicry, parasitic mimicry, reproductive mimicry, and reproductive-mutualistic mimicry.

crypsis *n.* Mimicry that comprises both eucrypsis and cryptic mimesis (Pasteur 1982, 183).

cf. biochemical crypsis

developmental mimicry *n.* Mimicry that is present at a certain stage in an organism's life cycle and is not changeable, *e.g.*, a very young sturgeon resembling a drifting twig which is not found in other stages; contrasted with adjustable mimicry (Pasteur 1982, 177).

direct mimicry *n.* Mimicry directly due to a mimic's own trait(s); contrasted with indirect mimicry (Pasteur 1982, 179).

Comment: "Direct mimicry" is a more common kind of mimicry than "indirect mimicry."

Dodsonian mimicry *n.* Mimicry of the flower of one species by that of another species; *e.g.*, mimicry of *Asclepias curassavica* (Bloodflower Milkweed) and *Lantana camara* (Lantana), which have nectar, by *Epidendrum ibaguense* (orchid) which does not have nectar (Boyden 1980 in Pasteur 1982, 187). [after Calaway H. Dodson, biologist]

egg mimicry See mimicry: Gilbertian mimicry, Wicklerian-Barlowian mimicry.

Emsleyan mimicry *n.* Mimicry in which a moderately noxious model is mimicked by a species whose defense is fatal to an assailant that misses its attack; *e.g.*, mimicry of less dangerous coral snakes by lethal coral snakes (Mertens 1956 in Wickler 1968, 111–121; Emsley 1966 in Pasteur 1982, 186).

syn. Mertensian mimicry [after R. Mertens, but Pasteur (1982, 175) explains that Mertens did not allude to this kind of mimicry]

[after Michael G. Emsley, biologist, who discovered this phenomenon]

ethomimicry See mimicry: behavioral mimicry.

eucrypsis *n.* In many species: Mimicry in which a mimic resembles its general background, not particular things in it, based on similar coloration (homochromy) alone; contrasted with mimesis (Pasteur 1982, 182).

Comment: Although eucrypsis is found in many animal species, it is represented in plants by only one case: homochromy of pollinia of certain orchid species with hummingbird beaks (Pasteur 1982, 183).

► acoustic eucrypsis *n.* Eucrypsis in which the silence achieved by cats and owls when hunting

enables them to blend into their silent environment (Pasteur 1982, 184).

► **tactile eucrypsis** *n.* A possible kind of eucrypsis in which an inquiline's touching its ant, or termite, host helps the inquiline to blend into its host's colony (Pasteur 1982, 184).

fast-evader mimicry *n.* In some butterfly species: Mimicry of the colors of a species, adept at evading birds by fast erratic flight by another species that may, or may not, have similar evading flight (Marden 1992, 60).

Comments: These colors indicate to bird predators that the models are difficult to catch. Mimicry analogous to "Batesian mimicry" and "Müllerian mimicry" occurs in "fast-evader mimicry" (Marden 1992, 54).

female mimicry See mimicry: automimicry: female mimicry.

floral mimicry *n.*

1. Mimicry in which one kind of flower resembles another kind that possibly results in the mimic's attracting pollinators and increasing its fitness (Little 1983, 295).

2. Mimicry in which a pseudoflower caused by a fungus mimics a true flower, *e.g.*, a yellow buttercup-like flower caused by *Puccinia monoica* (rust fungus) (Roy and Raguso 1997, 414).

Note: Both the pseudoflower and the buttercup produced nectar that is collected by insects. This might be part of a mutualistic-parasitic system rather than a mimetic system, considering mimicry in its strict sense.

cf. mimicry: Pouyanian mimicry

Comments: Many kinds of floral mimicry are discussed by Endler (1981 in Little 1983, 295 and Little 1983). Little (1983, 295) classifies "floral mimicry" as a kind of "plant mimicry." Floral mimics may be the ends of a continuum of phenomena (Little 1983, 296).

► **deceptive-floral mimicry** *n.* Floral mimicry in which one flower provides no pollinator reward(s) but receives visits from either naive pollinators or pollinators specializing on a similar rewarding flower (Little 1980 in Powell and Jones 1983, 312).

syn. Batesian mimicry (Brown and Kodric-Brown 1979 in Powell and Jones 1983, 312, but Little 1983, 297 discusses the problem with this synonym), food-deception mimicry, food-source mimicry, inviting mimicry (Vane-Wright 1976 in Powell and Jones 1983, 312)

cf. mimicry: floral mimicry: nondeceptive-floral mimicry

► **nondeceptive-floral mimicry** *n.* Floral mimicry in which two, or more species, of flowers provide rewards for one, or more, common pollinating species (Little 1980 in Powell and Jones 1983, 312).

syn. advertising mimicry (Proctor and Yeo 1972 in Little 1983, 296), floral mutualism, Müllerian mimicry (Little 1983, 296–297)

cf. mimicry: floral mimicry: deceptive-floral mimicry

Comment: The problem with using "Müllerian mimicry" as a synonym is discussed by Little (1983, 297).

food mimicry *n.*

1. Mimicry in which plants produce morphological structures that resemble morphology, odor, or both of food; *e.g.*, nectar-droplet-like features that attract pollinating insects to *Parnassia* sp. (a grass-

- of-Parnassus) and some orchids and prey to sundews and rotten-meat odors that attract pollinators to certain aroids (Wickler 1968, 147–151).
2. For example, in the fish *Corynopoma riisei* (Swordtail Characins): Mimicry of food by part of an animal's body that attracts a mate (Wickler 1968, 219–200).

Gilbertian mimicry *n.* Protective mimicry in which the model and dupe are conspecific; *e.g.*, *Passiflora* stipules that mimic *Heliconius* butterfly eggs near the point of hatching (Gilbert 1975 in Pasteur 1982, 186).

syn. egg mimicry (Gilbert 1983, 278; Sbordoni and Forestiero 1985, 191)

Comment: Because larvae of most *Heliconius* species are cannibalistic, *Heliconius* females avoid ovipositing on plants bearing such eggs (Pasteur 1982, 186). [after L. E. Gilbert, biologist, who discovered this phenomenon]

hi-fidelity mimicry See mimicry: specialized mimicry.

historical mimicry *n.* For example, in some fly and a mantispid species: Mimicry in which a model gains protection from a predator due to its experience with the mimic's model(s) in the previous summer (Rothschild 1981 in Waldbauer and LaBerge 1985, 101).

cf. mimicry: specialized mimicry, vague mimicry

homochrome mimicry, homoeochromatic mimicry See mimicry: androchromatic mimicry.

indirect mimicry *n.* Mimicry that is performed through a dummy, or in parasitic species through a host that the parasite alters causing the host to become a mimic; contrasted with direct mimicry (Pasteur 1982, 176).

Comments: Indirect mimicry is rare among organisms. Indirect mimicry through a dummy may be carried out by West African *Cyclosa* and *Uloborus* spiders which add conspicuous dummy spiders to their webs which may distract predators from actual spiders (Edmunds 1974 in Pasteur 1982, 179).

individual mimicry *n.* Mimicry in which an individual organism fully performs mimicry without involvement of other members of its species; contrasted with collective mimicry and social mimicry (Pasteur 1982, 179).

inherent mimicry *n.* Mimicry that is intrinsic, developing ontogenetically in an organism; contrasted with adventitious mimicry (Pasteur 1982, 180).

intraspecific mimicry See mimicry: automimicry.

isochromic mimicry, isomorphous mimicry See mimicry: androchromatic mimicry.

Kirbyan mimicry *n.* Mimicry of host-bird eggs, young, or both by brood parasites (Kirby and Spence 1923 in Pasteur 1982, 188).

[after W. Kirby]

Mertensian mimicry See mimicry: Emsleyan mimicry.

mimesis *n.* Mimicry in which a mimic resembles its general background based on similar coloration (homochromy), morphology (homomorphy), and if necessary the model's moves and postures (homokinemy); contrasted with eucrypsis (Pasteur 1982, 182). *cf.* camouflage, -cryspsis, mimicry

► **cryptic mimesis** *n.* Mimicry in which the model is a dominant element of a mimic's environment, either inanimate (*e.g.*, leaves, sticks and twigs, thick

inflorescences and large flowers, bark, grass, lianas, sea-weeds, soil, and pebbles) or animal (*e.g.*, gregarious, or colonial, animals that dupes do not react towards); contrasted with phaneric mimesis (Pasteur 1982, 182).

syn. cryptic mimicry (Pasteur 1982, 183)

Comments: In plants, cryptic mimesis includes dead-grass mimicry, dead-stick mimicry, soil mimicry obtained by sticky succulent plants that catch dust and sand, and stone mimicry in five plant families (Pasteur 1982, 183).

aggressive-cryptic mimesis *n.* For example, in some species of antlike spiders and a vulture species that resembles a buzzard (Accipitridae): Cryptic mimesis in which a predator resembles an individual of a gregarious-animal species that is innocuous to the predator's prey and the predator loses itself in its model-species flock (Pasteur 1982, 184).

syn. Peckhamian mimicry (in some cases Pasteur 1982, 184)

phaneric mimesis *n.* Mimicry in which the model is an isolated, conspicuous inanimate element of a mimic's environment; contrasted with cryptic mimesis (Pasteur 1982, 183).

Comment: Models include an animal dropping, flower bud, mushroom, insect carcass, and part of the mimic's own body (Pasteur 1982, 183).

self-mimesis *n.* For example, in many animal species: Mimicry in which a mimic looks like itself but looks dead, which can involve suddenly ceasing to move or feigning death sometimes after abruptly turning upside down (Pasteur 1982, 184).

syn. thanatosis (Pasteur 1982, 184)

cf. playing dead

mimetic polymorphism *n.* Mimicry in which the mimic is one species with different morphological forms that resemble models of more than one species, *e.g.*, *Papilio dardanus* (Mocker Swallowtail) which resembles other butterfly species (Wickler 1968, 19–33).

"mimic-not-perceived-by-dupe mimicry" *n.* Mimicry in which a dupe does not see a mimic (Pasteur 1982, 183).

"mimic-perceived-by-dupe mimicry" *n.* Mimicry in which a dupe sees a mimic (Pasteur 1982, 183).

"model-agreeable-to-dupe mimicry" *n.* Mimicry in which a dupe finds a model not unpleasant (Pasteur 1982, 187).

"model-disagreeable-to-dupe mimicry" *n.* Mimicry in which a dupe finds a model unpleasant in some way (Pasteur 1982, 185).

molecular mimicry *n.*

1. A parasite's making eclipsed antigens (antigenic determinants that resemble its hosts' antigenic determinants to such a degree that they do not elicit host antibodies against them) (Damian 1964, 129; Pasteur 1982, 1978; King and Stansfield 1985).
2. One molecule's resembling the shape of another molecule (Campbell et al. 1999, 33).

Note: A molecule of heroin, morphine, or other opiate drug has a part that resembles the shape of the part of an endorphin molecule that is recognized by a Human's brain receptor for this molecule (Campbell et al. 1999, 33, illustration). Endorphin and these drugs affect mood and pain perception.

Müllerian mimicry, Muellerian mimicry *n.*

1. Mimicry between, or among, two, or more, distasteful, or toxic, species that reduces predation for each species because in this resemblance situation, predators learn to avoid only one color pattern rather than several, e.g., in the tiger-stripe butterfly complex in South America (Wickler 1968, 78–85; Matthews and Matthews 1978, 330; Wittenberger 1981, 618); contrasted with Batesian mimicry, *q.v.*
2. Mimicry in which both mimic and model are unpalatable for all potential predators (Müller 1878, 1879, in Pasteur 1982, 185); contrasted with Batesian mimicry, *q.v.*

syn. arithmetic mimicry (Pasteur 1982, 173)

cf. mimicry; mimicry: Batesian mimicry, floral mimicry: nondeceptive-floral mimicry, mimicry ring, reproductive mimicry; Müllerian association

Comment: Strictly speaking, Müllerian mimicry is not mimicry because both model and mimic are sending nondeceitful signals to a perceiver (Pasteur 1982, 185). Therefore, some workers forsake the term “Müllerian mimicry” for “Müllerian resemblance” and “Müllerian convergence.”

[after Fritz Müller, German zoologist]

mutualistic mimicry *n.* Mimicry in which the mimic and dupe help one another (Pasteur 1982, 176).

Comment: Intermediate cases between mutualistic and aggressive mimicry occur (Pasteur 1982, 176). Mutualistic mimicry is contrasted with aggressive mimicry, aggressive-reproductive mimicry, mutualistic mimicry, parasitic mimicry, reproductive mimicry, reproductive-mutualistic mimicry, and commensalist mimicry.

Nicolaian mimicry *n.* Mimicry of the vocalization of its estrildid-finch host by a male Widowbird (Nicolai 1964 in Pasteur 1982, 190).

Comment: Nicolaian mimicry conditions a female Widowbird to copulate. A similar kind of mimicry is also found in photomimetic fireflies (Pasteur 1982, 190).

[after J. Nicolai]

nonprotective mimicry *n.* Mimicry that does not protect a mimic from its dupe; contrasted with protective mimicry (Pasteur 1982, 175).**parasitic mimicry** *n.* Mimicry used by a parasite in promoting its reproduction; contrasted with aggressive mimicry, aggressive-reproductive mimicry, mutualistic mimicry, reproductive mimicry, reproductive-mutualistic mimicry, and commensalist mimicry (Pasteur 1982, 176).

Comment: Parasitic mimicry has a gamut of intermediate cases between aggressive reproductive mimicry to reproductive mimicry (Pasteur 1982, 176).

Peckhammian mimicry See mimicry: aggressive mimicry.**Pouyannean mimicry** *n.* An orchid flower's mimicking a female bee, or wasp, which causes a male bee, or wasp, to pseudocopulate with the flower (Pouyanne 1917 in Pasteur 1982, 188).

cf. copulation: pseudocopulation

Comments: Male bees of *Andrena nigroaenea* pseudocopulate with flowers of the orchid *Ophrys sphegodes* (Schiestl et al. 1997, 2881). These flowers have different odor bouquets of aldehydes and alkanes which elicit pseudocopulation. The male bees often transfer pollinia during their pseudocopulation bouts (Schiestl et al. 1999, 421). The orchid

produces the same compounds and in similar relative proportions as do females of this bee species.

[after M. Pouyanne]

protective mimicry *n.* Mimicry in which a potential victim is camouflaged, or has a formidable appearance, that foils its predators or other potential enemies; contrasted with nonprotective mimicry (Pasteur 1982, 175).

syn. defensive mimicry (Pasteur 1982, 175)

Comment: Protective mimicry includes many kinds of mimicry such as “arithmetic mimicry” and “Batesian mimicry.”

rank mimicry *n.* In some bird and primate species: A lower ranking animal's mimicking the behavior of a higher ranking animal (Immelman and Beer 1989, 241).**reproductive mimicry** *n.* Mimicry used in propagation of the mimicking species without assaulting, or harming, dupes (Pasteur 1972 in Pasteur 1982, 176).

Comment: Reproductive mimicry is contrasted with aggressive mimicry, aggressive-reproductive mimicry, mutualistic mimicry, parasitic mimicry, reproductive-mutualistic mimicry, and commensalist mimicry.

reproductive-mutualistic mimicry *n.* Mimicry with both reproductive and mutualistic components, e.g., in ant ectosymbionts (Pasteur 1982, 176).

Comment: Reproductive-mutualistic mimicry is contrasted with aggressive mimicry, aggressive-reproductive mimicry, mutualistic mimicry, parasitic mimicry, reproductive mimicry, and commensalist mimicry.

social mimicry *n.*

1. Mimicry of conciliatory and contact signaling that serves to diminish hostility among species forming mixed flocks of birds (Moynihan 1968 in Wilson 1975, 360).

2. Batesian mimicry in which a group of conspecific animals are distasteful to one, or more, predators and serves as a nucleus for fishes, or birds, of another species that tend to look and behave like their models; contrasted with collective mimicry and individual mimicry (Pasteur 1982, 179).

specialized mimicry *n.* For example, in some syrphid-fly and robber-fly species: Mimicry in which a mimic has a suite of morphological and behavioral adaptations that mimic salient features of its model(s) (given as “specialized mimic” in Waldbauer and Sheldon 1971, 371).

syn. high-fidelity mimicry (given as “high-fidelity mimic” in Waldbauer and LaBerge 1985, 103; “specialized high-fidelity mimic” in Waldbauer 1988, S107)

cf. mimicry: historical mimicry, vague mimicry

Comment: High-fidelity mimicry is contrasted with low-fidelity mimicry (given as “low fidelity” mimic in Waldbauer and LaBerge 1985, 108).

transformational mimicry *n.* For example, in some species of swallowtail butterflies (Papilionidae): The phenomenon in which different instars imitate entirely different models (Matthews and Matthews 1978, 332).

syn. I-led-three-lives syndrome (Matthews and Matthews 1978, 332)

vague mimicry *n.* For example, in some syrphid-fly and robber-fly species: Mimicry in which a mimic does not have a suite of morphological and behavioral adaptations that mimic salient features of its model, or models (given as “vague mimic” in Waldbauer and Sheldon 1971, 371).

cf. mimicry: historical mimicry, specialized mimicry
Vavilovian mimicry *n.* Mimicry of seeds of one crop by another, *e.g.*, mimicry of wheat seeds by rye (Vavilov 1951 in Pasteur 1982, 187).
 [after N. I. Vavilov]

“virtual-model mimicry” *n.* Mimicry, not of an actual species, but of a character found in models that we can specify in general terms and those that we cannot (Pasteur 1982, 191).

► **“definable-model-virtual-model mimicry”** *n.* Mimicry involving a character of more than one species, but not mimicry of any particular species; *e.g.*, mimicry of eyes as seen in eye spots of many insect species which may frighten, deflect, or do both to predators (Blest 1957, etc. in Pasteur 1982, 191); mimicry of young snakes by caterpillars; mimicry of an insect's head by its rear end and vice versa; mimicry of poisonous snakes by harmless ones or legless lizards; mimicry of prey food by outgrowths on a predatory fish; mimicry of prey food by the tail of a venomous snake; the simulation of flowers by trap-leaves of certain terrestrial carnivorous plants; and mimicry of filamentous algae by extensions on trap vesicles of *Utricularia* spp. (bladderworts); contrasted with “nondefinable-model-virtual-model mimicry” (Pasteur 1982, 191).

cf. mimicry: aggressive mimicry; head mimicry

► **“nondefinable-model-virtual-model mimicry”** *n.* Mimicry in which the mimic resembles a generalized character not found in any particular species; contrasted with “nondefinable-model-virtual-model mimicry” (Pasteur 1982, 192).

vocal mimicry *n.* In some parrot species, Myna Birds, and Mockingbirds (Mimic-thrushes): An individual's adding the sounds of other species (including crickets and Humans) to its vocal repertoire (Immellmann and Beer 1989, 324).

cf. learning: vocal mimicry, vocal mocking

Comment: A captive Mockingbird incorporated the chirping of house crickets into its vocal repertoire (pers. obs.).

Waldbauerian-Batesian mimicry See mimicry: Batesian mimicry: Waldbauerian-Batesian mimicry.

Wasemannian mimicry *n.* Mimicry of an ant by an ant ectosymbiont that may benefit the dupe without damaging it (Wasemann 1925 in Pasteur 1982, 189); *e.g.*, the mimics are some salticid-spider and staphylinid-beetle species that resemble ants in size, coloration, body structure, and behavior (Wickler 1968, 99; Rettenmeyer 1970).

[after E. Wasemann]

Wicklerian-Barlowian mimicry *n.* Mimicry of eggs by a male mouth-brooding-cichlid species, *e.g.*, *Labeotropheus trewavasae* (Wickler 1962 and Barlow 1967 in Pasteur 1982, 190).

syn. egg mimicry (Wickler 1968, 222)

Comments: In such a fish, a male has false eggs spots on his anal fin, and a female with a mouth full of ova approaches his fin, possibly to collect the false eggs. When she gets close, he injects his sperm into her mouth and, thereby, fertilizes her ova (Pasteur 1982, 190). Another kind of Wicklerian-Barlowian mimicry is also found in fish.

[after W. Wickler and G. W. Barlow]

Wicklerian-Eisnerian mimicry *n.* Mimicry in which the model is not offensive to a dupe; *e.g.*, mimicry of a cleaner fish by *Aspidontus taeniatus*

(Saber-toothed Blenny) which approaches a fish to be cleaned and bites off some of its flesh rather than cleaning it (Wickler 1963 in Pasteur 1982, 187), or mimicry of its prey by the larva of a lacewing by covering itself with woolly wax from Woolly Aphids (Eriosomatinae) (Eisner et al. 1978).

cf. mimicry: behavioral mimicry, cleaner mimicry

Wicklerian-Guthrian mimicry *n.* Social self-mimicry in which the muzzle of a *Mandrillus sphinx* (Mandrill) appears to mimic its overcolored genitals (Jouventin 1975 in Pasteur 1982, 186).

Comments: It is controversial whether this phenomenon is actually mimicry (Pasteur 1982, 187).

Wicklerian mimicry *n.* Mimicry of female genitalia by a male or vice versa (Wickler 1967 in Pasteur 1982, 191).

Comments: The monstrous red buttocks of a male *Papio hamadryas* (Hamadryas Baboon) mimic a female's estrous genitalia. A male *P. hamadryas* may display his buttocks to a bellicose dominant male as a submission and appeasement gesture (Wickler 1967 in Pasteur 1982, 191). The pseudopenis of a female hyena resembles a male's penis and may have evolved to allow a female to participate in conciliatory communication within her pack (Wickler 1967 in Pasteur 1982, 191).

[after Wolfgang Wickler, biologist]

♦ **mimicry ring** *n.* A group of several organisms that are mimics of several other organisms (Wickler 1968, 78).

Batesian mimicry ring *n.* A group of several similar appearing Batesian mimics that are mimics of a group of several similar appearing Müllerian mimics (Wickler 1968, 80; Waldbauer and LaBerge 1985).

Müllerian mimicry ring *n.* A mimicry ring comprising animals that are Müllerian mimics of one another, *e.g.*, certain South American butterflies or North American yellowjackets (wasps) (Wickler 1968, 78–80; Waldbauer and LaBerge 1985).

syn. Müllerian mimicry club (Wickler 1968, 78–80)

♦ **mimicry system** See ²system: mimicry system.

♦ **mimetic analogies** See mimicry.

♦ **mimotype** See -type, type: mimotype.

♦ **mind** *n.*

1. A person's “thought, purpose, intention” (Oxford English Dictionary 1972, entries from 971).
2. The seat of a person's “consciousness, thoughts, volitions, and feelings; a system of cognitive and emotional phenomena and powers that constitutes the subjective being of a person; the incorporeal subject of the psychical faculties, the spiritual part of a human being;” a person's soul, as distinguished from his body (Oxford English Dictionary 1972, entries from *ca.* 1340).
3. A person's cognitive, or intellectual, powers, as distinguished from his will or emotions; often contrasted with heart (Oxford English Dictionary 1972, entries from *ca.* 1340).
4. The aggregate of processes originating in, or associated with, a person's brain, involving conscious and subconscious thought, interpretation of perceptions, insight, imagination, etc. (Michaelis 1963); a person's ability to monitor his own mental states (Gallup 1982, 243).
5. In animals: “That which has mental experiences,” *q.v.* (Griffin 1976, 5).

6. Organism activity that involves behavioral pattern-formation, appetency, irritability, tropisms, taxis, as well as an ability to learn (Brownlee 1981, iv).

cf. mentality; organ: brain

[Old English *gemynd*, mind]

mind reading See hypothesis: theory-of-mind hypothesis.

♦ **mineral** *n.*

1. A naturally-occurring, homogeneous substance formed by inorganic processes and having a characteristic set of physical properties, a definite and limited range of chemical composition, and a molecular structure, usually expressed in crystalline form (with characteristics including cleavage, color, fracture, hardness, luster, and relative density (Michaelis 1963; Allaby 1994, 255).

Note: Many geologists use this definition of “mineral.” Minerals include Aragonite, Calcite, Feldspar, Gold, Gypsum, Iron Pyrite, Magnitite, Mica, Silver, Smithsonite, and Vivianite.

2. Inorganic material; distinguished from that produced by organisms (Michaelis 1963).

3. Any of various natural substances such as an element (*e.g.*, Gold or Silver), a mixture of inorganic compounds (*e.g.*, Granite or Hornblende), or an organic derivative (*e.g.*, coal or petroleum) (Morris 1982).

Aragonite *n.* An orthorhombic mineral, CaCO_3 , trimorphous with Calcite and Vaterite (Bates and Jackson 1984).

Comment: Aragonite occurs in shells and pearls of some species and in beds of gypsum and iron ore, in coral reefs, in hot-spring deposits, and in shallow marine banks (Bates and Jackson 1984).

Magnetite *n.* A massive, isometric black iron oxide, Fe_3O_4 , that is strongly magnetic; when it has polarity, it is called lodestone (Michaelis 1963).

cf. taxis: geomagnetotaxis

Comment: Magnetite may be used in geomagnetotaxis in some animals, *e.g.*, the Homing Pigeon, Honey Bee, and Human, or orientation in some kinds of bacteria. Chitons (Mollusca) have Magnetite in their scrapers that they use to remove algae from substrates (Baker 1987, 691; D.B. Quine, pers. comm.). Magnetite is found in human brains (Anonymous 1992, 25).

Iron Pyrite *n.* Metallic, pale yellow iron disulfide, FeS_2 (Michaelis 1963).

syn. fool's gold, pyrite (Michaelis 1963)

Comment: Organized structures that preceded life on Earth might have been “Iron Pyrite aggregations” (*q.v.*).

[Latin *pyrites* < Greek *pyritē*, flint < *pyritē* (lithos), fire (stone) < *pyr*, fire]

Vivanite *n.* An iron-phosphate mineral (Guthrie 1990, 79; illustration, 80).

Comments: Vivanite is whitish gray when unoxidized and blue when oxidized. It occurs as crystals and dust on mammal bone fossils and mummies and as layers in pond sediments (Guthrie 1990, 79).

♦ **minerotroph** See -troph: minerotroph.

♦ **minogeographical isolation** See isolation: mini-geographical isolation.

♦ **minima** See caste: worker: minor worker.

♦ **minimum, law of** See law: law of the minimum.

♦ **minimum-interaction hypothesis** See hypothesis: minimum-interaction hypothesis.

♦ **minisatellite DNA** See nucleic acid: deoxyribonucleic acid: satellite DNA: minisatellite DNA.

♦ **minor community** See ²community: minor community.

♦ **minor pollinator** See pollinator: minor pollinator.

♦ **minor worker** See caste: worker: minor worker.

♦ **miosis** See meiosis.

♦ **misogamy** See isolation: reproductive isolation.

♦ **missense mutation** See ²mutation: missense mutation.

♦ **mist net** See trap: mist net.

♦ **mitochondrial-Eve hypothesis** See hypothesis: African-origin hypothesis of human mitochondrial DNA evolution.

♦ **mitochondrial genome** See genome: mitochondrial genome.

♦ **mitochondrion** See organelle: mitochondrion.

♦ **mitoschisis** See mitosis.

♦ **mitosis** *n.*

1. The division of a cell nucleus (Mayr 1982, 958).

2. In eukaryotes, most archaeal species: Cell division in which a somatic cell gives rise to daughter cells that each has a complete set of all its chromosomes; the ordinary cell division of bodily growth (Dawkins 1982, 290).

3. The result, or process, of mitosis.

syn. cytodiaeresis, karyokinesis, karyomitosis, mitoschisis (Lincoln et al. 1985)

cf. binary fission, meiosis

[Greek *mitos*, thread; coined by Flemming (1882 in Mayr 1982, 674)]

amitosis *n.* A nucleus' division by simple construction into two portions which often forms dissimilar daughter nuclei (Lincoln et al. 1985).

syn. holoschisis (Lincoln et al. 1985)

closed mitosis *n.* Mitosis during which a cell retains its nuclear membrane during mitosis; contrasted with open mitosis (Strickberger 1990, 276).

syn. closed division (Strickberger 1990, 276)

Comment: Closed mitosis is found in a flagellated organism that might have given rise to organisms including Dinoflagellida, Euglenophyta, Sporozoa, Ciliophora, Fungi, Acoela, and Metazoa (Strickberger 1990, 274).

endomitosis *n.*

1. Chromosomal replication within a nucleus of a cell that does not subsequently divide, resulting in polyploidy (Lincoln et al. 1985).

2. A reproductive system in which there is a premeiotic doubling of chromosomes followed by meiosis (Bernstein et al. 1985, 1279).

open mitosis *n.* Mitosis during which a cell's nuclear membrane breaks down during mitosis; contrasted with closed mitosis (Strickberger 1990, 276).

syn. open division (Strickberger 1990, 276)

Comment: Open mitosis is found in a flagellated organism that might have given rise to organisms including multicellular algae, Cnidaria, Metazoa, and Porifera (Strickberger 1990, 275).

♦ **mitosome** See organelle: mitosome.

♦ **mitotic parthenogenesis** See parthenogenesis: mitotic parthenogenesis.

♦ **mixed colony** See ²group: colony: mixed colony.

♦ **mixed dominance-subordination relationship** See relationship: mixed dominance-subordination relationship.

♦ **mixed dyadic social relationship** See relationship: mixed dyadic social relationship.

- ♦ **mixed evolutionarily stable strategy** See strategy: evolutionarily stable strategy: mixed evolutionarily stable strategy.
- ♦ **mixed forest** See ²community: mixed forest.
- ♦ **mixed group** See ²group: mixed group.
- ♦ **mixed motivation** See motivation: mixed motivation.
- ♦ **mixed nest** See nest: mixed nest.
- ♦ **mixed singer** *n.*
 1. For example, in *Regulus ignicapillus* (European Firecrests) and *Regulus regulus* (Goldcrests): An individual that produces the songs, or song parts, of other species (usually closely related ones) in addition to its species-typical song(s) (Immelmann and Beer 1989, 186–187).
 2. In dialect-forming birds: An individual that includes song elements of another conspecific dialect in its own song (Immelmann and Beer 1989, 187).
cf. mimic: vocal mimic
- ♦ **mixed-species group** See ²group: mixed group.
- ♦ **-mixis, -mixia** *adj.* mictic.
- allomixis** See fertilization: cross-fertilization.
- amixis** *n.* Absence of meiosis and fertilization in all stages of an organism's life cycle (Margulis et al. 1985, 73).
cf. parthenogenesis
- amphimixis** *n.*
 1. "True sexual reproduction; the union of male and female gametes;" which "may be either autogamy (inbreeding) or allogamy (outbreeding)" (Lincoln et al. 1985).
 2. Syngamy (contact, or fusion, of gametes) or karyogamy (fusion of gamete nuclei) that leads to fertilization and forms an individual with two different parents (Margulis et al. 1985, 73).
syn. mixis (Margulis et al. 1985, 73)
- n.* amphimict
- apomixis** See parthenogenesis: apomixis.
- automixis** *n.*
 1. Karyogamy of nuclei, or syngamy of cells, that derive from the same parent (Margulis et al. 1985, 73).
See -gamy: autogamy.
syn. autogamy, extreme inbreeding, selfing (Margulis et al. 1985, 73)
 2. Obligatory self-fertilization by autogamy, pedogamy, or automictic parthenogenesis (Lincoln et al. 1985).
 3. "Reproduction by single cells that are derived from a single parent by meiosis and restoration of ploidy (Judson and Normark 1996, 41).
syn. endomixis
- n.* Self-fertilization in which male and female nuclei from one individual fuse (Lincoln et al. 1985).
cf. parthenogenesis
- exomixis** *n.* Fusion of gametes from different sources (Lincoln et al. 1985).
syn. xenomixis (Lincoln et al. 1985)
- holoschisis** See mitosis: amitosis.
- panmixis** *n.* Random breeding among members of a small population or deme (Wilson 1975, 9).
syn. pangamy, panmixia, random mating (Lincoln et al. 1985)
See mating: random mating.
Comment: Panmixis is an important simplifying assumption in population biology (Wilson 1975, 9).

- parthenomixis** *n.* "The fusion of two female nuclei produced within a single gamete or gametangium" (Lincoln et al. 1985).
- xenomixis** See -mixis: exomixis.
- ♦ **mixis** *n.*
 1. Genetic material rearrangement through meiosis, syngamy, or usually both, almost always resulting in the production of one, or more, new organisms that differ genetically from one another and from their parents (Bell 1982, 509).
syn. sex, sexuality (Bell 1982, 509)
 2. Fusion of gametes, karyogamy, and karyomixis (Lincoln et al. 1985).
See -mixis: amixis, amphimixis.
cf. sex, sexual reproduction
- ♦ **mixoploidy** See -ploidy: mixoploidy.
- ♦ **mixotroph** See -troph: mixotroph.
- ♦ **mma** See macarthur: millimacarthur.
- ♦ **MMPA** See law: Marine Mammal Protection Act.
- ♦ **mnemotaxis** See taxis: mnemotaxis.
- ♦ **mob** See ²group: animal group.
- ♦ **mobbing** *n.*
 1. In many bird species, including *Aphelocoma californica* (Western Scrub Jays), *Aphelocoma coerulescens* (Florida Scrub Jays), and *Aphelocoma ultramarina* (Mexican Jays): Behavior in which conspecific, and sometimes heterospecific, individuals gather around a predator and vocalize loudly or perform conspicuous visual displays (Hinde 1952, Altmann 1956, and Cully and Ligon 1976 in Francis et al. 1989, 795).
 2. In baboons, many bird species, a ground-squirrel species, *Lemur catta* (Ring-tailed Lemurs), and *Pan troglodytes* (Chimpanzees): A joint assault by an animal group (of one, or more, species) "on a predator too formidable to be handled by a single individual" that the mobbers attempt to disable; or at least drive from the vicinity, even though the predator is not engaged in an attack on the group (Wilson 1975, 46–47, 454, 589).
v.t. mob

Comments: All explanations of avian "mobbing" include the idea that it is somehow antipredator in nature (Curio 1978 in Francis et al. 1989, 795). Francis et al. (1989, 798) carefully define "mobbing" in Florida Scrub Jays. "Mobbing" can involve a mobber's changing its position frequently; stereotyped wing, tail, or both, movements in birds; and loud calls, often with a broad frequency spectrum and transients (Heymer 1977, 85; Curio 1978 in Immelmann and Beer 1989, 187). Perhaps "mobbing" should be applied to the defensive behavior of some species of social insects and nonsocial insects, e.g., *Bembix* wasps (Matthews and Matthews 1978, 351).

- ♦ **mobile genetic element** See transposable genetic element.
- ♦ **mobility** See vagility.
adj. mobile
- ♦ **mock hunting** See play.
- ♦ **mocking** *n.*
 1. A person's holding something up to ridicule; deriding; assailing with scornful words or gestures (Oxford English Dictionary 1972, verb entries from ca. 1450).
 2. A person's using, or uttering, ridicule; acting, or speaking, in derision; jeering, scoffing; flouting (Oxford English Dictionary 1972, verb entries from 1450).

3. A person's deceiving or imposing upon; deluding, befooling; tantalizing, disappointing (Oxford English Dictionary 1972, verb entries from *ca.* 1470).
4. A person's behavior directed at another person who deviates from a group norm that places social pressure on him to readopt group-appropriate behavior, *e.g.*, in Bushmen, sticking out one's tongue, vulva presentation, and pubic presentation (Eibl-Eibesfeldt 1973 in Heymer 1977, 167).
syn. mockery (Michaelis 1963), ridiculing (Heymer 1977, 167).
v.i., v.t. mock
cf. display: genital display; joking; mimicry; vocal mimicry
[Old French *mocquer*, to mock]

♦ **modal-action pattern (MAP)** See action pattern: modal-action pattern.

♦ **modality** *n.*

1. A kind of sense; sensory means (Hinde 1970, 87).
syn. sensory modality (Hinde 1970, 87)
2. The state, or quality, of a stimulus or sensation (Lincoln et al. 1985)
3. Stimuli (light, sound, smell, taste, touch, magnetism) that an animal perceives via its particular kind of sense receptor and that give rise to particular sensations, *e.g.*, vision, audition, olfaction, and gustation (Immelmann and Beer 1989, 188).
cf. receptor, perception, sensation

audition See modality: mechanoreception: audition.

chemoreception *n.* An organism's capability of identifying chemicals and sometimes estimating their concentrations (McFarland 1985, 187).

► **exteroception** *n.* An organism's chemoreception of chemicals in its external environment; contrasted with interoception (McFarland 1985, 187).

► **gustation** *n.*

1. The action, or facility, of tasting; the sense of taste (Oxford English Dictionary 1972, entries from 1599).

adj. gustative, gustatory

2. Chemoreception of chemicals by direct contact (McFarland 1985, 189).
syn. gust, taste (Michaelis 1963)

Comments: The basic tastes in mammals are acid (sour), bitter, salt, and sweet (McFarland 1985, 189). Some researchers consider umami, *q.v.*, to be the Human's fifth taste (Willoughby 1998, C3).
[Latin *gustus*, taste]

► **interoception** *n.* An organism's chemoreception of internal chemicals, *e.g.*, carbon dioxide, nutrients, and hormones; contrasted with exteroception (McFarland 1985, 187).

► **olfaction** *n.*

1. The action of smell; sense of smell (Oxford English Dictionary 1972, entries from 1846).

2. Chemoreception of airborne substances (McFarland 1985, 188).
syn. smell

[Latin *olfactus*, past participle of *olfacere*, to smell]

► **osmoreception** *n.* An organism's detection of its cell dehydration and shrinkage due to water loss (McFarland 1985, 267).

electroreception, electrical sensitivity *n.*

For example, in Dogfish, Gymnotid Fish, Mormyrid Fish, and Sharks: An individual's perception of electric current (McFarland 1985, 226).

interoceptive senses, organic senses, visceral senses *n.* An animal's perceptions of sensations that arise within its body, *e.g.*, hunger, thirst, visceral pain, nausea, and cramps (Storz 1973, 134).

kinesthesia *n.* An animal's perception of its own movement and body-part positions (Immelmann and Beer 1989, 164–165).

syn. muscle sense, position sense, proprioception (Storz 1973, 140), space orientation (Heymer 1977, 125)

cf. -ceptor: proprioceptor, -ference: reaference, learning: kinesthetic learning, method: putting-through method

magnetoreception *n.* For example, in *Apis mellifera* (Western Honey Bees), some bacterium species, *Columba livia* (Rock Doves), and Humans: An individual's perception of magnetic waves (Baker 1987, 691).

cf. magnetite; taxis: geomagnetotaxis

mechanoreception *n.* An organism's perception of sound, vibration, or pressure (McFarland 1985, 191).

► **audition** *n.* A person's faculty of hearing (Oxford English Dictionary 1972, entries from 1599); sound perception.

syn. hearing

Comment: "Audition" is now commonly used for hearing in nonhuman animals as well. These animals hear from 0.1 (*Columba livia*, Rock Doves) through 100,000 hz (some bat species) (Gould 1982, 115).

binaural hearing *n.* A vertebrate's use of both of its ears to locate the direction of sound sources (Gregory and Zangwill 1987, 88).

► **touch** *n.* A person's means of perceiving an object after touching it with a body part (Oxford English Dictionary 1972, entries from 1394).

Comment: "Touch" is now often used to refer to a sense in nonhuman animals as well.

reception *n.* An organism's receiving a stimulus or stimuli (McFarland 1985, 187).
cf. modality

Comment: McFarland (1985, chapters 12–13) reviews "chemoreception" (including "gustation" and "olfaction"), "mechanoreception" (including "hearing"), "touch reception," and "thermoreception."

thermoreception *n.* Probably in most animal species: An individual's perception of heat (infrared radiation) (McFarland 1985, 190).

vision *n.*

1. A person's seeing with his "bodily eye" (Oxford English Dictionary 1972, entries from 1491).
2. An animal's perception of electromagnetic radiation (Gould 1982, 114).

cf. Purkinje shift

Comment: Kinds of vision include binocular, color, complex-linear-polarization, luminance vision, monocular, and polarized-light vision (Chiou et al. 2008, 429). Color vision is eight-channel-color vision, monochromatic, dichromatic, and trichromatic depending on the species. *Apis mellifera* (Western Honey Bees) see from ultraviolet through near red; Humans see from intense low-wavelength ultraviolet through red; some hummingbird species see from ultraviolet through far red; pit-viper snakes perceive infrared from a distance with their pit organs (Gould 1982). *Gasterosteus aculeatus* (Three-spined Stickleback) color vision is similar to that of Humans (Canolin 1999, 1262).

► **binocular vision** *n.* In some invertebrate and vertebrate species, especially predators: Vision in which visual fields of both eyes overlap enabling more accurate depth perception and distance judgement compared to monocular vision (McFarland 1985, 204; Gould 1982).
cf. stereopsis

► **monocular vision** *n.* In many vertebrate species: Vision in which the visual fields of each eye do not overlap (McFarland 1985, 204).

polarized-light vision *n.* In many arthropod and cephalopod-mollusc species: Vision of plane-polarized light (Land 2008, R348).

circular-polarized-light vision *n.* In some stomatopod crustacean species including *Odontocalanus cultrifer*: Vision of circular-polarized light using specialized ommatidia (Chiou et al. 2008, 429).

Comments: Some stomatopods convert circular-polarized light into plane-polarized light, which they detect by microvilli in their eyes (Land 2008, R348). Some stomatopod species may perceive both left- and right-handed forms of circular-polarized light (Chiou et al. 2008, 434; Land 2008, R348).

◆ **1model** *n.*

1. An object, usually built in miniature and to scale, that represents something to be made or already existing (Michaelis 1963).

syn. scale model (Michaelis 1963)

2. An object that an investigator uses to represent particular stimuli in a behavioral experiment, *e.g.*, a “hawk model,” “goose model,” or “stickleback model” (Tinbergen 1948 and 1951 in Hinde 1970, 60, 66).

◆ **2model** *n.* An artificial, often abstract, representation of specific characteristics of stimuli that is used in studying factors that elicit fixed-action patterns, or other specific behaviors, *e.g.*, an imitation of part of another animal’s body, colored wooden balls or cubes, tape-recorded vocalizations or artificially generated sounds, and artificial scents (Heymer 1977, 31; Dewsbury 1978, 17; Immelmann and Beer 1989, 293).
syn. dummy, stimulus model, surrogate (Immelmann and Beer 1989, 293)

◆ **3model** *n.*

1. A living, or nonliving, agent that emits perceptible stimuli, or signals, in a mimicry system, *q.v.* (Pasteur 1982, 169).
2. An organism that is unpalatable, or noxious, and is imitated in some way(s) by its mimic(s) (Lincoln et al. 1985).

cf. mimicry

natural-stimulus model *n.* A parasitic animal’s imitating another species’ character that has a specific releaser function in the parasite’s host, *e.g.*, the mouth markings of widowbird chicks which are exact copies of those of young of widowbirds’ estrildine-finches hosts (Immelmann and Beer 1989, 293).

predator model *n.* A model that resembles a potential predator of an animal species and is used to study specific stimuli that enable its enemy recognition (Tinbergen 1948 in Heymer 1977, 67).

◆ **4model** *n.*

1. A simple, formal statement of a hypothesis, often expressed mathematically (Bell 1982, 82).
cf. hypothesis; model; mathematical model
2. A mathematical representation of a phenomenon (Lincoln et al. 1985) which may be a tested, or untested, hypothesis.

3. A group of related hypotheses concerning a phenomenon.
See hypothesis.

syn. hypothesis (Futuyma 1998, 591), theoretical model

cf. axiom, concept, hypothesis, law, principle, supposition, ³theory

autocatalysis model *n.* The core of a theory of the origin of human sociality: When the earliest hominids became bipedal as part of their terrestrial adaptation, their hands were freed, their manufacture and handling of artifacts were made easier, and their intelligence grew as part of the improvement of their tool-using habit; this was followed by an expansion of their entire materials-based culture, perfected cooperation during hunting, increased intelligence, still more sophisticated tool use, a shift to big-game hunting, and so forth (Wilson 1975, 567–569).

BIOCLIM v.5.0 *n.* A mathematical climate model that involves 35 climate parameters and can estimate the change in a species range with regard to climate change (Beaumont and Hughes 2002 in New 2009, 112).

Boorman-Levitt model of group selection *n.* A model of group selection that involves marginal populations derived from one large, stable population, and altruist genes that do not influence extinction rates until the marginal populations have reached demographic carrying capacity (Boorman and Levitt 1972, 1973a in Wilson 1973, 1975, 112).

bounded-rationality model of human behavior *n.* A model that examines the psychological limits of humans in complex situations by simplifying complexity and, thus, accounts for their irrational behavior (Simon in Tierney 1983).

cf. ⁴model: classical model of human rationality

Brock-Riffenburgh model *n.* A model that suggests that by clumping into schools, fish are found less often by predators (Wilson 1975, 135).

classical model of human rationality *n.* Human behavior involving application of a consistent set of values (utility function) over a vast array of choices in order to pick the best possible one (Simon in Tierney 1983).

cf. ⁴model: bounded rationality model of human behavior

density-dependent-growth model (DDGM)

n. A mathematical simulation of growth of a population that includes factors that change population growth (Alstad 2005).

Comment: This model is based on $dN_t/dt = r_m N_t (1 - (N_t/K))$ where dN_t = the change in population size of time t , dt = the change in time (such as, in generations), r_m = the theoretical maximum per capita intrinsic rate of population increase, and K = the carrying capacity of the population’s environment (Alstad 2005).

density-independent-growth model (DIGM)

n. A mathematical simulation of growth of a population that includes no density factors that change population growth (Alstad 2005).

Comment: This model is based on $N_t = N_0 e^{rt}$ where N_t = number of individuals in the population at time t , N_0 = number of individuals in the population at time $t = 0$, e = the base of the natural logarithms, r = per capita rate of increase measured as offspring per time interval, and t = time (such as in generations) (Alstad 2005).

deductive-nomological model (D-N model)

n. In the philosophy of science, one's considering a scientific explanation to be a deductive argument in which one deduces the statement describing the to-be-explained event from one, or more, true universal laws in conjunction with statements of particular facts (correspondence rules) (Hempel and Oppenheim 1948 in Mayr 1997, 50).

syn. received view

cf. model: semantic conception of theory structure
Comments: In this model, a scientific theory is an "axiomatic deductive system" whose premises are based on "scientific laws" (Mayr 1997, 50). The original D-N model was very typological and deterministic; researchers soon modified it "to cope with probabilistic, or statistical laws." The D-N model had its heyday in the 1950s and 1960s. The "semantic conception of theory structure" is one of the modifications of the D-N model (Beatty 1991, 1987 in Mayr 1997, 50).

deterministic model *n.* A model in which all relationships are fixed, *i.e.*, not probabilistic, so that a particular input produces one exact prediction of the output (Lincoln et al. 1985).

cf. ⁴model: stochastic model

drive model *n.* For example, in a cichlid fish species: A postulated endogenous aggressive drive, a process in the central nervous system that continuously produces energy of an aggressive nature independently of external stimuli (Lorenz 1950, 1963 in Heymer 1977, 179).

Comment: Plack (1973) and Reyer (1975) (in Heymer 1977, 179) do not support the existence of a drive model.

dual-inheritance model *n.* The hypothesis that the forces that bring about changes in gene frequencies (drift, migration, mutation, natural selection) have analogs within the realm of cultural evolution (inferred from Dugatkin and Godin 1998, 323).

energy model of behavior *n.* Konrad Lorenz's hypothesis to explain the self-exhausting characteristic of fixed-action patterns (FAPs): Each FAP has its own reservoir of "action-specific energy" (ASE), the amount of ASE in its reservoir increases steadily as an animal refrains from displaying the particular FAP, the ASE level is depleted by repeated occurrence of the FAP, and the ease of occurrence of the FAP is related to characteristics of sign stimuli and the level of ASE at a point in time (Dewsbury 1978, 19).

Gadgil-Bossert model *n.* A mathematical model of life-history evolution that indicates when the optimal strategy is to breed iteroparously, or semelparously, and proposes that the reproductive effort in iteroparous species should increase steadily with age (Gadgil and Bossert 1970 in Wilson 1975, 96–98, 563).

gestalt model *n.* A hypothetical system in which a common odor is created by pooling the recognition pheromones of some, or all, of a group of individuals; and conspecifics classify group members as kin, or nonkin, according to the degree to which they possess the group odor (Wilson 1987, 10).

cf. ⁴model: individualistic model

hotspot model *n.* The hypothesis that lekking males clump at places that females visit in greatest numbers (Lill 1976; etc. in Gosling and Petrie 1990, 272).

cf. lek

Comment: Data from *Damaliscus korrigum* (Topi) (Gosling and Petrie 1990, 283) support this model rather than alternative hypotheses regarding lek initiation.

individualistic model *n.* A hypothetical system in which an individual judges other conspecific individuals to be kin, or nonkin, according to whether they possess certain alleles that encode a particular recognition pheromone (Wilson 1987, 11; Hölldobler and Wilson 1990, 639).

cf. ⁴model: gestalt model

instinct model *n.* A theoretical model of instinctive motivation, represented graphically by a diagram that is analogous to a hydraulic system, *e.g.*, Lorenz's hydraulic model and Tinbergen's hierarchical model of behavior (Lorenz 1950 and Tinbergen 1971 in Immelmann and Beer 1989, 152).

Comment: Because arguments against the concept of instinct apply to these models as well, they are of questionable utility (Immelmann and Beer 1989, 152).

island model *n.* "A population divided into many very small demes and affected by genetic drift that restricts genetic variation within individual demes but increases it between them" (Wright 1943 in Wilson 1975, 78).

keystone-predator model *n.* The hypothesis that a keystone predator increases the overall biomass of its prey species because it reduces the numbers of one, or more, less predator-resistant prey species; and this enables one, or more, more predator-resistant species (that are poor resource competitors with the other prey species) to invade an area and increase in abundance(s) (Paine 1966 and other references in Steiner 2001, 2496, whose work supports this hypothesis).

cf. hypothesis: exploitation-ecosystems hypothesis

Lorenz's hydraulic model *n.* Konrad Lorenz's model (somewhat analogous to a flush toilet) relating to action-specific energy (*q.v.*), sign stimuli, and innate releasing mechanisms (Lorenz 1950 in Dewsbury 1978).

syn. cistern model of behavior (Dawkins 1986, 70–72), flush-toilet model, Lorenz's hydraulic model of behavior, Lorenz's hydraulic model of behavior regulation
cf. ⁴model: instinct model

Comment: The utility of this model is questionable (Hinde 1970 in Dewsbury 1978, 20).

Lotka-Volterra-competition model *n.* A set of population-growth equations that calculate the population growth of two species, taking into consideration competitive effects of one species on the other (Molles 2002, 310).

Comments: Volterra (1926) and Lotka (1932) both in Molles (2002, 310) were the initial researchers of model density-dependent growth in the competition between (among) organisms. Volterra (1926) studied competition to develop a theoretical basis for explaining changes in the composition of marine-fish communities in response to reduced human fishing in World War I. Lotka (1932) independently repeated Volterra's analysis and extended it to show changes in the population densities of competing species during their interactions. Laboratory experiments with (1) *Paramecium aurelia* and *P. caudatum*, and (2) *Tribolium castaneum* and *T. confusus* demonstrated predicted outcomes of the Lotka-Volterra-competition model.

[after Vito Volterra and Alfred Lotka, original researchers of the model]

mathematical model *n.* A symbolic representation of a number of hypotheses, or assumptions, about a system in the form of an equation, or set of equations, that is used to describe, or predict, the behavior of a system (Lincoln et al. 1985).

cf. ⁴model

Orians-Verner model of polygyny *n.* For example, in *Agelaius phoeniceus* (Red-winged Blackbirds): A graphical model that suggests why it will be advantageous for some females to join a male's “harem” instead of becoming the sole partner of a male in a poor territory (Verner 1965 and Orians 1969 in Wilson 1975, 328; Davies 1989, 226).

Comment: There are now different versions of this model (Davies 1989, 226).

nearly-neutral model *n.* A mathematical model of how genetic drift and natural selection affect mutations that are slightly deleterious, instead of being strictly neutral (Ohta and Kimura 1971, Ohta 1972, 1977 in Freeman and Herron 2004, 616).

cf. ³theory: neutral theory

Comment: Genetic drift fixes or eliminates such mutations when the selection coefficient(s) $\leq 1/(2N_e)$ (Freeman and Herron 2004, 616).

parametric model *n.* A model that is an equation with one, or more, parameters, *q.v.* (inferred from Colwell and Coddington 1994, 109–111).

probabilistic model See ⁴model: stochastic model.

reflex model of behavior *n.* Animal behavior should be seen as a series of reflexes with an animal's reacting to a series of external stimuli; coordinated behavior is a result of a chain of these reflexes in which performance of the first small step in the movement stimulates an animal's sense organs to activate muscles to produce the next step, etc.; and animals react to environmental stimuli rather than being spontaneously active (Dawkins 1986, 69).

Comment: This view of behavior was modified by Lorenz's work on instinct (Dawkins 1986, 69).

regression model of evolution *n.* Groundwater and other limnic species evolved from populations of marine littoral species stranded by periodic regressions of sea level (Lincoln et al. 1985).

semantic conception of theory structure *n.* In the philosophy of science, a modification of the deductive-nomological model (*q.v.*) that considers a theory to be the definition of a system, and applications of a theory are instantiations of theory (Mayr 1997, 50).

syn. syntactic view

Comment: In the model of semantic conception of theory structure, the theory instantiations may or may not be spatio-temporally restricted. Further, theories are neither general nor permanent (Mayr 1997, 50). Theories are compatible with plural solutions and with research regarding evolutionary change. Difficulties with this model are: it has many different definitions and it's difficult for a working biologist to apply it (Mayr 1997, 51). These difficulties probably stopped biologists in general from using this model.

stationary model See hypothesis: stationary model.

stochastic model, probabilistic model *n.* A model in which a given input produces a range of

possible outcomes due to chance alone (Lincoln et al. 1985).

cf. ⁴model: deterministic model

Tinbergen's hierarchical model (of behavior regulation) *n.* Tinbergen's model designed to account for the structure of behavior over long periods: action-specific energy is not completely specific to individual fixed-action patterns; instincts are organized hierarchically, with the final repository of energy being a higher-level instinctive center; and energy flows downward through various inhibitory blocks through to progressively finer levels of appetitive behavior and consummatory acts and particular muscular activities down to the most indivisible motor units (Tinbergen 1951, 122–127; Dewsberry 1978, 21, 206).

syn. hierarchical model of behavior (Dewsberry 1978, 21, 206)

Comment: The utility of this model is questionable (Dewsberry 1978, 21).

♦ **“model-agreeable-to-dupe mimicry”** See mimicry: “model-agreeable-to-dupe mimicry.”

♦ **modes of evolution** *n. pl.* Phyletic evolution, quantum evolution, and speciation, *q.v.* (Simpson 1944, 197–217 in Gould 1994, 6766).

cf. tempos of evolution

♦ **modification** *n.* An environmentally, or experimentally, induced change in the life of an individual organism (Immelmann and Beer 1989, 188).

♦ **modifier gene** See gene: modifier gene.

♦ **modular society** See ²society: modular society.

♦ **modular unit** *n.* A member of a society (Lincoln et al. 1985).

♦ **modulation** *n.* In telecommunications, “the process whereby some characteristic of a carrier wave is varied in accordance with another wave,” the result of this process (Michaelis 1963).

amplitude modulation *n.* Variation in a signal's intensity, *e.g.*, sound intensity (Immelmann and Beer 1989, 13).

frequency modulation *n.* “Variation of the wavelength of energy transmitted in wave form;” including sound (Immelmann and Beer 1989, 113).

- ♦ **molecular theory of inheritance** See ²theory: molecular theory of inheritance.
- ♦ **molecule** *n.* One, or more, atoms that constitute the smallest part of an element, or compound, that can exist separately without losing its chemical properties (Michaelis 1963).
cf. acid: chemical-releasing stimulus: semiochemical; pheromone; drug; enzyme; ion; mineral; nucleic acid; neurotransmitter; ribozyme
Comment: A few of the thousands of kinds of molecules are below.
[French *molécule* < New Latin *molecula*, diminutive of Latin *moles*, mass]
- accessory pigment** *n.* A molecule that traps light wavelengths to which chlorophyll *a* is not sensitive (Campbell 1996, 542).
- Comments:* Accessory pigments include carotenoids, chlorophyll *b*, *c*, and *d*; phycobilins, and xanthophylls (Campbell 1996, 542-543).
- **chlorophyll *b*** *n.* A form of chlorophyll, $C_{55}H_{70}O_6N_4Mg$ (Michaelis 1963).
syn. chlorophyll-B (Michaelis 1963)
Comment: Chlorophyll *b* occurs in Prochlorophyta, Chlorophyta, and evidently occurred in the common ancestor of chloroplasts, Cyanobacteria, and Prochlorophyta (Tomitani et al. 1999, 161). This chlorophyll is yellow-green (Michaelis 1963) and is an accessory pigment (Campbell 1996, 542).
- **phycobilin** *n.* An accessory pigment (Campbell 1996, 542).
Comment: Phycobilins occur in photosynthetic prokaryotes (Cyanobacteria) and eukaryans (Glaucocystophyta, Rhodophyta), and evidently occurred in the common ancestor of chloroplasts, Cyanobacteria, and Prochlorophyta (Tomitani et al. 1999, 161).
- adenosine phosphate** *n.* One of three molecules in which the nucleotide adenosine is attached through its ribose group to one to three phosphoric acid molecules (King and Stansfield 1985).
See acid, -saccharide.
Comments: The adenosine phosphates are adenosine monophosphate, AMP; adenosine diphosphate, ADP;

and adenosine triphosphate, ATP. These compounds are interconvertible.

- **adenosine monophosphate (AMP)** *n.* An adenosine phosphate with one phosphoric acid molecule (King and Stansfield 1985).

Comment: Cyclic adenosine monophosphate, cAMP, is a chemical messenger within and between cells (Starr and Taggart 1989, 59).

- **adenosine diphosphate (ADP)** *n.* An adenosine phosphate with two phosphoric acid molecules (King and Stansfield 1985).

- **adenosine triphosphate (ATP)** *n.* An adenosine phosphate with three phosphoric acid molecules (King and Stansfield 1985).

Comment: When ATP is hydrolyzed it yields energy that is used to drive a multitude of biological processes including bioluminescence, muscle contraction, and photosynthesis; and biosynthesis of proteins, nucleic acids, polysaccharides, and lipids (King and Stansfield 1985).

aldehyde *n.* An organic compound with a carbonyl group (=CO, *q.v.*) attached to a hydrogen atom; distinguished from ketone (Campbell et al. 1999, 54; D. A. M. Mackay, pers. comm.).

alcohol *n.* An organic compound with a hydroxyl group (-OH, *q.v.*) (Campbell et al. 1999, 54).

alkaloid *n.* A nitrogen-containing organic compound of fungal or plant origin (Lehninger 1982, 969; Omacini et al. 2001, 78).

Comments: Alkaloids are basic and have intense biological activity (Lehninger 1982, 735, 969). Caffeine and theophylline are alkaloids that are present in small amounts in coffee and tea. They inhibit phosphodiesterase and prolong, or intensify, the activity of adrenaline (*q.v.*) by decreasing the rate of breakdown of cyclic AMP.

amine *n.* An organic compound with an amino group (-NH₂, *q.v.*) (Campbell et al. 1999, 54).

anthocyanin, anthocyan *n.* A member of a class of water-soluble pigments that give flowers, leaves, and stems colors ranging from blue through many kinds of reddish colors (Morris 1982, 114).

carbon dioxide (CO₂) *n.* A molecule comprising one carbon atom and two oxygen atoms.

cf. carbon-footprint assessment

Comments: Photosynthetic plants use CO₂ as a carbon source for making other compounds, and many organisms produce CO₂ as a byproduct of respiration. Earth's atmosphere is about 0.04% CO₂. Carbon dioxide is a major greenhouse gas, *q.v.* (Revkin 2000, 3 October, D1). The pre-industrial concentration of CO₂ in the Earth's atmosphere was about 280 parts per million (ppm); the current concentration is 360 ppm; and the predicted concentration in 2050 is 560 ppm (DeLucia et al. 1999, 1177, 1179). Currently, the CO₂ concentration is 30% higher than before the Industrial Revolution (which started in about 1850) and the highest in 420,000 yr (Stevens 2000 27 February, D1).

carboxylic acid *n.* An organic compound with a carboxyl group (-COOH, *q.v.*) (Campbell et al. 1999, 54).

syn. organic acid (Campbell et al. 1999, 54)
carotenoid *n.* A member of a family of lipid-soluble pigments that range in color from yellow through purple and red (King and Stansfield 1985).

Comments: The reddish colors of Caribbean Flamingos, Three-spined Sticklebacks, and some other organisms are from carotenoids in their diets

(Canolin 1999, 263; Pyeatt 2002). For example the Sticklebacks obtain carotenoids from *Cladophora*, a genus of green algae. Some kinds of carotenoids (beta-carotene and xanthophyll) are secondary light-absorbing pigments in photosynthetic organisms (Lehninger 1982, 654). Beta-carotene is a red isoprenoid compound, and xanthophyll is yellow.

Ced proteins See death: apoptosis (comment).

chitin (KIGH tin) *n.* nitrogenous polysaccharide formed primarily of N-acetyl-glucosamine units (Borror et al. 1989, 793).

Comments: Chitin is found in the integuments of arthropods and in some fungi. Chitin increases the flexibility of arthropod integuments, and scleritins (proteins) give integuments rigidity.

chlorofluorocarbon (CFC) *n.* A chemically-inert compound that contains both chlorine and fluorine atoms instead of hydrogen atoms in certain positions (D. A. M. Mackay, pers. comm.).

cf. ozone hole

Comments: Chlorofluorocarbons include CFC-12 (CCl_2F_2) and CFC-21 (CCl_2F) (Allaby 1994). Industry is using them and has used them widely in aerosol propellants, fire extinguishers, foam-plastic manufacturing, packaging materials, refrigerants, and solvents. Chlorofluorocarbons are in emissions from aluminum smelting and the manufacture of semiconductors (Revkin 2000, 3 October, D1). Chlorofluorocarbons are greenhouse gases and provide chlorine which destroys ozone and causes ozone holes. Manufacturers are using other chemicals to replace CFCs (Rensberger 1993, 1 June, A18).

chlorophyll *n.* For example, in Cyanobacteria, most plants, and some protists (Algae, Euglenoids): A nitrogenous molecule, composed of a hydrocarbon tail and porphyrin ring, found in chloroplasts, and essential in carbohydrate production in oxygenic photosynthesis (Michaelis 1963; Campbell 1996, 207, illustration)

Comments: All Algae have chlorophyll *a* and other kinds of chlorophyll used as accessory pigments along with carotenoids, phycobilins, and xanthophylls, depending on the species (Campbell 1996, 542–543).

[Greek *chlóros*, green + *phyllon*, leaf]

► **chlorophyll *a*** *n.* The most abundant form of chlorophyll, $\text{C}_{55}\text{H}_{72}\text{O}_5\text{N}_4\text{Mg}$ (Michaelis 1963).

syn. chlorophyll-A (Michaelis 1963)

Comment: This chlorophyll is blue-green (Michaelis 1963)

► **chlorophyll *b*** See molecule: accessory pigment: chlorophyll *b*.

cis-9,10-octadecenoamide *n.* A fatty acid found in cerebrospinal fluid of sleep-deprived cats (Cravatt et al. 1995, 1506).

Comments: Synthetic cis-9,10-octadecenoamide induces an apparently normal state of sleep in rats after it is injected into them (Cravatt et al. 1995, 1506). This chemical and other fatty-acid primary amides are natural constituents of the cerebrospinal fluid of cats, rats, and Humans.

geosmin *n.* An organic compound (4,8a-dimethyl-decahydronaphthalen-4a-ol, IUPAC name) with a distinctive earthy taste and odor (Johnsen and Bett 1996, 21).

cf. petrichor

Comments: Geosmin causes the earthy taste of *Beta vulgaris* (Beets) which they can produce independently of microorganisms (Lu et al. 2003,

1026), and geosmin contributes to the strong scent that occurs in air when rain falls after a dry spell. Humans are extremely sensitive to the odor of geosmin. Actinobacteria (especially *Streptomyces* spp.) and Cyanobacteria produce geosmin (Tabachek and Yurkowski 1976, 25; Izaguirre et al. 1982, 708; Gust et al. 2003, 1541). Some cyanobacterium species produce geosmin and 2-methylisoborneol which both give water an unpleasant taste. Geosmin causes the muddy smell of bottom-dwelling, freshwater fish such as Carp and some catfish species.

[Greek *geo*, Earth + *osme*, smell]

G-protein *n.* A protein that acts as a switch that is on or off depending on which of two guanine nucleotides is attached, guanosine diphosphate (GDP) or guanosine triphosphate (GTP) (Campbell et al. 1999, 192).

Comments: A G-protein is inactive when GTP binds with it and active when GDP binds with it (Campbell et al. 1999, 192). Bacteria that cause botulism, cholera, pertussis (whooping cough) and other diseases make their victims ill by producing toxins that interfere with G-protein function. Up to 60% of all medicines used today help patients by influencing G-protein pathways.

G-protein-linked-receptor protein *n.* A protein with seven *α*helices that span a cell membrane (Campbell et al. 1999, 193, illustration).

Comment: Many different signal molecules use G-protein linked receptors, including epinephrin and many other hormones, neurotransmitters, and yeast-mating factors (Campbell et al. 1999, 193).

greenhouse gas *n.* A gas that increases the temperature of Earth's lower atmosphere and surface when this gas is present in the atmosphere (Revkin 2000, 3 October, D1).

cf. carbon-footprint assessment effect, greenhouse effect; global warming, treaty: Kyoto Protocol

Comments: Greenhouse gases include carbon dioxide (*q.v.*), halocarbons, methane (*q.v.*), nitrous oxide (*q.v.*), ozone (*q.v.*), sulfates, and sulfur hexafluoride (*q.v.*) (Allaby 1994; Revkin 2000, 3 October, D1). Humans are evidently increasing the amount of greenhouse gases in the atmosphere through burning fuels used in transportation and cooling and heating buildings, using gas and oil for energy production, and other activities. Increase in these gases appears to be increasing the rate of global warming. The concentrations of these gases rose from 315 parts per million in the late 1950s to 360 parts per million in 2000 (Stevens 2000, 27 February, D1).

hemoglobin Brit. **haemoglobin** *n.* A protein molecule composed of a globin (protein part) and a heme (iron-containing part) (Michaelis 1963).

Comments: Hemoglobin, in some form, occurs in many taxa including some bacteria, chironomid flies, cyanobacteria, plants, and yeast; and Vertebrates (Blakeslee 1999, 5 October, D2). In Vertebrates, hemoglobin regulates blood pH, serves as an NO-activated deoxygenase, and transports CO_2 and O_2 (Imai 1999, 437; Minning et al. 1999, 501). About 2 Ga ago, flavohemoglobin helped bacteria detoxify nitric oxide (Blakeslee 1999, 5 October, D2, Imai 1999, 437). Iron in the hemoglobin catalyzed the conversion of nitric oxide in to consumable byproducts. About 1.5 Ga ago, Round Worms (*Achelminthes*) had hemoglobin bound with oxygen that reacted with nitric acid, producing nitrate and water. From about 245 Ma ago

through the present, hemoglobin has carried oxygen from a mammal's lungs to its tissues.

histone *n.* One of several kinds of proteins that are associated with DNA into molecular aggregates (nucleosomes) which seem to differ in function (Mayr 1982, 575); small, DNA-binding proteins, rich in basic amino acids and classified according to their relative amounts of lysine and arginine (King and Stansfield 1985).

hydrocarbon *n.* A molecule that consists of only carbon and hydrogen (Campbell et al. 1999, 51).

Comments: Hydrocarbons are major components of petroleum, but are not prevalent in living organisms (Campbell et al. 1999, 51). However, many biotically made molecules have regions consisting only of carbon and hydrogen, such as the long tails of fat molecules.

ketone *n.* An organic compound with a carbonyl group (=CO, *q.v.*) at a position on its carbon skeleton besides its end, distinguishing it from an aldehyde (Campbell et al. 1999, 54).

leghemoglobin *Brit. leghaemoglobin n.* A hemoglobin (*q.v.*) found in the root nodules of legumes (Imai 1999, 437).

Comments: Leghemoglobin, which has a very high oxygen affinity, keeps the symbiotic nitrogen-fixing bacteria in root nodules aerobic and protects the nitrogen-fixing enzyme system from oxidation (Imai 1999, 437).

ligand *n.* A small molecule that specifically binds with a larger one (Campbell et al. 1999, 192).

Comments: Ligand binding generally causes a receptor protein to undergo a change in shape, which in many receptors directly activates the receptor in a way that it can interact with another cellular molecule (Campbell et al. 1999, 192). In other kinds of receptors, the immediate effect of a ligand mainly causes the aggregation of two, or more, receptor molecules.

lipid *n.* An organic molecule that is variably soluble in an organic solvent such as alcohol and barely soluble in water; *e.g.*, a carotenoid, fat, oil, phospholipid, sterol, or wax (King and Stansfield 1985; Strickberger 1990, 113).

syn. lipide (Michaelis 1963)

[lip(o)- + id(e)]

lucibufagin *n.* One of a group of steroidal pyrones produced by *Photinus* firefly species (Eisner et al. 1997, 9723; Fountain 1999, 27 July, D5).

Comments: Some female *Photuris* fireflies, which do not produce lucibufagins, consume male *Photinus* fireflies which contain lucibufagins. Lucibufagin is a spider-feeding deterrent (Eisner et al. 1077, 9723) and vertebrate-heart stimulant (Fountain 1999, 27 July, D5). This compound kills pet Australian Bearded Dragons which eat fireflies and did not evolve in the same habitat as fireflies.

[coined by Eisner et al. 1978, 905]

luciferin *n.* A molecule, in bioluminescent organisms, that produces cool light when it is oxidized (McDermott 1948, 17).

cf. firefly, glowworm (Appendix 1); enzyme: luciferase.

[named by Raphael DuBois, French physiologist (1886) in McDermott 1948, 17]

methane (CH₄) *n.* A molecule made up of one carbon and four hydrogen atoms; the simplest hydrocarbon (D. A. M. Mackay, pers. comm.).

syn. marsh gas, natural gas

Comment: Methane is a major greenhouse gas, *q.v.*, which originates from coal mining; decomposition of wastes in landfills; digestive processes of Humans, ruminant livestock, and termites; manure decomposition; production of natural gas and oil; rice cultivation; and other phenomena (Revkin 2000, 3 October, D1).

[meth(yl) + ane]

methoprene *n.* A molecule that functions as a juvenile-hormone analog under experimental conditions (Sim and Denlinger 2008, 6781).

methycyclohexanol *n.* An alcohol that smells like the odor of tennis shoes in July (Hall 1998, 32).

murein *n.* A peptidoglycan with chains of sugars cross-linked with short polypeptides, some of which contain D-amino acids (Strickberger 1990, 153).

cf. peptidoglycan

Comment: Murein is found in cell walls of most bacterial species, but not in those of Archaea (Strickberger 1990, 153).

nitric oxide (NO) *n.* A gaseous molecule composed of one nitrogen and one oxygen atom.

Comments: Nitric oxide molecules break apart in about 5 sec after forming (Rensberger 1992, 17 July, A3). In Humans, immune-system cells emit nitric oxide that kill bacteria and cancer cells, and brain cells use nitric oxide to relay impulses to other brain cells. In *Canis familiaris* (Domestic Dogs) and *Rattus norvegicus* (Norway Rats), nitric oxide causes muscles of a penis to relax, resulting in its erection.

nitrous oxide (N₂O) *n.* A molecule comprising two nitrogen atoms and one oxygen atom.

Comments: Nitrous oxide, a greenhouse gas, is about 200 times more efficient than CO₂ in trapping heat radiation in Earth's atmosphere (Suplee 1997, 8 December, A2). This gas comes from emissions from bacteria in the ocean and soil, chemical manufacturing, fossil fuel use, livestock manure, nitrogen fertilizers, nitrogen-fixing crops, waste management and runoff, an unknown atmospheric source, and wastewater treatment (Revkin 2000, 3 October, D1).

N-methyl D-aspartate, NMDA *n.* In vertebrates, a molecule found at the end of dendrites (Lemonick 1999, 13 September, 57).

Comment: NMDA functions in learning and memory formation (Lemonick 1999, 13 September, 57).

nucleic acid See nucleic acid.

octanol *n.* An alcohol that smells like licorice (Hall 1998, 32).

organic phosphate *n.* An organic compound with an attached phosphate group such as H₃PO₄ (Campbell et al. 1999, 54).

ozone (O₃) *n.* A molecule composed of three oxygen molecules (Strickberger 2000, 170).

cf. ozone hole

Comments: Ozone, that in the stratosphere 15 through 50 km (9–31 mi) above the ground, protects Earth's life from damage from ultraviolet light (Strickberger 2000, 170), and ozone is also a greenhouse gas (Revkin 2000, 3 October, D1). Ozone that forms near the ground due to pollution is deleterious to life.

peptidoglycan *n.* A compound in bacterial cell walls made up of polymers of modified sugars cross-linked by short polypeptides that vary from species to species (Campbell 1990, 524).

cf. molecule: murein

polar molecule *n.* A molecule, *e.g.*, water, that has opposite charges at its opposite ends (Campbell et al. 1999, 37).

Comment: Water's anomalous properties arise from attractions among its polar molecules (Campbell et al. 1999, 38, illustration).

polycyclic aromatic hydrocarbon (PAH) *n.*

A molecule comprising hexagons of carbon and hydrogen atoms linked in various arrangements (Zimmer 1995, November, 76).

Comments: Polycyclic aromatic hydrocarbons occur in some meteorites, giving them the scent of outer space, a smell like a musty attic (Zimmer 1995, November, 76). A PAH exposed to light can give off an electron, and PAHs might have supplied energy for early cells.

polypeptide *n.* A molecule that is composed of two, or more, amino acids linked together by chemical bonds; a polymer of amino acids (Michaelis 1963).

Comment: A dipeptide is a polypeptide made up of two linked amino acids.

porphyrin *n.* An organic molecule in which four pyrrole nuclei are connected in a ring structure that is usually associated with metals, *e.g.*, iron or magnesium (King and Stansfield 1985).

syn. porphyrin ring (Strickberger 1990, 112)

Comments: Porphyrins form parts of chlorophyll, cytochrome, and hemoglobin molecules.

protein *n.* A molecule composed of one, or more, polypeptide chains twisted, wound, and folded upon itself forming a macromolecule with a definite 3-dimensional shape (= conformation) (Curtis 1983, 78). *cf.* Molecular Modeling Database (Appendix 4); molecule: proteinoid

Comment: A protein's amino-acid sequence and three-dimensional structure determine the protein's specific function(s) in organisms (National Academy of Sciences and Institute of Medicine 2008, 4). Heterotrophs obtain proteins from autotrophs.

[German < Greek *protos*, primary < *proto*, first; so called because proteins are a main constituent of living matter]

► **homeodomain protein** *n.* A protein that possesses a homeodomain, *q.v.* (Dye 2002, 73).

► **Hox proteins** *n.* A group of homeodomain proteins that have a special role in controlling antero-posterior patterns in animals (Dye 2002, 76).

► **nucleoporin (Nup)** *n.* One of a group of proteins that make up the nuclear-pore complex that regulates the traffic of proteins and nucleic acids into and out of a cell's nucleus (Lackie and Dow 1999).

syn. nuclear-pore protein (Presgraves et al. 2003, 716)

Comments: Many nucleoporins contain N-acetyl-glucosamine residues (Lackie and Dow 1999). Nup96 is a nucleoporin in *Drosophila* (Presgraves et al. 2003, 716). Differences in Nup96 in *Drosophila melanogaster* and *D. simulans*, cause inviability of male hybrids of these two species.

proteinoid, thermal protein *n.* A synthetic polymer, from 4,000 through 10,000 daltons in molecular weight, of amino acids linked together by peptide and other bonds [named by Fox and his colleagues in Strickberger 1990, 115]. *cf.* molecule: protein

Comments: Strickberger (1990, 115–116; 1996, 124, 610) lists traits of proteins and proteinoids. Some proteinoids show protein-like properties such as enzyme activity, color-test reactions, hormonal activity, and nonrandom amino-acid sequences. Researchers make proteinoids by heating dry mixtures of amino acids.

pyrophosphate *n.* A molecule formed from two orthophosphate molecules, containing a high-energy phosphate bond (Strickberger 1990, 114).

-**saccharide** *comb. form* A sugar.

► **disaccharide** *n.* A compound formed by the combination of two monosaccharide units, *e.g.*, maltose (Strickberger 1990, 113).

► **monosaccharide** *n.* A simple sugar, *e.g.*, fructose or glucose, that cannot be decomposed by hydrolysis into simpler sugars (Michaelis 1963; D. A. M. Mackay, pers. comm.).

► **polysaccharide** *n.* A carbohydrate formed by the combination of more than two monosaccharide units; *e.g.*, starch, cellulose, and glycogen (King and Stansfield 1985).

sterane *n.* A reduced breakdown product of a sterol and which generally occurs in eukaryotic cells (Gerhart and Kirschner 1997, 11).

cf. Protista: acritarch (Appendix 1)

Comments: Ancient sterane molecules in the Pilbara Craton, Australia, suggest that eukaryans lived there about 2.7 Ga ago (Brocks et al. 1999). An abundance of other steroid components, particularly sterenes and sterones, in organic matter in sedimentary sequences deposited during the early Aptian Oceanic Anoxic Event suggests that the organic matter includes major contributions from eukaryotic sources (Dumitrescu and Brassell 2005, 1002).

steroid *n.* A lipid that has a carbon skeleton composed of four fused rings (Campbell and Reece 2005, 77, illustration).

cf. hormone: steroid hormone

Comments: Different steroids have different functional groups attached to their rings (Campbell and Reece 2005, 77). The steroid cholesterol is a common component of animal cell membranes and a precursor of other steroids synthesized by organisms, including vertebrate sex hormones.

sulfur hexafluoride (SF₆) *n.* A molecule composed of one sulfur and six fluorine atoms.

Comment: Sulfur hexafluoride is a minor greenhouse gas (*q.v.*) which comes from electrical equipment insulation, magnesium production, and medical devices such as asthma inhalers (Revkin 2000, 3 October, D1).

tannic acid *n.* A lustrous, yellowish through light brown, amorphous, powdered, flaked, or spongy mass composed of C, H, and O derived from bark, fruit, and leaves of many plants (Morris 1982, 1242).

thiol *n.* An organic compound with a sulphydryl group (–SH), *q.v.* (Campbell et al. 1999, 54).

volicitin *n.* A caterpillar regurgitant ([N-(17-hydroxylinolenoyl)-L-glutamine]) which is an important elicitor of induced plant volatiles as a result of herbivory (Moraes and Mescher 2004, 8995).

Comment: The plant volatiles attract parasitic wasps of caterpillars of some species (Moraes and Mescher 2004, 8995).

water (H₂O) *n.* A molecule composed of two hydrogen atoms and one oxygen atom.

Comments: Water is essential to all known life on Earth (Campbell et al. 1999, 37; Sawyer 1999, 27 August, A1). Extraterrestrial microscopic bubbles of water locked inside halite crystals in two meteorites is evidently about 4.5 Ga old. One of the meteorites fell in Monahans, TX, and the other fell in Morocco in 1998.

♦ **molluscivore** See *vore: molluscivore*.

♦ **MOLPHY** See *program: MOLPHY*.

♦ **molt** *Brit. moult* *n.*

1. Part (feather, antler, skin) of an animal that it casts off in preparation for its replacement by new growth (Michaelis 1963).
2. In Arthropods: An animal's castoff skin, comprising many integumental plates and membranes, that results from molting (Wilson 1975, 589).
syn. *exuviae* (preferred), *exuvium* (not preferred)
Note: An exuvium is usually considered to be one of these plates.
3. *v.t.* To produce a molt (Michaelis 1963).
syn. *ecdysē* (Michaelis 1963)
cf. *ecdysis*

♦ **fright molt** *n.* In some bird species: An individual's losing part, or all, of its feathers during severe distress and restraint (Dathe 1955 and Dementiev 1958 in Heymer 1977, 158).

♦ **molting** *Brit. moltinism* See *-morphism: polymorphism: molting*.

♦ **momentary behavior** See *behavioral event*.

♦ **monacmic** See *-acmic: monacmic*.

♦ **monkey-see-monkey-do behavior** See *learning: social-imitative learning*.

♦ **monadadaptive** *adj.* Referring to a character that possesses only one function (Wilson 1975, 22).

♦ **monandry** See *mating system: monogamy: monandry*.

♦ **Monarch Butterfly Biosphere Reserve** See *place: Monarch Butterfly Biosphere Reserve*.

♦ **monarchistic dominance, monarchy** See *dominance (social): monarchistic dominance*.

♦ **monarsenous** See *mating system: polygamous*.

♦ **monaxenic** See *-xenic: monaxenic*.

♦ **monecious, monoecious** See *-oecism: monoecism*.

♦ **monestric species, monoestric species** See ²*species: monestric species*.

♦ **monestrous, monestrus** See *estrus: monestrus*.

♦ **monistic evolution, theory of** See ²*theory: monistic evolution, theory of*.

♦ **mono-, mon-** *comb. f.* "Single; one" (Michaelis 1963).
[Greek < *monos*, single, one, alone]

♦ **monochronic** See *-chronic: monochronic*.

♦ **monoclimax** See *climax: monoclimax*.

♦ **monoclinous flower** See *hermaphrodite*.

♦ **monocular vision** See *modality: vision: monocular vision*.

♦ **monocyclic** See *cyclic: monocyclic*.

♦ **monocyclic parthenogenesis** See *parthenogenesis: monocyclic parthenogenesis*.

♦ **monodomic, monodomous** See *-domous: monodomic*.

♦ **monoecism** See *-oecism: monoecism*.

♦ **monofactorial** See *-genic: monogenic*.

♦ **monogamous** See *-gamous: monogamous*.

♦ **monogamy** See *mating system: monogamy*.

♦ **monogenesis** See *parthenogenesis: asexual reproduction*.

♦ **monogenetic** See *-genetic: monogenetic*.

♦ **monogenetic marker** See *marker: single-gene marker*.

♦ **monogenetic parasite** See *parasite: monogenetic parasite*.
See *-genic: monogenic*.

♦ **monogenic** See *-genic: monogenic*.

♦ **monogenous** See *-genous: monogenous*.

♦ **monogony** See *parthenogenesis: asexual reproduction*.

♦ **monogynopaedium** See *-paedium: monogynopaedium*.

♦ **monogyny** See *mating system: monogyny*.

♦ **monozygous cross** See *cross: monozygous cross*.

♦ **monolectic** See *-lectic: monolectic*.

♦ **monolepsis** *n.* The condition in which only one parent's characters are transmitted to its progeny (Lincoln et al. 1985).

♦ **monometrosis** See *-metrosis: haplotrosis*.

♦ **monomorphic** See *-morphic: monomorphic*.

♦ **monomorphism** See *-morphism: monomorphism*.

♦ **monomorphous life cycle** See *life cycle: monomorphous life cycle*.

♦ **monophage** See *-phage: monophage*.

♦ **monophage-oligophage-polypage continuum** *n.* A spectrum of how many and what kinds of food that a species consumes (May and Ahmad 1983).
cf. *-lectic*
Comment: For example regarding insects, researchers do not agree as to what constitutes a "monophage," "oligophage," or "polypage;" and these terms and their subdivisions have been defined differently for different insect taxa (May and Ahmad 1983).

♦ **monophasic allometry** See *-auxesis: heterauxesis: monophasic allometry*.

♦ **monophenic population** See ¹*population: monophenic population*.

♦ **monopheny** *n.* The occurrence of only one phenotype in a population (Lincoln et al. 1985).

♦ **monophile** See ²*-phile: monophile*.

♦ **monophyletic** See *phyletic: monophyletic*.

♦ **monophyletic group** See ²*group: monophyletic group*.

♦ **monophylistic** *adj.* Referring to phylogenetic relationships between taxa based on both monophyly and genotypic similarity (Lincoln et al. 1985).
n. *monophylist*

♦ **monophyly** See ²*group: monophyletic group*.

♦ **monoplanetic** See *-planetic: monoplanetic*.

♦ **monoploid** See *-ploid: monoploidy*.

♦ **monosaccharide** See *-saccharide: monosaccharide*.

♦ **monosomic** *n.* An individual organism (aneuploid) that is missing an autosome from its chromosome set (Mayr 1982, 759).
syn. *monosomy, monosome* (Lincoln et al. 1985)
adj. *monosomal*

♦ **monospermy** See *sperm: monospermy*.

♦ **monothelious mating system** See *mating system: polyandrous mating system*.

♦ **monotokous, monotoky** See *-toky: monotoky*.

♦ **monoton plankton** See *plankton: monoton plankton*.

♦ **monosexual** See *sexual: monosexual*.

♦ **monosynaptic reflex** See *reflex: monosynaptic reflex*.

- ◆ **monotroph** See -phage: monophage.
- ◆ **monotrophic** See -phagous: monotrophic.
- ◆ **monotypic** See -typic: monotypic.
- ◆ **monotypic evolution** See ²evolution: monotypic evolution.
- ◆ **monotypic species** See ²species: monotypic species.
- ◆ **monovoltine** See voltine: monovoltine.
- ◆ **monovular** See -ovular: monovular.
- ◆ **monoxenous** See -xeny: monoxeny.
- ◆ **monoxyyny** See -xeny: monoxyyny.
- ◆ **monozygotic** See -zygotic: monozygotic.
- ◆ **monstrosity** *n.* Any abnormal, malformed, or markedly aberrant individual of a species (Lincoln et al. 1985).
cf. mutation
- ◆ **monticole** See -cole.
- ◆ **MOO** See program: MOO.
- ◆ **mood** *n.* An animal's preliminary state of change, or readiness, for action, necessary for the performance of an instinctive behavior (Lincoln et al. 1985).
- ◆ **mood induction** See behavior: allelomimetic behavior.
- ◆ **moon illusion** See illusion: moon illusion.
- ◆ **mooning** See display: buttocks display.
- ◆ **moral** *adj.* Referring to an act by which a person hurts himself but helps another person(s) (Alexander 1987, 12).
Comment: "Moral" and "immoral" are difficult to define precisely (Alexander 1987, 12).
- ◆ **immoral** *adj.* Referring to an act by which a person helps himself, but hurts another person(s) (Alexander 1987, 12).
cf. moral
- ◆ **moral philosophy** See study of: philosophy: moral philosophy.

- ◆ **moralistic aggression** See aggression: moralistic aggression.
- ◆ **morality** See ¹system: moral system.
- ◆ **morass** See habitat: bog.
- ◆ **mores, mune** See ²group: mores.
- ◆ **Morgan school** *n.* A group of geneticists led by T.H. Morgan that started dominating genetics in 1910 and was occupied primarily with pure genetic problems such as the nature of genes and their arrangements on chromosomes (Mayr 1982, 732).
- ◆ **Morgan's canon** *n.*
 1. "In no case may we interpret an action as the outcome of the exercise of a higher physical faculty, if it can be interpreted as the outcome of the exercise of one which stands lower in the psychological scale" (Morgan 1894); that is, one should interpret data using the most parsimonious explanation (Dewsbury 1978, 10).
 2. "Behavior patterns of an animal should not be described in terms of anthropomorphic or higher psychic activity such as love, gentleness, deceit, and so forth, but instead interpreted exclusively by the simplest mechanisms known to work" (Wilson 1975, 30).

syn. law of parsimony, (Lloyd) Morgan's canon (Dewsbury 1978, 10)
See law: law of parsimony
cf. Ockham's razor
Comments: This canon went too far in simplifying explanations of behavior. Other behaviorists rationally argued that one should explain behavioral mechanisms

as correctly, not as simply, as possible (Wilson 1975, 30). Bateson (1991, 836) remarks that "slavish obedience to such a maxim ... tends to sterilize imagination."

[after C. Lloyd Morgan, animal behaviorist]

- ◆ **moribund** *adj.* Referring to an organism in the state of dying or being close to death (Lincoln et al. 1985).
n. moribundity
adv. moribundly
[Latin *moribundus* < *mori*, to die]
- ◆ **-morph-, -omorphic, -morphy** *comb. f.* Having the form, or shape, of (Michaelis 1963).
[Greek *morphe*, form]
- ◆ **-morph** *cf.* morphic
antimorph See gene: antimorph.
- ◆ **apomorph, apomorphy, autapomorph, nonhomologous apomorph, pseudoapomorph** See character: apomorph.
- ◆ **ergatandromorph, ergatomorphic male, ergatoid male** See caste: ergatandromorph.
- ◆ **genomorph** *n.* A polyphyletic taxon of generic, or subgeneric, rank that contains a group of superficially similar, but not closely related species (Lincoln et al. 1985).
See ²species: genomorph
- ◆ **gynandromorph, gynander, mosaic, sex mosaic** *n.* For example, in some insect species and Humans: An individual that is a sexual mosaic with genotypic and phenotypic male and female parts, e.g., sexual organs (Lincoln et al. 1985).
n. gynandromorphism
- ◆ **bilateral gynandromorph** *n.* In some butterfly and moth species: The most common kind of gynandromorph which is female on one side of its body and male on the other side (Lincoln et al. 1985; Sbordoni and Forestiero 1985, 44–45).
- ◆ **homeomorph** See -morph: homeomorphy.
- ◆ **hygromorph** *n.* An organism that is structurally adapted for life in a moist habitat (given as an adjective in Lincoln et al. 1985).
- ◆ **hypermorph** See allele: hypermorphic allele.
- ◆ **hypomorph** See allele: hypomorphic allele.
- ◆ **paedomorph** *n.* An individual, or taxon, that retains juvenile characters of ancestral forms in its adults or later ontogenetic stages of their descendants (inferred from Eldredge and Gould 1972, 101 and Gould 1977, 227, 484).
cf. ²heterochrony: paedomorphosis
[New Latin < Greek *pais*, *paidos*, child + *morphe*, form]
- ◆ **paramorph** *n.* Any phenotypic variant that lacks accurate definition (Lincoln et al. 1985).
- ◆ **pleiomorph** See -morphic: pleiomorphic.
- ◆ **plesiomorph, plesiomorphy** See character: plesiomorph.
- ◆ **polymorph** *n.* One of the two, or more, forms (morphs) of a polymorphic species (Lincoln et al. 1985).
- ◆ **pseudoapomorph** See character: apomorph: nonhomologous apomorph.
- ◆ **stasimorph, stasimorphy** See character: stasimorphic character.
- ◆ **synapomorph, homologous synapomorph** See character: synapomorph.
- ◆ **morph** *n.*

1. An individual of a polymorphic group (Lincoln et al. 1985).
 2. Any phenotypic, or genetic, variant (Lincoln et al. 1985).
 3. Any local population of a polymorphic species exhibiting distinctive morphology or behavior (Lincoln et al. 1985).
- syn.* form
adj. morph (Lincoln et al. 1985)
cf. character, -morphe
- ♦ **-morphic** *cf.* -morph
- apomorphic** *adj.* Referring to an apomorphic character, *q.v.*
- andromorphic** *adj.* Referring to a character that morphologically resembles a male (Lincoln et al. 1985).
- n.* andromorphy
cf. -morphic: gynomorphic
- caenomorphic** See -morphism: caenomorphism.
- dimorphic** *adj.* Referring to dimorphism, *q.v.*
- ergatomorphic, ergatoid** *adj.* Referring to a worker of a social insect species (Lincoln et al. 1985).
- gynomorphic** *adj.* Referring to a character that morphologically resembles a female (Lincoln et al. 1985).
- n.* gynomorphy
cf. -morphic: andromorphic
- heteromorphic, heteromorphous** *adj.*
 1. Referring to an organism that has different forms at different times or stages of its life cycle (Lincoln et al. 1985).
 2. Referring to a plant species that has an alternation of vegetatively dissimilar generations (Lincoln et al. 1985).
- homeomorphic** See morphy: homeomorphy.
- hydromorphic** *adj.* Referring to an organism that is adapted for aquatic life (Lincoln et al. 1985).
- matromorphic** *adj.* An organism's resembling its female parent (Lincoln et al. 1985).
cf. -morphic: patromorphic
- monomorphic** *adj.*
 1. Referring to monomorphism, *q.v.*
 2. Referring to a population with respect to a particular allele that is present in all of its members (Lincoln et al. 1985).
- patromorphic** *adj.* Referring to an organism's resembling its male parent (Lincoln et al. 1985).
cf. -morphic: matromorphic
- pleomorphic, pleiomorphic** *adj.*
 1. Referring to a species, or group, that assumes different shapes or forms (Lincoln et al. 1985).
 2. Referring to an organism that assumes different shapes, or forms, during its life cycle (Lincoln et al. 1985).

n. pleomorph, pleomorphism
adj. pleomorphous

polymorphic *adj.* Referring to polymorphism, *q.v.*

protomorphic See primitive.

stasimorphic *adj.*
 1. Referring to a deviant form that arose as a result of arrested development (Lincoln et al. 1985).
 2. Referring to a stasimorphic character, *q.v.* (Lincoln et al. 1985).

cf. -morphic: apomorphic

stenomorphic *adj.* Referring to an organism that is small due to its cramped habitat conditions (Lincoln et al. 1985).

zoomorphic *adj.*

1. Pertaining to, or produced by, animal activities (Lincoln et al. 1985).

syn. zoomorphosis (Lincoln et al. 1985)

2. "Having the form of an animal" (Lincoln et al. 1985).

cf. zoogenic, -morphism: zoomorphism

♦ **-morphism** *cf.* -morph

anthropomorphism *n.*

1. A person's attributing human form and attributes to the Deity (Oxford English Dictionary 1972, entries from 1753).

2. A person's attributing human characteristics to nonhuman organisms, deities, or inanimate objects (Oxford English Dictionary 1972, entry from 1858; Michaelis 1963).

Note: These characteristics include human behaviors, emotions, and motivations (Morris 1982).

syn. humanization (Lincoln et al. 1985)

v.i. anthropomorphize

cf. Morgan's canon; -morphism: zoomorphism; zoocentric

Comment: Technical scientific communication should avoid anthropomorphism (def. 2), teleological constructions, and zoomorphism.

[Greek *anthrōmorphos* < *anthrōs*, man + *morphe*, form, shape]

balanced-genetic polymorphism See -morphism: polymorphism: balanced polymorphism: balanced-genetic polymorphism.

► **behavioral polymorphism** See polyethism.

caenomorphism *n.* A living organism's change from a complex to a simpler form (Lincoln et al. 1985).

adj. caenomorphic

dimorphism *n.*

1. The presence of two forms of an allele, or trait (e.g., physical structure or behavior), in a group of conspecific animals; e.g., in some ant species, two different forms' existing in the same colony "including two size classes, not connected by intermediates" (Wilson 1975, 582) or oak-catkin and oak-twigs mimics in larvae of the same moth species (Greene 1989, 643).

2. A taxon's having two morphs or marked sexual dimorphism (Lincoln et al. 1985).

See character: dimorphism.

syn. ditypism

adj. ditypic

cf. -morphism: polymorphism

Comment: "Dimorphism" can be classified into many of the same categories as is "polymorphism," age dimorphism, balanced dimorphism, etc.

[Greek *dimorphos* < *di-*, two + *morphe*, form]

► **age dimorphism** *n.* Dimorphism with regard to age (Immelmann and Beer 1989, 8).

cf. -morphism: polymorphism: age polymorphism

► **chromosomal dimorphism** *n.* Dimorphism with regard to chromosome type, or structure, e.g., in sex chromosomes (Lincoln et al. 1985).

► **horiodimorphism, horodimorphism** *n.* An organism's showing a seasonal, or periodic, alternation of form (Lincoln et al. 1985).

cf. cyclic: monocyclic

► **sexual dimorphism** *n.* Dimorphism in appearance (size, shape, coloration), physiology, and behavior, with regard to sex beyond the basic functional portions of a species' sex organs (= primary sex characteristics) (Wilson 1975, 334, 595; Immelmann and Beer 1989, 267).

syn. antigeny (Lincoln et al. 1985)

adj. sexually dimorphic

cf. sex dichromatism

ditypism See -morphism: dimorphism.

gynandromorphism *n.* The occurrence of male and female characteristics (*e.g.*, sexual organs) in the same individual (Michaelis 1963; Wilson 1975, 585). *syn.* gynandromism (Lincoln et al. 1985)

n. gynander, gynandromorph

cf. parthenogenesis: androgynous; -morph: gynandromorph

[Greek of doubtful sex <*gynē*, woman + *anē, andros*, man]

horiodimorphism See -morphism: dimorphism: horiodimorphism.

monomorphism *n.*

1. In many social-insect species: The existence of only one worker subcaste (Wilson 1975, 589).

cf. -morphism: polymorphism

2. A population's, or taxon's, having no genetically fixed discontinuous variation, and, thus, comprising a single morph (Lincoln et al. 1985).

3. A species' having no differences in appearance between its sexes, no division into castes, or no behavioral-role segregation (Immelmann and Beer 1989, 189).

cf. -morph: dimorphism, polymorphism

polymorphism *n.* The co-occurrence of more than two different forms of an allele, or trait (*e.g.*, structure or behavior), in a group of conspecific organisms (West-Eberhard 1989, 251), *e.g.*, a spectrum of worker sizes in some ant species (Smith 1965, 3) or different color patterns in a garter-snake species (Brodie 1990, 45).

syn. morphism (Lincoln et al. 1985)

cf. -morph: dimorphism, genetic polymorphism, monomorphism

Comment: Some investigators consider the presence of only two different forms of a trait to constitute "polymorphism;" thus, they make "dimorphism" a subtype of "polymorphism."

► **age polymorphism** *n.* Polymorphism with regard to distinct developmental stages (Immelmann and Beer 1989, 8).

cf. -morph: dimorphism: age dimorphism

► **balanced polymorphism, balanced-genetic polymorphism** *n.*

1. Polymorphism in which alleles on the same locus coexist at high frequencies during natural selection for both of them; balanced polymorphism involves heterozygote superiority, frequency-dependent selection, disruptive selection, a spatially heterogeneous environment with migration, cyclical selection, and counteracting selection at different levels (Wilson 1975, 71).

cf. mimetic polymorphism

2. Polymorphism in which genetically distinct forms are more, or less, permanent components of their population, maintained by selection in favor of diversity (Lincoln et al. 1985).

► **behavioral polymorphism** See polyethism.

► **chromosomal polymorphism** *n.* Polymorphism with regard to chromosome types, or structure, *e.g.*, chromosome inversions (Lincoln et al. 1985).

► **cryptic polymorphism** *n.* Genetic polymorphism that is controlled by a recessive gene, such that the different gene forms are not phenotypically distinguishable (Lincoln et al. 1985).

► **genetic polymorphism, polymorphism** *n.* Co-occurrence of more than two alleles at the same locus in a population at frequencies that cannot be accounted by recurrent mutation alone (Lincoln et al. 1985).

► **inversion polymorphism** *n.* "Polymorphism in chromosomes of both inverted and uninverted forms within a population at frequencies higher than could be maintained by chromosome breakage alone" (Wittenberger 1981, 617).

► **mimetic polymorphism** See mimicry: mimetic polymorphism.

► **molting** *Brit. moultinism* *n.* Polymorphism in which different strains of a species have a different number of larval stages (Lincoln et al. 1985).

► **parallel polymorphism** See morphism: tautomorphism.

► **phenotypic polymorphism** *n.* Polymorphism with regard to phenotypes in a population (Lincoln et al. 1985).

syn. nongenetic polymorphism (Immelmann and Beer 1989, 227)

Comment: Phenotypic polymorphism differs from other forms of intraspecific variability in that discontinuities separate the different forms; there are no intermediate forms (Immelmann and Beer 1989, 227).

pleiomorphism, pleomorphism *n.* Polymorphism at different stages in an animal's life cycle (Lincoln et al. 1985).

► **pseudoseasonal polymorphism** *n.* Plants' having phenotype polymorphism according to time of year at which they germinate and flower, that is caused by local fluctuations in temperature, season durations, and other climatic factors (Lincoln et al. 1985).

► **restriction-fragment-length polymorphisms (RFLPs)** *(RIF lips)* *n.* Polymorphisms in a noncoding DNA sequence on homologous chromosomes that result in different restriction-length fragments (Campbell et al. 1999, 373).

cf. enzyme: restriction enzyme

Comment: Researchers use RFLPs as makers of variants in a population (Campbell et al. 1999, 373).

► **single-nucleotide polymorphism (SNP)** *(SNIP)* *n.* A point mutation that can produce a particular phenotype and can be a contributory factor in a human disease (Lee and Lee 2000, 172).

cf. method: matrix-assisted-laser-desorption-ionization mass spectroscopy

Comment: SNPs can cause major changes in mRNA structure folds, which might affect cell regulation (Lee and Lee 2000, 172).

► **transient polymorphism** *n.*

1. Two alleles' (on the same locus) coexisting at high frequencies during the long time that it takes one to replace the other by natural selection (Wilson 1975, 71).

2. Genetic polymorphism that occurs while one form is in the process of replacing another due to natural selection (Lincoln et al. 1985).

- protomorphic** *adj.* “Primordial; primitive; original” (Lincoln et al. 1985).
- tautomorphism** *n.* Superficial resemblance of morphs belonging to two, or more, different polymorphic species (Lincoln et al. 1985).
- n.* tautomorph
- zoomorphism** *n.* A person’s attributing characteristics of nonhuman animals to Humans, especially aspects of social life that are ascribed more to human biological constraints and imperatives than to ethical, or rational, considerations (Immelmann and Beer 1989, 331).
- v.t.* zoomorphize
- cf.* -genic: zoogenic, -morphic: zoomorphic, -morphism: anthropomorphism, teleological
- Comment:* Technical scientific communication should avoid anthropomorphism (def. 2), teleological constructions, and zoomorphism.
- ♦ **morphism** See -morphism: polymorphism.
- ♦ **morphocline** See cline: morphocline.
- ♦ **morphogen** See hypothesis: gradient hypothesis.
- ♦ **morphogenesis** See -genesis: morphogenesis.
- ♦ **morphogenetic** See -genetic: morphogenetic.
- ♦ **morphogeny** See -genesis: morphogenesis.
- ♦ **morphological character** See character: morphological character.
- ♦ **morphological quantitative-trait locus, morphological QTL** See gene locus: morphological quantitative-trait locus, morphological QTL.
- ♦ **morphological species concept** See ²species.
- ♦ **morphological support** *n.* An animal’s physical feature that is used in its behavioral display; *e.g.*, the head crests of cockatoos, large tails of male Peacocks, reddish breasts of *Turdus migratorius* (American Robins), swollen buttocks of receptive female monkeys of many species, and wing eyespots of many moth species (Immelmann and Beer 1989, 189).
- ♦ **morphological transformation series** See cline: morphocline.
- ♦ **morphology** *n.* An organism’s form and structure, especially its external features (Lincoln et al. 1985). See study of: morphology.
- cf.* -morph
- adj.* morphologic, morphological
- endomorphology** *n.* An organism’s internal morphology; anatomy; contrasted with exomorphology (Lincoln et al. 1985).
- exomorphology** *n.* An organism’s external morphology; contrasted with endomorphology (Lincoln et al. 1985).
- functional morphology** *n.* One’s interpretation of the function of an organism, or organ system, by reference to its shape, form, and structure (Lincoln et al. 1985).
- idealistic morphology** *n.* The explanation of form as a product of an underlying essence or archetype (Mayr 1982, 455).
- macromorphology** *n.* “Gross external morphology;” contrasted with micromorphology (Lincoln et al. 1985).
- micromorphology** *n.* Microscopic surface topography, or structure, typically studied with a scanning electron microscope; contrasted with macromorphology (Lincoln et al. 1985).
- phylogenetic morphology** *n.* “The derivation of form from that of a common ancestor or quite often the tracing back of form to that of the reconstructed common ancestor” (Mayr 1982, 455).

- ♦ **morphology of growth** See study of: morphology: morphology of growth.
- ♦ **morphometrics** See -metry: morphometrics.
- ♦ **morphon, morphone** *n., pl.* **morphontes** (badly formed, Oxford English Dictionary 1972).
1. “A morphological individual, element, or factor” (Oxford English Dictionary 1972, entries from 1873). [coined by E. Haeckel]
 2. “A definitively formed individual” (Lincoln et al. 1985).
- ♦ **morphont** See individual: morphont.
- ♦ **morphosis** *n.*
1. The manner, or order, of development of a plant or plant organ (Oxford English Dictionary 1972, entries from 1857).
 2. A animal’s morbid formation; an organic disease (Oxford English Dictionary 1972, entry from 1891).
 3. Variation in an individual’s morphogenesis caused by environmental changes (Lincoln et al. 1985). *cf.* metamorphosis
- ♦ **-morphosis** *adj.* -morphic.
- allomorphosis** See ²evolution: allomorphosis.
- aromorphosis** See ²evolution: aromorphosis.
- cyclomorphosis, cyclogeny** *n.* Cyclical changes in form, *e.g.*, an organism’s seasonal change in morphology (Lincoln et al. 1985).
- epimorphosis** *n.*
1. In some arthropod species: Development in which all larval forms are suppressed, or passed within an egg prior to hatching, and the juvenile hatches with adult morphology (Lincoln et al. 1985).
 2. An organism’s regeneration of a structure (Lincoln et al. 1985).
- See reproduction (def. 1, *note*).
- gerontomorphosis** *n.* Evolutionary change that results from adaptations and modifications of adult structures (Lincoln et al. 1985).
- heteromorphosis, xenomorphosis** *n.* An organism part’s being replaced by a structurally different replacement part following injury (Lincoln et al. 1985).
- holomorphosis** *n.* An organism’s regrowth of an entire part that was previously lost (Lincoln et al. 1985).
- hydromorphosis** *n.* Structural modification of an organism in response to water or wet habitat conditions (Lincoln et al. 1985).
- hypermorphosis** See ²heterochrony: hypermorphosis.
- meromorphosis** *n.* An organism’s partial regeneration of its lost part (Lincoln et al. 1985).
- neomorphosis** *n.* The regeneration of a structure that differs morphologically from the original structure (Lincoln et al. 1985).
- paedomorphosis** See ²heterochrony: paedomorphosis.
- peramorphosis** *n.* The morphological consequence of hypermorphosis that results in a more exaggerated shape of an evolutionary descendent compared to its evolutionary ancestor (Alberch et al. 1979 in Futuyma 1986, 416); *e.g.*, monstrously large, branched antlers in the extinct *Megaloceros giganteus* (Irish Elk).
- xenomorphosis** See -morphosis: heteromorphosis.
- ♦ **morphospecies** See ²species: morphospecies.
- ♦ **morphotype** See -type, type: morphotype.

♦ **-morphy** See -morph, morphic.

homeomorphy, homoeomorphy *n.*

1. An organism's having the same, or very similar, morphology as another organism as a result of convergent evolution rather than common ancestry (Lincoln et al. 1985).
2. "The state of being structurally similar but phylogenetically distinct" (Lincoln et al. 1985).

n. homeomorph

adj. homeomorphic

metromorphy *n.* The condition of an organism's resembling its mother (Lincoln et al. 1985).

♦ **mortality** *n.*

1. An organism's being mortal, or subject to death (Oxford English Dictionary 1972, entries from 1340).
2. Loss of human life on a large scale; abnormal human death frequency due to pestilence or war (Oxford English Dictionary 1972, entries from 1400).
3. The number of human deaths in a particular period, or area, from a particular cause; death frequency; death rate (Oxford English Dictionary 1972, entries from 1645).
4. A population's death rate expressed as a percentage or fraction (Lincoln et al. 1985).

syn. mortality rate (Lincoln et al. 1985)

cf. natality

concomitant mortality *n.* "Death during exposure to a harmful substance or stimulus" (Lincoln et al. 1985).

cf. mortality: consequential mortality, delayed mortality

consequential mortality *n.* Death during a recovery period that follows exposure to a harmful substance or stimulus (Lincoln et al. 1985).

cf. mortality: concomitant mortality, delayed mortality

delayed-density-dependent mortality *n.* For example, in paramecia, possibly the Bobwhite Quail, the Mule Deer: A population's mortality that is related to its past density of individuals (Lack 1954, 118).

delayed mortality *n.* An animal's death that occurs after a recovery period, following exposure to a harmful substance, or stimulus, when the animal appears to be healthy (Lincoln et al. 1985).

cf. mortality: consequential mortality

density-dependent mortality *n.* For example, in some barnacle, flour-beetle, trichogrammatid-wasp, and waterflea species; probably the Bobwhite Quail; and the Alpine Swift, Common Swift, Guinea Pig, and Whitefish: A population's mortality that is related to its recent density of individuals (Lack 1954, 116, 121–122).

syn. direct density-dependent mortality, ecological death

♦ **mortality selection** See selection: mortality selection.

♦ **mortification** See abasement.

♦ **mosaic** See chimera.

♦ **mosaic evolution** See ²evolution: mosaic evolution.

♦ **moss** See habitat: bog.

♦ **mother** *n.*

1. A female organism that has borne an offspring; female parent (Michaelis 1963).
2. A female person who adopts a child, or who otherwise has a maternal relationship with another person (Michaelis 1963).

3. "Anything that creates, nurtures, or protects something else" (Michaelis 1963).

See alloparent.

cf. father, aunt, uncle

allomother *n.*

1. In African Elephants, some primate species, and some other long-lived-mammal species: A female that shows maternal behavior (retrieving, guarding, cleaning, etc.) toward a young that is not her own (Lancaster 1971, Douglas-Hamilton and Douglas-Hamilton 1975, etc. in Lee 1987, 278; Immelmann and Beer 1989, 11).

syn. aunt (used in earlier literature)

adj. allomaternal

cf. parent: alloparent

2. *v.i.* In some primate species: To show the behavior of an aunt (Hrdy 1977, 199).

cf. aunt

play mother *n.* For example, in some monkey species: A female nonrelative that interacts with a young animal in such a way that she, rather than the young animal or its parents, benefits (C. M. Crockett 1984, pers. comm.).

syn. allomother (suggested synonym from description in Immelmann and Beer 1989, 11)

cf. parent: alloparent

surrogate mother *n.* An artificial mother model, or dummy, used in deprivation experiments with monkeys (Immelmann and Beer 1989, 300).

syn. mother surrogate

cf. surrogate

♦ **mother-child relationship** See relationship: mother-child relationship.

♦ **mother-Eve hypothesis** See hypothesis: African-origin hypothesis of human mitochondrial DNA evolution.

♦ **mother-infant attachment** See attachment: mother-infant attachment.

♦ **mother surrogate** See mother: surrogate mother.

♦ **motif song** See animal sounds: song: functional song.

♦ **motility** *adj.* An organism's having the capacity to move or show movement (Lincoln et al. 1985).

adj. motile

♦ **motivated altruism** See altruism (def. 1).

♦ **motivating stimulus** See ²stimulus: motivating stimulus.

♦ **motivation** *n.*

1. A factor that induces a person to act in a certain way; a person's desire, fear, or other emotion, or a consideration of reason, that influences, or tends to influence, his volition (Oxford English Dictionary 1972, entries from 1412).

2. A person's contemplated result, or desired object, that tends to influence his volition (Oxford English Dictionary 1972, entries from 1412).

3. An individual animal's "behavioral mood, drive; action readiness or tendency; compulsion or urge to behave in a certain way" (Immelmann and Beer 1989, 190).

4. An individual animal's "total complex of proximate causal factors governing" what it is doing or about to do (Immelmann and Beer 1989, 190).

5. Control of an animal's behavior (Immelmann and Beer 1989, 190).

syn. drive (Hinde 1970, 200)

cf. drive

Comments: Definitions of “drive” and “motivation” are controversial. “Motivation” has a broad range of definitions. Immelmann and Beer (1989, 191) discuss problems with some usages of “motivation,” and conclude that “motivation” is a useful term for covering the “subject of proximate causal control of behavior, without commitment to a specific conception or theory” and that “motivation” is now commonly defined in this way.

mixed motivation *n.* An animal’s expression of a behavior of more than one behavioral tendency or motivation, *e.g.*, a threat movement that consists of elements of attack and escape behavior (Immelmann and Beer 1989, 186).

cf. conflict

♦ **motivational analysis** See analysis: motivational analysis.

♦ **motivational change** *n.*

1. An animal’s temporary and reversible change in behavior; “more permanent changes are ascribed to learning or ageing” (Hinde 1982, 46–47).
2. An animal’s change in the underlying causal control of a behavior in accordance with a change in the behavior’s function through evolution (Immelmann and Beer 1989, 192).

cf. emancipation

♦ **motivational competition** See competition: motivational competition.

♦ **motivational conflict** See ²conflict: motivational conflict.

♦ **motivational energy** See energy: action-specific energy.

♦ **motivational impulse** See energy: action-specific energy.

♦ **motivational state** *n.* An animal’s combined physiological and perceptual state represented in its brain, including factors relevant to its incipient and current behavior (McFarland 1985, 279; Immelmann and Beer 1989, 193).

syn. drive (Wilson 1975, 153)

cf. drive

Comment: McFarland (1985) discriminates between “motivational state” and “drive.”

♦ **motivational system** See ²system: motivational system.

♦ **motor cortex** See organ: brain: motor cortex.

♦ **motor pattern** See pattern: motor pattern.

♦ **motor program** See program: motor program.

♦ **moule intérieure** *n.* The theory that the first individual of all fundamental species is formed from organic molecules that combined spontaneously and this primary being becomes the epigenetic inner form that guarantees the permanence of the species; this permanence is incessantly challenged by the “circumstances” which induce the production of varieties; however, the inner form prevents variations from transgressing certain limits and in this respect, the *moule intérieure* plays a role similar to Aristotle’s *eidos* (Buffon in Mayr 1982, 333).

♦ **moultinism** See -morphism: polymorphism: molting.

♦ **mount bout** See bout: mount bout.

♦ **mountain-relict species** See ²species: mountain-relict species.

♦ **mounting, mounting behavior** See behavior: mounting, mounting behavior.

♦ **mounting attempt** *n.* In male *Macaca mulatta* (Rhesus Monkeys) raised in isolation: A male’s

copulation attempt with a female in estrus that is not made in a fashion that leads to copulation (Heymer 1977, 32).

cf. behavior: abnormal behavior

♦ **mouse pounce, stiff-legged jump** *n.* In some canid and felid species: An individual’s pouncing attack on a mouse or other small prey animal (Heymer 1977, 115).

♦ **Mousterian Tool Industry** See tool industry: Mousterian Tool Industry.

♦ **mouth breeder** *n.* A species that shows mouth brooding, *q.v.*, *e.g.*, some cichlid-fish and anabantid-fish species (Immelmann and Beer 1989, 195).

♦ **mouth-brooding** See brooding: mouth-brooding.

♦ **mouth clashing** See fight: mouth clashing.

♦ **mouth fighting** See fight: mouth fighting.

♦ **mouth pulling** See fight: mouth pulling.

♦ **mouth-to-mouth feeding** See feeding: mouth-to-mouth feeding.

♦ **¹movement** *n.* A person’s emptying his bowels; or the result of this behavior — feces (Oxford English Dictionary 1972, entry from 1891).

cf. elimination: defecation, egestion

♦ **²movement** *n.*

1. An animal’s motor pattern or locomotion (Immelmann and Beer 1989, 195).

2. An animal’s change in location, *e.g.*, migratory movement (Immelmann and Beer 1989, 195).

cf. behavior; kinesis: statokinesis; locomotion; migration

abdominal-up-and-down movement *n.* In some dragonfly and damselfly (Odonata) species: A male’s moving his abdomen up over his head and then straight back (Heymer 1977, 19).

Comments: This behavior is part of wing grooming in lepidopteran butterflies. In calopterygid damselflies, this movement is a rhythmic oscillation used for signaling (Heymer 1977, 19).

comfort movement *n.*

1. An animal’s body-maintenance movement, *e.g.*, preening, shaking, stretching, and washing (Dewsbury 1978, 262).

Note: Grzimek (1977, 688) also includes grooming, scratching, and scrubbing oneself.

2. An animal’s movements associated with its body metabolism, especially with its intake of oxygen, including stretching movements and yawning (*q.v.*) (Grzimek 1977, 688).

3. An animal’s movement performed to relieve muscular tension or integumentary irritation temporarily (*e.g.*, grooming, preening, scratching, shaking, stretching, or wing flapping) (Hurnick et al. 1995).

demonstrative movement *n.* An animal’s communicatory movement that attracts the attention of other animals particularly in courtship and displays against rivals, *e.g.*, pseudo-preening in which Mandarin duck drakes display their particularly striking speculum feathers (Heymer 1977, 50).

down-up movement *n.* In some duck species: A drake’s dipping his bill in water for an instant and then immediately thrusting his head high out of the water without lifting his breast which is deep in the water (Lorenz 1941, 1966 in Heymer 1977, 19).

instinctive movement See action pattern: fixed-action pattern.

multipurpose movement *n.* A behavior that is ordinarily simple and brief and appears in more than one functional system, *e.g.*, locomotion motor

patterns that occur in foraging, territorial defense, migration, etc. (Immelmann and Beer 1989, 195).

cf. action: transitional action

[introduced as *Mehrzweckbewegung* by Lorenz (1937 in Immelmann and Beer 1989, 195)]

rapid-eye movement *n.* A person's eyes' moving actively across his visual field behind closed lids during rapid-eye-movement sleep (Campbell 1996, 1018).

rapid-leaf movement *n.* For example, in *Dionaea muscipula* (Venus Flytraps) and *Mimosa* spp. (Sensitive Plants): A leaf's closing quickly after being touched in a specific way (Campbell 1996, 762).

Comments: The function of rapid-leaf movements in *Mimosa* spp. remains unknown (Campbell 1996, 762). These movements might reduce surface areas and help a plant to conserve water, they might more prominently expose protective thorns that discourage herbivores, or both. Venus Flytrap leaves entrap prey by quickly closing.

sleep movement *n.* For example, in many species of Fabaceae (Legumes) and *Maranta bicolor* (Prayer Plant): A leaf's changing its position on a plant with regard to time of day (Campbell 1996, 762–763, illustrations).

Comments: In many legume species, leaves lower themselves in the evening and rise in the morning (Campbell 1996, 762). A Prayer Plant raises its leaves in the evening and lowers them in the morning (pers. obs.). Water stressed prayer plants do not markedly raise their leaves in the evening.

♦ **MRI** See method: magnetic-resonance imaging.

♦ **mRNA** See nucleic acid: ribonucleic acid.

♦ **Murchison meteorite** See meteorite: Murchison meteorite.

♦ **mucivore** See -vore: mucivore.

♦ **mudeye** See animal names: mudeye.

♦ **mudflat** See habitat: mudflat.

♦ **Muellerian association** See Müllerian association.

♦ **mulada** See ²group: mulada.

♦ **Mule** See hybrid: Mule.

♦ **Muller-Lyer illusion** See illusion: Muller-Lyer illusion.

♦ **Müllerian association, Muellerian association** *n.* An assemblage of different species in a particular place, all of which display similar aposematic coloration (Lincoln et al. 1985).

cf. mimicry: Müllerian mimicry

♦ **Müllerian mimicry, Muellerian mimicry** See mimicry: Müllerian mimicry.

♦ **Müllerian mimicry club, Muellerian mimicry club** See mimicry ring: Müllerian mimicry ring.

♦ **Muller's ratchet** *n.*

1. The idea that without recombination, genetic errors continually accumulate in a finite population through chance, by the random loss of the least mutated genome; like a ratchet wheel that moves in only one direction, this process cannot be reversed; once mutants replace beneficial genes, the latter do not return without recombination to replace them, while the deleterious genes continue to accumulate (Morell 1994, 171–172).

2. A mechanism of an asexual population that prevents any of the population's other lines from attaining a mutation load smaller than that already existing in its least-loaded line (Lincoln et al. 1985).

[after H. J. Muller who proposed this concept in 1964 (Morell 1994, 171)]

♦ **multi-, mult-** *comb.f.*

1. Much; many; consisting of many (Michaelis 1963).
 2. Having more than two (or more than one) (Michaelis 1963).
 3. Many times over (Michaelis 1963).
 4. In medicine, affecting many (Michaelis 1963).
- [Latin *multus*, much]

♦ **multicollinearity** *n.* One, or more, correlation or covariance matrix's variables' being linear functions of one another (Softstat, Inc. 2008).

syn. matrix collinearity

Comment: When a matrix has collinearity, one cannot invert it; one can compute only its generalized inverse.

♦ **multicolonial** See colonial: multicolonial.

♦ **multidimensional species concept** See ²species (def. 27).

♦ **multifactorial** See -genic: polygenic.

♦ **multifactorial character** See character: multifactorial character.

♦ **multifactorial inheritance** See inheritance: multifactorial inheritance.

♦ **multigene** See gene: multigene.

♦ **multigenic** See -genic: polygenic.

♦ **multihybrid** See hybrid: multihybrid.

♦ **multimale group** See ²group: multimale group.

♦ **multimale society** See ²society: multimale society.

♦ **multiparity, multiparous** See -parity: multiparity.

♦ **multiple alleles** See allele: multiple alleles.

♦ **multiple allelism** *n.* The phenomenon in which more than two alleles occur at a single locus (Mayr 1982, 754).

Comments: Sturtevant (1913) first explained this phenomenon, and it refuted Bateson's "presence-absence theory of gene action" (Mayr 1982, 754). Mouse coat color and human blood groups are caused by "multiple allelism."

♦ **multiple-choice method** See method: multiple-choice method.

♦ **multiple-choice test** See test: choice test.

♦ **multiple-comparisons test** See statistical test: multiple-comparisons test.

♦ **multiparasitism** See parasitism: multiple parasitism.

♦ **multiple-factor hypothesis, multiple-factor theory** See hypothesis: multiple-factor hypothesis.

♦ **multiple factors** See gene: polygene.

♦ **multiple-gene effects, multiple-gene inheritance** See pleiotropy.

♦ **multiple pathways** *n. pl.* The phenomenon that natural selection, which is always opportunistic, makes use of that part of the variation of an organism that leads most easily to the needed adaptation (Mayr 1982, 590).

♦ **multiplier effect** See effect: multiplier effect.

♦ **multiploidy** See -ploidy: multiploidy.

♦ **multipolar mating system** See mating system: multipolar mating system.

♦ **multipurpose movement** See movement: multipurpose movement.

♦ **multistate character** See character: multistate character.

♦ **multivariable analysis, multivariate analysis** See analysis: multivariate analysis.

♦ **multivoltine** See voltine: multivoltine.

♦ **mummy** *n.*

1. A desiccated, mammal corpse preserved in northern permafrost (Guthrie 1990, 22). See fossil: mummy.

Notes: There are many prehistoric mummies (= fossils) (Guthrie 1990). In cold mummification, the water from a corpse crystallizes and forms ice lenses around the corpse, and it shrinks and shrivels. This differs from freeze drying in which water sublimates into surrounding air, and the corpse retains its size and shape.

2. A desiccated dead aphid that is parasitized by a parasitic wasp, or the remains of such an aphid from which its wasp parasite emerged (Omacini et al. 2001, 78).

Note: A secondary parasite may parasitize a primary parasite (*q.v.*) in a living, or mummified, aphid (Omacini et al. 2001, 79).

♦ **mune** See ²group: mores.

♦ **mural** See rupestral.

♦ **muriphobia** See -phobia: musophobia.

♦ **murder** See behavior: killing behavior; group: murderer.

♦ **murein** See molecule: murein.

♦ **murmuration** See animal sounds: murmuration; ²group: murmuration.

♦ **Murphy's law** See law: Murphy's law.

♦ **musicole** See -cole: musicole.

♦ **muscology** See study of: muscology.

♦ **musophobia** See -phobia: musophobia.

♦ **must, musth** *n.*

1. In male Elephants and Camels: An individual's being "must" — in a state of dangerous frenzy that occurs at irregular intervals (Oxford English Dictionary 1972, entries from 1871); a rutlike state displayed by healthy adult male Elephants (Schulte and Rasmussen 1999, 1265).

2. An Elephant in must (Oxford English Dictionary 1972).

3. *adj.* Referring to an animal in must (Michaelis 1963)

v.i. to go must

Comment: Male Elephants over 14 yr old become "must" — exceptionally aggressive and sexually active while secreting large quantities of temporal-gland liquid (Wilson 1975, 498; Poole 1989, 140).

[Hindu *mast*, drunk, lustful < Persian]

♦ **muster** See ²group: muster.

♦ **mutable gene** See gene: mutable gene.

♦ **mutant** *n.* An organism character, or gene, that has undergone a mutational change (Lincoln et al. 1985).

♦ **mutant type** See -type, type; mutant type.

♦ **¹mutation** See ²group: mutation.

♦ **²mutation** *n.*

1. A kind of change (contrasted with a variation) that results in a new species suddenly from its parental stock; also, the species that results from this process (Oxford English Dictionary 1972, entries from 1894).

See speciation: saltational speciation.

2. Any drastic change of organism form (Mayr 1963, 168 in Mayr 1982, 742).

Note: This usage goes back to at least the middle of the 17th century; it was first used both for discontinuous variation and changes in fossils (Mayr 1963, 168 in Mayr 1982, 742).

3. The smallest distinguishable change in a phyletic series (Waagen 1867 in Mayr 1982, 742).

4. A sudden event (phenotypic change) by which a species originates (de Vries 1901, 1903 in Mayr 1982, 742).

syn. saltation

Note: Most of de Vries' mutations in *Oenothera* are now known to be due to chromosomal rearrangements including polyploidy, not gene mutations (Mayr 1982, 743). De Vries used "mutation" to designate a saltation (Mayr 1982, 403).

5. "Any discontinuous change in the genetic constitution of an organism" (Wilson 1975, 589).

6. A change in the phenotype of a species (Mayr 1982, 742).

7. A change along a very narrow portion of the nucleic acid sequence of a chromosome; a point mutation (Wilson 1975, 589).

8. "A discontinuous change of a gene" (Mayr 1982, 794); any error in gene replication (Mayr 1982, 804).

Note: This definition does not apply to all cases of mutation (Mayr 1982, 804).

9. A change in the base-pair sequence of DNA that results from substitution, addition, deletion, or rearrangement of the standard base pairs of DNA (Bernstein et al. 1985, 1278).

Note: This change can alter the structure of proteins, regulation of protein production, and other things in cells (National Academy of Sciences and Institute of Medicine 2008, 4).

syn. sport

cf. group: mutation; ¹salutation

Note: Mutations do not generally alter the physical regularity of a DNA molecule, and they are replicable, and, thus, can be inherited (Bernstein et al. 1985, 1278).

Comment: Morgan's definition of a mutation (def. 7) is very different than de Vries' definition (def. 4). It took nongeneticists 30–40 yr to understand the Morgan's mutations were not the same as de Vries' mutations (Mayr 1997, 58).

[Old French < Latin *mutatio, -onis* < *mutare*, to change, coined by W. Bateson]

Two CLASSIFICATIONS OF MUTATION

I. Classification by how many genes are involved

- A. one gene — point mutation, micromutation
- B. a few genes — micromutation
- C. many genes — chromosomal mutation (*syn.* matic mutation), macromutation (*syn.* rogue, sport)

II. Classification by effect on organism's evolution

- A. advantageous mutation
- B. deleterious mutation
- C. neutral mutation

adaptive mutation See ²mutation: directed mutation.

back mutation See ²mutation: reverse mutation.

Cairnsian mutation *n.* A mutation that occurs with a higher probability when it is advantageous than when it is neutral [coined by Hall 1990, 6].

cf. hypothesis: directed-mutation hypothesis; ²mutation: directed mutation

chromosomal mutation *n.* A chromosomal rearrangement that has a genetic effect; rearrangements

include results of unequal crossing overs, inversions, Robertsonian rearrangements, translocations, and polyploidy (Mayr 1982, 769).

syn. chromosome mutation, matrix mutation (Mayr 1982, 804)

directed mutation *n.*

1. A mutation that is nonrandom with respect to normal environmental fluctuations and to effects on a gene product, and thus on fitness; contrasted with random mutation (Cairns et al. 1988, 142; Hall 1990, 5).
2. A mutation that “occurs at a higher rate specifically when (and even because) it is advantageous to the organism, whereas comparable increases in rate do not occur either (i) in the same environment for similar mutations that are not advantageous, or (ii) for the same mutation in similar environments where it is not advantageous” (Lenski and Mittler 1993, 188).
3. A selection induced change in a bacterium’s DNA that enables it to grow on a new medium (usually called adaptive mutation by Galitski and Roth 1995, 421; Radicella et al. (1995, 418); Shapiro 1995, 374).

cf. hypothesis: hypothesis of directed mutation; ²mutation: adaptive mutation, Cairnsian mutation.

Comments: Adaptive mutation is known in *Escherichia coli*, strain FC40. In the phenomenon of adaptive mutation, bacterial cells change their DNA, using biochemical systems, in response to physiological inputs (Shapiro 1995, 374). This ability is highly evolutionarily significant. Two genetic systems that evidently show adaptive mutation are the lacI-Z33 and the araB-lacZ (Shapiro 1995, 373–374). In the lacI-Z33 system, additional specific molecules participate in selection-induced mutations that restore a bacterium’s growth on lactose. Bacterial genetic change is often multicellular. DNA rearrangements can occur in one cell and be transferred to another before a clone of ‘mutant’ bacteria proliferates on selective medium. In the lacI-Z33 system, the mutation results from selection-induced recombination activities and plasmid-transfer functions, and in the araB-lacZ system, the mutation results from factors other than selective substrates (Shapiro 1995, 374).

syn. adaptive mutation (Galitski and Roth 1995, 421; Radicella et al. (1995, 418)

embryonic lethal *n.* A mutation with a phenotype that leads to the death of a *Drosophila* embryo or larva (Campbell et al. 1999, 399).

forward mutation *n.* Mutation of a gene from its normal, or wild-type, to a mutant state (Lincoln et al. 1985).

cf. ²mutation: reverse mutation

frameshift mutation *n.* One of a class of mutations that arises from the insertion, or deletion, of one nucleotide, or any number of nucleotides other than three or multiples of three, into or from DNA (Brenner et al. 1961 and Crick et al. 1961 in Rieger et al. 1991; Shapiro 1995, 373).

Comments: A frameshift mutation displaces the starting point of genetic transcription of the genetic code and the resulting mRNA is misread by the translation process from the point of the nucleotide(s) addition or deletion (Rieger et al. 1991).

syn. reading mutation, sign mutation (Rieger et al. 1991)

gene mutation, genovariation, infragenic mutation, micromutation, point mutation, transgenation *n.* A heritable change in a single gene (Lincoln et al. 1985).

See ²mutation.

cf. -morphism: polymorphism: single-nucleotide polymorphism

heterozygous lethal, heterozygous lethal mutation *n.* A mutation that causes the premature death of an organism when it occurs on one of its homologous chromosomes; contrasted with homozygous lethal (King and Stansfield 1985).

homeotic mutation *n.*

1. A mutation that causes one part of an organism’s body to develop in a manner appropriate to another part, *e.g.*, the homeotic mutation ‘antennapedia’ in *Drosophila* flies causes a leg to grow where an antenna normally does (Dawkins 1982, 288; Arms and Camp 1995, 252, illustration).

Note: In *Drosophila*, homeotic mutations result from mutations of genes that contain homeoboxes (DNA sequences encoding parts of transcription factors that control development in multicellular organisms) (Arms and Camp 1995, 252).

2. A structure’s mutation from one state to another that exists in a series of states, such as the mutation of an insect wing into a haltere (Lincoln et al. 1985).

syn. homoeotic mutation

cf. gene: homeobox-containing gene, homeotic gene [coined by W. Bateson in Gould (1985c)]

homoeotic mutation See ²mutation: homeotic mutation.

homozygous lethal (mutation) *n.* A mutation that causes the premature death of an organism when it occurs on both of its homologous chromosomes; contrasted with heterozygous lethal (King and Stansfield 1985).

intragenic mutation See ²mutation: gene mutation.

lacI-Z33 mutation *n.* A fusion of the lacI (encoding repressor) and lacZ (encoding β-galactosidase) which prevents bacterial growth on lactose medium because it includes a frameshift mutation that blocks lacZ translation (Shapiro 1995, 373).

Comments: This is a popular system to study adaptive mutation (Shapiro 1995, 373).

macromutation *n.*

1. “A heritable change in the genetic material that produces a large effect usually associated with speciation” (traced back to Bateson 1894 and de Vries 1910 in Dietrich 1992, 194).

Notes: Richard Goldschmidt might have been the first person to use “macromutation;” the concept of a macromutation as a speciation event is usually traced back to de Vries’ mutation theory (Dietrich 1992, 195).

2. The “large, easily recognizable mutations of genetic experiments” (Carter 1951, 95 in Dietrich 1992, 199).

Note: This is a redefinition of “macromutation” in terms of degree of phenotypic effect; Carter (1951) only weakly associates macromutation with speciation (Dietrich 1992, 199).

3. An individual that is a highly different variation within a species (Mayr 1982, 428), *e.g.*, the Ancon Sheep and Turnspit Dog (Mayr 1982, 738).

4. "Any mutation that results in a major adaptive shift, a change in the way of life that opens a new adaptive zone" (Bush 1982, 125, in Dietrich 1992, 201).
5. The sum of those processes that explain the character-state transitions that diagnose differences of major taxonomic rank; these processes include competition, predation, and habitat change (Levinton 1983, 104).
6. The simultaneous mutation of many different characters (Lincoln et al. 1985).

See allele: macromutation.

syn. rogue, sport

cf. hopeful monster; hypothesis: macromutationism; ³mutation: systemic mutation

Comments: There is a lack of consensus regarding the connection of macromutations to speciation events and the relative importance of this connection as a possible mode of speciation (Dietrich 1992, 201).

matrix mutation See ²mutation: chromosomal mutation.

micromutation See ²mutation: gene mutation.

missense mutation *n.* A point mutation within a codon that results in the incorporation of a different amino acid into part of the polypeptide chain that the codon codes for and produces an inactive, or unstable, enzyme (Lincoln et al. 1985).

cf. ²mutation: nonsense mutation, samesense mutation

neutral mutation *n.* A mutation that has no selective advantage, or disadvantage, compared with its allele (Dawkins 1982, 291).

cf. ³theory: neutral theory

Comment: In theory, a neutral mutation can become predominant in a population (Dawkins 1982, 291).

nonsense mutation *n.* A mutation that converts a sense codon into a chain-terminating codon, or vice versa, resulting in abnormally short, or long, polypeptides usually with altered function; contrasted with missense mutation, and samesense mutation (King and Stansfield 1985).

See allele: neutral allele.

numerical mutation *n.* Any change in chromosome number, either by polyploidy or aneuploidy (Lincoln et al. 1985).

paramutation *n.* In *Zea mays* (Corn): A phenomenon in which one allele influences the expression of another allele that is at the same locus when the two are combined in a heterozygote (King and Stansfield 1985).

point mutation See ²mutation: gene mutation.

quasi-normal mutation *n.* A mutation that causes death of less than 10% of the mutants in a population (Lincoln et al. 1985).

cf. ²mutation: semilethal mutation, subvital mutation

random mutation *n.* A mutation whose initial occurrence is independent of its specific value (advantageous, neutral, or deleterious) to the organism that has it (Lenski and Mittler 1993, 188).

Comments: "A fundamental tenet of evolutionary biology is that mutations are random events." This "does not mean that mutation rates are unaffected by environmental factors or that all portions of a genome are equally susceptible to mutation" (Lenski and Mittler 1993, 188).

reaper (*rpr*) *n.* A mutation in a *Drosophila* embryo that blocks apoptosis (= normal cell death) and causes the embryo to die because it develops abnormally (White et al. 1994, 677).

Comment: The reaper locus has been cloned; it appears to encode a small peptide that is expressed in cells destined to undergo apoptosis (programmed cell death) (White et al. 1994, 677).

regulatory mutation *n.* A mutation in a regulatory gene, *q.v.*, that affects the rates at which gene products are produced, although the products themselves may be unaffected (Strickberger 1990, 187-188).

Comment: A regulatory mutation of the bithorax locus in *Drosophila* may cause an extra set of wings (Strickberger 1990, 191). Regulatory mutations might cause changes in shape of fish and other organisms.

reverse mutation *n.* A change in genetic material back to its previous condition (Mayr 1982, 552).

syn. back mutation

samesense mutation *n.* A point mutation within a codon that produces no phenotypic change because the mutant codon codes for the same amino acid as the original codon (Lincoln et al. 1985).

cf. ²mutation: missense mutation, nonsense mutation

semilethal mutation *n.* A mutation that causes death of more than 50%, but not all of individuals that carry it (King and Stansfield 1985).

cf. ²mutation: quasi-normal mutation, subvital mutation

small-eye See gene: *pax-6* (comments).

sport See ²mutation: macromutation.

stuck *n.* In *Drosophila*: A mutation in which a male has difficulty in disengaging after a 20-minute copulation which is usual for his species (Dewsbury 1978, 126).

See ²group: stuck.

subvital mutation *n.* A mutation, or gene, that significantly lowers viability, but causes the death before maturity of less than 50% of individuals that carry it; contrasted with semilethal mutation (King and Stansfield 1985).

syn. sublethal gene

cf. ²mutation: quasi-normal mutation, semilethal mutation

transgenation See ²mutation: gene mutation.

transition *n.* A mutation resulting from the substitution of one kind of purine for another kind (adenine for guanine or *vice versa*) or one kind of pyrimidine for another kind (cytosine for thymidine or *vice versa*) (Futuyma 1998, 268).

cf. ²mutation: transversion

transversion *n.* One of eight possible kinds of mutation resulting from the substitution of one kind of purine for one kind of pyrimidine or *vice versa* (Futuyma 1998, 268).

cf. ²mutation: transition

♦ **3mutation** *n.* The process by which a new "species" originates (de Vries 1901, 1903 in Mayr 1982, 742).

Note: De Vries considered mutation to be an evolutionary phenomenon, but later geneticists considered it to be primarily a genetic phenomenon (Mayr 1982, 742).

systemic mutation *n.*

1. A complete repatterning of a chromosome that might produce a new chemical system that has a definite and completely divergent action upon an organism's development, "an action which can be conceived as surpassing the combined actions of numerous individual changes by establishing a completely new chemical system;" such a repatterning that could bridge the gap to form a new

- species (Goldschmidt 1940, 203 in Dietrich 1992, 197).
2. "A catastrophic mutation that would lead to the origin of an entirely new type of organism" (Lincoln et al. 1985).
- syn.* systematic mutation (Lincoln et al. 1985)
cf. hopeful monster; ²mutation: macromutation
- ♦ **⁴mutation** *n.*
1. A new species that results from a sudden change in its parental stock (Oxford English Dictionary 1972, entries from 1894).
 2. An individual, species, etc., that results from a sudden, transmissible variation, especially as the result of new modifications, or combinations, of genes and chromosomes (Michaelis 1963).
- syn.* mutant
- ♦ **mutation accumulation** *n.* The microevolutionary process in which neutral mutations in a population become fixed by genetic drift (*q.v.*) in genes (Cooper and Lenski 2000, 736).
- Comment:* Antagonistic pleiotropy (*q.v.*) and mutation accumulation both cause microevolution. Cooper and Lenski (2000, 736) were able to determine that the former accounted for a major part of the evolution in a laboratory culture of *Escherichia coli* which they grew on a minimal-nutrient diet with glucose as the carbon source for over 20,000 generations over a period of about 8 yr.
- ♦ **mutation frequency** *n.* "The proportion of mutant alleles in a population" (Lincoln et al. 1985).
- ♦ **mutation pressure** *n.*
1. The increase in frequency of one allele and simultaneous decrease in frequency of another allele due to mutation at the gene locus in question (Wilson 1975, 64).
 2. "Evolution by different mutation rates alone" (Wilson 1975, 589).
- Comments:* Mutation pressure is usually about 10^{-4} per organism (or cell) (Wilson 1975, 64). The evolutionary synthesis "led to a decline of the concept of "mutation pressure," and its replacement by a heightened confidence in the powers of natural selection, combined with a new realization of the immensity of genetic variation in natural populations" (Mayr 1982, 567).
- ♦ **mutational load** See genetic load: mutational load.
- ♦ **mutationism** *n.*
1. Hugo de Vries' (1901, 1903) concept that "speciation must be due to the spontaneous origin of new species by the sudden production of a discontinuous variant" (Mayr 1982, 546).
 2. The concept that evolution, in general, and speciation, in particular, are the results of drastic and sudden mutations (Lincoln et al. 1985).
- syn.* de Vriesianism (Lincoln et al. 1985), de Vries' mutation theory (Mayr 1982, 546)
- cf.* ²mutation: macromutation; saltation
- ♦ **mute** See ²group: mute.
- ♦ **mutilous** *adj.* Referring to an organism without defensive structures; harmless (Lincoln et al. 1985).
- ♦ **muton** See gene: muton.
- ♦ **mutual courtship** See courtship: mutual courtship.
- ♦ **mutualism** See cooperation; symbiosis: mutualism.
- ♦ **mutualistic mimicry** See mimicry: mutualistic mimicry.
- ♦ **M-V linkage** *n.* Linkage between morphological-character-determining and variability-controlling genes (Lincoln et al. 1985).
- ♦ **My, M.Y.** See Ma.
- ♦ **mycetology** See study of: mycetology.
- ♦ **mycetophage** See -vore: fungivore.
- ♦ **mychogamy** See -gamy: mychogamy.
- ♦ **mycobiont** See -biонт: mycobiont.
- ♦ **mycobiota** See -biota: mycobiota.
- ♦ **mycorrhiza** *n., pl. mycorrhizae* A mutualistic association between a plant root and a fungus (Campbell 1996, 723).
cf. symbiosis
- Comments:* The fungus secretes a growth factor that stimulates the root to grow and branch (Campbell 1996, 584, 723). Depending on the species involved, the fungus either sheaths the root and extends its hyphae among its cortex cells or invades the root cells themselves. The fungus mycelium provides the root with a greatly increased surface area through which it gains minerals, especially phosphate, and water. The fungus is more efficient at absorbing these materials and secretes an acid that increases the solubility of some minerals. The root obtains minerals and water from the fungus, and the fungus obtains photosynthetic products from the plant. The fungus also protects the plant against certain soil pathogens. Over 95% of vascular plants may have mycorrhizae if they contact the appropriate fungus species. Plants without their mycorrhizal fungi can be malnourished and show decreased growth compared to conspecific plants with such fungi. Ascomycota, Basidiomycota, and Zygomycota have mycorrhizae with plants. Half of all species of mushroom-forming Basidiomycetes live as mycorrhizal fungi with *Betula* spp. (Birches), *Pinus* spp. (Pines), and *Quercus* spp. (Oaks). Mycorrhizal fungal genera include *Albatrellus*, *Amanita*, *Boletus*, *Boletopsis*, *Cantharellus*, *Catathelasma*, *Clitopilus*, *Chroogomphus*, *Clavariadelphus*, *Cortinarius*, *Cystoderma*, *Elaphomycetes*, *Entoloma*, *Gautieria*, *Gomphidius*, *Gyroporus*, *Hebeloma*, *Hydnus*, *Hygrophorus*, *Hydnangium*, *Inocybe*, *Lactarius*, *Leucocortinarius*, *Limacella*, *Leccinum*, *Melanogaster*, *Myxocyebe*, *Paxillus*, *Phylloporus*, *Pisolithus*, *Porphyrellus*, *Ramaria*, *Rhizopogon*, *Rizites*, *Russula*, *Sarcosphaera*, *Sepultria*, *Suillus*, *Terfezia*, *Tricholoma*, *Tuber*, and *Tylopilus* (Pacioni 1981). Some groups of plants may have more than one kind of mycorrhizal fungus (www.mycorrhiza.com). Members of the Ericaceae have two distinct types of mycorrhizal fungus that are unique to this family and closely related plant families; some ericads have arbuscular mycorrhiza (AM) as well, e.g., *Arctostaphylos uva-ursi* (Bearberry). Individual plants of cottonwoods, eucalyptuses, and willows may have both AM and ectomycorrhizae (EM) on their root systems. Seedlings often start off with AM, then change over to EM as the canopy closes and a litter layer begins to accumulate. Arbuscular mycorrhiza are very common symbioses (Heckman et al. 2001, 1129). Exudates and hyphae of EM form a major link between above-ground producers and soil food webs, providing carbon for a wide range of bacteria, protozoa, arthropods, and microfungi (Pacific Northwest Research Station 1997). Mycorrhizal fungi are also important in above-ground food webs. Ectomycorrhizal fungi, with few exceptions, produce macroscopic sporocarps (mushrooms and truffles) that are important in the diets of animals, especially small mammals. Some rodents such as *Clethrionomys*

californicus (California Red-backed Voles) and *Glaucomys sabrinus* (Northern Flying Squirrels) rely on these sporocarps for over 90% of their food supply and are primary prey for species such as *Strix occidentalis caurina* (Northern Spotted Owls).

[Greek *mycos*, fungus + *rbiza*, root]

♦ **mycotroph** See -troph-: mycotroph.

♦ **myiophile** See ²-phile: myiophile.

♦ **myoD** See gene: *myoD*.

♦ **Myr** See units of measure: Ma.

♦ **Myr B.P.** *n.* 1 Ma before the present (Futuyma 1986, 328).

♦ **myrmeco-, myrmec-** *comb.f.* Referring to an ant; loosely, a termite (Lincoln et al. 1985).

[Greek *myrmēx*, *myrmēklos*, ant]

♦ **myrmecobromous** See myrmecotropic.

♦ **myrmecochore** See -chore: myrmecochore.

♦ **myrmecochory** *n.* Dispersal of a seed by an ant (Sernander 1906 in Swearingen 1992).

Comment: Ants disperse seeds of more than 3,000 flowering-plant species in over 60 families (Handel and Beattie 1990 in Swearingen 1992).

♦ **myrmecochorous** See -chorous: myrmecochorous.

♦ **myrmecoclepsy** See symbiosis: myrmecoclepsy.

♦ **myrmecodomatium** See domatium: myrmecodomatium.

♦ **myrmecodomus** *adj.* Referring to a plant that affords shelter for ants (Lincoln et al. 1985).

♦ **myrmecocole** See -cole.

♦ **myrmecology** See study of: myrmecology.

♦ **myrmecophage** See -phage: myrmecophage.

♦ **myrmecophile** See ²-phile: myrmecophile.

♦ **myrmecophobia** See -phobia: myrmecophobia.

♦ **myrmecophobe** See -phobe: myrmecophobe.

♦ **myrmecophyte** *n.* An angiospermous plant that has an obligatory mutualistic relationship with ants (Wilson 1975, 589).

syn. myrmecoxenous plant (Lincoln et al. 1985)

♦ **myrmecosymbiosis** See symbiosis: myrmecosymbiosis.

♦ **myrmecotroph** See -troph-: myrmecotroph.

♦ **myrmecotropic, myrmecobromous** *adj.* Referring to plants and animals that provide food for ants (Lincoln et al. 1985).

♦ **myrmecoxenous, myrmecoxeny** See -xeny: myrmecoxeny.

♦ **mysophobia** See -phobia: mysophobia.

♦ **myxotrophic** See -trophic: myxotrophic.

n

- ♦ **n, N, *n*, *N*** See population size.
- ♦ **NAAG** See neurotransmitter: N-acetylaspartylglutamate.
- ♦ **N-acetylaspartylglutamate** See neurotransmitter: N-acetylaspartylglutamate.
- ♦ **NADP** See program: National Atmospheric Deposition Program.
- ♦ **NADP+, NADPH** See enzyme: nicotinamide adenine dinucleotide phosphate.
- ♦ **naive, naïve** *adj.*
 1. Referring to a person who has an unaffected, or simple, nature and who lacks worldly experience; candid; artless (Oxford English Dictionary 1972, entries from 1654); referring to an uninstructed person (Michaelis 1963).
 2. Referring to an animal that has no previous experience with a particular thing such as a parasite species (Lincoln et al. 1985) or with a particular kind of food; *e.g.*, a fledgling bird that has not eaten a certain insect species.
[French feminine of *naïf* < Latin *nativus*, natural, in-born]
- ♦ **Nakhla meteorite** See meteorite: Nakhla meteorite.
- ♦ **namaphile** See ¹-phile: namophile.
- ♦ **namatium** See ²community: nematium.
- ♦ **name** *n.* A word, or group of words, by which a class, concept, organism, or other thing is distinctly referred to; especially, the proper appellation of a person or family (Michaelis 1963).
Comment: According to a Chinese proverb: The beginning of knowledge is knowing the correct name for an object.
- ♦ **common name, English name** See name: non-scientific name.
- ♦ **nonscientific name (NN)** *n.* A colloquial, or vernacular, name of a taxon in any language (Lincoln et al. 1985); contrasted with scientific name (SN).
syn. colloquial name, common name, English name, vernacular name
Comments: Origin of NNs. People base NNs on almost any information about organisms including their behaviors, collection sites, colors, tactile sensations, geographical ranges, medical uses, shapes, sizes, speeds, and toxicities and also on people's names. For example, some early American colonists named many organisms after their resemblances to ones in Europe, even if they were taxonomically unrelated (*e.g.*, buttercup and American Robin). Some workers have heated arguments about the coinage of new NNs and which already coined NNs should be used

for a particular taxon (Miller 1992, 3). English names regarding taxa above the species level include apine, from Apinae; apid, Apidae; apoid, Apoidea; and hominid, Hominidae.

Importance of NNs. Nonscientific names for species and subspecies are important for many reasons including (1) governmental organizations and publishers often require both a NN and scientific name (SN) for an organism to increase the usefulness of a publication, (2) for convenience, students and others often prefer to use a NN name instead of a SN for an organism, and (3) conservation efforts benefit from use of NNs (Miller 1992, 3–4). For example, public support for butterfly-conservation efforts markedly increased when conservationists referred to species by their NNs instead of their SNs.

Confusion about organism names. Overall, both nonscientific English organism names (NEONs) and scientific English organism names (SEONs) cause confusion because there are millions of species, and many of the named organisms have more than one NEON, SEON, or both. For example, the butterfly species *Phyciodes tharos* has four subspecies with a total of 20 published NEONs (Miller 1992, 87). Another butterfly species *Coenonympha tullia* has 21 subspecies with a total of 45 NEONS (Miller 1992, 104–105).

Unnamed organisms. Researchers have not yet given most living organisms NNs and SNs. Many species are going extinct even before scientists discover them during the current human-caused mass extinction (= the Biodiversity Crisis); therefore, unfortunately, these undiscovered species will never be named, let alone be known to science.

Standardization of NEONs. There is no universal standard for NEONs; however, having one would reduce confusion and improve communication. I suggest the following actions as part of this standardization. (1) Establish the principal NEON for each taxon in a style that correctly reflects its taxonomy. (2) Capitalize separate words of NEONS because they are proper nouns. This results in names such as Aardvark, Honey Fungus, Marsh Violet, and Zorillo. Miller (1992) and many other books use this convention. (3) Indicate an organism's taxonomic group by joining, not joining, and hyphenating words of names. For example, these species names have separate words because they are taxonomic flies (Order Diptera): American Flower Fly, Blue Bot Fly, Dung Fly, and House Fly. These species names have "fly" joined with other words because they are names of animals that are not taxonomic flies: Betten's Silverstreak

Caddisfly, Black-winged Damselfly, Common Snout Butterfly, and Northeastern Sawfly. Many books and some organizations use this convention (e.g., Alden et al. 2007 and NatureServe, 2008). Shetler and Orli (2000, 2002) use this taxonomic-awareness rule for plants. For example, plant species that are taxonomic roses (*Rosa*) are written as Carolina Rose, Prairie Rose, and Swamp Rose. Plant species which are not taxonomic roses are written as Desert-rose, Guelder-rose, and Orchid Rockrose.

scientific name (SN) *n.* A formal Latin or Latinized name of a taxon; contrasted with a nomenclatural name (Lincoln et al. 1985).

cf. ²group (table for taxonomic names)

See hybrid under H for information about chimera and hybrid-organism names.

Comments: Importance of SNs. Scientific names are the major names that scientists use for designating taxa in their publications and are used by many people worldwide. Although many species have more than one SN, SNs are generally more stable than non-scientific names (NNs) (Justice and Bell 1968, xii). Current researchers publish SNs in the English alphabet regardless of the principal language of a publication. The Code of Botanical Nomenclature and the Code of Zoological Nomenclature fix the rules for coining, publishing, and revising SNs, but these Codes do not have rules for NNs.

Parts of SNs. A full species name comprises a capitalized generic name, noncapitalized specific epithet, species author(s), and year when the author(s) named the species in a scientific publication; e.g., *Calephelis borealis* (Grote and Robinson, 1866) (Northern Metalmark, a butterfly) and *Calopogon pulchellus* (Salis.) R. Br. (the Grass-pink, an orchid). A full subspecific name has a subspecific epithet in addition to the parts of a species name, e.g., *Anartia jatrophae guantanamo* Munroe, 1942 (White-peacock, a butterfly) in which the subspecific epithet is *guantanamo*. Depending on the style of a scientific publication, an author may include only parts of full scientific names. Publications that are not taxonomic ones usually do not include a taxon's author and year of designation. In animal names, the taxonomic author(s) [= authority(ies)] is in parentheses if a subsequent researcher(s) moved the species into a genus different than the one into which an earlier author(s) placed it. In plant names, researchers designate both the original author(s) and the author(s) who placed a species into a new genus. The original author(s) is in parentheses before the subsequent author. Researchers usually abbreviate authors' names, but it would seem less confusing to nonspecialists if the researchers wrote out these names fully as do Opler and Krizek (1984) and other books. The author names of the above-mentioned orchid are Salish. (= Richard Anthony Salisbury) and R. Br. (= Robert Brown). Schuler (1983) usually gives the full author name(s) for each plant species in his book. Named taxa often have more than one scientific name: an earlier published one(s) and a more (most) recently published one. Researchers should use the correct current published name for a taxon from a taxonomic treatise that specifically deals with this taxon.

Taxonomic names above the level of species. These names are capitalized, but not italicized, e.g., Archaea (domain), Animalia (kingdom), Chordata (phylum), Insecta (group), and Mammalia (order).

trinomial *n.* A subspecies' full scientific name comprising its generic, specific, and subspecific names in that order; e.g., *Nymphaea odorata odorata* (White Waterlily) and *Gorilla gorilla gorilla* (Lowland Gorilla) (Mayr 1982, 289).

Comments: Schlegel (1844) was the first author to employ trinomials routinely (Mayr 1982, 289).

♦ **nanander** See male: nanander.

♦ **nanism** *n.* An organism's being stunted or smaller than normal, or having restricted growth (Lincoln et al. 1985).

syn. dwarfism, microsomia

adj. nanoid

♦ **nanitic worker** See caste: worker: nanitic worker.

♦ **nannander** See male: nanander.

♦ **nano-, nanno-, nan-** *comb.f.*

1. Exceedingly, or abnormally, small; dwarf (Michaelis 1963).

2. A metric unit of measure multiplied by 10^{-9} (Michaelis 1963).

[Greek *nānos*, dwarf]

♦ **nanoid** See nanism.

♦ **nanoplankton** See plankton: nanoplankton.

♦ **naptonuon** See nuon: naptonuon.

♦ **narcotized startle** See startle: narcotized startle.

♦ **narcotropism** See tropism: narcotropism.

♦ **narrow-sense heritability** See heritability: heritability in the narrow sense.

♦ **Nasanov gland** See gland: Nasanov gland.

♦ **Nash equilibrium** See equilibrium: Nash equilibrium.

♦ **nasus** See organ: nasus.

♦ **nasute soldier** See caste: nasute soldier.

♦ **natal dispersal** See dispersal: natal dispersal.

♦ **natal-homing hypothesis** See hypothesis: turtle-homing hypotheses: natal-homing hypothesis.

♦ **natality** *n.*

1. Birth rate in a population (Oxford English Dictionary 1972, entries from 1880).

2. Production of new individuals by birth, germination, or fission (Lincoln et al. 1985).

syn. birth rate, natality rate (Lincoln et al. 1985)

cf. mortality

Comment: Natality is calculated per female or head of a population (Lincoln et al. 1985).

♦ **natatorial** See -orial: natatorial.

♦ **National Atmospheric Deposition Program** See program: National Atmospheric Deposition Program.

♦ **National Medal of Science** See award: National Medal of Science.

♦ **National Medal of Technology** See award: National Medal of Technology.

♦ **native species** See ²species: native species.

♦ **natural balance** See balance of nature.

♦ **natural birth control** See effect: Bruce effect.

♦ **Natural Conservation Act 1980** See law: Natural Conservation Act 1980.

♦ **natural experiment** See experiment: natural experiment.

♦ **natural extinction** See ²extinction: natural extinction.

♦ **natural group** See ²group: natural group.

♦ **natural history** *n.*

1. A work that deals with the properties of natural objects or organisms; a scientific account of any subject written on similar lines (Oxford English Dictionary 1972, entries from 1567).

2. Our sum of knowledge that relates to natural objects, etc., of a place, or the characteristics of a class of persons or things (Oxford English Dictionary 1972, entries from 1593).
3. The systematic study of all natural objects including minerals, organisms, and rocks (Oxford English Dictionary 1972, entries from 1662).
Note: “Natural history” is often now restricted to animals, and it frequently deals with them from a popular, rather than scientific, standpoint (Oxford English Dictionary 1972).
4. The study of the entire Universe (Diderot 1751 in Goldensohn 1999, 6).
5. An early stage in the development of a branch of science that involves labeling of phenomena and concepts and syntheses concerning tedious cross-referencing of differing sets of definitions and metaphors erected by the more imaginative thinkers (Wilson 1975, 574).
6. A pejorative term used for a study that is primarily observational and inconclusive compared to a conclusive, experimental one (Mayr 1982, 142–143).
7. Biology; ecology (Goldensohn 1999, 6).

♦ **natural language processing** See study of: natural language processing.

♦ **natural law** See law; law: natural law.

♦ **natural period** See period: natural period.

♦ **natural philosopher** *n.* One who studies the proximate causes by which divine religious laws manifest themselves in nature (Mayr 1982, 103).

cf. natural theology; study of: philosophy: natural philosophy

♦ **natural philosophy** See study of: philosophy: natural philosophy.

♦ **natural predator** See predator: natural predator.

♦ **natural selection** See selection: natural selection.

♦ **natural selection, law of** See ³theory: Fisher's fundamental theorem.

♦ **natural-stimulus model** See ³model: natural-stimulus model.

♦ **natural system** See ¹system: natural system.

♦ **natural theology, physcio-theology** *n.* The idea that the harmony and perfection of nature are evidence of God's existence and that the analysis of nature is the way to understand God's plan (Mayr 1982, 92, 103; C. K. Starr, pers. comm.).

See study of: natural theology.

cf. natural philosopher

♦ **naturalism** *n.*

1. A philosophical world view with implications for Humans' relations to the world that admits, or assumes, only natural forces, rather than supernatural or spiritual (Oxford English Dictionary 1972, entries from 1750).

2. One of the six main components of uniformitarianism that involved all changes in the Earth's geology after Creation which are due to (1) secondary (or nonsupernatural) causes, or (2) secondary causes with occasional divine interventions from the Creator (Mayr 1982, 376–378).

♦ **natural science** See study of: science: natural science (Michaelis 1963)

♦ **naturalist** *n.*

1. An adherent of, or believer in, naturalism, *q.v.* (Oxford English Dictionary 1972, entries from 1587).

2. A biologist (usually a zoologist, botanist, paleontologist, or zoologist) who works with whole organisms in natural environments, is interested in ultimate (evolutionary) causations, and particularly concerned with problems of diversity (Mayr 1982, 540–542).

Comment: Some post-Darwinian naturalists had erroneous ideas on the nature of inheritance and variation (Mayr 1982, 540–542).

♦ **naturalistic fallacy** See fallacy: naturalistic fallacy.

♦ **naturalistic observation** See observation: naturalistic observation.

♦ **nature** *n.*

1. “The material world and its phenomena” (Morris 1982, 832).
2. The biochemical, biophysical, evolutionary, geological, and other processes that control all of the material-world phenomena (Morris 1982, 832; Maller et al. 2005, 46).
3. The world of living organisms and the outdoors (Morris 1982, 832).
4. An organic environment (ranging from gardens, farms, and parks through wilderness) where the majority of organic processes are present (*e.g.*, birth, death, species interrelationships with and reactions to their environments) (after Maller et al. 2005, 46).
5. Any single element of a natural environment, *e.g.*, air, animals, plants, soil, or water) (Maller et al. 2005, 46).

Note: In this definition, organisms include companion and domestic animals and potted plants (Maller et al. 2005, 46).

[Middle English, essential properties of a thing < Latin *natura* < *nasci*, to be born]

♦ **Nature Conservation and Amenity Lands (Northern Ireland) Order 1985** See law: Nature Conservation and Amenity Lands (Northern Ireland) Order 1985.

♦ **Nature Deficit Disorder** See disease: Nature Deficit Disorder.

♦ **nature versus nurture** *n.* The amount of phenotypic variation that an organism possesses that is related to its genetic makeup (nature) compared to its environmental influences (nurture) [coined by Francis Galton (Mayr 1982, 781)].

syn. environment versus heredity

cf. -genesis: epigenesis; twin: identical twin

Comment: Ascertaining the relative magnitudes of the effects of nature and nurture on a particular behavior may not be possible.

♦ **NatureServe** See database: NatureServe.

♦ **Naturphilosophie** See study of: philosophy: natural philosophy.

♦ **navigation** See taxis: navigation.

♦ **NDD** See disease: Nature-deficit Disorder.

♦ **N_e** See population size: effective population size.

♦ **nealogy** See study of: nealogy.

♦ **neanic** *adj.*

1. Referring to the larval phase that precedes an adult (Lincoln et al. 1985).
2. Referring to a character that first appeared, in evolution, in early ontogenetic stages (Lincoln et al. 1985).

cf. ephebic

♦ **neck bite** See bite: neck bite.

♦ **neck-over-neck diving** See behavior: dive: neck-over-neck diving.

- ♦ **necro-, necr-** *comb. f.* “Corpse; the dead; death” (Michaelis 1963).
[Greek *neckros*, corpse]
- ♦ **necrocoenosis** See -coenosis: necrocoenosis.
- ♦ **necrocoleopterophile** See ²-phile: necrocoleopterophile.
- ♦ **necrogenous** See -genous: necrogenous.
- ♦ **necrogeography** See study of: geography.
- ♦ **necrology** See study of: necrology.
- ♦ **necrophage** See -phage: necrophage.
- ♦ **necrophile** See ¹-phile: necrophile.
- ♦ **necrophilia** See -philia: necrophilia.
- ♦ **necrophobia** See -phobia: necrophobia.
- ♦ **necrophoresis** *n.* In some social-insect species: An individual’s transporting a dead member of its colony away from its nest (Wilson 1975, 589).
Comment: This is a highly developed, stereotyped behavior in ants (Wilson 1975, 589).
- ♦ **necrophoric behavior** See behavior: necrophoric behavior.
- ♦ **necrophytophage** See -phage: necrophytophage.
- ♦ **necrotrophic symbiosis** See symbiosis: necrotrophic symbiosis.
- ♦ **necrotype** See -type, type: necrotype.
- ♦ **nectar** *n.* A plant-produced sugary solution that is consumed by many kinds of animals, many of which are pollinators (Michaelis 1963).
Comments: Plants produce nectar in extrafloral and floral nectaries. Nectar contains amino acids, antioxidants, lipids, sugars, and other compounds (Buchmann and Nabhan 1996, 250). It varies greatly in sugar concentration. Nectar is the main raw material from which bees make honey, *q.v.*
[Greek *nekter*; the drink of the gods]
- ♦ **nectar corridor** *n.* A series of different plants that offer abundant nectar seasonally along an annual migration pathway, *e.g.*, the bat-pollinated cacti and century plants in Mexico and southwestern U.S. (Buchmann and Nabhan 1996, 250).
- ♦ **nectar flow** *n.* A time of nectar production in a particular habitat (Johansen 1977, 181).
- ♦ **nectar robber** See robber.
- ♦ **nectariferous** *adj.* Referring to a nectar-producing plant (Lincoln et al. 1985).
- ♦ **nectarivore** See -vore: nectarivore.
- ♦ **nectary** *n.* A specialized plant gland that produces nectar, *q.v.* (pers. obs.).
See nectary: floral nectary.
- ♦ **extrafloral nectary** *n.* A nectary on a plant’s vegetative part, *e.g.*, a leaf or stem.
- ♦ **floral nectary** *n.* An area of a flower that produces nectar (Usher, 1996, 246).
syn. nectary (Buchmann and Nabhan 1996, 250)
Comments: Floral nectaries are often at the base of an innermost floral tube where nectar forms a pool (Buchmann and Nabhan 1996, 250).
- ♦ **nectism** See swimming: nectism.
- ♦ **nectobenthic** See benthic: nectobenthic.
- ♦ **nectobenthos** See ²community: benthos: nectobenthos.
- ♦ **nectogenic** See -genic: nectogenic.
- ♦ **necon** See nekton.
- ♦ **need** *n.*
1. Something that a person requires; a necessity (Oxford English Dictionary 1972, entries from 900).
 2. A construct representing a force in a person’s brain that directs and organizes his perception, thinking,

- and action, so as to change an existing, unsatisfying situation (based on Murray in Wolman 1973, 250).
3. An individual organism’s lacking, wanting, or requiring something that if present would benefit it “by facilitating its behavior or satisfying a tension” (Wolman 1973, 250).
syn. drive (Murray in Wolman 1973, 250)
v.i., v.t. need
cf. drive
Comments: “Requirement” seems to sound less anthropomorphic than “need” when used with nonhuman organisms. Some common essential needs in Humans (Murray in Wolman 1973, 250) follow.
- ♦ **abasement** *n.* One’s accepting criticism, punishment, or both; admitting blame, error, inferiority, or a combination of these things; or passively submitting to external forces.
- ♦ **achievement** *n.* One’s independent mastering of ideas, objects, other persons, or a combination of these things to increase self-esteem by successful exercise of one’s talent.
- ♦ **affiliation** *n.* One’s drawing near, cooperating with, and remaining near to another person whom one sees as similar to oneself and a friend.
cf. affiliation (under A)
- ♦ **aggression** *n.* One’s fighting, injuring, opposing, or punishing another person or a combination of these things.
- ♦ **autonomy** *n.* One’s unattachedness, unrestrictedness, and independence.
- ♦ **counteraction** *n.* One’s overcoming failure and weakness through resumed action and repression of fear.
- ♦ **defendance** *n.* One’s defending oneself against assault, blame, criticism, or a combination of these things, and justifying or concealing an error, a failure, humiliation, or a combination of these things.
- ♦ **deference** *n.* One’s admiring, honoring, praising, or supporting a superior and conforming to custom or showing a combination of these things.
- ♦ **dominance** *n.* One’s influencing, or controlling, others’ behavior.
- ♦ **exhibition** *n.* One’s impressing others.
- ♦ **harm avoidance** *n.* One’s avoiding death, illness, injury, pain, or a combination of these things.
- ♦ **infavoidance** *n.* One’s avoiding humiliation.
- ♦ **nurturance** *n.* One’s comforting, gratifying, healing, protecting, or supporting, the needs of helpless persons or a combination of these things.
- ♦ **order** *n.* One’s arranging, balancing, or organizing objects in one’s environment or a combination of these things.
- ♦ **play** *n.* One’s seeking enjoyment and relaxation generally without further purpose.
- ♦ **rejection** *n.* One’s separating oneself from a negative object.
- ♦ **sentience** *n.* One’s seeking and enjoying sensuous impressions.
- ♦ **sex** *n.* One’s forming and pursuing an erotic relationship.
- ♦ **succorance** *n.* One’s being gratified by an allied object and always having support and protection.
- ♦ **understanding** *n.* One’s questioning, answering, speculating, formulating, analyzing, and generalizing.

♦ **negation** *n.*

1. A person's denying or making a statement that involves the use of "no," "not," "never," etc. (Oxford English Dictionary 1972, entries from 1530).
2. A person's rejecting, or negating, with the use of nonverbal communication, *e.g.*, throwing his head up and back with eyes closed (in Greece, Turkey, and many Arab countries of the Near East) or one's shaking his head laterally (Western Europe) (Heymer 1977, 190).

♦ **negative-assortative mating** See mating: negative-assortative mating.

♦ **negative-binomial distribution** See distribution: binomial distribution: negative-binomial distribution.

♦ **negative conditioning** See learning: conditioned learning: negative conditioning.

♦ **negative eugenics** See eugenics: negative eugenics.

♦ **negative evidence** *n.*

1. No found significant statistical effect (pers. obs.).
Note: This is an inconclusive result because a different avenue of investigation could reveal an effect in question.
2. No particular found phenomenon (pers. obs.).
Note: This is an inconclusive result because further work could discover the phenomenon.

♦ **negative example** *n.* An example based on negative evidence.

♦ **negative feedback** See feedback: negative feedback.

♦ **negative photophobotaxis** See taxis: photophobotaxis: negative photophobotaxis.

♦ **negative reinforcement** See reinforcement: negative reinforcement.

♦ **negative reinforcer** See reinforcer: negative reinforcer.

♦ **negative rheotaxis** See taxis: rheotaxis: negative rheotaxis.

♦ **negative skewness** See skewness: negative skewness.

♦ **negative thermotropism** See -tropism: thermotropism: negative thermotropism.

♦ **negentropy** See entropy: negentropy.

♦ **negotiation** *n.*

1. A person's interaction, or making a treaty, with another person to obtain, or bring about, some result, especially in affairs of state (Oxford English Dictionary 1972, entries from 1579).
2. A person's action, or business, of negotiating, or making terms, with another person (Oxford English Dictionary 1972, entries from 1614).
3. Individual animals' behavior that involves their "attempting to control" each other's behavior, adapting one animal's behavior to that of the other animal, or both (Hinde 1985, 989).

♦ **neidioplankton** See plankton: neidioplankton.

♦ **neighbor-joining method** See method: neighbor-joining method.

♦ **neighbor-modulated fitness** See fitness: inclusive fitness.

♦ **neighbor recognition** See recognition: neighbor recognition.

♦ **neighborhood** *n.* In population genetics, the area around an individual that contains the source(s) of gametes that produced that individual (Lincoln et al. 1985).

♦ **neighboringly sympathetic** See -patric: sympathetic: neighboringly sympathetic.

♦ **neighboringly-sympathetic population** See ¹population: neighboringly-sympathetic population.

♦ **necrophytophage** See -phage: necrophytophage.

♦ **nekto-** See benthic: nektobenthic.

♦ **nekto-****benthos** See ²community: benthos: nektobenthos.

♦ **nekto-****genic** See -genic: nectogenic.

♦ **nekton** *n. pl.* Marine animals of open water that are capable of swimming freely, relatively independently of currents and waves and that range in size from micro-organisms through whales, typically 20 mm through 20 m long (Michaelis 1963; Lincoln et al. 1985).
syn. necton

cf. neuston, plankton, pleuston

Comments: Because Lincoln et al. (1985) call nekton "pelagic organisms," they imply that nekton are both marine and fresh-water organisms. They indicate that nekton are divided into "centimeter nekton," "decimeter nekton," and "meter nekton." Ali and Lord (1980) refer to "nektonic organisms" and "nectonic invertebrates" which they collected from fresh-water ponds. [New Latin < Greek *nēktos*, neuter *nēkton*, swimming]

♦ **nematodology, nematology** See study of: nematology.

♦ **nemericole** See -cole: nemericole.

♦ **nemorose, nemoricolous** *adj.* Referring to an organism that lives in open woodlands (Lincoln et al. 1985).

♦ **Nemesis** *n.*

1. "In Greek mythology, the goddess of retributive justice or vengeance" (Michaelis 1963).
2. A hypothesized companion star of the Sun that might be responsible, at least in part, for mass extinctions on Earth (Strickberger 1990, 355).
[Greek *Nemesis*]

♦ **neo-** *comb. f.* "New; recent;" a modern, or modified, form of (Michaelis 1963). Also ne- before vowels.
[Greek *neos*, new]

♦ **neo-Adansonism** See study of: systematics: phenetic systematics.

♦ **neobiogenesis** See -genesis: neobiogenesis.

♦ **neobiogeography** See study of: geography: biogeography: neobiogeography.

♦ **neobiont** See biont: neobiont.

♦ **neo-Darwinian evolution, Neo-Darwinian theory** See evolutionary synthesis.

♦ **neo-Darwinism, neo-Darwinist** See Darwinism: neo-Darwinism.

♦ **neoendemic** See ¹endemic: schizoendemic: neoendemic.

♦ **neofemale** See female: neofemale.

♦ **neogamy** See -gamy: neogamy.

♦ **neotechnology** See study of: neotechnology.

♦ **neo-Lamarckian** See Lamarckian: neo-Lamarckian.

♦ **neo-Lamarckian evolution** See ²evolution: neo-Lamarckian evolution.

♦ **neologism** *n.* A new term, or expression, that some people disapprove of because of its novelty or barbarousness (Lincoln et al. 1985).

♦ **neomorph, neomorphic allele** See allele: neomorphic allele.

♦ **neomorphosis** See -morphosis: neomorphosis.

♦ **neontology** See study of: neontology.

♦ **neophobia** See -phobia: neophobia.

♦ **neoschizoendemic** See ¹endemic: schizoendemic: neoschizoendemic.

♦ **neoteinic** *adj.* Referring to being a supplementary reproductive termite, *e.g.*, neoteinic reproductive (Wilson 1975, 589).
See caste: neoteinic.

♦ **neoteny, neotenia, neotenia, neoteny** See ¹heterochrony: neoteny.

♦ **nepotism** *n.*

1. A Pope's, or other ecclesiastic's, showing special favors to nephews, or other relatives, in conferring offices; unfair preferment of nephews, or other relatives, to other qualified persons (Oxford English Dictionary 1972, entries from 1670).
2. For example, in Acorn Woodpeckers, Belding's Ground Squirrels, Lions, some paper-wasp and sweat-bee species, a prairie-dog species, and some primate species including Humans: An individual's favoring, or investing in, its kin over nonkin, or certain categories of kin over other categories (Alexander 1974 in Hoogland 1986, 263; Wilson 1987, 11; Fletcher 1987, 23).
3. An individual animal's (sociobiological) altruism towards close kin, including offspring (Immelmann and Beer 1989, 13).

cf. altruism; altruism: kin altruism, parental altruism

Comments: Alexander (1974 in Fletcher 1987, 23) also includes favoring offspring and assisting mates as part of "nepotism." A few authors use "nepotism" in preference to "altruism" where it is appropriate to do so.
[Latin *nepotismo*, bestowal of patronage upon the "nephew" of Vatican officials in Renaissance Rome]

♦ **neritopelagic** See pelagic: neritopelagic.

♦ **nerve impulse** See potential: action potential.

♦ **nerve net** *n.*

1. An anatomically dispersed system "of neurons, so connected that excitation can spread through some considerable number of neurons in any direction and diffusely, bypassing incomplete cuts" (Bullock and Horridge 1965, 288 in Brown 1975, 470).
2. For example, in Cnidaria, Echinodermata, Hemichordata: A group of neurons, often occurring in a sheet, which have a low degree of organization and structural diversity (Brown 1975, 470).

cf. ¹system: nervous system

♦ **nerve spike** See potential: action potential.

♦ **nervicole** See -cole: nervicole.

♦ **nervous system** See ²system: nervous system.

♦ **nest** *n.*

1. The structure made, or a place selected, by a female bird in which to lay her eggs and that serves as a shelter for her unfledged young (Oxford English Dictionary 1972, entries from 950).

Note: This concept of a "nest" is now used for many kinds of animals, including some insect, fish, and reptile, most bird, and probably all mammal species.

2. A place where a person rests or resides; a lodging, shelter, bed, etc., especially of a secluded, or comfortable nature; a snug retreat (Oxford English Dictionary 1972, entries from 1000).

3. In some insect and mammal species: The place, or structure, used by a female as an abode or lair, in which she deposits her eggs, spawn, or young (Oxford English Dictionary 1972, entries from 1386).

Note: This concept of nest is now known to be relevant to many kinds of animals in addition to insects

and mammals. Social animals have nests occupied by colonies.

See ²group: nest.

v.i., v.t. nest

Comment: Some animals also incubate their eggs, keep their young, spend significant parts of their lives in other activities, or a combination of these activities in their nests (Immelmann and Beer 1989, 199). Larvae of some insect species including *Hyphantria cunea* (Fall Webworm) and *Malacosoma americanum* (Eastern Tent Caterpillar) make silken group nests in which they reside. Silken nests of *M. americanum* often occur on *Prunus serotina* (Wild Black Cherry) as occurred in a New Jersey forest, U.S. (fig. 29). Three larvae are resting on the outside of the nest.

♦ **bubble nest** *n.* In *Betta splendens* (Siamese Fighting Fish), *Macropodus opercularis* (Paradise Gourami), and other gourami spp.: A nest of bubbles made by a male that is used as a place in which a female lays her eggs and where young fry might rest (Immelmann and Beer 1989, 200).

♦ **compound nest** *n.* A nest that contains colonies of two, or more, species of social insects, "up to the point where the galleries of the nest run together and the adults sometimes intermingle but in which the broods of the species are still kept separate" (Wilson 1975, 354, 581).

♦ **formicarium, formicary** *n.*

1. An ant's nest (Hölldobler and Wilson 1990, 638).
2. An ant mound, or an artificial nest used to house ants in a laboratory (Hölldobler and Wilson 1990, 638).

♦ **mixed nest** *n.* A nest containing a mixed colony, *q.v.* (Wilson 1975, 589).

♦ **sleep nest** *n.* In *Pan troglodytes* (Chimpanzees) and many songbird species: A nest used for sleeping rather than for rearing young (Immelmann and Beer 1989, 273).

♦ **spittle nest** *n.* The frothy mass that envelopes one, or more, spittle-bug larvae which feed on a plant's xylem fluid (Torre-Bueno 1989, 698).

Comments: The mass itself is called "spittle." It is derived from anal excretion and a mucilaginous substance secreted by abdominal epidermal glands of spittle-bug larvae (Borrer et al. 1989, 325). Spittle reduces ant predation of spittle bugs (Henderson et al. 1990, 50; Nachappal et al. 2006, 1711). A spittle bug can eliminate its ammonia waste through excreting it into the spittle from which the ammonia volatilizes (Turner 1994, 679). Spittle bugs produce nests on *Euphorbia corollata* (Flowering Spurge) in prairies in Wisconsin, U.S. (fig. 30).

♦ **termitarium** *n.*

1. A termite nest (Wilson 1975, 597).
2. An artificial nest used in the laboratory to house termites (Wilson 1975, 597).

♦ **wasp nest** *n.* A structure used and modified (*e.g.*, a hollow stem), or completely built (*e.g.*, a burrow in the ground or a paper nest), by one, or more, conspecific individuals (Balduf 1954; Evans and West Eberhard 1970; Spradbery 1973).

Comment: Some parts of vespid-wasp nests follow.

► **cell** *n.* An elongated, paper chamber, with a hexagonal cross section, in which a female vespid wasp lays an egg and a larva develops into an adult (Balduf 1954, 445; Evans and West Eberhard 1970, 134–136; Torre-Bueno 1978).

- Comment:* “Worker cells” and “queen cells” are illustrated by Spradbery (1973, 99).
- **comb** *n.* A group of attached cells of a vespid-wasp nest (Balduf 1954, 445; Evans and West Eberhard 1970, 164; Spradbery 1973, 99). See comb under C.
- **cupola, dormer** *n.* In *Dolichovespula maculata* (Bald-faced Hornet): A dome-shaped sheath that workers build over the top of their nest (Balduf 1954, 446).
- **envelope** *n.* The shell of paper around the comb(s) of a vespid-wasp nest (Balduf 1954, 445; Evans and West Eberhard 1970, 166; Spradbery 1973, 99).
- **pedicel** *n.* The central supporting pillar at the top of a vespid-wasp nest (Evans and West Eberhard 1970, 181).
syn. main nest pillar (Spradbery 1973, 99), suspensorium (Balduf 1954, 450)
cf. pedicel
- ◆ **nest aggregation** See aggregation.
- ◆ **nest-brooding** See brooding: nest-brooding.
- ◆ **nest-cleaning behavior** See behavior: nest-cleaning behavior.
- ◆ **nest commensalism** See symbiosis: commensalism.
- ◆ **nest odor** See odor: nest odor.
- ◆ **nest parasitism** See parasitism: nest parasitism.
- ◆ **nest provisioning** See provisioning: nest provisioning.
- ◆ **nest relief** *n.* In some monogamous-fish species, many bird species: One pair member's taking over egg incubation, or chick brooding from the other (Immelmann and Beer 1989, 201).
- ◆ **nesting** *n.* A species' nest-use characteristics.
joint nesting *adj.* In many bird species including *Crotophaga sulcirostris* (Groove-billed Ani): Referring to a nesting system in which two, or more, conspecific females normally lay their eggs in the same nest (Skutch 1959, 302, in Brown 1987, 21, 304).
cf. nesting: separate nesting
Comment: The term “joint nesting” is independent of a species' breeding system (Brown 1987, 304).
- separate nesting** *adj.* In many bird species including *Melanerpes cruentatus* (Red-fronted Woodpeckers): Referring to a nesting system in plural breeding species in which each breeding female has her own nest (Brown 1987, 21–22, 306).
cf. nesting: joint nesting
- ◆ **nesting association** *n.*
1. In some bird species: Members' of one species nesting close to those of another species (Immelmann and Beer 1989, 200–201).
 2. A bird's nesting in a termite, or ant, nest (Immelmann and Beer 1989, 201), *e.g.*, the Indian Ant Woodpecker's nesting in an ant nest (Linsenmaier 1972, 357).
 3. An insect's living in a bird nest (Immelmann and Beer 1989, 201).
 4. A bird's using a building as a nesting site (Immelmann and Beer 1989, 201).
- ◆ **nesting symbol** *n.* In many bird species: A piece, or bunch, of nesting material (*e.g.*, grass blades, leaves, pebbles, twigs, or straw) that a male presents, or shows, to a female, often with accompanying body, or head, movements, prior to, or during, mating (Immelmann and Beer 1989, 201).
- ◆ **nestling** *n.* A young bird that is not yet old enough to leave its nest (Oxford English Dictionary 1972, en-
- tries from 1399), contrasted with a fledgling, a young bird that has recently left its nest.
- ◆ **nidicolous nestling** *n.* In many bird species (*e.g.*, Passeriforms): An altricial chick that remains in its nest for some time after hatching and receives food and warmth from its parents while it is in its nest (Immelmann and Beer 1989, 203).
cf. -cial: altricial; nestling: nidifugous nestling
- ◆ **nidifugous nestling** *n.* In many bird species (*e.g.*, Galliforms): A precocial chick that hatches at a relatively advanced developmental stage and can actively follow its parent, or parents, shortly after hatching and feed itself (Immelmann and Beer 1989, 203).
cf. -cial: altricial; nestling: nidicolous nestling
- ◆ **Net** See Internet.
- ◆ **net assimilation** See ²production: net-primary productivity.
- ◆ **net-expected benefit** See benefit: expected benefit: net-expected benefit.
- ◆ **net-primary productivity, net-primary production** See ²production: net-primary productivity.
- ◆ **net-reproductive rate, R₀** See rate: net-reproductive rate.
- ◆ **neural imprinting** See learning: imprinting: neural imprinting.
- ◆ **neural inhibition** See inhibition: neural inhibition.
- ◆ **neuroembryology** See study of: embryology.
- ◆ **neuroendocrine cell** See cell: neuroendocrine cell.
- ◆ **neurendocrine system, neuroendocrine system** See ²system: neurendocrine system.
- ◆ **neuroendocrinology** See study of: endocrinology.
- ◆ **neuroethology** See study of: ³ethology: neuroethology.
- ◆ **neurohormone** See hormone: neurohormone.
- ◆ **neurohumor** See hormone: neurohormone.
- ◆ **neurohypophysis** See gland: pituitary gland.
- ◆ **neuron** See cell: neuron.
- ◆ **neuronal adaptation** See ³adaptation: ¹physiological adaptation: sensory adaptation.
- ◆ **neuropeptide Y** See hormone: neuropeptide Y.
- ◆ **neurophysiology** See study of: physiology: neurophysiology.
- ◆ **neurosecretion** See secretion: neurosecretion.
- ◆ **neurotransmitter, neural transmitter** *n.* A substance that is released upon stimulation of a neuron at a nerve ending (with a synapse) and that aids in stimulus transmission by means of changes in the cell's membrane permeability (von Muralt 1939 in Heymer 1977, 26).
syn. transmitter substance (Immelmann and Beer 1989, 318)
Comment: Bradford (in Gregory and Zangwill 1987, 554) lists 48 neurotransmitters, putative neurotransmitters, and neuroactive peptides in six systems.
- acetylcholine** *n.* In Vertebrates: A neurotransmitter secreted from central nervous systems, peripheral nervous systems, and neuromuscular junctions that excites skeletal muscles and both excites and inhibits other sites (Campbell 1999, 975).
- aspartate** *n.* In Vertebrates: An amino-acid neurotransmitter secreted from central nervous systems that is excitatory (Campbell 1999, 975).
- dopamine** *n.* In Vertebrates: A biogenic-amine neurotransmitter secreted from central nervous systems and peripheral nervous systems that is excitatory

at most sites, and inhibitory at other sites (Campbell 1999, 975).

gamma-aminobutyric acid (GABA) n. In some invertebrate species and Vertebrates: An inhibitory, amino-acid neurotransmitter secreted from vertebrate central nervous systems and invertebrate neuromuscular junctions (Campbell 1999, 975).

glutamate n. In some invertebrate species and Vertebrates: An excitatory, amino-acid neurotransmitter secreted from vertebrate central nervous systems and invertebrate neuromuscular junctions (Campbell 1999, 975).

glycine n. In Vertebrates: An amino-acid neurotransmitter secreted from central nervous systems that is inhibitory (Campbell 1999, 975).

met-enkephalin n. In Vertebrates: A neuropeptide neurotransmitter secreted from central nervous systems that is generally inhibitory (Campbell 1999, 975).

N-acetylaspartylglutamate (NAAG) n. In many animal species: An acidic dipeptide neurotransmitter (Neale et al. 2000, 443).

Comments: Researchers found NAAG in some species of cockroaches, frogs, planarians, and sea anemones; *Bos primigenius* (Domestic Cattle), *Carassius auratus auratus* (Goldfish), *Cavia porcellus* (Guinea-pigs), *Cyprinus carpio* (Common Carp), *Equus ferus caballus* (Domestic Horses), *Gallus gallus* (Domestic Chickens), Humans, *Oryctolagus cuniculus* (Domestic Rabbits), *Rattus norvegicus* (Norway Rats), and *Sus scrofa domestica* (Domestic Pigs) (Blakely and Coyle 1998, 46–47). NAAG is the most prevalent and widely-distributed peptide neurotransmitter in mammalian nervous systems (Neale et al. 2000, 443).

norepinephrine n. In Vertebrates: A biogenic-amine neurotransmitter secreted from central nervous systems and peripheral nervous systems that both excites and inhibits receptor sites (Campbell 1999, 975).

serotonin n. For example, in Vertebrates: A biogenic-amine neurotransmitter secreted from central nervous systems that is generally inhibitory (Campbell 1999, 975).

substance P n. In Vertebrates: A neuropeptide neurotransmitter secreted from central nervous systems and peripheral nervous systems that is excitatory (Campbell 1999, 975).

♦ **neuston, neustont n. pl.** Small- through medium-sized organisms that live on, or under, the surface films of water (Lincoln et al. 1985); e.g., the Portuguese Man-of-war or marine and freshwater water-striders (insects) (Baker et al. 1966).

adj. neustonic

cf. nekton, pleuston, plankton

epineuston, supraneuston n. pl. Neuston that live on the surface films of water (Lincoln et al. 1985).

adj. epineustic.

hyponeuston, infraneuston n. pl. Neuston that live immediately below a water surface (Lincoln et al. 1985).

► **planktohyponeuston n. pl.** Plankton that congregate immediately below a water surface at night and migrate downward during the day (Lincoln et al. 1985).

► **merohyponeuston n. pl.** Organisms that spend only part of their life cycles in the hyponeuston (Lincoln et al. 1985).

meroneuston, meroneustont n. pl. Organisms that spend only part of their life cycles in the neuston (Lincoln et al. 1985).

phytoneuston, phytoneustont n. “The plant component of neuston” (Lincoln et al. 1985).

planktohyponeuston See neuston: hyponeuston.

supraneuston See neuston: epineuston.

♦ **neustonology** See study of: neustonology.

♦ **neuter adj.** Referring to an organism that is of neither sex or with imperfectly developed sex organs (Lincoln et al. 1985).

♦ **neutral allele** See allele: neutral allele.

♦ **neutral association** See neutralism.

♦ **neutral equilibrium** See equilibrium: neutral equilibrium.

♦ **neutral introgession** See introgession: neutral introgession.

♦ **neutral marker, neutral molecular marker** See marker: neutral marker.

♦ **neutral mutation** See ²mutation: neutral mutation.

♦ **neutral object** See object: neutral object.

♦ **neutral theory** See ³theory: neutral theory.

♦ **neutralism, neutral association n.**

1. An association between two species in which the population dynamics of each are unaffected by the presence of the other population (Lincoln et al. 1985).

2. “The absence of any interaction between two associated populations” (Lincoln et al. 1985).

See symbiosis: parasymbiosis; ³theory: the neutral theory.

♦ **neutron star** See star: neutron star.

♦ **new synthesis** See evolutionary synthesis.

♦ **new systematics** See study of: systematics: population systematics.

♦ **nexus hypothesis** See hypothesis: nexus hypothesis.

♦ **nibble preening** See preening: nibble preening.

♦ **niche** (NEESH, NITCH, NICH) *n.*

1. A shallow, ornamental recess, or hollow, formed in a building wall, usually made for a statue or other object (Oxford English Dictionary 1972, entries from 1611); figurative: a place, or position, adapted to the character, or capabilities, or suited to the merits of a person or thing (Oxford English Dictionary 1972, entries from 1726).

2. An organism's place in nature (Johnson 1910 in Griesemer 1992, 232).

3. An organism's place, or role, in an environment (Grinnell and Swarth 1913 and Grinnell 1914, 1917, 1924, 1928 in Griesemer 1992, 232).

Note: Lewontin (2000, 44) discusses the metaphor of an ecological niche as a kind of space that is filled by a species.

syn. ecologic niche, environmental niche (Grinnell in Griesemer 1992, 233); habitat niche (Griesemer 1992, 235)

Notes: Many textbooks call this kind of niche concept the “habitat niche” and Elton’s idea of niche (def. 5), the “functional niche;” however, both definitions consider both habitat and function (Griesemer 1992, 235). Colwell (1992, 241) calls Grinnell’s and Elton’s niche concepts the “environmental niche concept.”

4. A subdivision of a habitat (Grinnell 1917 in Krebs 1985, 255).

5. An organism's place, or role, in a community (Elton, 1924, 1927, 1946 in Griesemer 1992, 232).

syn. functional niche (Griesemer 1992, 235)

6. A unit whose limits are set by factors such as food supply, shelter (including refugia from enemies and safe breeding places), competition, parasitism, temperature, humidity, rainfall, insolation, and soil characteristics (Grinnell 1917, 1928 in Griesemer 1992, 232).
7. The multidimensional space that represents the total range of conditions within which a species can function and which it could occupy in the absence of competitors or other interacting species (Hutchinson 1958 in Krebs 1985, 255; Lincoln et al. 1985); “the space framed by the limits of each environmental parameter within which the species in question can exist and reproduce” (Wilson 1975, 25); “the range of each environmental variable, such as temperature, humidity, and food items, within which a species can exist and reproduce” (Wilson 1975, 590); the fundamental niche.
syn. ecospace, preinteractive niche, prospective ecospace (Lincoln et al. 1985); fundamental niche (Griesemer 1992, 238–239); niche (Krebs 1985, 255); population-niche concept [coined by Colwell 1992, 242]

Notes: Hutchinson described the fundamental niche in terms of two, or more, variables; four, or more, variables make an *n*-dimensional hypervolume (Krebs 1985, 255). Hutchinson credits Robert MacArthur for the concept of fundamental niche (Griesemer 1992, 238). This concept views niche as an attribute of a population, or species, in relation to its environment (Colwell 1992, 241).

8. Loosely, the microhabitat (physical space) occupied by a species (Lincoln et al. 1985).

cf. biospace; niche: realized niche; principle: competitive-exclusion principle

Comments: Grinnell indicated that niches are unique, thus only one species can occupy a particular niche; Elton, in viewing the concept of niche from a functional perspective, suggested that the same niche could be filled by distinct (but often closely related) species in different communities (Griesemer 1992, 235). A species' niche can change in ecological and evolutionary time when it adds and deletes variables, changes ranges of one or more variables, or both. Niche has been an important organizing idea in ecology, although criticized by some workers. Modern niche theory focuses on species' actual resource-utilization distributions rather than their permissive ranges of environmental conditions (Levins 1966, 1968; MacArthur and Levins 1967; etc., in Griesemer 1992). Colwell (1992) lists many references that review the niche concept; the literature does not agree on many issues. The pronunciation NITCH is common in the U.S. NEESH is the original French pronunciation, used by some people in the U.S.

[probably from French < *nicher*, to nest, ultimately < Latin *nidus*, nest; introduced by Joseph Grinnell, ecologist (1913 in Griesemer 1992, 233)]

ecospace See niche (def. 7).

empty niche See niche: vacant niche.

fundamental niche See niche (def. 7).

included niche *n.* A niche of a more specialized species that occurs entirely within the niche of a more generalized species (Lincoln et al. 1985).

postinteractive niche See niche: realized niche.

preferred niche *n.* The portion of a Hutchinsonian hyperspace in which an organism's fitness is maximum and to which laboratory animals usually also

move if given a choice along a series of environmental gradients (Wilson 1975, 25).

Comment: An organism's preferred niche can differ from its realized niche, *q.v.* (Wilson 1975, 25).

preinteractive niche, prospective ecospace
See niche (def. 7).

realized niche *n.* “The range of all environmental conditions, including microclimatic regimes and resource characteristics, actually occupied or utilized by a species;” a subset of fundamental niche (Wittenberger 1981, 620).

syn. biospace, postinteractive niche, realized ecospace (Lincoln et al. 1985)

Comment: A species' realized niche is the part of its fundamental niche that does not overlap with that of other species plus the overlapping part in which the species can persist by excluding its competitors (Griesemer 1992, 238).

spatial niche *n.* The spatial parameters of a realized niche (Lincoln et al. 1985).

vacant niche *n.* A role in a community that is available to, but not occupied by a species (Grinnell 1914; Taylor 1916; etc. in Colwell 1992, 242).

syn. empty niche (Griesemer 1992, 238)

Comment: The hypothesis that a vacant niche (apart from the kind resulting from a recent extinction of a population or species) exists in nature is extremely difficult to test because it is virtually unfalsifiable even in the best cases; nonetheless, popular writers and some recent scientific papers consider vacant niches to occur in nature (Colwell 1992, 245).

♦ **niche breadth** *n.* The upper and lower limits of a given niche parameter (one axis of a niche hyperspace), or the range of a parameter in which a species can function (Lincoln et al. 1985).

Comment: Gould (1982, 338) suggests that “niche width” represents an organism's degree of specialization.

♦ **niche diversification** See character displacement.

♦ **niche-diversification hypothesis** See hypothesis: hypotheses of species richness: niche-diversification hypothesis.

♦ **niche expansion** See ecological release.

♦ **niche overlap** *n.*

1. Direct competition for a given resource by two, or more, species (Lincoln et al. 1985).

2. Co-occurrence of two, or more, niches along all, or part, of the same resource axis of a niche (Lincoln et al. 1985).

♦ **niche size, habitat tolerance** *n.* The relative size of a species' realized niche in a species group, community, or habitat (Lincoln et al. 1985).

Comment: “Niche size” is usually estimated in terms of species distribution and tolerance to variables (Lincoln et al. 1985).

♦ **Nicolaian mimicry** See mimicry: Nicolaian mimicry.

♦ **nicotinamide adenine dinucleotide phosphate** See enzyme: nicotinamide adenine dinucleotide phosphate.

♦ **nide** See ²group: nide.

♦ **nidicole** See -cole: nidicole.

♦ **nidicolous** *adj.* Referring to an organism that lives in a nest, *e.g.*, a young animal, especially an altricial bird that remains in its nest for a prolonged period after birth (Lincoln et al. 1985).

- cf.* -cole: nidicole; nestling: nocolous nestling; nidifuge; nidifugous
- ♦ **nidicolous nestling** See nestling: nidicolous nestling.
- ♦ **nidification** *n.* “Nest building” (Lincoln et al. 1985).
- ♦ **nidifuge** *n.* A young animal, especially a bird, that leaves its nest soon after birth (Lincoln et al. 1985). *adj.* nidifugous
cf. nidicole; nestling: nidifugous nestling; nocolous
- ♦ **nidifugous** *n.* Referring to an animal that follows its parents out of its nest soon after it is born or hatched; *e.g.*, precocial animals (Immelmann and Beer 1989, 203, 229).
cf. nestling: nidifugous nestling; nocolous; nidifuge
- ♦ **nidus** *n.*
1. “A nest domicile, breeding place, or point of origin” (Lincoln et al. 1985).
 2. The focus, or primary site, of an infection (Lincoln et al. 1985).
- ♦ **night dance** See dance: night dance.
- ♦ **niphic, nivil, niveal** *adj.* Referring to snow (Lincoln et al. 1985).
- ♦ **nitric oxide** See molecule: nitric oxide.
- ♦ **nitrification** *n.* The conversion of ammonia into nitrite and then nitrate by nitrifying bacteria (Campbell and Reece 2005, 1197).
cf. denitrification
- ♦ **denitrification** *n.* The conversion of nitrate into nitrogen gas by denitrifying bacteria (Campbell and Reece 2005, 1197).
cf. nitrification, nitrogen mineralization
- ♦ **nitrogen cycle** See cycle: biogeochemical cycle: nitrogen cycle.
- ♦ **nitrogen fixation** *n.* Bacterial conversion of nitrogen gas into forms that organisms use for transformation into organic compounds (Campbell and Reece 2005, 1197).
- ♦ **nitrogen mineralization** *n.* The conversion of organic forms of nitrogen (*e.g.*, proteins in dead plant material) into inorganic forms of nitrogen (*e.g.*, ammonia and nitrate) by microbes (Hubbard Brook Organization 2008).
- ♦ **nitrophile** See ¹-phile: nitrophile.
- ♦ **nitrous oxide** See molecule: nitrous oxide.
- ♦ **nival, niveal** See niphic.
- ♦ **nivicole** See -cole: nivicole.
- ♦ **Niwot Ridge** See place: Niwot Ridge.
- ♦ **NMDA** See N-methyl D-aspartate.
- ♦ **NMDA receptor** See ²receptor: N-methyl-D-aspartate receptor.
- ♦ **NMDA receptor 2B** See ²receptor: NMDA receptor 2B.
- ♦ **N-methyl-D-aspartate receptor** See ²receptor: N-methyl-D-aspartate receptor.
- ♦ **“no-allelic-replacement hypothesis”** See hypothesis: “no-allelic-replacement hypothesis.”
- ♦ **Nobel Prize** See award: Nobel Prize.
- ♦ **nocturnae** *adj.* Referring to night-flying insects (Lincoln et al. 1985).
cf. diurnae
- ♦ **nocturnal** *adj.*
1. Referring to an animal that is active during darkness hours (Oxford English Dictionary 1972, entries from 1726).
 2. Referring to a phenomenon than lasts only one night (Lincoln et al. 1985).
3. Referring to a phenomenon that occurs during the night, as distinct from daytime (Bligh and Johnson 1973, 951).
cf. crepuscular, diurnal, matinal, pomeridianus [Latin *adj.* *nocturnus* < *nox*, night]
- ♦ **nocturnal migrant** See migrant: nocturnal migrant.
- ♦ **nod swimming** See swimming: nod swimming.
- ♦ **noise** *n.*
1. In physics, a disturbance, especially a random and persistent one, that obscures, or reduces, the clarity of quality of a signal (Morris 1982); background activity in a channel that is unrelated to the signal in question (Dewsbury 1978, 99).
 2. In computer science, irrelevant, or meaningless data generated by a computer along with desired data (Morris 1982).
- See ¹system: communication system.
- ♦ **developmental noise** *n.* Random events within a cell at the level of molecular interactions that can cause different phenotypes from the same genotype of a species (inferred from Lewontin 2000, 36).
- ♦ **nomad** *n.*
1. “A wandering organism” (Lincoln et al. 1985).
 2. “A pasture plant” (Lincoln et al. 1985).
- ♦ **nomadic phase** See phase: nomadic phase.
- ♦ **nomadism** *n.*
1. An organism’s wandering from place to place, usually within a well-defined territory (Lincoln et al. 1985).
 2. For example, in some fish species, army ants: “The relatively frequent movement by an entire society from one nest site or home range to another” (Wilson 1975, 441, 590).
- adj.* nomadic
- ♦ **nomenspecies** See ²species: nomenspecies.
- ♦ **nominal fallacy** See fallacy: nominal fallacy.
- ♦ **nominal scale** See scales of measurement: nominal scale.
- ♦ **nominal variable** See variable: qualitative variable.
- ♦ **nominalism** *n.*
1. A philosophical doctrine (opposed to essentialism = realism) that universals, or abstract concepts, exist only as names and without a basis in reality (Oxford English Dictionary 1972, entries from 1836; Mayr 1982, 308).
cf. conceptualism
 2. A school of scholastic philosophy, that stresses that only individuals, not essences, exist, bracketed together into classes by names (Mayr 1982, 92).
- See scholasticism.
- n.* nominalist
- ♦ **nominalistic species concept** See ²species (def. 10).
- ♦ **nominalization** *n.* A verb, or other part of speech, that a person uses as a noun: Development of indices for community diversity made possible some useful comparative studies.
Comment: Lanciani (1998) describes how nominalizations unnecessarily complicate scientific writing.
- ♦ **nomocole** See -cole: nomocole.
- ♦ **nomogenesis** See -genesis: abiogenesis; hypothesis: nomogenesis.
- ♦ **nomogram** See -gram: nomogram.
- ♦ **nomophile** See ¹-phile: nomophile.
- ♦ **non-Darwinian evolution** See ²evolution: non-Darwinian evolution.

- ♦ **nonadaptive character** See character: nonadaptive character.
- ♦ **nonadaptive evolution** See ²evolution: nonadaptive evolution.
- ♦ **nonadaptive trait** See character: nonadaptive trait.
- ♦ **nonadaptive zone** See adaptive zone: nonadaptive zone.
- ♦ **nonasymptotic-species-accumulation curve** See curve: species-accumulation curve: nonasymptotic-species-accumulation curve.
- ♦ **nonautogenous** See -genous: nonautogenous.
- ♦ **noncommunicative stridulation** See stridulation.
- ♦ **noncorrection procedure** See procedure: non-correction procedure.
- ♦ **nondeceptive-floral mimicry** See mimicry: floral mimicry: nondeceptive-floral mimicry.
- ♦ **"nondefinable-model-virtual-model mimicry"** See mimicry: "virtual-model mimicry;" "non-definable-model-virtual-model mimicry."
- ♦ **nondimensional-species concept** See ²species (def. 28).
- ♦ **nondisjunction** *n.* For example, in *Drosophila*, Humans: Failure of two homologous chromosomes of a pair to go to opposite poles during a cell's first meiotic division; as a result one daughter cell has both chromosomes and the other has neither (Mayr 1982, 581, 59).
- ♦ **nonepigamic behavior** See behavior: epigamic behavior: nonepigamic behavior.
- ♦ **"nonequilibrium hypothesis of species organization"** See hypothesis: hypotheses of species organization: "nonequilibrium hypothesis of species organization."
- ♦ **"nonequilibrium hypothesis of species richness"** See hypothesis: hypotheses of species richness: "nonequilibrium hypothesis of species richness."
- ♦ **nonexclusive-occupancy territory** See territory: nonexclusive-occupancy territory.
- ♦ **nonfeeding territory** See territory: nonfeeding territory.
- ♦ **noncoding DNA** See nucleic acid: deoxyribonucleic acid: noncoding DNA.
- ♦ **nonfunctional DNA** See nucleic acid: deoxyribonucleic acid: nonfunctional DNA.
- ♦ **nongenetic polymorphism** See -morphism: polymorphism: phenotypic polymorphism.
- ♦ **nongenetic sex determination** See sex determination: nongenetic sex determination.
- ♦ **nonharmonious character transformation** See ²evolution: mosaic evolution; principle: principle of mosaic evolution.
- ♦ **"nonhomeotic-homeobox gene"** See gene: "nonhomeotic-homeobox gene."
- ♦ **nonhomologous** *adj.* Referring to chromosomes, or chromosome segments, composed of dissimilar gene sequences that do not become intimately associated during meiosis (Lincoln et al. 1985).
- ♦ **nonhomologous apomorph** See morph: apomorph: nonhomologous apomorph.
See homolog; homologous: nonhomologous.
- ♦ **nonhomologous similarity** See homoplasy.
- ♦ **nonhospicidal** See hospicidal: nonhospicidal.
- ♦ **nonkin-group selection** See selection (table).
- ♦ **nonmating territory** See territory: nonmating territory.
- ♦ **nonmotile** See sessile.
- ♦ **nonMendelian** *adj.* Referring to any extrachromosomal hereditary factor (Lincoln et al. 1985).
- ♦ **nonobject-bound tradition** See tradition: non-object-bound tradition.
- ♦ **nonparametric methods for estimating species richness from samples** See method: non-parametric methods for estimating species richness from samples.
- ♦ **nonparametric test** See statistical test: nonparametric test.
- ♦ **nonprotective mimicry** See mimicry: nonprotective mimicry.
- ♦ **nonrandom** *adj.* Referring to an event that has an *a priori* probability of occurrence of zero or one (unity) (Lincoln et al. 1985).
cf. haphazard, random
- ♦ **nonrearing territory** See territory: nonrearing territory.
- ♦ **nonreciprocal recombination** See ²theory: transmutation.
- ♦ **nonscientific name** See name: nonscientific name.
- ♦ **nonsense mutation** See ²mutation: nonsense mutation.
- ♦ **nonsequential patrolling** See patrol.
- ♦ **nonsexual selection** See selection: nonsexual selection.
- ♦ **nonshareable-parental investment** See investment: parental investment: nonshareable-parental investment.
- ♦ **nonshivering thermogenesis** See thermogenesis: nonshivering thermogenesis.
- ♦ **nonshivering-obligatory thermogenesis** See thermogenesis: nonshivering-obligatory thermogenesis.
- ♦ **nonshivering-thermoregulatory thermogenesis** See thermogenesis: nonshivering-thermoregulatory thermogenesis.
- ♦ **nonsocial** See solitary.
- ♦ **nonthermal sweating** See sweating: nonthermal sweating.
- ♦ **nontranslated spacers** See external-nontranscribed spacers.
- ♦ **nonverbal communication** See communication: nonverbal communication.
- ♦ **nonviable** *adj.* Referring to an organism that is incapable of normal development or survival (Lincoln et al. 1985).
- ♦ **nonworker** See caste: worker: nonworker.
- ♦ **noosphere** See -sphere: biosphere: noosphere.
- ♦ **norepinephrine** See hormone: norepinephrine.
- ♦ **norm of reaction** See plasticity: phenotypic plasticity: norm of reaction.
- ♦ **normal curve** See curve: normal curve.
- ♦ **normal-demographic distribution** See distribution: normal-demographic distribution.
- ♦ **normal distribution** See distribution: normal distribution.
- ♦ **normalizing selection** See selection: stabilizing selection.
- ♦ **normothermy** See -thermy: cenotherapy.
- ♦ **North Atlantic Oscillation** See oscillation: Arctic Oscillation.
- ♦ **Northern blotting** See method: Northern blotting.
- ♦ **northern-evergreen forest** See ²community: northern-evergreen forest.

- ◆ **northern hardwoods** See ²community: northern hardwoods.
- ◆ **Northern Hemisphere Annular Mode** See oscillation: Arctic Oscillation.
- ◆ **nose-up posture** See display: upward stretch.
- ◆ **nosogenic** See -genic: nosogenic.
- ◆ **nosography** See study of: nosology.
- ◆ **nosology** See study of: nosology.
- ◆ **noterophile, noterophilous** See ¹-phile: mesophile.
- ◆ **nothocline** See cline: nothocline.
- ◆ **nothogamy** See -gamy: nothogamy.
- ◆ **notify** *v.i., v.t.*
 1. In Humans: "To make known, publish, proclaim; to intimate, give notice of, announce" (Oxford English Dictionary 1972, entries from 1386).
 2. In some primates, *e.g.*, male *Papio hamadryas* (Hamadryas Baboons): To turn one's anal region toward a conspecific (Sigg and Falett 1985, 981). *cf.* display: buttocks display
- ◆ **notifying** See greeting: notifying.
- ◆ **notochord** See organ: notochord.
- ◆ **novelty seeking** *n.* In Humans: the personality trait of tending to search for new experiences (Angier 1996, 2 January, A1). *cf.* drive: curiosity drive, exploratory drive
Comments: A person with a high novelty-seeking quotient tends to be excitable, exploratory, extravagant, extroverted, impulsive, and quick-tempered (Angier 1996, 2 January, A1). A novelty seeker tends to have a particular variant of a gene that allows his brain to respond to dopamine. This gene encodes for the D4-dopamine receptor, one of several kinds of brain receptors known to play a role in dopamine reception.
- ◆ **NPY** See hormone: neuropeptide Y.
- ◆ **NR2B** See ²receptor: NMDA receptor 2B.
- ◆ **NST** See thermogenesis: nonshivering thermogenesis.
- ◆ **NST(O)** See thermogenesis: nonshivering-obligatory thermogenesis.
- ◆ **NST(T)** See thermogenesis: nonshivering-thermo-regulatory thermogenesis.
- ◆ **NTS** See external-nontranscribed spacers.
- ◆ **nth order** See order: nth order.
- ◆ **nucivore** See -vore: nucivore.
- ◆ **nuclear family** See ¹family: nuclear family.
- ◆ **nuclear species** See ²species: nuclear species.
- ◆ **nucleic acid** *n.*
 1. An acid found in cell nuclei (Oxford English Dictionary 1972, entries from 1893).
 2. An acid composed of bases and a backbone of sugar and phosphate molecules or peptides (King and Stansfield 1985). *cf.* acid, molecule
[nucleus + IC]

deoxyribonucleic acid (DNA) *n.*

 1. A nucleic acid composed of the bases adenine, cytosine, guanine, and thymine which project from a backbone of deoxyribose and phosphate molecules (King and Stansfield 1985).
Note: DNA contains the information that enables cells to manufacture molecules, grow, and divide into new cells (National Academy of Sciences and Institute of Medicine 2008, 4).
 2. The basic hereditary material of organisms (Watson and Crick 1953; Mayr 1982, 809–817; Wilson 1975, 582; King and Stansfield 1985). *cf.* gene

Comments: The chemical name for DNA has an alleged 207,000 letters and is published in its shortened form in Nature (9 April 1981) (Ash 1996, 108). DNA is the molecular carrier of genetic information within cells, has a double-helix structure, *q.v.*, and can self-replicate as well as code for RNA synthesis (King and Stansfield 1985). The great bulk of an organism's DNA is located within its chromosome(s). DNA molecules can have molecular weights of over 1×10^8 daltons (King and Stansfield 1985).

SOME KINDS OF DNA

- I. anonymous DNA
- II. copy DNA (*abbr.* cDNA)
- III. mitochondrial DNA (*abbr.* mit DNA, mtDNA)
- IV. nonfunctional DNA
- V. nuclear DNA
- VI. parasitic DNA
- VII. polite DNA
- VIII. repetitious DNA (*syn.* repeated DNA, repetitive DNA)
 - A. highly-repeated DNA (*syn.* satellite DNA)
 1. satellite DNA
 2. interspersed repeated DNA
 - B. middle-repetitive DNA (*syn.* intermediate DNA)
- IX. satellite DNA
- X. selfish DNA (*syn.* junk DNA, self-centered DNA, silent DNA)
 - A. DNA in general
 - B. nonfunctional DNA
 - C. parasitic DNA
 - D. satellite DNA
 - E. spacer DNA
 - F. transposable elements

- **anonymous DNA** *n.* "A length of DNA of unknown gene content" (Jasney 1991).
- **chloroplast DNA (cpDNA)** *n.* DNA found in chloroplasts (Hamilton 1999, 129).
Comment: This DNA is maternally inherited in most angiosperm species and disperses only through seeds (Hamilton 1999, 129).
- **copy DNA (cDNA)** *n.* Complementary DNA produced from an RNA template by the action of a reverse transcriptase (an RNA-dependent DNA polymerase), which may or may not have introns depending on its processing (King and Stansfield 1985, Campbell et al. 1999, 369).
syn. complementary DNA
Comment: If a researcher processes the RNA template to remove its introns, its corresponding cDNA is not identical to the gene from which the researcher transcribed the RNA (King and Stansfield 1985).
- **highly-repeated DNA** *n.* DNA that contains short and simple sequences repeated hundreds of thousands, or millions, of times (Gould 1981, 7).
syn. satellite DNA (Gould 1981, 7)
Comment: About 5% of human DNA falls into this class (Gould 1981, 7).
- **intermediate DNA** See nucleic acid: deoxyribonucleic acid: middle-repetitive DNA.
- **junk DNA** *n.* "DNA with no real function" (Nowak 1994a, 608).
See nucleic acid: deoxyribonucleic acid: selfish DNA.

Comments: DNA originally considered to be junk DNA in Humans is now known to be a complex mix of different kinds of DNA including regulatory elements (Nowak 1994a). Some repetitive sequences of junk DNA seem to have crucial functions in maintaining a genome's structure. Researchers previously classified introns as junk DNA, but the *lin-4* gene of *Caenorhabditis elegans*, which occurs in an intron, regulates expression of its *lin-14* by blocking its ability to make a protein (Lee et al. and J. Mattick in Nowak 1994a, 609–610). The 3'UTR is a so-called 3' untranslated region which lies at the end of each gene's mRNA; however, a mutation in a 3'UTR region can suppress its gene's action (Nowak 1994a, 610). Introns also encode for small nucleolar RNAs (snoRNAs), which might play a role in ribosome assembly.

► **middle-repetitive DNA** *n.* DNA composed of sequences of 10 through a few hundred copies of particular DNA segments with the copies often being widely dispersed on several chromosomes of an individual (Gould 1981, 7).

syn. intermediate DNA

Comment: Some 15 through 30% of *Drosophila* and human genomes are composed of middle-repetitive DNA (Gould 1981, 7).

► **mitochondrial DNA (mtDNA)** *n.* DNA of a mitochondrion which consists of a circular duplex usually with 5 through 10 copies per organelle (King and Stansfield 1985).

abbr. mtDNA (Reid 1980, 620)

Comments: The mitochondrial genetic code differs slightly from the universal genetic code. Mitochondrial DNA encodes a limited number of RNAs and proteins that are essential for formation of a functional mitochondrion (Gray et al. 1991, 1476). Most of the genetic information for a mitochondrion's biogenesis and function resides in that nuclear genome of the cell that produces the mitochondrion. Many species have mtDNAs that map as circles; some have those that map as linear molecules. Mitochondrial genomes size ranges from < 6 kilobase pairs (= kbp) in *Plasmodium falciparum* through > 200 kbp in land plants. Only egg cells contribute significant numbers of mitochondria to zygotes; thus, mtDNA is primarily maternally inherited (King and Stansfield 1985). A sperm's mitochondrion can enter an egg, and sperm-contributed mtDNA can recombine with that from an egg; this might explain why some people have two different versions of mtDNA in their cells (Strauss 1999, 1438).

► **noncoding DNA** *n.* DNA that does not code for proteins or functional RNAs, including introns, pseudogenes, regions that flank coding regions, and regulatory sites (Freeman and Herron 2004, 613).

► **nonfunctional DNA** *n.* DNA, especially a pseudogene, that is not known to code for proteins, or functional RNAs, but may in fact have a function (Zuckerkandl et al. 1989, 504).

► **parasitic DNA** *n.* A sequence of DNA (an intron) that is not transcribed into messenger RNA, but is excised during transcription (Mayr 1982, 579).

cf. exon
Comment: Orgel and Crick (1980) hypothesize that this DNA is parasitic because an organism is helpless to prevent its replication and accumulation. "Although valid arguments in favor of this

hypothesis exist, it is intuitively distasteful to a Darwinian. Surely natural selection, a Darwinian would say, should be able to come up with a defense mechanism against such an expensive type of parasitism" (Mayr 1982, 579).

► **polite DNA** *n.* "DNA, that, without being crucially involved in function, is subject to constraints of conformity and, through its base composition, respects a function for which it is not required;" DNA with no crucial function that does not disrupt the action of functional DNA (Zuckerkandl 1986, 12).

► **repetitious DNA** *n.* DNA of eukaryotes that has nucleotide sequences serially repeated many times (Lincoln et al. 1985).

syn. repeated DNA, repetitive DNA

Comment: Repetitious DNA is also found in prokaryotes (Doolittle and Sapienza 1980, 603).

► **recombinant DNA** *n.* DNA from two different sources, *e.g.*, two different species (Campbell et al. 1999, 364).

cf. technology: recombinant-DNA technology

► **satellite DNA** *n.*

1. Eukaryote DNA that differs sufficiently in its base composition from a cell's main DNA so as to be separable by centrifugation (isopycnic-CsCl-gradient centrifugation) (Lincoln et al. 1985; King and Stansfield 1985).

See nucleic acid: deoxyribonucleic acid: highly repeated DNA.

2. DNA composed of tandem repeats of a simple sequence (Alberts et al. 1989, 604).

See nucleic acid: deoxyribonucleic acid: highly repeated DNA.

Comments: Satellite DNAs from chromosomes are either lighter (rich in A + T), or heavier (rich in G + C) than the majority of DNA, and are usually highly repetitious (King and Stansfield 1985). Satellite DNA sequences usually are not transcribed and are most often located in the heterochromatin associated with the centromeric regions of chromosomes (Alberts et al. 1989, 604). In some mammal species, a single kind of satellite DNA constitutes 10% or more of DNA. Satellite-DNA sequences seem have changed very rapidly and even shifted their positions on chromosomes. Because satellite DNA has no known function, it has been classified as an extreme form of selfish DNA. Satellite DNA might function in maintaining the survival of a chromosome (Nowak 1994b).

[satellite, after the minor component of DNA that was separable from the bulk of a cell's DNA (Alberts et al. 1989, 604)]

► **microsatellite DNA** *n.* Satellite DNA that is roughly 10 through 100 base pairs long, has repeating units of only a few base pairs, and is longer than minisatellite DNA (Nowak 1994b; Campbell et al. 1999, 382).

Comments: Microsatellite DNAs are found throughout human genes and are highly variable from one person to another (Nowak 1994b; Campbell et al. 1999, 382). Defects in these DNAs might cause cancer.

► **minisatellite DNA** *n.* Satellite DNA that is shorter than microsatellite DNA (Nowak 1994b).

Comments: Defects in minisatellite DNAs might cause cancer (Nowak 1994b).

► **selfish DNA** *n.*

1. A DNA sequence that spreads within an organism and makes no contribution to its phenotype, except that it is a slight burden to the cell that contains it (Orgel and Crick 1980, 605).
 2. DNA in general (Doolittle and Sapienza 1980, 601).
- Note:* This concept of selfish DNA is based on the idea that organisms are simply DNA's way of producing more DNA (Doolittle and Sapienza 1980, 601). This idea is also stated in terms of genes: Organisms are simply genes' ways of producing more genes.
3. Repetitive DNA that has increased, or is increasing, in frequency within an organism and whose increase is not stopped because the organism which hosts it cannot stop it, possibly because it has no appreciable effect on its host (Gould 1981, 13).

syn. junk DNA (King and Stansfield 1985); silent DNA (Mayr 1982, 826; Gould 1985d)

cf. chromosome: supernumerary chromosome; gene machine; nucleic acid: deoxyribonucleic acid; junk DNA, parasitic DNA; gene: selfish gene; nuon; transposable element

Comments: Östergren formulated the concept (but not the name) of selfish DNA in about 1945 (Cavalier-Smith 1980, 618). Because "selfish" implies that the DNA should be doing something besides acting for itself, it might be better to call this DNA "self-centered DNA" (Gould 1981, 13). Selfish DNA replicates, moves, and inserts into new places in chromosomes and performs no known functions for the organisms containing it (Gould 1981). King and Stansfield (1985) also suggest the "selfish DNA" is functionless, and that according to selfish-DNA theory, an eukaryotic organism is merely a throwaway survival machine used by selfish DNA to replicate itself. "Spacer DNA," "satellite DNA," and other kinds of repetitive DNA may be examples of "selfish DNA." Brosius and Gould (1992, 10706) write that ambiguous and even derogatory names such as "pseudogene" and "junk DNA" "do not reflect the significance of retroposed sequences as large valuable assets for the future evolvability of species; and as a result, it is more difficult to contemplate their significance, impact, and function."

► **silent DNA** See nuclei acid: deoxyribonucleic acid: selfish DNA.

► **simple-tandem repeats (STRs)** *n.* The repeated short base-pair sequences within a strand of microsatellite DNA (Campbell et al. 1999, 382).

► **3' untranslated region (3'UTR)** *n.* The final protein coding portion of a gene that is transcribed into RNA but not translated into protein (Nowak 1994, 608).

Comment: Researchers once classified 3'UTRs as junk DNAs, *q.v.*, but they are now known to contain sequences that regulate gene activity (Nowak 1994, 608).

peptide-nucleic acid (PNA) *n.* An artificially produced nucleic acid composed of bases linked together with peptides (Zimmer 1995, December, 38, illustration).

Comments: Peter Nielsen and colleagues created PNA in 1991 (Zimmer 1995, December, 38). PNA peptide bonds are much stronger than ribose-phosphate

bonds of DNA and RNA. PNA might have preceded these other nucleic acids in the origin of life on Earth. Prelife might have gone through the states of a PNA world, RNA world, and DNA world, *q.v.*

ribonucleic acid (RNA) *n.* A nucleic acid composed of the bases adenine, cytosine, guanine, and uracil which project from a backbone of ribose and phosphate molecules (King and Stansfield 1985).

cf. nucleic acid: deoxyribonucleic acid, technology: recombinant-DNA technology

Comments: Types of RNA are heterogeneous nuclear RNA, hnRNA; messenger RNA, mRNA; ribosomal RNA, rRNA; small nucleolar RNA, snoRNA; and transfer RNA, tRNA. RNA is the genetic material of many viruses (King and Stansfield 1985). RNAs are single stranded and have lower molecular weights than DNAs.

► **double-stranded RNA (dsRNA)** *n.* A part of, or total, RNA molecule that has both of its strands (Campbell and Reece 2005, 368).

► **18S-ribosomal RNA (18S rRNA)** *n.* A structural RNA of ribosomes (Maley and Marshall 1998, 505).

Comments: Since 1988, researchers have produced many dendograms based on 18S rRNA, which might not be as accurate as originally thought (Maley and Marshall 1998, 505). Therefore, researchers might use amino-acid sequences of proteins more in future phylogenetic studies.

► **heterogeneous-nuclear RNA (hnRNA)** *n.* RNA that is immature messenger RNA or has unknown functions (Nowak 1994b).

► **ribosomal RNA (rRNA)** *n.* The structural RNA of ribosomes (Lincoln et al. 1985).

♦ **nucleic-acid probe** See ¹probe: nucleic-acid probe.

♦ **nucleic-acid hybridization** See method: nucleic-acid hybridization.

♦ **nuclein** *n.* The phosphorus-rich compound in cell nuclei [named by Miescher (Mayr 1982, 679, 959)].

♦ **nucleoporin** See molecule: protein: nucleoporin.

♦ **nucleoprotein world** *n.* The situation that exists today in which nucleic acids and proteins cooperate in production of new proteins and nucleic acids; contrasted with the RNA world (inferred from Illangasekare et al. 1995, 646).

♦ **nucleosome** *n.* A chromatin bead and its adjacent DNA; the basic unit of DNA packing (Campbell et al. 1999, 346).

cf. 30-nm chromatin fiber

Comment: The bead consists of DNA wound around a protein core composed of two molecules each of four different histone types — H2A, H2B, H3, and H4 (Campbell et al. 1999, 346).

♦ **nucleotide** *n.* A biochemical molecule (composed of a purine or pyrimidine base, a pentose, and a phosphoric-acid group) that is the basic building block of the polynucleotides DNA and RNA (King and Stansfield 1985).

♦ **nucleotide element** *n.* A repeated sequence of DNA (Zuckerkandl et al. 1989, 504).

long-interspersed nucleotide element (LINE) *n.* A nucleotide element (*q.v.*) of from 20,000 through 50,000 base pairs (Singer 1982 in Zuckerkandl et al. 1989, 504); contrasted with short-interspersed nucleotide element.

short-interspersed nucleotide element (SINE)

n. A nucleotide element (*q.v.*) of from 150 through 300 base pairs (Singer 1982 in Zuckerkandl et al. 1989, 504); contrasted with long-interspersed nucleotide element.

Comments: *Alu* sequences (discovered by Houck et al. 1979) represent the great majority of SINES in Humans (Zuckerkandl et al. 1989, 505, who describe their characteristics). These sequences are variable in structures, numbers, locations, orientations, and transcriptional regulation.

♦ **nucleus** See organelle: nucleus.

♦ **nucleus species** See ²species: nuclear species.

♦ **nuisance variable** See variable: nuisance variable.

♦ **null hypothesis** See hypothesis: null hypothesis.

♦ **nullipara** See -para: nullipara.

♦ **number** *n.* A specific quantity, or place, in a sequence, usually designated by one or a series of symbols or words called numerals (Michaelis 1963).

fuzzy number *n.* A quantity whose value is imprecise, compared to a single-valued number (Whatisit?.com 2009).

Comments: One can conceive of any fuzzy number as a function whose domain is usually a set of real numbers whose range includes 0 through 1000 (Whatisit?.com 2009). Each of these values has a specific “grade of membership” where 0 is the smallest possible grade, and 1000 is the largest possible one. Fuzzy numbers create problems in establishing the conservation statuses of organisms (New 2009, 20).

grail number *n.* The total number of species on Earth (Yoon 1995, 11 July, C4).

[Old French *graal* < Medieval Latin *gradalis*, flat dish]

♦ **number concept** See counting.

♦ **number of replicates** See sample size.

♦ **numeracy** *n.* For example, in Humans, *Macaca mulatta* (Rhesus Macaques), and *Saguinus oedipus* (Cotton-top Tamarins): An individual’s ability to assess the amount, or bulk, of an object (M. Hauser in Williams 1997, 3 January, 29).

Comments: Human infants less than 1 yr old display numeracy (Williams 1997, 3 January, 30).

♦ **numerical character** See character: quantitative character.

♦ **numerical hybrid** See hybrid: numerical hybrid.

♦ **numerical mutation** See ²mutation: numerical mutation.

♦ **numerical phonetics** See study of: taxonomy: numerical taxonomy.

♦ **numerical response** See response: numerical response.

♦ **numerical taxonomy** See study: systematics: phenetic systematics; taxonomy: numerical taxonomy.

♦ **nuon** *n.* Any stretch of a nucleic-acid sequence that may be identifiable by any criterion; a nuon can be an enhancer, exon, intron, or intergenic region; a gene, promoter, pseudogene, telomere of a few through thousands of nucleotides long, terminator, or transposon; a long- or short-interspersed element; or any other retroelement [nucleic acid sequence + on; coined by Brosius and Gould (1992, 10706)].

Comment: Genes are always nuons, but not all nuons are genes (Brosius and Gould 1992, 10707, who give actual and possible examples of kinds of nuons and also coin “aptogene,” “potogene,” “potomass,” “retro-naptonuon,” “retro-potonuon,” “retro-xaptonuon,” “retro-potogene,” “xaptogene,” and “xaptoprotein”).

aptonuon *n.* A nuon with an adaptive function resulting from natural selection [adaptive + o + nuon; coined by Brosius and Gould (1992, 10709)].

naptonuon *n.* A potonuon that never acquires a function in a genome (so far as we know) [nonadaptive + o + nuon; coined by Brosius and Gould 1992, 10706].

potonuon *n.* A nuon that has the potential of becoming functional in the course of evolution [potential + o + nuon; coined by Brosius and Gould (1992, 10706)].

xaptonuon *n.* A potonuon that has been coopted into a variant, or novel, function in a genome by exaptation [exaptation + o + nuon; coined by Brosius and Gould (1992, 10706)].

♦ **Nup** See molecule: protein: nucleoporin.

♦ **nuptial dress, nuptial coloration** See dress: advertising dress.

♦ **nuptial flight** See flight: nuptial flight.

♦ **nuptial gift** *n.* For example, in some empidid-fly and scorpionfly species, *Pisaura mirabilis* (European Nursery-web Spiders) and *Utetheisa ornatrix* (Bella Moths): An object that a male presents to a female as a way of eliciting insemination (Thornhill and Alcock 1983, 190; Austad and Thornhill 1991, 44).

Comments: Depending on the species, empidid males present females with fresh insects, pieces of dried insects, insect parts wrapped in silk, and empty silken “balloons” (Kessel 1955). Male *P. mirabilis* present females with insects wrapped in silk (Austad and Thornhill 1991, 44). A male *U. ornatrix* gives a female protective alkaloids during copulation (González et al. in Yoon 1999, 18 May, D3).

♦ **nursery group** See ²group: creche.

♦ **nursing** *n.*

1. An individual’s taking care of (the sick, injured, or infirm) (given as a verb in Michaelis 1963).

2. A female mammal’s feeding (an infant) at her breast; suckling (Michaelis 1963).

See suckling.

cf. lactation

3. An individual’s bringing up, or nourishing, another (Michaelis 1963).

4. An individual’s taking nourishment from a breast (Michaelis 1963).

See sucking: welcome sucking.

substitute nursing *n.* In *Bos primigenius* (Domestic Cattle): A calf’s stereotyped sucking on metal chains, metal rings, or even other calves, when it has been fed from buckets rather than being allowed usual nursing (Heymer 1977, 206).

♦ **nursing position, nursing posture** See posture: nursing posture.

♦ **nurturance** See need: nurturance.

♦ **nutricism** See symbiosis: nutricism.

♦ **nutrition** *n.* An organism’s action, or process, of supplying, or receiving, nourishment (Oxford English Dictionary 1972, entries from 1615); this involves ingestion, digestion, assimilation, or a combination of these activities (Lincoln et al. 1985).

adj. nutritive

♦ **nurturance, nurturing behavior** See behavior: nurturance.

♦ **nychthemeron** See period: nycthemeron.

♦ **nyctipelagic** See -pelagic: nyctipelagic.

♦ **nyctiperiod** See period: nyctiperiod.

♦ **nyctophobia** See -phobia: nyctophobia.

♦ **nymph** See animal names: nymph.

♦ **nymphiparity** See parity: nymphiparity.

O

♦ **object** *n.*

1. Anything that a person actually apprehends, or can potentially apprehend, with his senses; especially touch and vision; a material thing; a thing, or body, on which an individual makes an observation (Oxford English Dictionary 1972, entries from 1398; Michaelis 1963).
2. That to which a person directs his action, thought, or feeling; that to which one does something; that on which something acts or operates (Oxford English Dictionary 1972, entries from 1586).

Comment: Animal behaviorists consider objects from the viewpoints of both Humans and nonhuman animals.

neutral object *n.* An object other than the focal one that an animal directs its action toward in a conflict situation (Immelmann and Beer 1989, 203).

syn. substitute object (according to some authors, Immelmann and Beer 1989, 299)

cf. behavior: displacement behavior

substitute object *n.* An object that can elicit an animal's consummatory behavior in the absence of appropriate stimuli and without necessarily fulfilling its biological "need" that underlies this behavior (Heymer 1977, 63); *e.g.*, a rat's treating its own tail as nesting material when it is deprived of nesting material (Immelmann and Beer 1989, 203).

♦ **object-bound tradition** See tradition: object-bound tradition.

♦ **object imprinting** See learning: imprinting: object imprinting.

♦ **object play** See play: object play.

♦ **object taxis** See taxis: object taxis.

♦ **objective self-awareness** See awareness: self-awareness: objective self-awareness.

♦ **oblige** *adj.*

1. Something that is necessarily as it is (Oxford English Dictionary 1972, entries from 1887); "essential; necessary; unable to exist in any other state, mode, or relationship" (Lincoln et al. 1983).

2. Referring to an organism that is restricted to one mode of life, *e.g.*, an obligate parasite (Michaelis 1963).

cf. facultative

♦ **obligate anaerobe** See aerobe: anaerobe: obligate anaerobe.

♦ **obligate apogamy** See -gamy: apogamy: parthenoapogamy.

♦ **obligate gamete** See gamete: obligate gamete.

♦ **obligate hyperparasitism** See parasitism: hyperparasitism: obligate hyperparasitism.

♦ **obligate-schooling species** See ²species: obligate-schooling species.

♦ **obligate siblicide** See -cide: siblicide: obligate siblicide.

♦ **obligate thermophile** See ¹-phile: thermophile: obligate thermophile.

♦ **obligatory parasitism** See parasitism: obligatory parasitism.

♦ **oblique crossing over** See crossing over: unequal crossing over.

♦ **obliterative coloration, oblitterative shading** See camouflage: background imitation: counter-shading.

♦ **obscurantist holism** See holism: obscurantist holism.

♦ **observability sample** See sample: observability sample.

♦ **observation** *n.* A person's action, or act, of observing something scientifically; especially his, or her, careful noting of a phenomenon in regard to its cause or effect, or of phenomena with regard to their mutual relations as they are observed in nature (contrasted with "experiment"); also a record of this action (Oxford English Dictionary 1972, entries from 1559).

descriptive observation *n.* Naturalistic observation with the objective of documenting the natural history of a group, or population, of animals with an emphasis on behavior (Lehner 1979, 60).

cf. experimental manipulation

individual observation *n.* An observation, or measurement, taken on the smallest sampling unit of a population (Sokal and Rohlf 1969, 8).

syn. item

cf. sample of observations, population, variable

naturalistic observation *n.* Scientific investigation involving studying animal behavior "as it occurs naturally, with as little human intrusion as possible" (Lehner 1979, 59).

cf. experimental manipulation

reconnaissance observation *n.* Intense observation of an animal species' behavior before one poses questions and constructs hypotheses about its behavior [coined by Lehner 1979, 24].

♦ **observational learning** See learning: emphatic learning.

♦ **observational method** See method: observational method.

♦ **observed frequency** *n.* The actual number of sample values that belong to a class of a frequency distribution (Lincoln et al. 1985).

- ♦ **Observer** See program: The Observer.
- ♦ **observer error** See error: observer error.
- ♦ **obsolescence** *n.* A phase, or stage, of population reduction that leads to a species' extinction or the loss of one of its characters (Lincoln et al. 1985).
adj. obsolete
- ♦ **obstinacy** See ²group: obstinacy.
- ♦ **Occam's razor** See Ockham's razor.
- ♦ **occasional** See frequency (table).
- ♦ **occasional species** See ²species: occasional species.
- ♦ **oceanic** See pelagic.
- ♦ **oceanodromous** See -dromous: oceanodromous.
- ♦ **oceanography** See study of: oceanography.
- ♦ **oceanophile** See ¹-phile: oceanophile.
- ♦ **ochthium** See ²community: ochthium.
- ♦ **ochthophile** See ¹-phile: ochthophile.
- ♦ **Ockham's razor, Occam's razor** *n.* *Pluralitas non est ponenda sine necessitate* (plurality must not be posited without necessity) (Ockham in Jefferys and Berger 1992, 64).
cf. law: law of parsimony; Morgan's canon; simplicity
Comments: Lincoln et al. (1985) indicate that Ockham's razor is the idea that the simplest sufficient hypothesis that explains known relevant facts is the preferred one even if other hypotheses are plausible. Jefferys and Berger (1992, 64) list other restatements of Ockham's razor: "entities should not be multiplied without necessity; it is vain to do with more what can be done with less; an explanation of the facts should be no more complicated than necessary;" and "among competing hypotheses, favor the simplest one." These authors state, "Ockham's razor has proved to be an effective device for trimming away unprofitable lines of inquiry, and scientists use it every day, even when they do not cite it explicitly."
[after William of Ockham, 1300?–1349?, English Franciscan and scholastic philosopher]
- ♦ **octa-** prefix Eight, eightfold (Michaelis 1963).
- ♦ **oddity effect** See effect: oddity effect.
- ♦ **oddity learning** See learning: oddity learning.
- ♦ **oddity problem** See test: oddity test.
- ♦ **oddity test** See test: oddity test.
- ♦ **odor** *n.* *Brit. odour*
 1. A substance's quality that renders it perceptible to one's sense of smell (olfaction) (Oxford English Dictionary 1972, entries from 1300).
syn. scent, smell; sometimes a sweet scent, pleasing scent; fragrance (Oxford English Dictionary 1972)
 2. A substance that emits a sweet smell or scent; a perfume; especially incense, spice, ointment, etc. (Oxford English Dictionary 1972, entries from 1388).
cf. chemical-releasing stimulus; molecule: geosmin
- clan-specific odor** *n.* A group odor arising from the odors of individual male sugar gliders produced by their frontal glands which are rubbed against sternal glands of females of their group (Müller-Schwarze 1974, 319).
- colony odor** See odor: group odor.
- environmental odor** *n.* Odor(s) from an animal's environment that it carries, e.g., odors of an ant's nesting substrate and foods (Crosland 1989, 912).
- gestalt odor** *n.* For example, in an ant species: Odor of a group of nest mates that results from a complete transfer of pheromones among them (Crosland 1989, 920).
- group odor** *n.* For example, in some rodent species, social Hymenoptera, Flying Phalangers

(marsupials): A group-specific smell caused by reciprocal scent marking, or odor exchange, in a group of closely associated conspecific animals (Heymer 1977, 80; Immelmann and Beer 1989, 123).
syn. colony odor (Immelmann and Beer 1989, 123)
cf. chemical-releasing substance: semiochemical: pheromone: surface pheromone; odor: nest odor, species odor
Comment: Group odors enable animals to tell whether another animal is a member of its group (Immelmann and Beer 1989, 123). Hölldobler and Wilson (1990, 643) refer to a "group odor" that is on the bodies of social insects and peculiar to a particular colony as "colony odor." Individuals recognize their nest mates by colony odor.

hive odor, hive aura *n.* The nest odor of the Western Honey Bee (Wilson 1975, 212, 589).
cf. odor: nest odor
Comment: Hive aura may be the same substance as Western Honey Bee footprint substance (Wilson 1975, 212, 589).

human-underarm odor, perspiration odor *n.* Odor composed of 3-methyl-2-hexanoic acid and other components (Booth 1990).
Comment: 3-methyl-2-hexanoic acid is produced by bacteria (lipophilic diphtheroids) that feed on apocrine-gland secretions (Booth 1990).

human-vaginal odor *n.* An odor composed of at least 30 compounds derived from several glands and tissues of vaginas (Forsyth 1985, 30).
cf. chemical-releasing stimulus: semiochemical: pheromone: human-female pheromone
Comment: In *Macaca mulatta* (Rhesus Macaques), vaginal secretions of a volatile fatty acid increase near the midpoint of a female's estrus cycle and are attractive to male *M. mulatta* (Curtis 1983, 805).

individual odor See chemical-releasing stimulus: pheromone: individual pheromone.

nest odor *n.* In many social-insect species: A nest's distinctive odor, by which its inhabitants are able to distinguish their nest from those of other societies or at least from their surrounding environment (Wilson 1975, 589).
cf. odor: colony odor
Comments: Apis mellifera (Western Honey Bees) and some ant species can orient toward their nests by means of their nest odors. Nest odor may be the same as the colony odor in some cases (Wilson 1975, 589).

MHC-dependent odors *n.* For example, *Mus musculus* (Domestic Mice) and Humans: Body odors that are influenced by major-histocompatibility-complex (MHC) genes (Richardson 1996, 26).
Comments: Women tend to prefer odors of men whose major-histocompatibility-complex genes are dissimilar compared to theirs (Richardson 1996, 26). Choosing MHC-dissimilar mates might have functions including increasing fertility, producing hardier offspring, and reducing the risk of genetic disease.

petrichor *n.* An argillaceous odor that accompanies rains after a warm, dry period (Bear and Thomas 1964, 993; 1966, 869).
Comment: Petrichor likely derives from atmospheric contaminants such as carotenoids, lipids, and terpenes (Bear and Thomas 1966, 869). Clays and rocks adsorb these compounds and their oxygenated derivatives which transform especially during warm through hot conditions. When the relative humidity of the atmosphere approaches saturation, the odorous,

volatile compounds move into the air. Petrichor and geosmin (*q.v.*) produce an odor that many people consider pleasant and refreshing (Bear and Thomas 1966, 869).

[Greek *petros*, stone, *ichor*, serum, watery part of blood; coined by Bear and Thomas 1965]

species odor *n.* Odor on a social-insect's body that is peculiar to a species (Hölldobler and Wilson 1990, 643).

Comment: A species odor might be merely the distinctive component of a larger mixture that comprises a colony odor (Hölldobler and Wilson 1990, 643).

♦ **odor-conditioned anemotaxis** See *taxis: anemotaxis*.

♦ **odor plume, odor signal** See *signal: odor signal*.

♦ **odor trail** *n.* A chemical trace (trail pheromone or trail substance) laid down by one insect and followed by another (Hölldobler and Wilson 1990, 641).

exploratory trail *n.* In Army Ants: An odor trail that advance workers of a foraging group lay more or less continuously (Hölldobler and Wilson 1990, 638).

Comment: This is a common kind of army-ant communication (Hölldobler and Wilson 1990, 638).

recruitment trail *n.* In Ants: An odor trail laid down by scout workers and used to recruit nest mates to a food find, a desirable new nest site, a breach in their nest wall, or some other place where the assistance of many workers is needed; opposed to exploratory trail (Hölldobler and Wilson 1990, 642).

♦ **odor signature** *n.* The individual odor deposited by an animal (Wilson 1975, 205).

♦ **oecad** See *ecad*.

♦ **-oecism, -oecy**

adj. -oecious, -oecius, -oekous

cf. -cole, ¹-phile

amphioecism *n.* A population's, or species', showing broad variable tolerance of habitat and environmental conditions, reflected in the presence of clines and a subspecies in the case of a species (given as an adjective in Lincoln et al. 1985).

adj. amphioecious, amphitopic

cf. -oecism: euryoecism, stenoecism

coenomoноoecism See -oecism: trimonoecism.

dioecism *n.*

1. A species' having male and female reproductive organs on different individuals (Lincoln et al. 1985).

syn. diecism, dioecy, dioicism, bisexuality, unisexuality (Lincoln et al. 1985)

See sexual: unisexual.

cf. bisexual; -oecism: monoecism, trioecism

adj. bisexual, dioecious, diecious, dioicious, gonochoristic, unisexual

2. A plant species' having unisexual flowers of each sex on separate plants or in separate parts of the same inflorescence (Fernald 1950, 1573).

adj. dioecious, dioicious

cf. bisexual; -oecism: monoecism

[Greek *dis*, twice + *oikos*, house]

euryoecism, euroky *n.* An organism's being tolerant of a wide range of habitats and environmental conditions (Lincoln et al. 1985).

adj. euryoekous, euryokous

cf. -oecism: amphioecism; stenoecism

heteroecism *n.* In unisexual organisms: production of male and female gametes by different individuals (Lincoln et al. 1985).

See -xeny: pleioxeny.

syn. heterocism, heteroxeny, metoxeny

adj. heterocious, heteroecious, metoecious

homoeicism, host specificity, monoxeny See -xeny: monoxeny.

metoxeny *n.*

1. A parasite's not being host specific, *i.e.*, occupying two, or more, different hosts at different stages of its life cycle (Lincoln et al. 1985).

cf. -oecism: homoeicism

adj. heterocious, heteroecious, metoecious

2. In unisexual organisms: production of male and female gametes by different individuals (Lincoln et al. 1985).

monoecism, monecy, monoecy *n.*

1. An individual organism's having both male and female reproductive organs (Lincoln et al. 1985).

syn. bisexuality, hermaphroditism (Lincoln et al. 1985)

adj. bisexual, hermaphrodite, hermaphroditic

2. A plant species' having separate male and female flowers (unisexual) on the same individual (Fernald 1950, 1578; Lincoln et al. 1985).

Note: Hermaphroditic refers to a plants' having both stamens and carpels in the same flower (Fernald 1950, 1576).

syn. autoicity, ambisexuality (Lincoln et al. 1985)

cf. -oecism: dioecism, trioecism

3. A plant species' having unisexual flowers of each sex on separate plants or in separate parts of the same inflorescence (Fernald 1950, 1573).

adj. dioecious, dioecious, dioicious

cf. bisexual; -oecism: monoecism

polygamodioecism *n.* A polygamous plant species' being mostly dioecious (having separate female and male flowers on different individuals or in different parts of the same inflorescence on a single individual) and partly monoecious [having separate male and female flowers (unisexual) on the same individual]; contrasted with polygamomonooecism (Fernald 1950, 1580).

syn. polygamo-dioecious (Strausbaugh and Core 1978, 626)

polygamomonooecism *n.* A polygamous plant species' being partly dioecious (having separate female and male flowers on different individuals or in different parts of the same inflorescence on a single individual) and mostly monoecious [having separate male and female flowers (unisexual) on the same individual]; contrasted with polygamodioecism (Fernald 1950, 1580).

syn. polygamo-monoecism (Strausbaugh and Core 1978, 626)

stenoecism, stenoecy *n.* An organism's being restricted to a narrow range of habitats and environmental conditions (given as an adjective in Lincoln et al. 1985).

cf. -oecism: amphioecious, euryoecious

adj. stenoecic, stenecious, stenoecious, stenoekous

synoecy *n.* An organism's producing both male and female gametes (Lincoln et al. 1985).

See symbiosis: synoecy.

adj. synoecius

trimonoecism, coenomoноoecism *n.* An individual plant's bearing male, female, and hermaphrodite flowers (Lincoln et al. 1985).

trioecism, trioecy, trioiky *n.* A plant species' having male, female, and hermaphrodite flowers on different individuals (Lincoln et al. 1985).

adj. trioikous

- cf.* -oecism: dioecism, monoecis
- ♦ **oecology** See study of: ecology.
- ♦ **oecoparasitism** See parasitism: ecoparasitism.
- ♦ **oecotrophobiosis** See trophallaxis.
- ♦ **okeospecies** See ²species: ecospecies.
- ♦ **oestrus** See estrus.
- ♦ **offensive threat** See behavior: threat behavior: offensive threat.
- ♦ **offspring** *n.* The progeny of an organism (Michaelis 1963).
syn. descendant; unit of direct fitness (West Eberhard 1975, 6)
- ♦ **offspring equivalent, unit of inclusive fitness** *n.* The fraction of genes that (1) a focal individual organism shares with a genetic relative (not its offspring) through common descent, and (2) is mathematically converted into a fraction of the genes that the focal individual shares with one of its own offspring (West Eberhard 1975, 6).
- Comments:* For example, a mother diploidiploid organism shares one half of her genes with one of her offspring. She shares an average of one-fourth of her genes with her niece, or nephew, through common descent. Thus, on the average, her niece, or nephew, is equivalent to one half of her offspring; that is, it equals about one half of an offspring from a genetic perspective, and it can be counted as one half of an “offspring equivalent.”
- ♦ **offspring imprinting** See learning: imprinting: offspring imprinting.
- ♦ **OGMP** See program: Organelle Genome Megasequencing Program.
- ♦ **O horizon** See soil horizon: O horizon.
- ♦ **oike** See habitat.
- ♦ **oikology** See study of: ecology.
- ♦ **oikos** See habitat.
- ♦ **oikosite** *n.* A commensal, or parasitic, organism that is attached to another organism (Lincoln et al. 1985).
- ♦ **oil droplets** *n. pl.* For example, in Birds and Reptiles: Colored droplets of oil found in front of rods, or cones, in a retina which enhance color vision by biasing the wavelengths of light reaching a photoreceptor, thereby, enabling an animal to resolve more colors than would otherwise be possible (D. B. Quine, pers. comm.).
- ♦ **old field** See habitat: field: old field.
- ♦ **Oldowan Stone Industry** See tool industry: Oldowan Stone Industry.
- ♦ **oleaginous** *adj.* Producing, or containing, oil (Lincoln et al. 1985).
- ♦ **olfaction** See modality: chemoreception: olfaction.
- ♦ **olfactory imprinting** See learning: imprinting: olfactory imprinting.
- ♦ **oligo-, olig-** *comb. f.* “Small; few; scanty” (Michaelis 1963).
[Greek *oligos*, few]
- ♦ **oligohaline** See haline: oligohaline.
- ♦ **oligogene** See gene: oligogene.
- ♦ **oligogenic** See -genic: oligogenic.
- ♦ **oligogyny** See -gyny: oligogyny.
- ♦ **oligolectic** See -lectic: oligolectic.
- ♦ **oligomerization, law of integration** *n.* An evolutionary trend involving a reduction in the number of segments of a body or structure (Lincoln et al. 1985).
- ♦ **oligonitrophile** See ¹-phile: oligonitrophile.
- ♦ **oligophage** See -phage: oligophage.
- ♦ **oligophile** See ²-phile: oligophile.
- ♦ **oligopyrene sperm** See sperm: oligopyrene sperm.
- ♦ **oligotherm** See -therm: oligotherm.
- ♦ **oligotoky** See -toky: oligotoky.
- ♦ **oligotroph** See -phage: oligophage.
- ♦ **oligotypic** See -typic: oligotypic.
- ♦ **oligoxeny** See -xeny: oligoxeny.
- ♦ **oligyny** See -gyny: oligyny; mating system: oligyny.
- ♦ **olisthium** See ²community: olisthium.
- ♦ **-ology** *comb. f.* “Discourse, study of” (Lincoln et al. 1985).
See study of.
- ♦ **ombrophile** See ^{1,2}-phile: ombrophile.
- ♦ **ombrotroph** See -troph: ombrotroph.
- ♦ **omega, ω** *n.* The lowest ranking animal in a dominance hierarchy (Wilson 1975, 279).
cf. alpha, beta
[ω, the last letter of the Greek alphabet]
- ♦ **omni-** *comb. f.* “All, totally” (Michaelis 1963).
[Latin *omnis*, all]
- ♦ **omnicole** See -cole: omnivore.
- ♦ **omnисpective method** See study of: systematics: omnispective systematics.
- ♦ **omnivore** See -vore: omnivore.
- ♦ **on-the-dot sampling** See sampling technique: instantaneous sampling.
- ♦ **onanism** *n.* A man's withdrawing his penis from a woman's vagina just prior to his ejaculation as a contraception practice (Storz 1973, 183).
syn. masturbation, self-abuse (Oxford English Dictionary 1972, entries from 1727; not preferred synonyms, Storz 1973, 183)
n. onanist
adj. onanistic
cf. *coitus interruptus*, masturbation
[after Onan who violated Jewish law by “spilling his seed” rather than inseminating his brother's widow, the Bible, 38, 9]
- ♦ **oncogenic** See -genic: oncogenic.
- ♦ **one-gene-one-character hypothesis** See hypothesis: one-gene-one-character hypothesis.
- ♦ **one-gene-one-enzyme hypothesis** See hypothesis: one-gene-one-enzyme hypothesis.
- ♦ **one-gene-one-polypeptide hypothesis** See hypothesis: one-gene-one-polypeptide hypothesis.
- ♦ **one-male unit** *n.* For example, in *Papio anubis* (Anubus Baboons): The basic social element consisting of a mature male and the harem of females permanently associated with him (Devore, Hall, in Wilson 1975, 534).
cf. group: band, harem
- ♦ **one-sided test, one-tailed test** See statistical test: one-tailed test.
- ♦ **one-zero sampling** See sampling technique: one-zero sampling.
- ♦ **onomatography** See -graphy: onomatography.
- ♦ **onto-, ont-**
comb. f. “Being; existence” (Michaelis 1963).
[Greek *ōn*, *ontos*, present participle of *einai*, to be]
- ♦ **ontocline** See cline: ontocline.
- ♦ **ontogenesis** See -genesis: ontogenesis.
- ♦ **ontogenesis of behavior** See -genesis: ontogenesis of genesis.
- ♦ **ontogenetic migration** See migration: ontogenetic migration.
- ♦ **ontogenetic ritualization** See ritualization: ontogenetic ritualization.
- ♦ **ontogeny** See -genesis: ontogenesis.

- ♦ **ontogeny recapitulates phylogeny** See law: biogenic law.
- ♦ **ontology** See study of: philosophy: metaphysics: ontology.
- ♦ **oo-** *comb. f.* Egg; referring to eggs (Michaelis 1963). [Greek, *ōon*, egg]
- ♦ **ooapogamy** See parthenogenesis: ooapogamy.
- ♦ **oocyte** *n.* The cell that produces ova (eggs) by meiosis (Lincoln et al. 1985). *cf.* gamete, spermatocyte
- ♦ **oogenesis** See -genesis: oogenesis.
- ♦ **oology** See study of: oology.
- ♦ **oophage** See -phage: oophage.
- ♦ **oophagy** See -phagy: oophagy.
- ♦ **ophiophage** See -phage: ophiophage.
- ♦ **oosphere** See gamete: oosphere.
- ♦ **oospore** See gamete: oospore.
- ♦ **open-anonymous group** See ²society: open society: anonymous group.
- ♦ **open-behavioral program** See program: open-behavioral program.
- ♦ **open-brooding** See brooding: open-brooding.
- ♦ **open community** See ²community: open community.
- ♦ **open field** *n.* A large open box, often made of wood and painted flat gray and having a floor marked off in equal-sized squares used to study behavior such as exploration and “emotionality” (Dewsbury 1978, 62–63).
- Comment:* After an animal is introduced into an open field, data such as the number of squares entered, number of fecal boli deposited, frequency of sniffing, and other behaviors can be recorded (Dewsbury 1978, 62–63).
- ♦ **open-field test** See test: open-field test.
- ♦ **open-genetic program** See program: genetic program: open-genetic program.
- ♦ **open-group species** See ²species: open-group species.
- ♦ **open-mouth laughing** See facial expression: open-mouth laughing.
- ♦ **open pollination** See breeding: outbreeding.
- ♦ **open population** See ¹population: open population.
- ♦ **operant behavior** See behavior: operant behavior.
- ♦ **operant conditioning** See learning: conditioning: operant conditioning.
- ♦ **operational definition** See definition: operational definition.
- ♦ **operational taxonomic unit (OTU)** *n.*
1. In numerical taxonomy: The unit of classification (Mayr 1982, 223).
 2. In numerical taxonomy: Any item, individual, or convenient group used for comparison or analysis (Lincoln et al. 1985).
- ♦ **operational sex ratio** See ratio: sex ratio: operational sex ratio.
- ♦ **operationalism** *n.* One’s developing a repeatable method for measuring, or quantifying, a concept; *e.g.*, foliage density, human attitudes, or sweetness (Diemand 1987).
- v.t.* operationalize
- adj.* operational
- ♦ **operator** *n.*
1. In the operon model of bacterial molecular genetics, a location on a gene where a repressor substance binds, and, thereby, controls the functioning of adjacent cistrons (Wittenberger 1981, 619; King and Stansfield 1985).
 2. A target organism of a signal, *e.g.*, a predator that is deceived by mimicry (Lincoln et al. 1985).
- syn.* signal receiver (Lincoln et al. 1985)
- ♦ **operator gene** See gene: operator gene.
- ♦ **operon** *n.* In Bacteria: Adjacent cistrons that function together under an operator gene’s control (King and Stansfield 1985).
- ♦ **ophiciophobia** See -phobia: ophidiophobia.
- ♦ **ophidiophobia** See -phobia: ophidiophobia.
- ♦ **ophiophobia** See -phobia: ophidiophobia.
- ♦ **ophiology** See study of: ophiology.
- ♦ **ophiophage** See phage: ophiophage.
- ♦ **ophiotoxicology** See study of: ophiotoxicology.
- ♦ **opium** See ²community: opium.
- ♦ **opophile** See ¹-phile: opophile.
- ♦ **opportunistic** *adj.* Referring to an organism that has the ability to exploit newly available habitats or resources (Lincoln et al. 1985).
- ♦ **opportunistic species** See ²species: opportunistic species.
- ♦ **opportunity for selection (*I*)** *n.* V/\bar{w}^2 , where *V* is a population’s variance in fitness, and \bar{w} is the population’s mean fitness. (Crow 1958 in Futuyma 1986, 527). *Comment:* *I* represents only the opportunity for natural selection; selection can actually occur only if *V* has a genetic component (Futuyma 1986, 527). A high *I* suggests a high potential for selection.
- ♦ **optimal** *adj.*
1. Referring to levels of environmental factors that are best suited for growth and reproduction of an organism (Lincoln et al. 1985). *syn.* most favorable (Lincoln et al. 1985)
 2. Referring to an organism’s character that, may not be perfect, but under prevailing conditions helps to promote its fitness (McFarland 1985, 427). *cf.* optimality, pessimal
- ♦ **optimal breeding** See breeding: optimal outbreeding.
- ♦ **optimal decision making** See decision making: optimal decision making.
- ♦ **optimal-diet theory** See ³theory: optimal-diet theory.
- ♦ **optimal inbreeding** See inbreeding: optimal inbreeding.
- ♦ **optimal-foraging theory (OFT)** See ³theory: optimal-foraging theory, OFT.
- ♦ **optimal mix of castes** *n.* The ratio of castes that can achieve the maximum rate of production of virgin queens and males while a colony is at, or near, its maximum size (Wilson 1975, 305).
- ♦ **optimal outbreeding** See breeding: optimal outbreeding.
- ♦ **optimal-outbreeding hypothesis** See hypothesis: optimal-outbreeding hypothesis.
- ♦ **optimal yield** *n.* The highest rate of increase that a population can sustain in a given environment (Wilson 1975, 590).
- ♦ **optimality** *n.* An organism’s obtaining as much of its required resources that it can or increasing its fitness as much as it can given its environmental constraints. *cf.* benefit; cost; design; ³theory: optimality theory; utility
- Comment:* An organism’s actual optimality is unlikely to be as great as its theoretical optimality.

long-term optimality *n.*

1. An organism's leaving as many viable offspring as it can in its lifetime [coined by Dawkins 1986, 21].
syn. goal function (McFarland and Houston 1981 in Dewsbury 1978, 31)
2. A state that an animal species approaches when natural selection has been in operation for a certain length of time in the same environment (Maynard Smith 1978, Dawkins 1982 in Dawkins 1986, 23).

Comment: The linkage between "long-term optimality" and "short-term optimality" in organisms is variable. Extant species are optimal, subject to provisions such as time-lag effects (Maynard Smith 1978, Dawkins 1982 in Dawkins 1986, 23).

short-term optimality *n.* An organism's optimizing, *q.v.*, a function in its day-to-day life, such as the amount of energy that it collects per unit time [coined by Dawkins 1986, 21].

syn. goal function (McFarland and Houston 1981 in Dewsbury 1978, 31)

♦ **optimality theory** See ³theory: optimality theory.

♦ **optimization principle of evolution** See compromise of evolution.

♦ **optimization theory** See ³theory: optimality theory.

♦ **optimon** *n.* The unit of natural selection for whose benefit adaptation may be said to exist (Dawkins 1982, 291).

Comment: An optimon may be a gene, individual organism, or group of organisms (Dawkins 1982, 291).

♦ **optimum** *n.*

1. The value taken by an independent variable when a related dependent variable is maximized or minimized; *e.g.*, optimum values of fecundity, gamete size, or parental care may be paired with optimum fitness (Bell 1982, 510).
2. The conditions that are most favorable for growth and reproduction of an organism or maintenance of a system (Lincoln et al. 1985).

cf. optimal, pessimum

♦ **optimum-permissible trait** See character: optimum-permissible character.

♦ **optokinetic response** See reflex: optomotor reflex.

♦ **optomotor reflex** See reflex: optomotor reflex.

♦ **oral-scent gland** See gland: oral-scent gland.

♦ **oral trophallaxis** See trophallaxis: stomodeal trophallaxis.

♦ **orchard** See ²community: orchard: habitat: orchard.

♦ **order** See ²group: A Taxonomic Classification of Groups.

♦ **order** *n.*

1. Rank, grade, or class (Oxford English Dictionary 1972, entries from 1563).
2. Sequence, disposition, arrangement; arranged, or regulated condition (Oxford English Dictionary 1972, entries from 1320).
3. Formal disposition or array; regular, methodological, or harmonious arrangement of the position of things in any space, or area, that compose any group or body (Oxford English Dictionary 1972, entries from 1374).
4. A method according to which things act or events occur; the fixed arrangement in the existing constitution of things; a natural, moral, or spiritual system in which things proceed according to definite laws; in phrases such as "order of nature, things, and the

world; "moral order," "spiritual order," etc. (Oxford English Dictionary 1972, entries from 1340).

v.t. order

♦ **order** *n.*

1. The degree of mathematical complexity in analytical form, geometrical form, an equation, expression, operator, or the like, as denoted by an ordinal number (first, second, third, ..., nth) (Oxford English Dictionary 1972, entries from 1706).
2. The number of rows and columns in mathematical matrices (Lincoln et al. 1985).

♦ **order** *n.* The relationship between behavioral events with regard to preceding ones.
See need: order.

v.t. order

Comment: Order is used to describe Markoff chains and transition matrices.

first order *n.* The situation in which the probability of a particular behavior's occurring is dependent on only the behavior that immediately precedes it (Lehner 1979, 273).

nth order *n.* The situation in which the probability of a particular behavior's occurring is dependent on the n (= the specified number of) behaviors that precede it (Lehner 1979, 273).

second order *n.* The situation in which the probability of a particular behavior's occurring is dependent on only the two behaviors that immediately precede it (Lehner 1979, 273).

zeroth order *n.* The situation in which behavioral events are independent of one another; *i.e.*, the probability of a particular behavior's occurring is not related to any behaviors that precede it (Lehner 1979, 273).

♦ **ordered variable** See variable: ranked variable.

♦ **ordinal scale** See scales of measurement: ordinal scale.

♦ **ordinate** *n.* The vertical, or y-axis, of a graph (Lincoln et al. 1985).

cf. abscissa

♦ **ordination** *n.*

1. A mathematical process by which organism communities are ordered along a gradient (Lincoln et al. 1985).
2. A numerical-analysis method used for summarizing similarities between communities, or OTUs, by representing them as points in a multidimensional space in such a way that the interpoint distances are inversely related to their similarities (Lincoln et al. 1985).

♦ **ORFX** See gene: ORFX.

♦ **orgadium** See ²community: orgadium.

♦ **orgadophile** See ¹-phile: orgadophile.

♦ **orgadocole** See -cole: orgadocole.

♦ **organ** *n.* An organism's functionally distinct structure composed of tissue, or tissues, that is part of one of its physiological systems; *e.g.*, brain, heart, liver, sense organ, or skin (Immelmann and Beer 1989, 208).

cf. gland, organelle, spermatheca

Comments: Barnes (1974) describes many of the scores of kinds of organs in invertebrates; Chapman (1971) describes those in insects. Some of the many kinds of organs are defined below.

[Greek *organon*, tool]

brain *n.*

1. A convoluted mass of "nervous substance" contained in a vertebrate's skull; an analogous, but

less developed, organ in an invertebrate (Oxford English Dictionary 1971, entries from 1000).

Note: An adult human brain can store up to 100 trillion bits of information, and have up to 100 billion neurons (Dowling 1997b).

2. The principal ganglion of an invertebrate (Michaelis 1963).

cf. H. M. (Appendix 1); memory, system: memory system

Comments: Vertebrate brains contain centers for complex integration of homeostasis, movements, perceptions, and in Humans, at least, emotions and intellect (Campbell 1996, 1012). The Avian Brain Nomenclature Consortium (an international group of neuroscientists) presented a new nomenclature for bird-brain anatomy which reflects current knowledge of the subject (Jarvis et al. 2005, 151). The nomenclature replaces Ludwig Edinger's 19th-century bird-brain nomenclature which has a religious overlay and attempts to rank organisms from "lowest to highest" with Humans at the top. The old inaccurate "terminology for the vertebrate brain that was used throughout the 20th century became a severe impediment to the communication of scientific discoveries and the generation of new insights" (Jarvis et al. 2005, 155).

► **amygdala** *n.* In a vertebrate brain, part of the cerebrum, that is involved in learning and memory (Campbell et al. 1999, 988).

Comment: The amygdala seems to be crucial in forming and triggering recall of a specific subclass of memories tied to strong emotions, especially fear (Lemonick 1999, 13 September, 57).

► **basal ganglia** *n.* In a vertebrate brain, areas in a cerebrum which are important centers for motor coordination (Campbell 1996, 1017; illustration, 1016). *Comments:* Degeneration of cells that enter the basal ganglia occur in Parkinson's disease (Campbell 1996, 1017). In Huntington's Disease, patients show destruction of their basal ganglia. They have perfectly functioning explicit memory, but they cannot learn new motor skills (Lemonick 1999, September 13, 56).

► **brain stem** *n.* In a vertebrate brain, the midbrain and the hindbrain (Campbell 1996, illustration, 1015, 1016).

► **cerebellum** *n.* In a vertebrate brain, part of a hindbrain that is a major center for coordinating movement (Campbell 1996, 1014).

► **corpus callosum** *n.* In a vertebrate brain, a thick band of fibers (cerebral white matter) that connects the two hemispheres of a cerebrum (Campbell 1996, illustration, 1016; 1017).

► **diencephalon** *n.* In a vertebrate brain, a hypothalamus and thalamus; contrasted with telencephalon (Campbell 1996, 1014).

► **forebrain** *n.* In a vertebrate brain, the telencephalon (which contains the cerebrum) and the diencephalon (which contains the hypothalamus and thalamus); contrasted with midbrain and hindbrain (Campbell 1996, 1014, 1016; illustration, 1015, 1016).

► **gray matter** *n.* In a vertebrate brain, the cerebral cortex which is the outer gray area; contrasted with white matter (Campbell 1996, 1012).

► **hindbrain** *n.* In a vertebrate brain, the cerebellum, medulla oblongata, and pons; contrasted with forebrain and midbrain (Campbell 1996, 1014; illustration, 1015, 1016).

SOME PARTS OF VERTEBRATE BRAINS

- I. forebrain
 - A. telencephalon
 - 1. cerebrum
 - a. amygdala
 - b. basal ganglia
 - c. cerebral cortex
 - d. corpus callosum
 - e. frontal lobe
 - (1) frontal-association area
 - (2) motor cortex
 - (3) speech center
 - (4) supplementary-motor area
 - f. hippocampus
 - g. left-cerebral hemisphere
 - h. olfactory bulb
 - i. occipital lobe
 - (1) "vision center"
 - (2) visual-association area
 - j. parietal lobe
 - (1) "reading center"
 - (2) somatosensory-association area
 - (3) "speech center"
 - (4) "taste center" (*syn.* gustatory center)
 - k. pituitary gland
 - l. right-cerebral hemisphere
 - m. temporal lobe
 - (1) "hearing center" (*syn.* auditory center)
 - (2) "hearing-association area" (*syn.* auditory-association center)
 - (3) "smelling center" (*syn.* olfactory center)
 - B. diencephalon
 - 1. hypothalamus
 - a. hunger-regulating center
 - b. pleasure center
 - c. suprachiasmatic nucleus
 - d. thirst-regulating center
 - 2. thalamus, including intralaminar nucleus
 - II. brain stem
 - A. midbrain, including optic lobe with its inferior colliculus, reticular formation, and superior colliculus.
 - B. hindbrain
 - 1. cerebellum, including inferior olive
 - 2. *medulla oblongata*
 - 3. pons

► **hypothalamus** *n.* In a vertebrate brain, the ventral part of a diencephalon (Campbell 1996, 1017).

Comments: A hypothalamus is a major center for integrating an animal's endocrine and nervous systems (Immelmann and Beer 1989, 138, 222). Hypothalamus functions include regulation of eating, drinking, reproduction, and general drive; hormone secretion by an individual's pituitary gland and, thus, indirectly regulation of its gonadal, thyroid, and adrenocortical functions; and playing a role in the fight-or-flight response, pleasure, mating behavior, and sexual response (Campbell 1996, 1017). The hypothalamus secretes antidiuretic hormone and oxytocin. In mammals the hypothalamus regulates body temperature. In Humans, the hypothalamus is also associated with pleasure, pain, and anger (Curtis 1983, 819).

- **inferior colliculus** *n.* In a vertebrate brain, an auditory center; contrasted with superior colliculus (Campbell 1996, 1017).
- **inferior olive** *n.* In a vertebrate brain, a small knot of cells in the cerebellum that act as the pacemaker for cerebellum cells (discovered by Rodolfo Llinas in Hilts 1997, 27 May, C5).
- **intralaminar nucleus** *n.* In a vertebrate brain, a group of cells in a thalamus that might set the rhythm for conscious thinking (discovered by Rodolfo Llinas in Hilts 1997, 27 May, C5).
- **midbrain** *n.* In a vertebrate brain, the optic lobe; contrasted with forebrain and hindbrain (Campbell 1996, 1014; illustration, 1015).
Comments: The midbrain contains centers for the integration and receipt of several types of sensory information (Campbell 1996, 1017). It also sends coded sensory information along neurons to specific regions of the forebrain.
- **motor cortex** *n.* In a vertebrate brain, an area of the frontal lobe that sends commands to skeletal muscles, signaling appropriate responses to sensory stimuli (Campbell 1996, 1017; illustration, 1018).
Comments: A reticular formation is in the central gray core of a brain (Immelmann and Beer 1989, 20). It receives input indiscriminately from all of the animal's sensory systems and projects this input's pooled activation, together with probable inherent excitation flux, as a background of neural facilitation to more specific areas of the animal's cerebellum where it makes connections between stimuli and responses.
- **somatosensory cortex** *n.* In a vertebrate brain, an area of the parietal lobe that receives and partially integrates signals from pain, pressure, temperature, and touch receptors throughout a body (Campbell 1996, 1017; illustration, 1018).
- **superior colliculus** *n.* In a vertebrate brain, a visual center; contrasted with inferior colliculus (Campbell 1996, 1017).
- **supplementary-motor area** *n.* In Humans, a part of a brain in the left frontal lobe that is related to laughter (Browne 1998, 10 March, 1).
- **suprachiasmatic nucleus** *n.* In a vertebrate brain, part of a hypothalamus that functions as a biological clock (Campbell 1996, 1017).
- **telencephalon** *n.* In a vertebrate brain, a cerebrum; contrasted with diencephalon (Campbell 1996, 1014).
- **thalamus** *n.* In a vertebrate brain, part of a diencephalon which is a major relay station for sensory information on its way to a cerebrum (Campbell 1996, 1017).
- **ventromedial-prefrontal cortex** *n.* In Humans: The area of a brain that might store information about past rewards and punishments and triggers the nonconscious emotional responses that normal people may register as intuition or a "hunch" (Antonio Damasio in Vogel 1997, 28 February, 1269).
cf. intuition
- **white matter** *n.* In a vertebrate brain, axons in the inner region with myelin sheaths that give them a white appearance; contrasted with gray matter (Campbell 1996, 1012).

copulatory organ *n.* An organ that is directly involved in an animal's coition.

Comment: Some kinds of copulatory organs are given below.

- **aedeagus** *n.* A male insect's entire copulatory organ; the distal part of a phallus; a penis plus parameres (Borror et al. 1989).

syn. intromittent organ, penis (Barnes 1974, 632), but in some species a penis is considered to be part of an aedeagus

Comment: A "phallus" is the intromittent organ in Cyclorrhaphan Flies and consists of a short "basiphallus" and a usually very elongate "distiphallus" (White et al. 2000, 896).

- **bursa copulatrix** *n., pl. bursae copulatrices*
n. In many insect species: A female's pouch that receives an aedeagus during copulation (Borror et al. 1989, 792).

syn. genital pouch (in flies, Torre-Bueno 1978)

- **cloaca** See gland: cloacal gland.

- **gonopodium** *n.* In Poeciliid Fish: A male intromittent organ formed by the modification of the anterior three through five rays of an anal fin (Murdy et al. 1997, 129).

- **hemipenis** *n.* In Lizards and Snakes: One of a male's two independent copulatory organs (Dewsbury 1978, 77; Tokarz 1988, 1518).

Comment: A male *Anolis sagrei* (Brown Anole) can use either of his hemipenes in copulation (Tokarz 1988, 1518); alternating the use of his hemipenes is a behavioral means of increasing sperm transfer (Tokarz and Slowinski 1990, 374).

- **intromittent organ** See organ: copulatory organ: aedeagus, penis.

- **penis** *n., pl. penes* For example, in *Ascaraphus* spp. (Tailed Frogs); all flightless-bird, duck, and mammal species; many arthropod species; some gastropod, platyhelminth, and reptile species: A male's copulatory organ (Oxford English Dictionary 1972, entries from 1693; Barnes 1974; Wilson 1975, 443; Curtis 1983, 840).

syn. intromittent organ (in males and hermaphrodites of some species)

cf. organ: copulatory organ: aedeagus, vagina
[Latin, *penis* = *cauda*, tail; now as defined above]

- **vagina** *n.* In Mammals: A female's muscular tube that leads from the cervix of her uterus to outside of her body, receives a penis during copulation, and acts as a birth canal (Curtis 1983, 842).

corbicula *n., pl. corbiculae* A pollen holding area on the hind tibia of a female apid bee (bumble bee, honey bee, orchid bee, or stingless bee) (Michener 1974, 10, illustration; 143; O'Toole and Raw 1991, 185).

syn. pollen basket (O'Toole and Raw 1991, 185)

cf. organ: scopa

Comments: A corbicula is formed by the smooth, slightly concave outer surface of a tibia, fringed by long, stiff hairs, and is used to transport pollen (combined with nectar), and building materials (such as resin) to a bee's nest (Michener 1974, 10; O'Toole and Raw 1991, 185).

- **-derm** *suffix* Skin.

[Greek *derma*, skin]

- **ectoderm** (EK toe durm) *n.* The outer of an animal embryo's three primary germ layers that develops into its sense organs, skin, and nervous system; contrasted with endoderm and mesoderm (Michae lis 1963).

► **endoderm** (EN doe durm) *n.* The inner of an animal embryo's three primary germ layers that develops into its digestive and respiratory systems; contrasted with ectoderm and mesoderm (Michaelis 1963).

syn. endoblast, entoblast, entoderm (Michaelis 1963)

► **mesoderm** (ME sew durm) *n.* The middle of the three primary germ layers in an animal embryo that develops into its skeletal and muscular systems, heart, kidneys, etc.; contrasted with ectoderm and endoderm (Michaelis 1963).

flower *n.*

1. A plant's simple through complex cluster of petals, usually brightly colored and with an outer envelope of green sepals, enclosing reproductive parts (Michaelis 1963).
2. Any plant's reproductive structure, whether or not it is surrounded by a calyx and petals (Michaelis 1963).
3. An angiosperm structure with one or more of these parts calyx, petals, stamens, staminodes, and carpels.

Note: Flowers are often structures that produce pollen, seeds, or both. They vary in many features including color, numbers of parts, scent, shape, and size. Mutant flowers are sometimes nonreproductive ones, including horticultural varieties such as many kinds of double flowers.

[Old French *flour*, *flor* < Latin *flos*, *floris*, flower]

► **explosive flower** *n.* A flower that quickly ejects its pollen out of its anthers (von Helversen and von Helversen 1999, 759).

cf. organ: flower: virgin flower

Comments: Explosive flowers are rare in Anthophyta (Flowering Plants). Regarding *Mucuna boltonii* (Fabaceae), a *Glossophaga commissarisi* (Commisarisi's Long-tongued Bat) lands on a flower, presses its snout into the slit between the flower's wings (side petals), and causes its keel to burst and its staminal column (which was under pressure) to catapult much pollen onto the bat's rump (von Helversen and von Helversen 1999, 759). *Anthornis melanura* (New Zealand Bellbirds) and *Prosthemadera novae-seelandiae* (Tui), twist open flowers of two New Zealand mistletoes *Peraxilla* spp. (Loranthaceae) (Kelly et al., 2004, illustrations). This causes the flowers to spring open and spray the birds with their pollen. Two species of colletid bees can also twist open the flowers and cause them to spray their pollen, which the bees use as food.

► **pollen flower** *n.* A flower with one, or more, anthers that produces pollen but no seeds (inferred from Farrar 1995).

syn. male flower

Comments: Pollen flowers are borne on plants with seed flowers, or on plants with only pollen flowers, depending on the species. Pollen flowers can have nonfunctional carpels as in *Acer saccharum* (Sugar Maples) and other species (Farrar 1995, 134).

► **seed flower** *n.* A flower with one, or more, carpels that can produce seeds (inferred from Farrar 1995).

syn. female flower

Comments: Seed flowers are borne on plants with pollen flowers or on plants with only seed flowers, depending on the species. Seed flowers can have nonfunctional anthers as in *Acer saccharum* (Sugar Maples) and other species (Farrar 1995, 134).

► **virgin flower** *n.* A flower, e.g., of *Mucuna boltonii* (Fabaceae), that is open, but has not yet quickly ejected its pollen (von Helversen and von Helversen 1999, 759, illustration).

cf. organ: flower: exploded flower

Jacobson's organ *n.* In most vertebrate species: A chemoreceptor area used for detecting chemicals related to aggregation, courtship, feeding, and trailing conspecifics and prey in snakes; identification of prey in a scincid lizard; and pheromone detection in mammals (Halpern 1983 and Wysocki et al. 1986 in Graves and Halpern 1990, 692; Blakeslee 1993, C3).

syn. vomeronasal organ (Immellmann and Beer 1989, 107), VNO (Weiss 1998, 12 March, A9)

cf. chemical-releasing stimulus: semiochemical: pheromone; flehmen

Comments: For example in *Elephas maximus* (Asian Elephants), ducts that lead to the Jacobson's organ are in the roof of an individual's mouth (Schulte and Rasmussen 1999, 1269). In Humans, this organ is a pair of tiny pits in a person's nose, and researchers are uncertain whether, or not, this organ is functional (Weiss 1998, 12 March, A9).

nasus *n.* In some nasutitermitine-termite species: A snout-like organ of soldiers used to eject poisonous, or sticky, fluid at intruders (Wilson 1975, 589).

[Latin *nasus*, nose]

notochord *n.* In Chordata: A flexible rod of cells (Curtis 1983, 553–556; Bucksbaum et al. 1987, chapter 22).

Comments: A notochord occurs in the dorsal area of a hemichordate, urochordate, cephalochordate, and vertebrate embryo; in hemichordate, urochordate, and cephalochordate larvae; and in cephalochordate adults (Curtis 1983, 553–556; Bucksbaum et al. 1987, chapter 22). This organ is composed of large, fluid-filled cells encased in fairly stiff, fibrous tissue, and it provides skeletal support (Campbell et al. 1999, 630). In most vertebrate species, an adult has a complex, jointed skeleton, and only remnants of its embryonic notochord as gelatinous material of disks between vertebrae.

[Greek *noto*, back; Latin *chorda*, gut, cord]

lophophore *n.* In Phyla Brachiopoda, Bryozoa, Entoprocta, and Phoronida: The food-catching organ that is a circular or horseshoe-shaped fold that encircles the mouth and bears numerous ciliated tentacles (Barnes 1974, 693, illustration).

Comment: The food-catching organ of Pterobranchia (Phylum Hemichordata) resembles a lophophore (Barnes 1974, 805).

pharyngeal gill slits *n.* In Acorn Worms (Hemichordata: Enteropneusta): One of a group of openings in the branchial region of an individual that may function in gas exchange.

Comments: Hemichordate and chordate gill slits probably evolved originally as feeding mechanisms in which the animals strained small particles out of the water passing through their pharyngeal clefts (Barnes 1974, 801–802). Urochordates and cephalochordates still use gill slits for feeding.

placenta *n.* In Eutherian Mammals: An organ that provides for fetal anchorage, fetal nourishment, and elimination of the fetal waste products and produces progestins; formed by the union of a fetus' and its mother's membranes (Wilson 1975, 591; Immelmann and Beer 1989, 223).

pollinium *n., pl. pollinia* In many species of apocynaciad (Apocynaceae) and Orchids (Orchidaceae): A specialized pollen mass that can attach to a pollinator by its sticky region (Lawrence 1951, 766, illustrations, 434, 674).

relict *n.* An organ that has become functionless (vestigial) yet persists usually in a fragmentary, or greatly reduced form; *e.g.*, pelvic girdles of some snake and whale species and embryonic gill slits in many terrestrial-vertebrate species (Immelmann and Beer 1989, 252).

syn. relict organ, evolutionary vestige

cf. behavior: relict behavior

scopa *n., pl. scopae* A bee's group of specialized hairs used for transporting pollen (Michener 1974, 9–10, illustration, 143; O'Toole and Raw 1991, 186). *cf.* corbicula

Comments: Colletid bees carry pollen in their crops. Fedeline and Megachilid Bees have scopae on the undersides of their metasomas. The other bee families have scopae on their hindlegs and sometimes on sides of their metasomas (O'Toole and Raw 1991, 186).

sense organ *n.* An organ that is specialized for receiving sensory stimulation which includes an arrangement of sense cells, nerve cells, and supporting tissue (Immelmann and Beer 1989, 263).

cf. ²receptor

spermatheca *n., pl. spermathecae* In females of many arthropod species: A small pouch attached to a female's common oviduct that stores sperm after mating (Oxford English Dictionary 1972, entries from 1826).

Comments: Fruit Flies (Tephritidae) have two, three, or four spermathecae per individual, depending on the taxon (White et al. 2000, 901). Queens of *Apis mellifera* (Western Honey Bees) store viable sperm in their spermathecae for up through 4 yr.

[Greek *sperma*, seed + *theke*, box, coffin, vault]

target organ *n.* An organ upon which a hormone acts and has one, or more, of these effects: a temporary, or lasting, change in an animal's ontogenesis, seasonal fluctuation, and sensory, neural, or glandular activity (Immelmann and Beer 1989, 306).

vomeronasal organ See organ: Jacobson's organ.

♦ **organ-identity gene** See gene: organ-identity gene.

♦ **organelle** *n.*

1. A cell's complex cytoplasmic structure of particular morphology and function (King and Stansfield 1985).

Note: This definition is incomplete because some organelles have a simple cytoplasmic structure, some have many variations on a basic structural theme, and some have more than one function (G. B. Chapman, pers. comm.).

2. Any of a variety of cytoplasmic structures that actively modify the components of a cell, *e.g.*, by participating in the synthesis of a cellular product or structure, its assembly, or both (G. B. Chapman, pers. comm.).

cf. organ, gland

Comments: Campbell (1987, G-14) indicates that only eukaryotes have organelles; however, if one classifies chromatophores and thylakoids as organelles, organelles are also found in prokaryotes (G. B. Chapman, pers. comm.). Other kinds of organelles are

chloroplasts, Golgi complexes, lysosomes, microbodies, mitochondria, nuclei, plastids, and ribosomes (King and Stansfield 1985; G. B. Chapman, pers. comm.). [Greek *organon*, instrument, tool]

amyloplast, leucoplast *n.* A colorless plastid that stores starch, particularly in roots and tubers (Campbell 1996, 135).

chloroplast *n.* A plastid that contains accessory pigments, chlorophyll, enzymes, and other molecules and functions in photosynthesis (Campbell 1996, 135–136, illustration).

Comments: Chloroplasts occur in Algae and Plantae (Campbell 1996, 136). This organelle is composed of inner and outer membranes, stroma, and thylakoids stacked into grana, and is about 2 by 5 μ .

chromoplast *n.* A plastid that contains pigments and gives flowers and fruits their orange and yellow colors (Campbell 1996, 135).

hydrogenosome *n.* In Archezoa, *e.g.*, *Plagiopyla* spp.: An organelle that generates ATP anaerobically and produces hydrogen as a reduced end product of its energy metabolism (Gray et al. 1998, 1479).

Comment: Hydrogenosomes and mitochondria may have a common evolutionary origin (Gray et al. 1998, 1480; Vogel 1998, 1633).

mitochondrion *n., pl. mitochondria* In Eukaryotes: an organelle that functions in respiration (Campbell 1996, 126).

syn. chondriosome (Michaelis 1963)

cf. nucleic acid: deoxyribonucleic acid: mitochondrial DNA

[New Latin < Greek *mitos*, thread + *chondros*, cartilage, granule]

Comments: Eukaryotes possibly obtained mitochondria for the first time sometime from 1.5 through 2.2 Ga ago (Knight 2004, 236). The energy-producing Krebs cycle and electron transport occur in a mitochondrion's matrix and inner membrane, respectively (Campbell 1996, 170). *Anaplasma*, *Ehrlichia*, and *Rickettsia* may be the very close eubacterial relatives of mitochondria (Gray et al. 1998, 1476).

mitosome *n.* A relic of a mitochondrion (*q.v.*) found in the protistan *Entamoeba histolytica* and possibly *Giardia intestinalis* (Knight 2004, 237).

Comment: Jorge Tovar et al. (in Knight 2004, 237) first identified mitosomes in *E. histolytica* in 1999.

nucleus *n.* In Eukaryans: The region of a eukaryotic cell that is enclosed by a double membrane and contains one or more chromosomes (Michaelis 1963).

[Contraction of Latin *nucleus*, diminutive of *nux*, *nucis*, nut]

plastid *n.* In plant cells, any of a class of specialized organelles that contain pigments and may synthesize and accumulate particular substances (Rieger et al. 1991).

cf. plasmid

Comment: Leucoplasts are colorless plastids (Rieger et al. 1991). Amyloplasts produce starch; chloroplasts produce glucose; elaioplasts produce fats and essential oils. Chromoplasts are colored plastids that contain less chlorophyll and more carotenoid pigments than chloroplasts.

♦ **Organelle Genome Database** See database: Organelle Genome Database (Appendix 3).

♦ **Organelle Genome Megasequencing Program** See program: Organelle Genome Megasequencing Program.

♦ **organic** *adj.*

1. Pertaining to, or derived from, living organisms (Lincoln et al. 1985)
 2. Pertaining to a compound that contains carbon (Lincoln et al. 1985).
- cf.* inorganic
[Greek *organon*, instrument, tool]

inorganic *adj.*

1. Referring to something that does not have the organized anatomical structure of an organism (Michaelis 1963).
2. Referring to something that is not characterized by life processes (Michaelis 1963).
3. In chemistry, of, pertaining to, or designating a compound that lacks carbon, except for carbonates and cyanides (Michaelis 1963).

♦ **organic chemistry** See study of: chemistry: organic chemistry.

♦ **organic compound** See compound: organic compound.

♦ **organic phosphate** See molecule: organic phosphate.

♦ **organic selection** See effect: Baldwin effect.

organicism *n.*

1. "The doctrine that organic structure is merely the result of an inherent property in matter to adapt itself to circumstances" (Oxford English Dictionary 1972, entry from 1883).
2. The concept that living processes are the result of the activity of all organs considered as an autonomous, integrated system (Michaelis 1963).
3. Sociologically, the concept that a society is an organism (Michaelis 1963).
4. The concept that "unique" characteristics of organisms are not due to their composition but rather to their organization (Mayr 1997, 16).

Note: Organicism is an approach used to explain a biological phenomenon that combines the appropriate explanatory ideas from both physicalism (application of methodology of the physical sciences to biology) and vitalism (the concept that a biological phenomenon is explained at least partly by a factor outside of the jurisdiction of chemical and physical laws) (Mayr 1997, 69). As the concept of有机ism evolved, it incorporated the phenomenon of genetic program and emergence (Mayr 1997, 19). It then "became antireductionist and yet remained very mechanistic." Organicism considers an organism to be a whole and the wholeness should be studied and analyzed at the correct level(s) of analysis (Mayr 1997, 20).

cf. holism, physicalism, vitalism

n. organicist

[coined by W. E. Ritter (1919) in Mayr (1997, 17)]

♦ **organism** See Appendix 1.

♦ **organism behavior** See behavior: organism behavior.

♦ **organism-environment coevolution** See ¹evolution: coevolution: organism-environment coevolution.

♦ **organismal theory, organismal theory of multicellularity** See ³theory: organismal theory.

♦ **organismic theory** See ³theory: organismic theory.

♦ **organized society** See ²society: organized society.

♦ **organogenesis** See -genesis: organogenesis.

♦ **organology** See study of: organology.

♦ **organophyly** *n.* The phylogeny of organs and structures (Lincoln et al. 1985).

♦ **organotroph** See -troph: organotroph.

♦ **organized structure** *n.* A naturally occurring, or artificial, group of molecules with particular relative positions due to forces such as hydrogen bonding, ionization, solubility, adhesion, and surface tension (Strickberger 1990, 117).

cf. cell: protocell

Comment: Organized structures might be predecessors of protocells, *q.v.* (Strickberger 1990, 117).

♦ **"clay aggregation"** *n.* An organized structure which forms on clay (Cairns-Smith in Nash 1993, 73). *Comments:* The organized structure has positively charged nucleic acids associated with negatively charged proteins associated with positively charged clay.

♦ **coacervate** *n.* An organized structure that is a droplet formed from dispersed colloidal particles that separate spontaneously from solution because of special conditions such as acidity and temperature; contrasted with membranous droplet and microsphere (Oparin 1924 in Strickberger 1990, 118).

Comments: Coacervates, depending on the kinds, have certain properties including a simple, but persistent organization; stability in solution, and size increase (Strickberger 1990, 119).

♦ **"Iron Pyrite aggregation"** *n.* An organized structure which forms on Iron Pyrite (Wächtershäuser in Nash 1993, 74).

Comments: This organized structure has positively charged nucleic acids associated with negatively charged proteins associated with positively charged Iron Pyrite.

♦ **liposome** *n.* An organized structure which is a sphere, the surface of which is made of a double layer of lipid molecules (Zimmer 1995, 76, illustration).

♦ **membranous droplet, vesicle** *n.* An organized structure composed of lipids, polypeptides, other molecules, or a combination of these molecules and produced by the mechanical agitation of molecular films on liquid surfaces or even spontaneously; contrasted with coacervate and microsphere (Deamer 1986 in Strickberger 1990, 117).

Comment: Membranous droplets allow certain processes to occur that are necessary for life.

♦ **microsphere** *n.* A sphere formed from thermally produced proteinoids that are boiled in water and allowed to cool; contrasted with membranous droplet and coacervate (Fox et al. 1974 in Strickberger 1990, 119).

Comment: Microspheres have certain characteristics that suggest they evolved into protocells (Strickberger 1990, 119).

♦ **quasi-cell** *n.* A spheroidal organized structure comprised of a membrane of a double layer of lipids (= a liposome) with RNA inside (David Deamer et al. in Zimmer 1995, 78, illustration).

♦ orgasm *n.*

1. A person's immoderate, or violent, excitement of feeling; rage, fury; a paroxysm of excitement or rage (Oxford English Dictionary 1972, entries from 1646).

2. An animal's excitement, or violent, action in an organ or part, accompanied with turgescence; specifically the height of venereal excitement in coition of some animal species (Oxford English Dictionary 1972, entries from 1684).

Comments: In Humans, "male sexual orgasm" involves muscle contractions that propel sperm out through a

man's urethra and associated sensations (Curtis 1983, 841). "Female sexual orgasm" involves a woman's cervix's dropping down into the upper portion of her vagina, where semen tends to form a pool; this orgasm may also produce contractions in her oviducts that propel sperm upward and associated sensations (Curtis 1983, 847). About 30% of women typically experience orgasms from intercourse (Hrdy 1999, 851). In Primates, "female sexual orgasm" also occurs in *Gorilla* spp. (Gorillas) and *Macaca arctoides* (Stump-tailed Macaques) (Smith 1984, 621; Waal 1989, 152). [Latin *orgasmus*, to swell as with moisture, be excited or eager]

♦ **-orial**

cursorial, running *adj.* Referring to a trait, or animal, that is adapted for running (Lincoln et al. 1985).

fossorial, digging *adj.* Referring to a trait, or animal, that is adapted for digging (Lincoln et al. 1985). *Comment:* Animals with fossorial legs include Mole Crickets, Moles, and Turtles, including *Terrapene carolina carolina* Linnaeus, 1758 (Eastern Box Turtle, fig. 31) native to the U.S.

grallatorial *adj.* Referring to a trait, or animal, that is adapted for wading (Lincoln et al. 1985).

inssessorial *adj.* Referring to a trait, or animal, that is adapted for perching (Lincoln et al. 1985).

natatorial, natant, natatorious, natatory *adj.* Referring to a trait, or animal, that is adapted for swimming (Lincoln et al. 1985).

raptorial, raptatory, preying *adj.* Referring to a trait, or animal, that is adapted for seizing prey (Lincoln et al. 1985).

rasorial *adj.* Referring to a trait, or animal, that is adapted for scratching, or scraping, the ground (Lincoln et al. 1985).

repugnatorial *adj.* Referring to a trait, or animal, that is adapted for defense or offense (Lincoln et al. 1985).

saltatorial, saltatory *adj.* Referring to a trait, or animal, that is adapted for leaping, or bounding, locomotion (Lincoln et al. 1985).

scansorial *adj.* Referring to a trait, or animal, that is adapted for climbing (Lincoln et al. 1985).

♦ **Orians effect** See effect: Orians effect.

♦ **Orians-Verner model of polygyny** See ⁴model: Orians-Verner model of polygyny.

♦ **orientating reflex, orientating response** See response: orientating response.

♦ **orientation** *n.* An organism's ability to direct its body position and locomotion with respect of object locations and environmental forces (Immelman and Beer 1989, 208).

See taxis.

♦ **orientation flight** See flight: orientation flight.

♦ **orientation response** See response: orientation response.

♦ **origin of insect wings, hypotheses of** See hypothesis: hypotheses of the origin of insect wings.

♦ **original** See -morphic: protomorphic.

♦ **ornament** *n.* An exaggerated morphological trait of an animal, e.g. the long, fork-shaped tail of a male *Hirundo rustica* (Barn Swallow) (Saino et al. 1997, 563).

♦ **ornithic** *adj.* Referring to birds.

♦ **ornithischian pelvis** See pelvis: ornithischian pelvis.

♦ **ornithichite** See fossil: ornithischite.

- ♦ **ornithogenic** See -genic: ornithogenic.
- ♦ **ornithology** See study of: ornithology.
- ♦ **ornithophile** See ²phile: ornithophile.
- ♦ **ornithophobia** See -phobia: ophidiophobia.
- ♦ **ogenesis, origeny** See -genesis: origenesis.
- ♦ **orography** See study of: orography.
- ♦ **orohylile community** See ²community: orohylile community.
- ♦ **orophile** See ¹phile: orophile.
- ♦ **orophytium community** See ²community: orophytium community.
- ♦ **orothamnic community** See ²community: orothamnic community.
- ♦ **ortet** *n.* The original organism from which a clone originates (Lincoln et al. 1985).
cf. genet, ramet
- ♦ **ortho-** *comb. f.*
 1. "Straight; upright; in line" (Michaelis 1963).
 2. "At right angles; perpendicular" (Michaelis 1963).
 3. "Correct; proper; right" (Michaelis 1963).
[Greek *orthos*, straight]
- ♦ **orthogamy** See -gamy: orthogamy.
- ♦ **orthogenesis** See -genesis: orthogenesis.
- ♦ **orthographic error** See error: orthographic error.
- ♦ **orthography** See -graphy: orthography.
- ♦ **orthologous** See -logous: orthologous.
- ♦ **orthokinesis** See kinesis: orthokinesis.
- ♦ **orthoselection** See selection: orthoselection.
- ♦ **orthotopic** *adj.* Referring to an organism in its normal habitat (Lincoln et al. 1985).
- ♦ **ortstreue, Ortstreue** *n.*
 1. In some mammal species, including bats and *Eschrichtius robustus* (Gray Whales); many migratory bird and fish species, the monarch butterfly: An individual's tendency to return to a place used by its ancestors for reproducing, feeding, or resting, where it performs the same activity (Wilson 1975, 1968).
 2. An animal's propensity to return to its birth place, first-breeding place, or any other previously occupied place (Immelman and Beer 1989, 104).
syn. site fidelity (C. K. Starr, pers. comm.)
cf. homing
[German *Ort*, site + *S* + *treue*, faithful, loyal, constant]
- ♦ **oryctocoenosis** See ²community: oryctocoenosis.
- ♦ **oscillating-big-bang hypothesis** See hypothesis: hypotheses of the beginning and evolution of the Universe: oscillating-big-bang hypothesis.
- ♦ **oscillation** *n.*
 1. The state, or act, of swinging back and forth with a steady uninterrupted rhythm (Morris 1982).
 2. Physics, the state of varying between alternate extremes, usually with a definite period (Morris 1982).
[Latin *oscillare*, *oscillat-* < *oscillum*, swing]
- ♦ **Arctic Oscillation, North Atlantic Oscillation, Northern Hemisphere Annular Mode** *n.* A large-scale mode of climate variability that involves an atmospheric pressure change over the northernmost part of the Earth, from about 55° latitude north (Song and Nash 2001, 16; Thompson 2001).
cf. oscillation: Antarctic Oscillation, *El Niño*–Southern Oscillation Event, Southern Oscillation
Comments: When the Arctic Oscillation is in a positive phase, the atmospheric pressure at the core of the northernmost part of the Earth is low and a ring of wind swirls around the North Pole increases in

strength and keeps frigid Arctic air from escaping southward out of the vortex (Song and Nash 2001, 16). This results in unusually warm weather in most of the northern hemisphere such as record-high temperatures in late October through December 2001 and many other years since the late 1960s. When the Arctic Oscillation is in a negative phase, atmospheric pressure in the core area is high and cold air descends from the polar region.

[Arctic Oscillation, coined by D. W. J. Thompson and J. M. Wallace in 1998 (Song and Nash 2001, 16)]

Antarctic Oscillation, High-Latitude Mode, Southern Hemisphere Annular Mode *n.* A large-scale mode of climate variability that involves an atmospheric pressure change over the southernmost part of the Earth (Thompson 2001).
cf. oscillation: Arctic Oscillation, *El Niño*–Southern Oscillation Event

Southern Oscillation *n.* A fluctuation of the intertropical atmospheric circulation, in particular in the Indian and Pacific Oceans, in which air moves between the southeastern Pacific subtropical high and the Indonesian equatorial low (Allaby 1994).
cf. oscillation: Antarctic Oscillation, Arctic Oscillation, *El Niño*–Southern Oscillation Event
Comments: The temperature difference between the Indian and Pacific Oceans drives the southern oscillation (Allaby 1994). Its general effect is a high pressure over the Pacific Ocean and a low one over the Indian Ocean and vice versa. Southern Oscillations are strongly linked to *Los Niños* (*q.v.*).

♦ **osmallaxis** *n.* Exchange of odor between (among) members of a species [coined by Müller-Schwarze 1974, 319].

cf. trophallaxis

accidental osmallaxis *n.* Osmallaxis that results from interactions of conspecific animals that are not intentional social marking [coined by Müller-Schwarze (1974, 319)].

stereotyped osmallaxis *n.* For example, in *Ovis dalli* (Dall Sheep), *Petaurus breviceps* (Sugar-gliders), and *Vicugna vicugna* (Vicuñas); some rabbit and rat species: Osmallaxis performed as social communication [coined by Müller-Schwarze (1974, 319)].

♦ **osmoconformer** *n.* An organism whose body fluid is of the same osmotic concentration as its surrounding medium (Lincoln et al. 1985).

cf. osmoregulator

♦ **osmophile** See ¹-phile: osmophile.

♦ **osmoreception** See modality: chemoreception: osmoreception.

♦ **osmoregulator** *n.* An organism that maintains its body osmotic concentration at a level independent of its surrounding medium (Lincoln et al. 1985).

cf. osmoconformer

♦ **osmotaxis** See taxis: osmotaxis.

♦ **osmotroph** See -troph: osmotroph.

♦ **osphresiology** See study of: osphresiology.

♦ **ostentation** See ²group: ostentation.

♦ **osteology** See study of: osteology.

♦ **OTU** See operational taxonomic unit.

♦ **outbreak, outbreak year** See wasp year.

♦ **outbreeding, outcrossing** See breeding: outbreeding.

♦ **outcome variable** See variable: dependent variable.

♦ **outflow theory** See ³theory: outflow theory.

♦ **outlaw gene** See gene: outlaw gene.

♦ **outlaw sperm** See sperm: outlaw sperm.

♦ **ova** See gamete: ovum.

♦ **ovariectomy** See castration: ovariectiony.

♦ **ovariicole** See -cole: ovaricole.

♦ **ovariole** *n.* One of a group of egg tubes that form an ovary of a female insect (Wilson 1975, 590).

♦ **ovary** See gonad: ovary.

♦ **overdispersed distribution** See distribution: overdispersed distribution.

♦ **overdispersion** See distribution: overdispersed distribution.

♦ **overdominance** See dominance (genetic): overdominance.

♦ **overflow activity** See activity: vacuum activity.

♦ **overgrazing** *n.* Grazing that exceeds a community's recovery capacity and thus reduces its available forage crop or causes undesirable changes in its composition (Lincoln et al. 1985).

♦ **overlap promiscuity** See mating system: polybrachyamy: overlap promiscuity.

♦ **overreactive startle** See startle: overreactive startle.

♦ **oversampling** See sampling: oversampling.

♦ **overstepping** *n.* A descendant organism's development through the ontogenetic stages and beyond the final adult stage of its ancestor (Lincoln et al. 1985).

♦ **ovicide** See -cide: ovicide.

♦ **ovigerous** See gravid.

♦ **oviparity** See parity: oviparity.

♦ **oviposition** *n.* In many animal species: The act, or process, of laying eggs (Lincoln et al. 1985). *v.t.* oviposit.

♦ **ovipositional stimulant** See chemical-releasing stimulus: ovipositional stimulant.

♦ **ovism** See ³theory: encasement theory.

♦ **ovogenesis** See -genesis: oogenesis.

♦ **ovoviparity** See -parity: ovoviparity.

♦ **-ovular** *comb.f.* Referring to eggs.

♦ **monovular** *adj.* Referring to an individual animal that produces a single egg and usually, unless twinning takes place, a single offspring during each of its reproductive cycles (Eisenberg 1981, 507).

♦ **polyovular** *adj.* Referring to an individual animal that produces several eggs during each of its reproductive cycles (Eisenberg 1981, 507).

♦ **ovulation** *n.*

1. In female mammals: Formation and development of ovules, or ova, and especially their discharge from an ovary (Oxford English Dictionary 1972, entries from 1853).

2. In female mammals: An individual's release of a ripe ovum from its egg follicle (= enveloping capsule) (Immelman and Beer 1989, 210).

Comment: "Ovulation" is rarely used for development and laying eggs in oviparous animals (Oxford English Dictionary 1972).

♦ **ovulator** *n.* An animal in which ovulation occurs.

♦ **induced ovulator** *n.* In some mammal species including Ferrets, Ground Squirrels, Mink, Rabbits, and Shrews: A species in which follicles rupture and release ova after a female has copulated (Immelman and Beer 1989, 210).

cf. ovulator: spontaneous ovulator

♦ **spontaneous ovulator, automatic ovulator** *n.* In the majority of mammal species, including rats, cats, and primates: A species in which follicles rupture and release ova spontaneously as part of the species' ovarian cycle (Immelman and Beer 1989, 210).

cf. ovulator: induced ovulator

♦ **ovum** See gamete: egg.

♦ **oxidation** *n.*

1. In chemistry, something's combining with oxygen (Michaelis 1963).
2. In chemistry, an atom's, or molecule's, losing, or being deprived of, valence electrons (Michaelis 1963).
3. In chemistry, a compound's gain of oxygen, loss of hydrogen, or loss of electrons (King and Stansfield 1985).
4. In chemistry, a compound's, or atom's, partial, or complete loss, of electrons to oxygen or some other substance (Campbell 1987, 184).

cf. reduction

Comments: Oxidation can also be the state resulting from these processes. Oxidation increases the valence of an atom, or group of atoms, by losing electrons (Michaelis 1963). Ferrous iron is oxidized to ferric iron. An oxidized atom gives electrons (or takes protons).

♦ **oxidizing agent** See agent: oxidizing agent.

♦ **oxodic community, oxodium** See ²community: oxodium.

♦ **oxy-** *comb. f.* Oxygen; of, or containing, oxygen, or one of its compounds (Michaelis 1963).

♦ **oxybiont** See biont: oxybiont.

♦ **oxybiotic, oxybiotic** See aerobic.

♦ **oxygenotaxis** See taxis: oxygenotaxis.

♦ **oxygeophile** See ¹-phile: oxygeophile.

♦ **oxylium** See ²community: oxodium.

♦ **oxylophile, oxylophile** See ¹-phile: oxylophile.

♦ **oxyphile** See ¹-phile: oxyphile.

♦ **oxyphobe** See -phobe: oxyphobe.

♦ **oxytaxis** See taxis: oxytaxis.

♦ **oxytocin** See hormone: oxytocin.

♦ **oversampling** *n.* One's taking a scientific sample(s) of an organism that is large enough to lower its population size and interfere with its future sampling (inferred from Perry 1995, 27).

♦ **ozone** See molecule: ozone.

♦ **ozone hole** *n.* An area of depleted ozone in Earth's ozone layer which is mostly in the stratosphere, 15 through 50 km above Earth's surface (Rensberger 1993, 15 April, A19).

cf. molecule: ozone

Comments: The protective stratospheric ozone layer absorbs most of the ultraviolet light that comes from the Sun (Rensberger 1993, 15 April, A18–19). The ozone zone over Antarctica tends to be completely depleted in a 1- through 2-km-thick zone centered 17 km above the Earth. Researchers discovered the first evidence for ozone holes in the 1970s. Human-made chlorofluorocarbons (CFCs), methyl chloroform, and other chemicals produce these holes by catalytic decomposition. In 1995, CFCs were responsible for 75% of the damage to the ozone layer; methyl chloroform, 12.5%; and other chemicals, 12.5%. In 1995, as a result of the Montréal Protocol, people decreased the amount of methyl chloroform in Earth's atmosphere. Sulfuric-acid particles from volcanoes might also cause ozone depletion. Human-made ozone holes are expected to disappear by 2050 because people are reducing their use of hole-producing chemicals. Air pollution causes appreciable ozone near the ground, which unlike stratospheric ozone, is essentially harmful to organisms, being a very powerful oxydizing agent.

♦ **ozone layer** *n.* A concentration of ozone in Earth's stratosphere at from about 15 through 30 mi altitude; distinguished from ozone near ground level (Gardener 1992, 41; Rensberger 1993, 15 April, A18).

cf. molecule: ozone; ozone hole

Comment: The ozone concentration is about 1 molecule per 100,000 molecules of air at 22 mi altitude. The amount of ozone naturally varies from place to place in the ozone layer. This protective shield reduces that amount of deleterious ultraviolet-B that impinges on organisms. Without this process, only a few kinds of organisms could live on Earth.

♦ **ozonosphere** See -sphere: stratosphere: ozonosphere.

p

♦ **p, P, *p*, *P*** *n.* In statistics, a probability.

Comment: There are four main kinds of p's that relate to experimental design. Statisticians and others often call each of them simply "p" which can certainly be confusing.

"data-set-choice-p" *n.* A person's probability of drawing a particular set of data from a population with random, independent data.

Comment: For example, if a person randomly picks data from a population of 1,000,000 with 100,000 individuals who are Smiths, and gets 10 Smiths in a row, then the probability of obtaining the "data-set-choice-p" is 0.1^{10} or 0.0000000001.

"datum-choice-p" *n.* A person's probability of drawing a particular datum, or kind of datum, from a population of random, independent data.

Comments: For example, in a population of 1,000,000, if 100,000 individuals are Smiths, then the probability ("datum-choice-p") of drawing one Smith from the population is $100,000/1,000,000$ or 0.1. The probability of drawing a non-Smith is q which is $1 - p$ or 0.9.

"found-p," "calculated-p" *n.* A person's probability of selecting a particular data sample from a population of random, independent data plus the probabilities of obtaining all rarer samples from this population if the relevant null hypothesis were true (Siegel 1956, 11).

Comment: The "found-p" is the sum of the "data-set-choice-p" for the selected sample and the "data-set-choice-ps" for all rarer samples from its population.

"stipulated-p" *n.* The probability value that a person sets that is the probability at which he is willing to reject a *true* null hypothesis.

syn. α , alpha, alpha level, p level, probability level, significance level (Siegel 1956, 8), *P*, *P* level

Comment: "Stipulated-p" is often set at 0.05 by statisticians and biologists. If he uses 0.05, a person is willing to make a type-I error 5% of the time; that is, he is willing to be wrong (*i.e.*, reject a true null hypothesis) 5 times out of 100. If "found-p" < "stipulated-p," a person rejects his null hypothesis.

♦ **pace** See ²group: pace.

♦ **pachy** *comb. f.* "Thick, massive" (Michaelis 1963). [Greek *pachys*, thick]

♦ **pachytene** *n.* The state during prophase of meiosis during which homologous chromosomes are completely paired (Mayr 1982, 775, 959).

♦ **pack** See ²group: pack.

♦ **pack dating** See dating: pack dating.

♦ **Pacific Ocean Preserve** See place: Pacific Ocean Preserve.

♦ **pacing** See locomotion: pacing.

♦ **-paedic** *adj.* Referring to a child (Brown, 1956). [Greek *pais*, *paidos*, child]

psilopaedic *adj.* Referring to a bird that is featherless when it hatches (Lincoln et al. 1985).

ptilopaedic *adj.* Referring to a bird that is covered with down when it hatches (Lincoln et al. 1985).

♦ **-paedium**

gynopaedium *n.* A family group whose mother remains with her offspring for some time (Lincoln et al. 1985).

monogynopaedium *n.* An assemblage of one mother and her immediate progeny (Lincoln et al. 1985).

patrogynopaedium *n.* A family group in which both parents remain with their offspring for some time (Lincoln et al. 1985).

patropaedium *n.* A family group whose father remains with his offspring for some time (Lincoln et al. 1985).

polygynopaedium *n.*

1. An association of mothers and daughters each of which is reproducing parthenogenetically (Deegener 1918).

2. A family group in which both parents remain with their offspring for some time (Lincoln et al. 1985).

sympaedium *n.* An assemblage of young animals that are playing together (Lincoln et al. 1985).

synchronopaedium *n.* A group of young animals of about the same age but of different parents (Lincoln et al. 1985).

♦ **paedium** *n.* "An assemblage of young animals" (Lincoln et al. 1985).

♦ **paedogamy** See -gamy: paedogamy.

♦ **paedogamous autogamy** See -gamy: autogamy: paedogamous autogamy.

♦ **paedogenesis** See -genesis: paedogenesis.

♦ **paedomorph** See -morph: paedomorph.

♦ **paedomorphosis** See ²heterochrony: paedomorphosis.

♦ **paedoparthenogenesis** See parthenogenesis: paedoparthenogenesis.

♦ **paedophage** See -phage: paedophage.

♦ **paedophile** See ⁻¹phile: pedophile.

♦ **paedophilia, paedophilia erotica** See -philia: paedophilia.

♦ **pagophile** See ⁻¹phile: pagophile.

- ♦ **PAH** See molecule: polycyclic aromatic hydrocarbon.
- ♦ **pain** *n.*
1. A person's primary condition of sensation, or consciousness, the opposite of pleasure; his sensation when feeling hurt in body or mind (Oxford English Dictionary 1972, entries from 1300).
syn. distress, suffering (Oxford English Dictionary 1972)
 2. A person's bodily suffering; a distressing sensation such as soreness, usually of a part of his body (Oxford English Dictionary 1972, entries from 1377).
 3. A nonhuman animal's "severe, perhaps transient state, recognizable by positive signs such as screaming and struggling" (Dawkins 1980, 25).
Note: It is controversial whether nonhuman animals feel pain (Bateson 1991, 828).
 4. Human "unpleasant sensory or emotional experience associated with actual or potential tissue damage, or described in terms of such damage" (The International Association for the Study of Pain and Iggo [1984] in Bateson 1991, 828).
cf. animal suffering; general-emergency reaction; project: Animal Rights Law Project; stress; syndrome: fight syndrome, flight syndrome, general-adaptation syndrome
v.t. pain
Comment: Some authors consider "pain" to be part of "suffering," not synonymous with it. Bateson (1991, 827) separates "stress" and "anxiety" from pain. He discusses difficulties of assessing pain in Humans and other animals and the possibility of invertebrates such as octopods' and insects' feeling pain (Wigglesworth 1980, 8).
- ♦ **paint-pot theory of heredity** See inheritance: blending inheritance.
- ♦ **'pair** *n.* Two associated things; a set of two things (Oxford English Dictionary 1972, entries from 1278).
- ♦ **consort pair** *n.* In some primate species: A male and female with a consort relationship, *q.v.* (Immelman and Beer 1989, 58).
- ♦ **contact pair** *n.* In some fish species: Any two fish that have established, or are in the process of establishing, a dominance-subordination relationship (Braddock 1945, 178).
- ♦ **²pair** *v.i.*
1. In Humans: To unite in love, marriage, or both (Oxford English Dictionary 1972, entries from 1673).
 2. In Animals: To mate or copulate, *q.v.* (Oxford English Dictionary 1972, entries from 1702; Immelman and Beer 1989, 212).
 3. In many animal species: To show pair formation, *q.v.* (Immelman and Beer 1989, 212).
 4. In many animal species: To form a pair bond, *q.v.* (Immelman and Beer 1989, 212).
- ♦ **pair bond, pair bonding** See bond: pair bond, marriage.
- ♦ **pair duet** See animal sounds: song: duet: pair duet.
- ♦ **pair formation** *n.* For example, in many duck and geese species; Humans: Behavioral interactions (*e.g.*, courtship, mating, threats, appeasement, infantile behavior) of potential mates that leads to their pair formation (Heymer 1977, 127; Immelman and Beer 1989, 212).
See pair bonding.
syn. mating foreplay (Heymer 1977, 127)
cf. bonding, courtship
- ♦ **pair-rule genes** See gene: segmentation genes (comment).
- ♦ **paired-limiting factor** See factor: paired-limiting factor.
- ♦ **pairing, pairing behavior** See copulation.
- ♦ **pairing bite** See bite: neck bite.
- ♦ **pairing territory** See territory: pairing territory.
- ♦ **pairwise coevolution** See ²evolution: coevolution: pairwise coevolution.
- ♦ **pairwise comparison** See statistical test: multiple-comparisons test: planned-multiple-comparisons procedure: pairwise comparison.
- ♦ **paka-paka** *n.* Alternate flashing of differently colored lights that causes tension in Humans (WuDunn 1997, A3).
cf. ²stimulus: photostimulation
Comments: Paka-paka with light from 10 through 30 hz can cause human seizures (WuDunn 1997, A3).
[Japanese *paka-paka* (WuDunn 1997, A3)]
- ♦ **palaeo-, palae-, paleo-, pale-** *comb.f.*
1. "Ancient, old" (Michaelis 1963).
 2. "Primitive" (Michaelis 1963).
[Greek *palaios*, old, ancient]
- ♦ **palaeoagrostology, paleoagrostology** See study of: paleoagrostology.
- ♦ **palaeoalgology, paleoalgology** See study of: paleoalgology,
- ♦ **palaeoautecology, paleoautecology** See study of: ecology: autoecology: paleoautecology.
- ♦ **palaeobiocoenosis** See ²community: paleobio-coenosis.
- ♦ **palaeobiogeography, paleobiogeography** See study of: geography: paleobiogeography.
- ♦ **palaeobiology, paleobiology** See study of: biology: paleobiology.
- ♦ **palaeobotany, paleobotany** See study of: botany: paleobotany.
- ♦ **paleoclimatology, palaeoclimatology** See study of: climatology: paleoclimatology.
- ♦ **palaeocommunity, paleocommunity** See ²community: paleocommunity.
- ♦ **palaeodendrology, paleodendrology** See study of: dendrology: paleodendrology.
- ♦ **palaeoecology, paleoecology** See study of: ecology: paleoecology,
- ♦ **palaeoendemic, paleoendemic** See ¹endemic: paleoendemic.
- ♦ **palaeoethnology, paleoethnology** See study of: ³ethnology: palaeoethnology.
- ♦ **palaeogenesis, paleogenesis** See neoteny.
- ♦ **palaeogenetics, paleogenetics** See study of: genetics: paleogenetics.
- ♦ **palaeontography, paleontography** See -graphy: paleontography.
- ♦ **palaeoichnology, paleoichnology** See study of: ichnology: paleoichnology.
- ♦ **palaeolimnology, paleolimnology** See study of: limnology: paleolimnology.
- ♦ **palaeontology, paleontology** See study of: paleontology.
- ♦ **palaeopalynology, paleopalynology** See study of: palynology: paleopalynology.
- ♦ **palaeophytogeography, paleophytogeography** See study of: geography: phytogeography: paleophytogeography.
- ♦ **palaeophytology, paleophytology** See study of: botany: paleobotany.

- ♦ **palaeornithology** See study of: ornithology: palaeornithology.
- ♦ **palaeospecies, paleospecies** See ²species: chronospecies.
- ♦ **palaeosynecology, paleosynecology** See study of: ecology: syncology: paleosynecology.
- ♦ **palaeothanatocoenosis, paleothanatocoenosis** See ²community: palaeothanatocoenosis.
- ♦ **palaeozoology, paleozoology** See study of: zoology: paleozoology.
- ♦ **Paley's watch** *n.* The best known of William Paley's (1743–1805) arguments for the existence of God; a watch is too complicated, and too functional, to have come about by accident: it carries its own evidence of having been purposefully designed; this “argument seems to apply *a fortiori* to a living body which is even more complicated than a watch” (Dawkins 1982, 292).
- ♦ **palichnology** See study of: ichnology: palaeoichnology.
- ♦ **palingenesis** See -genesis: palingenesis.
- ♦ **palingenetic** See -genetic: palingenetic.
- ♦ **palmigrade** See -grade: plantigrade.
- ♦ **palpation** *n.* An insect's touching with its labial or maxillary palps, which can serve as a sensory probe, or a tactile, signal to another insect (Wilson 1975, 590).
- ♦ **paludal** See uliginous.
- ♦ **paludicole** See -cole: paludicole.
- ♦ **paludism** See disease: malaria.
- ♦ **palustrine** See uliginous.
- ♦ **palynology** See study of: palynology.
- ♦ **pan-** *comb.f.*
 1. “All, every; the whole” (Michaelis 1963).
 2. “Comprising, including or applying to all” (Michaelis 1963).

[Greek neutral of *pas*, all]
- ♦ **panchreston** *n.* “A word, or “concept,” covering a wide range of different phenomena and loaded with a different meaning for each user, a word that attempts to “explain” everything but explains nothing; *e.g.*, trophallaxis, drive, instinct, aggression, approach-withdrawal, or altruism (Hardin 1956 in Wilson 1975, 29). [Greek *pan*, all + *chres* + *-to*, useful]
- ♦ **panclimax** See climax: panclimax.
- ♦ **pandemic** *n.* A disease that reaches epidemic proportions simultaneously in many parts of the world (Lincoln et al. 1985).
See ubiquitous.
- ♦ **panformation** See panclimax.
- ♦ **pangamy** See -gamy: pangamy.
- ♦ **“Pangea hypothesis”** See hypothesis: hypotheses regarding the Permian mass extinction: “Pangea hypothesis.”
- ♦ **pangen** *n.* de Vries' “genetic unit” that migrates from a cell nucleus to its cytoplasm and thus determines a cell's character (Mayr 1982, 704).
cf. gene; ³theory: de Vries' theory of pangens, theory of pangensis
- ♦ **pangenesis** See ²theory: theory of pangenesis.
- ♦ **Panglossian paradigm** See adaptationist programme.
- ♦ **panmictic index** See coefficient: coefficient of relatedness.
- ♦ **panmictic population** See ¹population: panmictic population.
- ♦ **panmixis** See mating: random mating; -mixis: panmixis.
- ♦ **panogamy** See mating system: panogamy.
- ♦ **panne** See habitat: dune slack.
- ♦ **panphytophage** See -phage: panphytophage.
- ♦ **panselectionism** *n.* The view that natural selection is the most likely explanation for most traits of organisms; contrasted with pluralism (Gould and Lewontin 1979, 589).
- ♦ **panspermia hypothesis** See hypothesis: panspermia hypothesis.
- ♦ **panthalassic** *adj.* Pertaining to marine organisms, or species, that live in both neritic and oceanic waters (Lincoln et al. 1985).
- ♦ **panting** *n.*
 1. A person's breathing hard, or spasmodically, as when out of breath; his drawing quick, labored breaths, due to exertion or agitation; his gasping for breath (Oxford English Dictionary 1972, verb entries from 1440).
 2. A person's longing, or wishing, with breathless eagerness; his grasping with desire; his yearning (Oxford English Dictionary 1972, verb entries from 1560).
 3. For example, in anatid, corvid, and predatory birds: An individual's breathing fast with its beak wide open in response to overheating (Heymer 1977, 85).
 4. For example, in canid mammals: An individual's breathing fast with its mouth open in response to overheating (Heymer 1977, 85).

v.i. pant.
- ♦ **pantomictic plankton** See plankton: pantomictic plankton.
- ♦ **pantophage** See -phage: pantophage.
- ♦ **pap** See food: pap.
- ♦ **-para**
 - multipara** *n.* A female mammal that has gone through more than one cycle of pregnancy and parturition; contrasted with nullipara and primipara (Hurnik et al. 1995).

cf. -parity: multiparity
adj. multiparous
 - nullipara** *n.*
 1. A female primate without young during a particular breeding season (Hrdy 1977, 199).
 2. A female mammal that has not given birth to viable offspring; contrasted with multipara and primipara (Hurnik et al. 1995).

cf. -aparity
adj. nulliparous
- ♦ **para-, par-** *prefix*
 1. “Beside; nearby; along with” (Michaelis 1963).
 2. “Beyond; aside from; amiss” (Michaelis 1963).
 3. Medically, (a) a functionally disordered or diseased condition; (b) in an accessory, or secondary, capacity; (c) similar to but not identical with a true condition or form (Michaelis 1963).

[Greek *para*, beside]
- ♦ **parabiosis** See -biosis: parabiosis.
- ♦ **parabiosphere** See -sphere: biosphere: eubiosphere: parabiosphere.
- ♦ **paracentric inversion** See inversion: paracentric inversion.
- ♦ **parachoric** *adj.* Referring to a nonparasitic organism that lives within the body of another organism (Lincoln et al. 1985).
cf. symbiosis
- ♦ **parachuting** See ballooning.
- ♦ **paraclimax** See climax: paraclimax.
- ♦ **paraclonal society** See ²society: paraclonal society.

- ♦ **paracme** See -acme: paracme.
- ♦ **paracrine signaling** See signaling: paracrine signaling.
- ♦ **parade** See ²group: parade.
- ♦ **parade formation** *n.* An orderly arrangement of individual animals in space, *e.g.*, in dolphins, groups move in parade formation during silent navigation in clear water (Pilleri and Knuckey 1969 in Wilson 1975, 478).
- ♦ **paradigm** *n.*
 1. "Pattern, exemplar, example" (Oxford English Dictionary 1972, entries from 1483).
 2. "An archetype or outstanding example of type" (Lincoln et al. 1985).
 3. "A generally accepted way of explaining a scientific phenomenon of first magnitude" (Kuhn 1970 in Moore 1984, 478); an archetypal solution to a problem, such as Ptolemy's theory that the Sun revolves around the Earth (van Gelder 1996, B7).

Comments: Thomas S. Kuhn's (1923-1996) thesis is that science is not the steady, cumulative acquisition of knowledge (van Gelder 1996, B7). Instead, it is "a series of peaceful interludes punctuated by intellectually violent revolutions." In those revolutions, one "conconceptual world view is replaced by another." Kuhn argued that a typical scientist is not an objective, free thinker and skeptic. Rather, he is a somewhat conservative individual who accepts what he was taught and applies his knowledge to solving the problems that come before him. He tends to solve a problem in a way that extends the scope of an already present paradigm. During a scientific revolution, a person(s) develops a new paradigm that cannot build on the one that precedes it, but supplants it. Kuhn defined "paradigm" in 22 distinct ways in his book *The Structure of Scientific Revolutions* (1962) (Gleick 1996, 25, illustration).

[Latin *paradigma* < Greek *paradeigma*, pattern < *para-*, beside + *deiknyai*, to show]

- ♦ **paradoxical sleep** See sleep: stage-1 sleep.
- ♦ **paragamy** See -gamy: paragamy.
- ♦ **paragenesis** See -genesis: paragenesis.
- ♦ **paragenetic** See -genetic: paragenetic.
- ♦ **parahomology** See homology: parahomology.
- ♦ **paralanguage** See language: paralanguage.
- ♦ **parallel evolution** See ²evolution: parallel evolution.
- ♦ **parallel polymorphism** See -morphism: polymorphism.
- ♦ **parallelism** See ²evolution: parallel evolution.
- ♦ **paralocal-character species** See ²species: paralocal character species.
- ♦ **paralocal species** See ²species: paralocal species.
- ♦ **paralogous** See -logous: paralogous.
- ♦ **parameter** *n.*
 1. A mathematical quantity that is constant (distinguished from ordinary variables) in a particular case, but varies between cases (Oxford English Dictionary 1972, entries from 1852).

Notes: A parameter's value characterizes the other variable, or variables, in a system of expressions, functions, etc. (Michaelis 1963). In a particular kind of investigation, one holds a parameter constant in a model in which other quantities are being varied to study their relationships, and one might also change the parameter's value in other versions of the same model (Wilson 1975, 590).

 2. "Any variable property that exerts an effect upon a system" (Wilson 1975, 590).
 3. A characteristic of a distribution of a variable, or population, such as a mean or variance (Lincoln et al. 1985).

cf. statistic.

[New Latin < Greek *para*, beside + *metron*, measure]

- ♦ **parametric model** See ⁴model: parametric model.
- ♦ **parametric test** See test: statistical test: parametric test.
- ♦ **paramorph** See -morph: paramorph.
- ♦ **paramorphic homology** See homology: paramorphic homology.
- ♦ **paramutation** See ²mutation: paramutation.
- ♦ **paramutualism** See symbiosis: mutualism: paramutualism.
- ♦ **paranotal hypothesis of insect wing origin** See hypothesis: hypotheses of origin of insect wings: paranotal hypothesis of insect wing origin.
- ♦ **parapatric** See -patric: parapatric.
- ♦ **parapatric speciation** See speciation: parapatric speciation.
- ♦ **paraphilia** See -philia: paraphilia.
- ♦ **paraphyletic group** See ²group: paraphyletic group.
- ♦ **paraphyly** See -phyly: paraphyly.
- ♦ **parapsychology** See study of: psychology: parapsychology.
- ♦ **pararegional species** See ²species: local pararegional species.
- ♦ **parasexual** See sexual: parasexual.
- ♦ **parasite** *n.*
 1. A person who frequents rich tables and earns his welcome by flattery; one who obtains the hospitality, patronage, or favor of the wealthy, or powerful, by obsequiousness and flattery; a hanger-on from interested motives; a toady (Oxford English Dictionary 1972, entries from 1539).
 2. An individual organism that lives in, or upon, another living organism (= host) and draws its nutrient directly from it (Oxford English Dictionary 1972, entries from 1727); a symbiont that is metabolically dependent on another living organism for completion of its life cycle and is typically detrimental to its host to a greater, or lesser, extent (Lincoln et al. 1985).
 3. A symbiont that obtains more time, energy, metabolites, other resources, or a combination of these resources from another organism than it gives to it, *e.g.*, animal and plant parasites (including Dodders, Louseworts, Mistletoes, and Rust and Smut Fungi) (Lewin 1982). *Cuscuta* spp. (Dodders) obtain nutrient from many plant species including *Rhizophora mangle* (Red Mangrove) (fig. 32). *Monotropa hypopithys* (Pinesap) (fig. 22) is a parasite of fungi. Ticks are external parasites of chordates. This tick, possibly *Dermacentor variabilis* (American Dog Tick) (fig. 33), bit my arm while I was in Necedah Wildlife Refuge, Wisconsin. Many parasites have invaded new habitats and have become important alien, invasive species such as *Aphis nerii* (Oleander Aphid) which consumes native and alien members of the Apocynaceae. This parthenogenetic aphid can produce dense infestation *Asclepias syriaca* (Common Milkweed) as occurs in Virginia, U.S. (fig. 6). The red insect in the figure is a ladybird beetle that consumes aphids.

syn. biotroph, guest, guest-fly (Oxford English Dictionary 1972, entries from 1864), paratroph (Lincoln et al. 1985)

See ²group: functional feeding group: “parasites;” parasitoid; -zoite: histozoite.

v.t. parasitize

adj. parasitic

cf. commensal, parasitoid, symbiont, -xenic, -xeny, and parasitism because many kinds of parasites are classified with regard to kinds of parasitism

Comments: “Parasite” is sometimes inaccurately used to refer to an epiphytic organism that does not draw nutrients from its symbionts (Oxford English Dictionary 1972). It is sometimes very difficult, if not impossible, to determine whether a symbiont is a parasite (Lewin 1982). Types of parasites are classified by the kinds of parasitism, *q.v.*, that they show.

[Latin *parasitus* Greek *parasitos*, literally, one who eats at another’s table < *para*, beside + *sitos*, food]

allohospitalic parasite *n.* One of two, or more, parasitic species that occur only on different host species (Lincoln et al. 1985).

cf. parasite: synhospitalic parasite

digenetic parasite *n.* A parasite with two hosts (Bell 1982, 507), *e.g.*, *Gymnosporangium juniperi-virginianae* (Cedar-apple Rust, a fungus). The bright orange, spore-bearing form of this fungus occurs on *Juniperus virginiana* (Eastern Redcedar) in Wisconsin, U.S., and other parts of North America (fig. 34).

cf. parasite: homogenetic, monogenetic parasite

ectoparasite, ectosite, epiparasite, episite, exoparasite *n.* A parasite that practices ectoparasitism, *q.v.*

cf. parasite: endoparasite

endoparasite, endosite, entoparasite *n.* A parasite that practices endoparasitism, *q.v.* (Lincoln et al. 1985), including braconid wasps that consume lepidopteran larvae (fig. 35, white cocoons of *Cotesia congregata* (braconid wasp) made by larvae that were endoparasites of *Manduca sexta* (Tobacco Hornworm).

cf. ectoparasites

epiparasite, episite See parasite: ectoparasite.

euryadaptive parasite *n.* A parasite that tolerates a wide range of host species (Lincoln et al. 1985).

cf. euryxenous parasite

exoparasite See parasite: ectoparasite.

heteroecious parasite See parasite: heteroxenous parasite.

heterogenetic parasite *n.* A parasite with a complex life cycle (Bell 1982, 507).

heteroxenous parasite, heteroecious parasite, metoxenous parasite *n.* A parasite that occupies more than one host during its life cycle (Lincoln et al. 1985).

See parasite: pleioxenous parasite

homogenetic parasite *n.* A parasite with a single host (Bell 1982, 507).

syn. monogenetic parasite

cf. parasite: digenetic parasite, monogenetic parasite

metoxenous parasite See parasite: heteroxenous parasite.

monogenetic parasite See parasite: homogenetic parasite.

pleioxenous parasite, polyxenic parasite *n.*

A parasite that is not host specific or has several hosts during its life cycle (Lincoln et al. 1985).

n. pleioxeny

syn. heteroxenous parasite (inferred from Lincoln et al. 1985)

prey parasite *n.* A cleptoparasitic organism.

proovigenic parasite *n.* A parasite that ecloses with a full complement of mature, or nearly mature, eggs (Hassel and Waage 1984), *e.g.*, some parasitic-wasp species.

cf. parasite: synovigenic parasite

symparasite *n.* Any of several competing parasites that use the same host individual (Lincoln et al. 1985).

synhospitalic parasite *n.* One of two, or more, parasitic species that occur on the same host species (Lincoln et al. 1985).

cf. parasite: allohospitalic parasite

synovigenic parasite *n.* A parasite that ecloses with no, or only a partial complement of mature, or nearly mature, eggs (Hassel and Waage 1984), *e.g.*, some parasitic-wasp species.

cf. parasite: proovigenic parasites

xenoparasite *n.* A parasite that infests an organism that is not its normal host (Lincoln et al. 1985).

zooparasite *n.* “A parasitic animal” (Lincoln et al. 1985).

♦ **parasite hypothesis** See hypothesis: hypotheses of the evolution and maintenance of sex: parasite hypothesis.

♦ **parasite pollination** See pollination: parasite pollination.

♦ **parasitic castration** See castration: parasitic castration.

♦ **parasitic chromosome** See chromosome: parasitic chromosome.

♦ **parasitic DNA** See nucleic acid: deoxyribonucleic acid: parasitic DNA.

♦ **parasitic mate** See mate: parasitic mate.

♦ **parasitic mimicry** See mimicry: parasitic mimicry.

♦ **parasitism** *n.*

1. Obligatory symbiosis between individuals of two different species in which the parasite is metabolically dependent on its host and the host is typically adversely affected, even killed (Lincoln et al. 1985).

Note: There are numerous micro-organism, insect, and other parasite species in which the parasites kill their hosts. This phenomenon is sometimes called “parasitoidism,” *q.v.*

cf. parasitoid

2. An organism’s being a parasite.

syn. parasitoidism (in some cases), parasitosis (Lincoln et al. 1985)

adj. parasitic

cf. parasite, parasitoid, symbiont

Comments: Parasites often have a complex of body-structure, physiological, reproductive, life-history, and behavioral adaptations related to their modes of life (Immelmann and Beer 1989, 213).

accidental parasitism *n.* Parasitism of an organism that is not a parasite’s normal host (Lincoln et al. 1985).

adelphoparasitism *n.* In some cuckoo-bee species and their bee hosts: Parasitism in which a parasite utilizes a closely taxonomically related host species; contrasted with alloparasitism (*q.v.*) (Lincoln et al. 1985).

See parasitism: hyperparasitism: adelphoparasitism.

allohyperparasitism *n.* See parasitism: hyperparasitism: tertiary hyperparasitism: interspecific hyperparasitism.

SOME CLASSIFICATIONS OF PARASITISM

- I. Classification by chance events
 - A. accidental parasitism
 - B. normal parasitism
 - C. pseudoparasitism
- II. Classification by host requirement
 - A. facultative parasitism
 - B. hemiparasitism (*syn.* meroparasitism)
 - C. obligatory parasitism (*syn.* holoparasitism, obligate parasitism)
- III. Classification by kind of host resource used
 - A. nonsocial parasitism (many kinds)
 - B. social parasitism (many kinds)
- IV. Classification by level
 - A. primary parasitism
 - B. "secondary parasitism"
 - C. "tertiary parasitism"
 - D. higher-level parasitism
- V. Classification by parasite position on host
 - A. ectoparasitism (*syn.* exoparasitism)
 - B. endoparasitism
- VI. Classification by period of association of the parasite with its host
 - A. "permanent parasitism"
 - B. temporary parasitism
- VII. Classification by species (conspecific or heterospecific) and number of parasites in, or on, a host
 - A. hyperparasitism (many kinds)
 - B. multiparasitism
 - C. superparasitism
- VIII. Classification by taxonomic relationship of parasite and host
 - A. adelphoparasitism
 - B. alloparasitism

alloparasitism *n.* Parasitism in which a parasite utilizes an taxonomically unrelated host organism (Lincoln et al. 1985).

cf. parasitism: adelphoparasitism

autohyperparasitism See parasitism: hyperparasitism: tertiary hyperparasitism: intraspecific hyperparasitism.

autoparasitism See parasitism: hyperparasitism.

brood parasitism *n.* For example, in many now species; *Cuculus canorus* (Common Cuckoos), *Lepisosteus osseus* (Longnose Gar), *Molothrus ater* (Brown-headed Cowbirds), and *Vidua* sp. (widow bird): Parasitism in which a parasite species inserts its egg(s) into the nest of another species, with the result that the host partly, or fully, rears the parasite's brood as if it were its own (Wilson 1975, 353, 580; Immelmann and Beer 1989, 36; Baba et al. 1990, 777).

cf. parasitism: nest parasitism, social parasitism: facultative social parasitism, and obligatory social parasitism

brood rearing See parasitism: social parasitism: slavery.

cleptobiosis See parasitism: cleptoparasitism.

cleptoparasitism, kleptoparasitism *n.* For example, in some spider and stingless-bee species; the Frigate Bird and Hyena; terns: Parasitism in which an individual seeks out and takes the prey, or stored food, of another usually heterospecific individual; this frequently involves only female animals that take food for their young (Wilson 1975, 580; Heymer 1977,

43; Griswold and Meikle 1987; Jackson and Griswold 1979; Immelmann and Beer 1989, 167).

syn. food pilfering, prey stealing, piracy (Griswold and Meikle 1990, 8); cleptobiosis, prey parasitism (Heymer 1977, 43)

cf. parasitism: social parasitism: trophic parasitism; robber; symbiosis: cleptobiosis

[Greek *kleptēs*, thief + parasitism]

drone parasitism *n.* Care of an alien drone Africanized Honey Bee (*Apis* hybrid) by a worker(s) in a colony of *Apis mellifera* (Western Honey Bees) (Rinderer 1986, 224).

dulosis See parasitism: social parasitism: slavery.

ecoparasitism, oecoparasitism *n.* Parasitism in which a parasite is restricted to a specific host or to a small group of related host species (Lincoln et al. 1985).

ectoparasitism *n.* For example, in some chalcidoid-wasp species, many species of plant-feeding arthropods: A parasite's living on the external surface of its host and obtaining nutrients by feeding on host tissues, fluids, or both (Wittenberger 1981, 615).

cf. parasitism: endoparasitism, hyperparasitism: ectophagous hyperparasitism

endoparasitism, entoparasitism *n.* In many parasite species: Parasitism in which a parasite lives within the organs, or tissues, of its host (Lincoln et al. 1985).

n. endoparasite, endocite

cf. parasitism: ectoparasitism, hyperparasitism: endophagous hyperparasitism

ethoparasitism See parasitism: social parasitism: ethoparasitism.

exoparasitism See parasitism: ectoparasitism.

facultative parasitism *n.* Parasitism in which a species can reproduce with, or without, using a particular host species, or even any host, depending on the species.

cf. parasitism: obligatory parasitism, hyperparasitism: facultative hyperparasitism

false parasitism See parasitism: pseudoparasitism.

food pilfering See parasitism: cleptoparasitism.

Futterparasitismus See parasitism: social parasitism: trophic parasitism.

haemoparasitism *n.* Parasitism in which a parasite inhabits its host's blood (Lincoln et al. 1985).

cf. -troph-: hemotroph

Comment: There are many kinds of haemoparasites; e.g., the protistan *Lankesterella* in amphibians and birds; *Plasmodium* in Humans and other primates; different fluke species in blood vessels of Cattle, Humans, and sheep; the nematode *Angiostrongylus cantonensis* in rodent blood vessels; and the nematode *Dirofilaria immitis* (Heartworm) in canid hearts (Nobel et al. 1989, 4, 101, 171, 324, 339).

helotism See parasitism: social parasitism: slavery.

hemiparasitism, meroparasitism *n.* Parasitism in which a partial, or facultative, parasite can survive in the absence of its host (Lincoln et al. 1985).

holoparasitism See parasitism: obligatory parasitism.

hyperparasitism *n.*

1. Parasitism in which an individual host is parasitized by two, or more, species of primary parasites or by one species more than once [coined by Friske 1910 in Shepard and Gale 1977].

2. Parasitism in which an individual host is parasitized by two, or more species, of primary parasites (Smith 1916 in Shepard and Gale 1977).
3. In many beetle, fly, and hymenopteran species: Parasitism in which an individual parasite (secondary parasite) feeds on another individual parasite (primary parasite) (Sullivan 1987, 49).

See parasitism: superparasitism (a confusing synonym).

Notes: This is a widely used definition. Depending on the species, a primary parasite consumes an arthropod phytophage, predator, or scavenger.

syn. autoparasitism (Lincoln et al. 1985), superparasitism (confusing synonym, Lincoln et al. 1985)

cf. parasitism: primary parasitism

► **adelphohyperparasitism** *n.* In some aphelinid-wasp species: Hyperparasitism in which a male larva feeds on a conspecific female larva (Sullivan 1987, 60).

Comment: This is the usual mode of male feeding in some species (Sullivan 1987, 60).

► **direct hyperparasitism** *n.* Hyperparasitism in which a mother parasite oviposits in, or on, a primary parasite (Sullivan 1987, 49).

► **ectophagous hyperparasitism** *n.* Hyperparasitism in which individuals of a species live outside their hosts (Sullivan 1987, 49).

► **endophagous hyperparasitism** *n.* Hyperparasitism in which individuals of a species live inside their hosts (Sullivan 1987, 49).

► **facultative hyperparasitism** *n.* Hyperparasitism in which an individual of a parasite species can develop either as a primary, or secondary, parasite (Sullivan 1987, 49).

► **indirect hyperparasitism** *n.* Hyperparasitism in which a secondary parasite feeds on a primary parasite's host rather than consuming it directly (Sullivan 1987, 49).

► **obligate hyperparasitism** *n.* Hyperparasitism in which an individual of a secondary-parasite species can develop on, or in, an individual of a primary-parasite species (Sullivan 1987, 49).

► **tertiary hyperparasitism** *n.* In aphid hyperparasites: A hyperparasite's feeding on another hyperparasite (Sullivan 1987, 55).

See parasitism: "tertiary parasitism."

interspecific-tertiary hyperparasitism, aliohyperparasitism *n.* Tertiary hyperparasitism that involves members of the same species (Sullivan 1987, 55).

intraspecific-tertiary hyperparasitism, autohyperparasitism *n.* Tertiary hyperparasitism that involves members of different species (Sullivan 1987, 55).

inquilinism See parasitism: social parasitism.

intraspecific-nest parasitism See parasitism: nest parasitism.

kidnapping See parasitism: social parasitism: slavery.

kleptoparasitism See parasitism: social parasitism: trophic parasitism: cleptoparasitism.

meroparasitism See parasitism: hemiparasitism.

multiparasitism *n.*

1. Parasitism in which heterospecific insect parasites feed on the same individual insect host (Torre-Bueno 1978).

2. The occurrence of supernumerary individuals of more than one parasitoid species in, or on, the

same individual insect host (Propp and Morgan 1983b, 1232).

cf. parasitism: superparasitism

nest parasitism *n.*

1. Symbiosis between two termite species in which a colony of one species lives in, and feeds on, the nest walls of the other species (host) (Lincoln et al. 1985).

2. In many waterfowl species, a swallow species: A female's laying one, or more eggs, in another conspecific female's nest, which may hatch into nestlings that are taken care of by one, or more, foster parents (Møller 1987, 247; Lank et al. 1989, 77-78).

syn. intraspecific nest parasitism (Møller 1987, 247)

cf. parasitism: brood parasitism

obligatory parasitism, obligate parasitism, holoparasitism *n.* Parasitism in which a parasite species cannot survive without using a particular host species (Lincoln et al. 1985).

cf. parasitism: facultative parasitism

ecoparasitism See parasitism: ecoparasitism.

partial parasitism See parasitism: semiparasitism.

permanent parasitism See parasitism: social parasitism: inquilinism.

piracy See parasitism: cleptoparasitism.

prey parasitism, prey stealing See parasitism: cleptoparasitism.

primary parasitism *n.* For example, in chalcidoid wasps: Parasitism of a previously nonparasitized host by a particular species; contrasted with "secondary parasitism" and "tertiary parasitism" (Hooker and Barrows 1989, 460).

cf. parasitism: hyperparasitism

pseudoparasitism *n.* A free-living organism's chance entry and survival in the body of another free-living organism (Lincoln et al. 1985).

syn. false parasitism (Lincoln et al. 1985)

secondary parasitism *n.* For example, in chalcidoid wasps: Parasitism of a parasite within a host; contrasted with primary and "tertiary parasitism."

cf. parasitism: hyperparasitism

semiparasitism *n.*

1. An organism's deriving only part of its nourishment from its host (Lincoln et al. 1985).

2. An organism's living for only part of its life as a parasite (Lincoln et al. 1985).

syn. partial parasitism (Lincoln et al. 1985)

social parasitism *n.* In many animal species: Parasitism in which an individual takes food, or some other resource, from another either conspecific, or heterospecific, individual animal of a social species.

► **ethoparasitism** *n.* For example, in some beetle species: Social parasitism in which a parasite lives in an ant colony and is fed by the ants (Heymer 1977, 65).

► **facultative-social parasitism** *n.* For example, in a bumble-bee species, some yellowjacket species: Social parasitism in which a queen, of a species that can have an independent nest of her own offspring, usurps a nest of another species whose workers rear her brood (Akre et al. 1981, 36; Fisher 1987, 1628).

Comment: "Obligatory social parasitism" occurs in primitively eusocial bee species that produce no workers (Michener 1974, 225).

► **inquilinism** *n.* In some insect species: Social parasitism in which a parasite spends its entire life

cycle in the nests of its host species; the parasite either has no workers or a few workers with degenerate behavior (Wilson 1975, 354, 587).

syn. permanent parasitism (of some authors) (Wilson 1975, 354, 587)

cf. inquiline

[Latin *inquilinus*, lodger < *in-*, in + *colere*, to dwell]

► **prey parasitism** See parasitism: cleptoparasitism.

► **slave making** See parasitism: social parasitism: slavery.

► **slavery** *n.*

1. Severe human toil "like that of a slave; heavy labour, hard work, drudgery" (Oxford English Dictionary, 1972, entries from 1551).

2. A human slave's condition; a person's being a slave; servitude; bondage (Oxford English Dictionary, 1972, entries from 1604).

3. Human slaves' existing as a class in a community; a person's keeping slaves as a practice or institution (Oxford English Dictionary 1972, entries from 1728).

4. Social parasitism in which a group of slave-making ants raid a host-species colony, overwhelm its adults, capture its brood, and transport all, or part, of its brood to the parasite's nest; the adults that arise from the host's brood become workers in the slave-maker's colony and may even participate in future slave raids (Huber 1810 in Wilson 1975, 368; Regnier and Wilson 1971; Alloway 1979, 202).

syn. brood raiding (Rissing and Pollack, 1987, 975); dulosis, helotism (Lincoln et al. 1985), kidnapping (Heinsohn 1991, 1099), slave-making

cf. propaganda substance, scouting, slavery.

Comment: Some slave-makers require slaves to feed them because they cannot feed themselves (Heymer 1977, 165).

► **temporary-social parasitism** *n.*

1. In some ant, bee, and wasp species: Social parasitism in which one species spends part of its life cycle as a parasite in another species' society and the remainder of its time as a nonparasite (Wilson 1975, 354).

2. In some ant, bee, and wasp species: Parasitism in which a queen enters an alien nest, usually belonging to another species, kills or renders infertile the resident queen, and takes her place; the colony's population then becomes increasingly dominated by the offspring of the parasite queen as the host workers die off from natural causes (Wilson 1975, 354, 597).

► **trophic parasitism** *n.* Social parasitism in which one species steals food from another, and one, or both, of these species are social (Wilson 1975, 354).

syn. *Futterparasitismus* (Wilson 1975, 354)

cf. parasitism: social parasitism: ethoparasitism

Comment: Some cases of cleptoparasitism are trophic parasitism.

[German *Futter*, food + *parasitismus*, parasitism]

► **xenobiosis** *n.* In some ant species: Social parasitism in which a member of one ant species lives in the nests of another ant species and moves freely among its hosts, obtaining food from hosts by regurgitation or other means but still keeping their brood separate, e.g., the "shampoo ant" which

lives on regurgitated food from the ant *Myrmica brevinodis* (Wilson 1975, 354, 362, 598).

cf. -biosis

► **superparasitism** *n.*

1. For example, in some chalcidoid wasps: Parasitism in which an individual host insect is parasitized by two, or more, species of primary parasites or by one species more than once [coined by Friske 1910 in Shepard and Gale 1977, 315].

Note: Although Friske (1910) called both of these kinds of parasitism "superparasitism," today the first kind of parasitism is usually called "multiparasitism," and the second kind is called "superparasitism."

2. For example, in many insect species parasitized by wasps: Parasitism of an individual host insect by more than one mother of the same species (Smith 1916 in Shepard and Gale 1977, 315; Hooker and Barrows 1992).

3. The occurrence of more than one individual of a single parasitoid species on, or in, the same individual host insect (Propp and Morgan, 1983a, 561). [coined by Smith 1916 in Shepard and Gale 1977, 315]

Note: This is the main definition of "superparasitism" used today.

syn. hyperparasitism (Lincoln et al. 1985, a confusing synonym)

n. superparasite

cf. parasitism: hyperparasitism, multiparasitism, primary parasitism

► **temporary parasitism** *n.* Parasitism in which a parasite contacts its host only for feeding (Lincoln et al. 1985).

► **tertiary parasitism** *n.* For example, in chalcidoid wasps: Parasitism of a parasite of a parasite within the same host; contrasted with primary parasitism and "secondary parasitism."

See parasitism: hyperparasitism: tertiary hyperparasitism.

► **trophoparasitism** *n.* Parasitism in which an organism is an obligate parasite for part of its life cycle (Lincoln et al. 1985).

► **water parasitism** *n.* Parasitism in which a parasite derives only water from its host (Lincoln et al. 1985).

► **xenoparasitism** *n.* Parasitism in which a parasite infests an organism that is not its usual host (Lincoln et al. 1985).

cf. parasitism: social parasitism: temporary social parasitism

► **parasitocoenosis** *n.* The total parasite load of a host organism (Lincoln et al. 1985).

► **parasitoid** *n.* An organism, intermediate between a parasite and predator, which is usually a hymenopteran species whose larvae feed within, or upon, living bodies of another species eventually causing deaths of their hosts (Lincoln et al. 1985).

Comments: Many workers and this book lump "parasitoids" with "parasites" and call them all "parasites" (Hooker and Barrows 1992). To have consistent terminology, some workers use the terms "parasitoidism" and "parasitoidize" (Propp and Morgan 1985, 515).

► **parasitology** See study of: parasitology.

► **parasocial route to eusociality** *n.* A hypothesized pathway of evolution of eusociality in insects (Wilson 1975, 448).

cf. sociality, subsocial route to eusociality

- Comment:* Birds show a similar tendency (Wilson 1975, 448).
- ♦ **parasociality** See sociality: parasociality.
- ♦ **parasymbiosis** See symbiosis: parasymbiosis.
- ♦ **parasympathetic nervous system** See ²system: nervous system: parasympathetic nervous system.
- ♦ **paratelic character** See character: paratelic character.
- ♦ **paratenic host** See host: paratenic host.
- ♦ **paratonic, aitiogenic** *adj.* Referring to movement, or growth, stimulated, enhanced, or retarded by an external stimulus (Lincoln et al. 1985). See -genic: aitiogenic
- ♦ **paratrepsis** See display: distraction display.
- ♦ **paratroph** See -troph: paratroph.
- ♦ **Parc National des Virunga** See place: Virunga National Park.
- ♦ **parent** *n.*
1. A mother or father (Oxford English Dictionary, 1972, entries from 1450).
 2. A surrogate mother or father (Oxford English Dictionary, 1972, entries from 1526).
 3. "A progenitor; forefather" (Oxford English Dictionary, 1972, entries from 1413).
 4. An organism that generates another organism (Oxford English Dictionary, 1972, entries from 1774).
- cf.* mother, father, aunt, uncle
- alloparent** *n.* For example, in Humans, Macaques: An individual that assists a parent in care of its young and may, or may not, be a genetic relative of the young (Wilson 1975, 349, 578; Small 1990, 39). *syn.* "baby-sitter" (Dewsbury 1978, 305) See helper. *cf.* mother: allomother, aunt, uncle
- ♦ **parent-clinger** *n.* For example, in Bats, Lemurs, Monkeys, *Phascolarctos cinereus* (Koalas), Sloths: A suckling young that continuously holds onto and is passively carried by its mother during the first days through weeks after its birth (fig. 4, 43) [coined by Hassenstein 1973 in Heymer 1977, 175]. *cf.* parent-hugger
- ♦ **parent-hugger** *n.* For example, in Apes including Humans: A suckling young that continuously holds onto and is actively carried by its mother during the first days to weeks after its birth (Wickler 1969 in Heymer 1977, 175). *cf.* parent-clinger
- ♦ **parent imprinting** See learning: imprinting: filial imprinting.
- ♦ **parent-offspring conflict** See ³conflict: parent-offspring conflict.
- ♦ **parent-offspring recognition** See recognition: parent-offspring recognition.
- ♦ **parentage, coefficient of** See coefficient: coefficient of relatedness.
- ♦ **parental aggression** See aggression: parental aggression.
- ♦ **parental altruism** See altruism: parental altruism.
- ♦ **parental behavior** See behavior: parental behavior.
- ♦ **parental care** See care: parental care.
- ♦ **parental companion** See companion: parental companion.
- ♦ **parental disciplinary aggression** See aggression: parental disciplinary aggression.
- ♦ **parental effort** See effort: effort: parental effort.

- ♦ **parental facilitation** See ²facilitation: parental facilitation.
- ♦ **parental investment** See investment: parental investment.
- ♦ **parental manipulation** See manipulation: parental manipulation.
- ♦ **parity, -par** *n.*
1. Medically, an organism's fitness or ability to bear offspring (Michaelis 1963).
 2. The number of times that a particular female has given birth (Lincoln et al. 1985).
 3. The number of offspring that a female produces at a birth (Lincoln et al. 1985).
- adj.* -parous
cf. -para
[Latin *parere*, to bear + ity]
- ♦ **-parity** *comb.f.*
cf. care: parental care
adj. -parous
- biparity** *n.*
1. An organism's production of two offspring per brood (Lincoln et al. 1985). *syn.* ditokous (Lincoln et al. 1985)
 2. Referring to an organism that has produced only one previous brood (Lincoln et al. 1985).
- iteroparity** *n.*
1. In many species: An organism's reproducing in more than one bout during its lifetime (Wittenberger 1981, 347).
 2. An organism's production of offspring in successive groups (Wilson 1975, 587). *cf.* parity: semelparity
Comment: "Iteroparity" is on a continuum with "semelparity."
- larviparity** *n.* An animal's producing eggs that hatch internally and its releasing free-living larvae (Lincoln et al. 1985).
- multiparity** *n.*
1. A female mammal's having more than one young more, or less, contemporaneously, or producing several offspring within a single brood (Lincoln et al. 1985).
 2. An female mammal's having more than one brood of one, or more, offspring (Wilson 1975, 350). *syn.* pluriparity (as the adjective pluriparous) in Lincoln et al. (1985)
- oviparity** *n.* In many animal species: A mother's reproducing by laying eggs that hatch outside her body (Lincoln et al. 1985). *cf.* -ovular: polyovular; -parity: ovoviviparity, ovoviparity, viviparity
Comments: Oviparous taxa include most insect and reptile species, many fish species, all bird species, echidnas, and platypuses.
[New Latin < Latin *oviparous*, laying eggs < *ovum*, egg + *parus* < *parere*, to bring forth]
- ovoviparity** *n.*
1. In a minority of extant and extinct reptile species: A mother's caring for her eggs that are within her body cavity and develop within their shells, or shell membranes, and derive all of their nutrition from their yolks (Inger 1973, 183). *Notes:* In reptiles depending on the species, mothers retain their eggs for from a few days through most of their embryonic developmental period, with their eggs hatching soon after being laid (Inger 1973, 183).

2. For example, in many fish genera including *Chlamydoselachus*, *Latimeria*, *Scyliorhinus*, *Sebastes*, *Xenopocelis*: A mother's caring for eggs within her body cavity, where they grow into embryos, or larvae, using their yolks for food, (Balon 1975, 856).

Notes: In ovoviparity, fertilization is internal and is usually facilitated by a father's intromittent organ (Balon 1975, 856). Mothers release hatched embryos, or larvae, depending on the species.

3. For example, in many cockroach species: A mother's producing fully formed eggs that are retained and hatched inside her reproductive tract and released as free-living offspring (Lincoln et al. 1985).

oviovoviparity *n.* In many fish genera including *Chimera*, *Coelurichthys*, *Heterodontis*, *Pantodon*, *Rhincodon*, *Scyliorhinus*: A mother's caring for eggs within her body cavity which are internally fertilized and expelled at the moment of fertilization, at the beginning of cleavage, or at any time during their embryological development (Balon 1975, 855).

pluriparity See -parity: multiparity.

primaparity *n.* An animal's having her first "group" of one, or more, offspring.

pupiparity See -parity: nymphiparity.

scissiparity *n.* Multicellular organisms' reproducing by fission (Lincoln et al. 1985).

semelparity *n.* For example, in *Antechinus* sp. (marsupial mice); bamboos, mayflies, and some palm species: An organism's reproducing in one bout during its lifetime (Wittenberger 1981, 347).

syn. big-bang reproduction (Gadgil and Bossert 1970 in Wittenberger 1981, 347), monocarp (in plants)

adj. semelparous

cf. parity: iteroparity

Comment: "Semelparity" is on a continuum with "iteroparity."

[after Semele, one of the many human, mortal lovers of the chief Greek god Zeus, who was incinerated in his dramatic encounter with her in all his glory (Willson 1983, 14; Cockburn and Lee, 1989, 44)]

semioviparity *n.* Reproduction intermediate between oviparity and viviparity (Lincoln et al. 1985).

sexuparity *n.* An organism's producing male and female offspring either by sexual reproduction or parthenogenesis (Lincoln et al. 1985).

tomiparity *n.* Reproduction by fission (Lincoln et al. 1985).

uniparity *n.*

1. For example, in tsetse flies, many mammal species: An animal's producing one offspring in a single brood (Lincoln et al. 1985).
2. An animal's having only one brood in its lifetime (Lincoln et al. 1985).

cf. parity: semelparity

virginiparity *n.* For example, in some mantid, walkingstick, and wasp species; Whiptailed Lizards: Reproduction only by parthenogenesis (Lincoln et al. 1985).

viviparity *n.*

1. In a few extant reptile species, including *Denisonia* snakes, some skink species, and *Vipera berus* (Common European Adders): A mother's bearing embryos that develop within her body cavity and obtain nutrition from her through a temporary organ (Inger 1973, 183).

2. In many fish genera, including *Carcharias*, *Galeocerdo*, *Gambusia*, *Goodea*, *Mustelus*, *Poecilia*, *Prionace*, and *Xiphophorus*: Reproduction in which a mother provides partial, or entire nutrition, to her embryo(s) via a special absorptive organ (Balon 1975, 856).

Notes: *Carcharias taurus* (Sand Tiger Shark) seems to produce one young at a time, which is free within its mother's body cavity and feeds on eggs gradually produced by her (Balon 1975, 856). In some other sharks, young develop in their mother's uterus and receive nutrients from her blood through her placenta (Campbell 1996, 637). The poeciliids have unchorionated eggs (Balon 1975, 856).

3. In placental mammals: Reproduction in which young are nourished by a placenta and are born (expelled from their mothers) as animate entities not in eggs; these young are neither incubated as eggs nor hatched within their mothers (Lincoln et al. 1985).

4. In many insect species including *Aphis nerii* (Oleander Aphids, fig. 6): Reproduction via first-instar larvae, not egg production (McAuslane 2008).

syn. zoogony (Lincoln et al. 1985)

cf. -parity: larviparity, oviparity, ovovoviparity, ovoviparity

adj. viviparous, zoogenous

[Latin *viviparus* < *vivus*, alive + *parere*, to bring forth]

► **haemocoelous viviparity** *n.* Viviparity in which eggs are retained and commence development in their mother's haemocoel (Lincoln et al. 1985).

◆ **Parker-Smith model of evolution of sex** See hypothesis: Parker-Smith model of evolution of sex.

◆ **parliament** See ²group: parliament.

◆ **-parous** *comb.f.* Producing. See -parity.

◆ **parsimony, law of** See Morgan's canon.

◆ **parthenoapogamy** See -gamy: apogamy: parthenoapogamy.

◆ **parthenocaryogamy** See -gamy: parthenokaryogamy.

◆ **parthenogamete** See gamete: parthenogamete.

◆ **parthenogamy** See parthenogenesis: automictic parthenogenesis.

◆ **parthenogenesis** *n.*

1. For example, in many alga, insect, microorganism, plant, and rotifer species and *Cnemidophorus* (Whiptailed Lizards): Reproduction without concourse of opposite sexes or union of sexual elements" (Oxford English Dictionary 1972, entries from 1849); asexual reproduction (Lincoln et al. 1985).

syn. monogony (Lincoln et al. 1985)

2. Reproduction from unfertilized eggs, seeds, spores, or other organism parts (Michaelis 1963; Bernstein et al. 1985, 1279).

Note: "Sexual parthenogenesis" (*q.v.*) can produce offspring that are genetically different than their parents.

3. Reproduction from cells other than ovules, e.g., in some species of plants (Michaelis 1963).

4. The absence of mixis; asexuality (Bell 1982, 501).

syn. apomictic reproduction (in the broad sense), apomixia (Online Medical Dictionary 2007), apomixis (in the broad sense), geneogenesis, gynecogeny (Lincoln et al. 1985), virgin birth

cf. rule: Dzierzon's rule; mixis; -mixis: amixis, apomixis, endomixis, parthenomixis; polyembryony [Greek *parthenos*, virgin + genesis]

ameiotic parthenogenesis *n.* "Parthenogenesis in which meiosis has been suppressed so that neither chromosome reduction nor any corresponding phenomenon occurs" (Lincoln et al. 1985).

ameiotic thelytoky See parthenogenesis: apomixis.

ampherotoky, amphoterotoky See parthenogenesis: amphitoky.

amphitoky *n.*

1. For example, in some chalcidoid wasps: "Parthenogenesis in which unfertilized eggs develop into both sexes" (Gordh in Krombein et al. 1979, 746).

syn. deuterotoky (Lincoln et al. 1985)

2. Parthenogenesis in which both male and female progeny are produced (Lincoln et al. 1985).

syn. ampherotoky, amphoterotoky, deuterotoky, gametotoky (Lincoln et al. 1985)

androcyclic parthenogenesis *n.* Parthenogenesis in which a series of parthenogenetic generations is followed by the production, by a portion of a population only, of males as a sexual generation (Lincoln et al. 1985).

Comment: This occurs in species which also exhibit cyclic parthenogenesis (Lincoln et al. 1985).

androgenesis *n.*

1. The development of an egg that carries only paternal chromosomes (Lincoln et al. 1985).

syn. male parthenogenesis, patrigenesis (Lincoln et al. 1985)

See -genesis: patrigenesis.

2. Production of a haploid plant by germination of a pollen grain within an anther (Lincoln et al. 1985).

cf. parthenogenesis: gynogenesis

anhocyclic parthenogenesis *n.* In some aphid species: Parthenogenesis by obligate thelytoky, e.g., without a sexual generation (Bell 1982, 502).

apomixis *n.*

1. For example, in many plant species: Asexual parthenogenesis in which offspring arise through agamospermy (formation of a seed from an ovule without its fertilization) or from cells other than ovules (King and Stansfield 1985).

syn. apogamy (Usher 1996, 29)

2. Thelytoky in which there is no meiosis, and chromosome number is not reduced (Gordh in Krombein et al. 1979, 746).

syn. ameiotic thelytoky (Lincoln et al. 1985)

3. Reproduction from eggs without meiosis and syngamy (Bell 1982, 502).

See parthenogenesis.

Comment: Each apomictic offspring is genetically identical to its parent (unless mutations occur in offspring) (Judson and Normark 1996, 41).

[Greek *apo*, from; *mixis*, a mingling]

arrhenotoky *n.* In almost all species of Hymenoptera and some species of other arthropods: Sexual parthenogenesis in which hemizygous males arise from unfertilized eggs.

syn. haplodiploidy (Lincoln et al. 1985)

cf. parthenogenesis: hemizygoid parthenogenesis

Comment: "Arrhenotoky is a means whereby lethal and deleterious genes can be relatively rapidly eliminated from a population and superior genotypes can

be relatively rapidly selected" (Gordh in Krombein et al. 1979, 746).

artificial parthenogenesis *n.* Parthenogenesis resulting from activation of an egg by artificial treatment (Lincoln et al. 1985).

asexual-meiotic parthenogenesis *n.* Asexual parthenogenesis in which offspring arise from cells produced by meiosis (Thornhill and Alcock 1983, 34–39).

asexual reproduction, asexual parthenogenesis, monogenesis, monogony *n.* Reproduction without the formation of gametes and in the absence of any sexual process; contrasted with sexual parthenogenesis (Lincoln et al. 1985).

automic parthenogenesis, meiotic parthenogenesis, parthenogamy *n.* Parthenogenesis in which meiosis is preserved and diploidy reinstated either by the fusion of haploid nuclei within a single gamete or by the formation of a restitution nucleus (Lincoln et al. 1985).

automixis *n.*

1. For example, in some chalcidoid wasps: Sexual parthenogenesis that has reduction divisions of chromosome numbers, with diploidy maintained in several ways (Gordh in Krombein et al. 1979, 746).

syn. meiotic thelytoky

2. Obligatory self-fertilization by autogamy, *q.v.* (Lincoln et al. 1985).

autoparthenogenesis *n.* Development of an unfertilized egg that has been activated by a chemical, or physical, stimulus (Lincoln et al. 1985).

cyclic parthenogenesis *n.*

1. Reproduction in which one, or more, thelytokous generations is followed by a single arrhenotokous, or amphimictic, generation; usually with a more or less regular and predictable alternation of kinds of generations (Bell 1982, 504).

2. "Reproduction by a series of parthenogenetic generations alternating with a single sexually reproducing generation" (Lincoln et al. 1985).

syn. holocyclic parthenogenesis, monocyclic parthenogenesis (Lincoln et al. 1985)

deuterotoky See parthenogenesis: amphitoky.

diploid parthenogenesis *n.* See -gamy: apogamy: parthenopogamy.

facultative parthenogenesis *n.* Development of some eggs of an organism if they are not fertilized (Lincoln et al. 1985).

fission *n.* In protists: Asexual reproduction in which an organism splits into two parts (= binary fission) or more parts (= multiple fission) (Lincoln et al. 1985).

► **schizogony** *n.* A type of multiple fission in which a parent organism (schizont) divides and forms many new individuals (merozoites) (Lincoln et al. 1985).

gametotoky See parthenogenesis: amphitoky.

generative parthenogenesis, haploid parthenogenesis *n.* Development of a haploid organism from a female gamete that has undergone meiotic reduction division but has not been fertilized (Lincoln et al. 1985).

gynogenesis *n.* In some fish and plant species: Parthenogenesis in which an egg is activated by pseudogamy (penetration of a sperm without its genome's contributing genetic information to a zygote)

- (Bell 1982, 511; Licht and Bogart 1987); or, in some plant species, by pollen (Lincoln et al. 1985).
syn. pseudogamy (Lincoln et al. 1985)
cf. parthenogenesis: androgenesis
- haplodiploidy** *n.* See parthenogenesis: arrhenotoky.
- haploid parthenogenesis** See parthenogenesis: generative parthenogenesis.
- hemizygoid parthenogenesis** *n.* “Development of an individual from an unfertilized haploid egg” (Lincoln et al. 1985).
cf. parthenogenesis: arrhenotoky
- heterogony** *n.* Parthenogenesis in the absence of karyogamy (nuclear fusion) that is stimulated by sperm of another species (Margulis et al. 1985, 73).
- heteroparthenogenesis** *n.* Parthenogenesis that produces either offspring that reproduce parthenogenetically, or offspring that reproduce sexually (Lincoln et al. 1985).
- holocyclic parthenogenesis** See parthenogenesis: cyclic parthenogenesis.
- hybridogenesis** *n.* Thelytoky in which a sperm genome, donated by a male of a related amphimictic species, is received and expressed by a hybridogenic zygote but is not transmitted to this zygote's progeny (Bell 1982, 508).
- male parthenogenesis** See androgenesis.
- meiotic parthenogenesis** See parthenogenesis: automictic parthenogenesis.
- meiotic thelytoky** See parthenogenesis: automixis.
- mitotic parthenogenesis** *n.* In at least 12 orders of insects: Asexual parthenogenesis in which offspring arise from diploid cells (Thornhill and Alcock 1983, 35).
- monocyclic parthenogenesis** See parthenogenesis: cyclic parthenogenesis.
- monogenesis, monogeny** See parthenogenesis: vegetative reproduction.
- obligate apogamy** See parthenogenesis: diploid parthenogenesis.
- ooapogamy** *n.* Parthenogenetic development of an individual from an unfertilized female gamete (Lincoln et al. 1985).
- paedogenesis, pedogenesis** See -genesis: paedogenesis.
- paedoparthenogenesis** *n.* Parthenogenesis in which young arise from larvae (Lincoln et al. 1985).
- parthenapogamy, parthenogamy** See -gamy: apogamy; parthenogamy.
- patrigenesis** See parthenogenesis: androgenesis.
- polycyclic parthenogenesis** *n.* Reproduction involving two, or more, cycles of alternating parthenogenetic and sexually reproducing generations per year (Lincoln et al. 1985).
cf. parthenogenesis: cyclic parthenogenesis
- pseudogamy** See parthenogenesis: gynogenesis.
- sexual-meiotic parthenogenesis** *n.* Sexual parthenogenesis in which offspring arise from cells produced by meiosis (Thornhill and Alcock 1983, 34–39).
- sexual parthenogenesis** *n.* For example, in at least a few species in all orders of insects: Parthenogenesis in which offspring arise from unfertilized eggs produced by meiosis and are thus genetically different than their mother; contrasted with asexual parthenogenesis (Thornhill and Alcock 1983, 34–35).

Comment: A special kind of sexual parthenogenesis may occur in some kinds of aphids (Chapman 1971; Thornhill and Alcock 1983, 34–35).

somatic parthenogenesis See parthenogenesis: diploid parthenogenesis.

thelytoky *n.*

1. For example, in *Aphis nerii* (Oleander Aphid) and a walkingstick species: Parthenogenesis in which males are unknown, or rare, and females produce females by various asexual mechanisms (Gordh in Krombein et al. 1979, 746). *Aphis nerii* has both apterous and alate females and can attain very high densities on host plants (fig. 6).

Notes: “Cytologically, diploidy is maintained by apomixis and automixis” (Gordh in Krombein et al. 1979, 746). Thelytoky is classified as “ameiotic thelytoky” (= apomixis) and “meiotic thelytoky” (= automixis).

2. Parthenogenesis in which diploid individuals are formed by karyogamy of an egg with its own female pronucleus (Margulis et al. 1985, 73).

true parthenogenesis *n.* Parthenogenesis in which sperm play no part in egg activation (Licht and Bogart 1987).

cf. parthenogenesis: gynogenesis

tychoparthenogenesis *n.*

1. Asexual parthenogenesis that occurs in normally sexually reproducing organisms (Lincoln et al. 1985).

2. Occasional parthenogenesis in a species (Margulis et al. 1985, 73).

tychothelotoky *n.* An organism's occasional production of parthenogenetic daughters (Bell 1982, 513).

uniparental reproduction *n.* Reproduction from a single parent as occurs in self-fertilizing hermaphroditism, thelytoky, and vegetative reproduction (Lincoln et al. 1985).

vegetative reproduction *n.* Asexual parthenogenesis in which offspring arise from parental somatic cells (Bernstein et al. 1985, 1279). See parthenogenesis: asexual reproduction.

syn. asexual reproduction, monogenesis, monogeny, vegetative division, vegetative propagation (Lincoln et al. 1985)

zygoid parthenogenesis *n.* Parthenogenesis involving an “egg that remains diploid or undergoes diploidization during its development” (Lincoln et al. 1985).

♦ **parthenogenetic reproduction** See reproduction: parthenogenetic reproduction.

♦ **parthenogenome, parthenote** *n.* An organism that is produced by parthenogenesis (Lincoln et al. 1985).

♦ **parthenokaryogamy** See -gamy: parthenocaryogamy.

♦ **parthenomixis** See -mixis: parthenomixis.

♦ **parthenote** See parthenogenome.

♦ **partial dormancy** See dormancy: partial dormancy.

♦ **partial ethogram** See -gram: ethogram: partial ethogram.

♦ **partial homology** See homolog: partial homology.

♦ **partial parasitism** See parasitism: partial parasitism.

♦ **partial preference** See preference: partial preference.

♦ **partial reinforcement** See reinforcement: partial reinforcement.

- ♦ **partial selection** See selection: partial selection.
- ♦ **partially balanced-incomplete block** See experiment: incomplete block: partially-balanced-incomplete block.
- ♦ **partially claustral colony founding** *n.* An ant queen's founding her colony by isolating herself in a chamber but still occasionally leaving to forage for part of her food supply (Wilson 1975, 591).
- ♦ **particulate-organic matter** *n.* Bits of organic material that are found in an aqueous solution (inferred from Cummins and Merritt in Merritt and Cummins 1984, 61).
- ♦ **coarse-particulate-organic matter (CPOM)** *n.* Bits of organic material that are greater than 3 microns in diameter and found in an aqueous solution; contrasted with fine-particulate-organic matter, FPOM (Cummins and Merritt in Merritt and Cummins 1984, 61).
- ♦ **fine-particulate-organic matter (FPOM)** *n.* Bits of organic material that are less than 3 microns in diameter and found in an aqueous solution; contrasted with course-particulate-organic matter, CPOM (Cummins and Merritt in Merritt and Cummins 1984, 61). *Comment:* Cummins and Merritt in Merritt and Cummins (1984) do not tell us where to place organic matter that is 3 microns in diameter.
- ♦ **partner bonding** See bonding: partner bonding.
- ♦ **partner effect** See effect: group effect.
- ♦ **parturition** *n.*
 1. Chiefly technically, a woman's giving birth; child-birth (Oxford English Dictionary 1972, entries from 1646).
 2. An individual animal's giving birth (Lincoln et al. 1985).
- ♦ **party** See ²group: party.
- ♦ **-party** See -parity.
- ♦ **passive-avoidance conditioning** See learning: avoidance conditioning: passive-avoidance conditioning.
- ♦ **passive-avoidance learning** See learning: avoidance learning: passive- avoidance learning.
- ♦ **passive-nuclear species** See ²species: passive-nuclear species.
- ♦ **passive process** *n.* A system, or process, that does not require metabolic-energy expenditure (Lincoln et al. 1985). *cf.* active process
- ♦ **passive replicator** See replicator (comment).
- ♦ **passive withdrawal** See ³lactation: passive withdrawal.
- ♦ **patabiont** See -biонт: patabiont.
- ♦ **patacole** See -cole: patacole.
- ♦ **patch** *n.*
 1. In ecology, "A resource clump or habitat island that is essentially homogeneous internally but differs in some important way from surrounding areas" (Wittenberger 1981, 619). *Comments:* In some areas of ecology, "patch" can be almost synonymous with "habitat" because patchiness refers to environmental heterogeneity on any scale (Wiens 1976 in Kramer et al. 1995, 3).
 2. In behavioral ecology, a delimited, relatively homogeneous part of an organism's habitat, or microhabitat, that differs, especially in resource availability, from the rest of its habitat (Stephens and Krebs 1986 in Kramer et al. 1995, 3).
- ♦ **patchy distribution** See distribution: contiguous distribution.
- ♦ **patchy environment** See environment: patchy environment.
- ♦ **paternal** *adj.* Referring to a character of, or one derived from, a male parent (Lincoln et al. 1985). See patrilineal. *cf.* maternal
- ♦ **paternal behavior** See behavior: paternal behavior.
- ♦ **paternal care** See care: parental care: paternal care.
- ♦ **paternal family** See ¹family: paternal family.
- ♦ **paternal half sister** See sister: half sister: paternal half sister.
- ♦ **paternal investment** See investment: paternal investment.
- ♦ **paternal sex determination** See sex determination: paternal sex determination.
- ♦ **paternity** *n.* The proportion of offspring that a male has in his own brood (= the brood that he produces with his bonded mate) that are his own offspring (Saino et al. 1997, 563).
- ♦ **path analysis** *n.* A graphical analysis used to determine an inbreeding coefficient (Wilson 1975, 591).
- ♦ **patho-, path-, pathy** *prefix* "Suffering, feeling, associated with disease" (Lincoln et al. 1985). [Greek *pathos*, suffering]
- ♦ **pathogenesis** See -genesis: pathogenesis.
- ♦ **pathogenic** See -genic: nosogenic.
- ♦ **pathology** See study of: pathology.
- ♦ **pathway** *n.* A route, or course, along which something moves; a path (Michaelis 1963). *cf.* biochemical pathway
- ♦ **cyclic-AMP pathway** *n.* A signaling system in the nervous system of *Aplysia californica* (Hall 1998, 30).
- ♦ **signal-transduction pathway** *n.*
 1. A series of steps by which a signal on a cell's surface is converted into a specific cellular response (Campbell et al. 1999, 189). *Notes:* Cell-signaling mechanisms are likely to have evolved in early prokaryotes (Campbell et al. 1999, 189–190). The details of signal transduction are strikingly similar in cells of animals and *Saccharomyces cerevisiae* (Baker's Yeast) although their common ancestor lived over 1 Ga ago. Earl W. Sutherland won a Nobel Prize in 1971 for his pioneering work on signal-transduction pathways.
 2. A series of biochemical steps within a cell that occurs after a receptor(s) receives a stimulus and that relates to the cell's (and at times a whole organism's) responding to the stimulus (Campbell and Reece 2005, 788; Sim and Denlinger 2008, 6777).
- ♦ **patocole** See -cole: patocole.
- ♦ **patoxeny** See -xeny: patoxeny.
- ♦ **patri-** *comb. f.* Father (Michaelis 1963). *cf.* matri- [Latin *pater, patris*, father]
- ♦ **patriarchy** See ²group: patriarchy.
- ♦ **-patric** *comb. f.* Referring to an organism's geographical area. *n.* -patry [Greek *patris*, fatherland, native country]
- ♦ **allopatric** *adj.* Referring to populations, species, or other taxa, that occupy different and disjunct geographical areas (Lincoln et al. 1985). *n.* allopatry
- ♦ **dichopatric, macrodichopatric** *adj.* Referring to populations, or species, that occupy different

A

geographical areas and do not have gene flow (Lincoln et al. 1985).

n. dichopatric

♦ **macrodichopatric** See -patric: dichopatric.

♦ **microdichopatric, allotopic** *adj.* Referring to populations that coexist in the same locality but occupy different microhabitats (Lincoln et al. 1985).

parapatric *adj.* “Referring to two species’ having contiguous geographic ranges but no (or only minimal) interbreeding in the zone of contact” (Mayr 1982, 275, 959).

syn. macroparapatric (Lincoln et al. 1985)

n. parapatry

♦ **macroparapatric** See -patric: parapatric.

♦ **microparapatric** *adj.* Referring to a population that coexists in the same locality and in adjacent but not overlapping macrohabitats so that gene flow between them is possible (Lincoln et al. 1985).

sympatric *adj.*

1. Referring to populations, or species, whose geographical ranges at least partially overlap (Wilson 1975, 596; Immelmann and Beer 1989, 302).

2. Referring to populations, species, or taxa, that occupy the same geographical areas (Lincoln et al. 1985).

cf. -patric: allopatric

biotically sympatric *adj.* Referring to sympatry in which groups occupy the same habitats (Lincoln et al. 1985).

neighboringly sympatric *adj.* Referring to sympatry in which groups occupy different habitats (Lincoln et al. 1985).

♦ **patriliney, patrocliny** *n.* An offspring’s having a greater inherited resemblance to its father than to its mother (Lincoln et al. 1985).

cf. matriliney

adj. patrilineic, patractinal, patroclinal

♦ **patrigenesis** See -genesis: patrogenesis.

♦ **patrilineal** *adj.*

1. Referring to a paternal line (Michaelis 1963).

2. Referring to things passed from a father to his offspring, *e.g.*, access to a territory or status within a dominance system (Wilson 1975, 588).

syn. paternal

cf. matrilineal

♦ **patristic affinity** See affinity: patristic affinity.

♦ **patristic character** See character: patristic character.

♦ **patrocliny** See patriliney.

♦ **patroendemic** See ¹endemic: patroendemic.

♦ **patogenesis** See -genesis: patogenesis.

♦ **patrogynopaedium** See -paedium: patrogynopaedium.

♦ **patrol** *v.i.*

1. In Humans: To make the rounds in a camp or garrison; to go on patrol; to act as patrol; to reconnoiter as a patrol; to traverse on duty a particular beat, or district, as a constable or patrolman (Oxford English Dictionary 1972, entries from 1691).

2. *v.t.* In Humans: To go over, or around (a camp, garrison, town, harbor, etc.) to watch, guard, or protect; to perambulate, or traverse (a beat or district) as a constable or patrolman; to traverse leisurely in all directions (Oxford English Dictionary 1972, entries from 1765).

3. *v.i.* For example, in males of some bee and wasp species: To fly repeatedly, while not feeding, among

landmarks that may be locations where an individual is likely to find a mate (Barrows 1976a, 105).

syn. fly along a mating path (Haas 1960)

Note: “Continuous patrolling,” “non-sequential patrolling,” “food-related patrolling,” “sequential patrolling,” and “territorial patrolling” have been defined (Barrows 1976a, 108).

4. In a worker Western Honey Bee: To investigate the interior of her nest, leading to her defensive response to a nest intruder (Wilson 1975, 591).

5. In Ants: To investigate a nest interior and outer surface (Hölldobler and Wilson 1990, 641).

♦ **patromorphic** See -morphic: patromorphic.

♦ **patropaedium** See -paedium: patropaedium.

♦ **pattern** *n.* A complex of integrated parts that function as a whole, *e.g.*, a behavior pattern (Michaelis 1963), an ecological community pattern (Cale et al. 1989, 660).

cf. ²movement; pattern: fixed-action pattern

behavior pattern, behavioral pattern, behavior *n.*

1. An organism’s set of responses that are statistically organized in time, that is, associated with and manifesting some degree of stereotypy in the temporal sequence in which they occur (Verplanck 1957).

Note: “Behavior pattern” is applied whenever one has analyzed behavior into relatively large units, that is, units composed of a number of responses. Behavior chains, instincts, and the activities that are the empirical bases of particular drives are all labeled behavior patterns, which renders the term of very limited usefulness for theory (Verplanck 1957). In common English, “behavior pattern” can encompass an appreciable number of behaviors, such as the behavior pattern of a 5-yr-old person (Michaelis 1963).

2. A major type of behavior, *e.g.*, walking, swimming, diving, or flying (Chaplin 1968; Lehner 1979, 65).

syn. action system (Lincoln et al. 1985)

cf. behavior, classification of (table); behavioral act: component part of a behavioral act

Note: This is a commonly used definition.

Comment: In definitions in this book, I generally use “behavior,” rather than “behavior pattern,” to mean behavior of different complexities.

fixed-action pattern (FAP) *n.*

1. An animal’s movement that has a generally constant form, need not be learned, generally belongs to a functional system, and is characteristic of its species (Lorenz 1932, 1937; Lorenz and Tinbergen 1939; Tinbergen 1942 in Hinde 1982, 43–44, 47; Lorenz 1939 and Schleidt 1974 in Heymer 1977, 62; Immelmann and Beer 1989, 106).

syn. innate behavior pattern, stereotyped-action pattern (Provine and Hamernik 1986)

cf. modal-action pattern

Note: The English translation of “*Erbkoordination*” as “fixed-action pattern” has caused confusion. Yawning may be the best example of a stereotyped action pattern in Humans (Provine and Hamernik 1986); the escape response of *Tritonia* sea slugs may be a classic FAP (Gould 1982, 79).

2. A concept roughly equivalent to consummatory act, *q.v.*, that was important in ethological thinking (Dewsbury 1978, 15).

Note: Different workers have stressed different defining attributes of fixed-action patterns, e.g., (1) stereotypy, (2) complexity, (3) display by all members of a species, or at least by all members of a particular group, (4) elicitation by simple, but highly specific stimuli, (5) self-exhaustiveness, (6) triggerability, and (7) occurrence independently of experience (Dewsbury 1978, 15). With further research, investigators found more variability in FAPs than previously expected causing them to be renamed “motor patterns,” “action patterns,” or “modal-action patterns” (Dewsbury 1978, 21).

3. An animal’s “particular behavioral response that is always given in the same stereotyped manner whenever it is evoked by a stimulus situation;” “FAP” is sometimes equated with “instinct” (Wittenberger 1981, 615).

syn. instinctive movement (Immelmann and Beer 1989, 151)

cf. action pattern: modal-action pattern, activity: instinctive activity, program: motor program, stereotypy
Comments: Dawkins (1986, 76–78) gives reasons why the term “fixed-action pattern” should not be used. Gould (1982, 63) indicates that fixed-action patterns are “real.” Barlow (1968) proposed that “instinctive activity,” “instinctive movement,” and “fixed-action pattern” be replaced by the more neutral term “modal-action pattern,” because the former are so loaded with different conceptual meanings (Immelmann and Beer 1989, 152).

[German *Erbkoordination*, inherited movement coordination]

instinctive-behavior pattern *n.* A behavior sequence involving innate pathways of an animal’s central nervous system (Lorenz 1932, 1973 in Heymer 1977, 178).

cf. behavior: innate behavior, behavior: instinctive behavior, learning

instinctive movement See pattern: fixed-action pattern.

modal-action pattern (MAP) *n.* A behavior that is recognizable, describable at least in statistical terms, indivisible into smaller units, and “widely distributed in similar form throughout an interbreeding population” (Barlow 1977 in Hinde 1982, 47).

cf. pattern: fixed-action pattern

Comment: Barlow suggests that this term replace “fixed-action pattern.”

motor pattern *n.* An animal’s spatiotemporal change in its body configuration; e.g., foot flexing, fin fanning, or head nodding (Immelmann and Beer 1989, 194).

cf. behavior, Eshkol-Wachmann movement notation; pattern: fixed-action pattern

♦ **pattern formation** *n.* The development of a spatial organization in which an organism’s tissues and organs are all in their characteristic places (Campbell et al. 1999, 397).

cf. information: pattern information

Comments: Pattern formation is mostly limited to embryos and juveniles in animals and it occurs continually in the apical meristems of plants (Campbell et al. 1999, 397). Researchers have studied pattern formation most extensively in *Drosophila melanogaster*.

♦ **pattern of foraging movements** See mode: foraging mode.

♦ **pattern variegation** *n.* For example, in some *Coleus* cultivars and picotee-type *Petunia* cultivars: Color

variegation of a plant part that is due to developmental differences of cells that are essentially the same genetically (Geneve 1991, 35).

cf. chimera

♦ **Pauling** See unit of measure: macarthur: millimacarthur.

♦ **PAUP** See program: Phylogenetic Analysis Using Parsimony.

♦ **paurometabolous** See metamorphosis: paurometabolous.

♦ **Pavlov’s-reflex theory** See ³theory: chain-reflex theory.

♦ **Pavlovian conditioning** See learning: conditioning: Pavlovian conditioning.

♦ **paw drumming** See animal sounds: drumming: paw drumming.

♦ **payoff, E(A,B)** *n.* The expected change of fitness of an individual that adopts a strategy A against an opponent that adopts B (Maynard Smith 1982, 204).

cf. ³theory: game theory

♦ **payoff matrix** *n.* A table that specifies expected gains to a contestant that adopts different strategies in view of which strategy, or strategies, its opponent, or opponents, adopts (Maynard Smith 1982, 204).

cf. theory: game theory

Comment: Payoff is often measured in terms of fitness, but could be measured in other standard units (Maynard Smith 1982, 204).

♦ **PCR** See method: polymerase-chain reaction.

♦ **peck** See ²group: peck.

♦ **peck distance** See distance: peck distance.

♦ **peck order, pecking order, peck-right order** See hierarchy: dominance hierarchy.

♦ **Peckhamian mimicry** See mimicry: aggressive mimicry.

♦ **peculiar character** See character: diagnostic character.

♦ **pederosis** See -philia: pedophilia.

♦ **pedicel** *n.*

1. A stalk or supporting part (Michaelis 1963).
2. The “waist” of an ant; made up of either one segment (the petiole) or two segments (the petiole plus the postpetiole) (Wilson 1975, 591).

syn. petiole (C. K. Starr, pers. comm.)

See nest: wasp nest: pedicel.

[New Latin *pedicellus*, diminutive of Latin *pediculus*, diminutive of *pes*, *pedis*, foot]

♦ **pedigree** *n.* A formal list, or register, of ancestry, or genealogy, of an individual or family group (Lincoln et al. 1985).

♦ **pediophile** See ¹-phile: pediophile.

♦ **pedo-** See paedo-.

♦ **pedogamy** See -gamy: paedogamy.

♦ **pedogenesis** See -genesis: pedogenesis.

♦ **pedology** See study of: pedology.

♦ **pedon** *n. pl.* Organisms that live on, or in, the substrate of an aquatic habitat (Lincoln et al. 1985).

adj. pedonic

♦ **pedophobia** See -phobia: pedophobia.

♦ **pedosphere** See -sphere: biosphere: parabiosphere: pedosphere.

♦ **pee** See elimination: urination.

♦ **Peekskill meteorite** See meteorite: Peekskill meteorite.

♦ **peep** See ²group: peep.

♦ **pelagial** See pelagic.

♦ **-pelagic**

holopelagic *adj.* Referring to aquatic organisms that remain pelagic throughout their life cycles (Lincoln et al. 1985).

meropelagic *adj.* Referring to aquatic organisms that are only temporary members of the pelagic community (Lincoln et al. 1985).

cf. pelagic; holopelagic

neritopelagic *adj.* Referring to an organism that inhabits shallow coastal waters over a continental shelf (Lincoln et al. 1985).

nyctipelagic *adj.* Referring to organisms that migrate into surface waters at night (Lincoln et al. 1985).

♦ **pelagic** *adj.*

1. Referring to the water column of the sea or lake (Michaelis 1963).

2. Referring to organisms that inhabit open waters of a lake, ocean, or deep pond (Michaelis 1963).

syn. oceanic (Michaelis 1963), pelagial (Lincoln et al. 1985)

cf. benthic

[Latin *pelagicus* < Greek *pelagikos* < *pelagos*, the sea]

♦ **pelagium** See ²community: pelagium.

♦ **pelagophile** See ¹-phile: pelagophile.

♦ **pelasic** *adj.* “Moving from place to place” (Lincoln et al. 1985).

♦ **P element** See transposable element: P element.

♦ **pelochthium** See ²community: pelochthium.

♦ **pelochthophile** See ¹-phile: pelochthophile.

♦ **pelophile** See ¹-phile: pelophile.

♦ **pelvis** *n.* In bony vertebrates: The part of a skeleton that forms a bony girdle joining the lower, or hind limbs, to the body (Michaelis 1963).

Comments: In Humans, the pelvis is composed of two innominate bones and the sacrum (Michaelis 1963).

[Latin *pelvis*, basin]

ornithischian pelvis *n.* In many dinosaur species: A pelvis in which the longitudinal axes of the ischium and posterior part of the pubis are approximately parallel to one another; distinguished from saurischian pelvis (Strickberger 1996, 400, illustration).

saurischian pelvis *n.* In birds, many dinosaur species: A pelvis in which the longitudinal axes of the ischium and pubis are widely separated at their apices; distinguished from ornithischian pelvis (Strickberger 1996, 400, illustration).

♦ **pen** See animal names (table).

♦ **pene-, Brit. paene** *prefix* “Almost, nearly” (Brown 1956).

[Latin almost]

♦ **penecontemporary** *adj.* Referring to phenomena that are almost contemporary or occur at about the same time (Lincoln et al. 1985).

♦ **penetrance** *n.* A phenotypic character’s not being shown although the organism in question has the genetic material responsible for this character; *e.g.*, Humans with the gene(s) responsible for schizophrenia might not show the manifestations of this disease (Mayr 1982, 826).

♦ **penis** See organ: copulatory organ: penis.

♦ **penta-, pent-** *comb. f.* Five, fivefold (Lincoln et al. 1985).

[Greek *pente*, five]

♦ **peptide-nucleic acid** See nucleic acid: peptide-nucleic acid, PNA.

♦ **peptidoglycan** See molecule: peptidoglycan.

♦ **per-** *prefix*

1. “Through; throughout” (Michaelis 1963).

2. “Thoroughly; completely” (Michaelis 1963).

3. “Away” (Michaelis 1963).

4. “Very” (Michaelis 1963).

[Latin *per*, through, by means of]

♦ **percent rate** See rate: percent rate.

♦ **perception** *n.*

1. A person’s being cognizant, or being aware, of objects in general (Oxford English Dictionary 1972, entries from 1611).

Note: “Perception” is sometimes distinguished from “volition” and sometimes synonymized with “consciousness” (Oxford English Dictionary 1972).

2. A person’s being cognizant, or being aware, of a sensible, or quasi-sensible, object; loosely, pers. obs., especially sight (Oxford English Dictionary 1972, entries from 1704).

3. A person’s faculty of perceiving something (Oxford English Dictionary 1972, entries from 1678).

4. The result, or product, of a person’s perceiving; percept (Oxford English Dictionary 1972, entries from 1690).

5. An individual organism’s interpretation of sensory information in light of its experience and unconscious inference (McFarland 1985, 205).

6. Psychologically speaking, some degree of a person’s interpretation, or categorization, of stimuli; distinguished from sensation (Immelmann and Beer 1989, 216).

cf. awareness, consciousness, modality, sensation

depth perception *n.* An animal’s perceiving distance away from itself (Storz 1973, 68).

extraocular-light perception *n.* An organism’s perceiving light with an organ other than its eye, or eyes; *e.g.*, an amoeba’s perceiving light with its body, a fly maggot’s perceiving light with its anterior light receptor, or a reptile’s perceiving light with its pineal gland (Taylor and Adler 1978; D. B. Quine, pers. comm.).

gestalt perception *n.* In many animal species: An individual’s capacity to apprehend specific stimulus combinations, not only as the totality of their component characteristics, but also the particular relational structure among their components; perception of a whole’s being more than the sum of its parts; *e.g.*, songbirds with long, varied note sequences in their songs, base their reactions to the whole acoustic pattern of an artificial song, rather than on component traits taken separately (Immelmann and Beer 1989, 119).

cf. stimulus: configurational stimulus

♦ **perceptual psychology** See study of: psychology: perceptual psychology.

♦ **perceptual signs, perceptual stimulus** See ²stimulus: releaser.

♦ **percussive foraging** See foraging: percussive foraging.

♦ **perennial** *n.* A plant that remains alive for a number of years, especially a herbaceous plant that dies down to a root and resprouts the next year (Oxford English Dictionary 1972, entries from 1672).

cf. annual, biennial

Comment: Some perennial species also die down to a bulb, corm, or rhizome.

♦ **perennial** *adj.*

1. Referring to something that occurs throughout a year, or lasts through successive years, *e.g.*, a spring, or a stream, that flows all year (Oxford English Dictionary 1972, entries from 1703).

2. Referring to a structure that grows continuously from a persistent pulp such as a rodent's front tooth (Oxford English Dictionary 1972).
3. Referring to an insect that lives for more than 1 yr (Oxford English Dictionary 1972).
4. Referring to an insect colony that lives for more than 1 yr (Oxford English Dictionary 1972).

♦ **perennial monogamy** See mating system: monogamy; perennial monogamy.

♦ **pergelicole** See -cole: pergelicole.

♦ **perhalicole** See -cole: perhalicole.

♦ **peri-** prefix

1. "Around; encircling" (Michaelis 1963).
2. "Situated near; adjoining" (Michaelis 1963). [Greek *peri*, around]

♦ **pericentric inversion** See inversion: pericentric inversion.

♦ **periclinal chimera** See chimera: periclinal chimera.

♦ **perigenesis** See -genesis: perigenesis.

♦ **perimenopause** See menopause: perimenopause.

♦ **period** *n.*

1. A course, or extent, of time (Oxford English Dictionary 1972, entries from 1413).
2. One of the larger divisions of geological time, usually subordinate to an era and superior to an epoch (Oxford English Dictionary 1972, entries from 1833; Lincoln et al. 1985)

activity period *n.* In hibernating animals: The "time between emergence from and entrance into hibernation" (Carpenter 1952a, 238).

critical period See period: sensitive period.

free-running period See period: natural period.

latent period See time: reaction time.

lying-out period *n.* In ungulates including many gazelle species; *Cervus elaphus* (Red Deer), *Oryx* sp. (oryx), *Tragelaphus* sp. (kudu): A period soon after its birth after suckling, when a calf, or fawn, actively leaves its mother and lies down in cover where it remains "couched and concealed" until its mother calls it for its next feeding (Immelman and Beer 1989, 176–177).

cf. follower, hider

natural period, free-running period *n.* The fundamental periodicity of a biological clock when it is not entrained to a zeitgeber (Lincoln et al. 1985).

nychthemeron *n.* A period of 24 consecutive hours, consisting of a day and a night (Bligh and Johnson 1973, 951).

cf. period: nyctiperiod

nyctiperiod *n.* "A period of darkness; a dark phase in a light-dark cycle" (Lincoln et al. 1985).

phenocritical period *n.* The phase during an organism's development at which a gene's expression is most easily affected by externally applied factors (Lincoln et al. 1985).

photoperiod *n.* The light phase of a light-dark cycle (Lincoln et al. 1985); day length (Immelman and Beer 1989, 219).

cf. period: nyctiperiod

refractory period *n.* The time duration that follows excitation of a system and during which a subsequent stimulus of equal magnitude elicits no response or one of reduced amplitude (Heymer 1977, 143).

cf. time: reaction time

sensitive period *n.*

1. For example, in *Gallus gallus* (Domestic Chickens); *Macaca fuscata* (Japanese Macaque); *Macaca mulatta* (Rhesus Macaques); *Rattus norvegicus* (Norway Rats); some ant, duck, goat, and sheep species: The restricted period during which an individual becomes imprinted on a particular stimulus (Lorenz 1935 in Champalbert and Lachaud 1990, 850; Dewsbury 1978, 144; Champalbert and Lachaud 1990, 850).

syn. critical period, sensitive phase (Dewsbury 1978, 144)

cf. learning

Notes: "Sensitive period" is preferred to "critical period" by many workers because the former carries less of an implication of suddenness and inflexibility with regard to the onset and termination of the period of maximal susceptibility (Dewsbury 1978, 144). Because "sensitive period" also suggests a demarcated time span, "sensitive phase" seems to be a better term than "sensitive period," but the latter is now preferred in literature (Immelman and Beer 1989, 263–264). In *Taenopygia guttata* (Zebra Finches), the sensitive period for song learning occurs from 25 through 30 days after hatching and ends about 50 days later (Nash 1997, 3 February, 55). In Humans, one's ability to learn a second language is from birth up to the age of 6 yr.

2. A period during which a person's brain requires certain types of input in order to create and stabilize certain long-lasting structures (Nash 1997, 3 February, 55).

Notes: Children exposed to physical abuse in early life developed brains that are exquisitely tuned to danger (Bruce Perry in Nash 1997, 3 February, 55). Mothers who are disengaged, irritable, impatient, or a combination of these things, tend to have sad babies suggesting that a mother's temperament affects her child's brain development (Geraldine Dawson et al. in Nash 1997, 3 February, 55).

sensitive phase See period: sensitive period.

♦ **periodic plankton** See plankton: periodic plankton.

♦ **periodicity** *n.*

1. The periodic, or rhythmic, occurrence of an event (Lincoln et al. 1985).
2. The duration of a single phase of an oscillation (Lincoln et al. 1985).

See rhythm.

♦ **peripatric speciation** See speciation: peripatric speciation.

♦ **peripheral** *adj.* Referring to the surface of an animal's body, e.g., peripheral stimuli as distinguished from central, or internal, stimuli (Immelman and Beer 1989, 217).

♦ **peripheral male** See male: peripheral male.

♦ **peripheral nervous system** See ²system: nervous system: peripheral nervous system.

♦ **peripheral stimulus, peripheral stimulation** See ²stimulus: external stimulus.

♦ **peripheral stimulus filtering, peripheral filtering** See stimulus filtering: peripheral stimulus filtering.

♦ **periphyton** See ²community: periphyton.

♦ **perittogamy** See -gamy: perittogamy.

♦ **permanent heterozygosity, permanent hybrid** See hybrid: permanent hybrid.

- ♦ **permanent hybrid, permanent heterozygosity** See hybrid: permanent hybrid, permanent heterozygosity.
- ♦ **permanent parasitism** See parasitism: social parasitism: inquilinism.
- ♦ **permeability** *n.* A society's degree of acceptance of, or tendency to accept, immigrants from other conspecific societies (Wilson 1975, 17, 591).
- ♦ **perpetual-intervention hypothesis** See hypothesis: perpetual intervention hypothesis.
- ♦ **persistence** *n.* An allele's number of generations in which it persists in a population before its elimination (Lincoln et al. 1985).
- ♦ **persistent dance** See dance: persistent dance.
- ♦ **personal fitness** See fitness (def. 2, 4); fitness: inclusive fitness.
- ♦ **personal recognition** See recognition: individual recognition.
- ♦ **personality** *n.*
1. The quality, character, or fact, of one's being a person as distinct from a thing; the quality, or principle, that makes a being personal (Oxford English Dictionary 1972, entries from 1380).
 2. A personal being, a person (Oxford English Dictionary 1972, entries from 1678).
 3. The quality, or assemblage of qualities, that makes one person distinct from other persons (Oxford English Dictionary 1972, entries from 1795).
 4. An individual organism's distinctive suite of behavioral traits (Wilson 1975, 294, 549).
- ♦ **personnel psychology** See study of: psychology: personnel psychology.
- ♦ **persuasion signal** See signal: persuasion signal.
- ♦ **perturbation, disturbance** *n.* Any departure of a biological system from its steady state (Lincoln et al. 1985).
- ♦ **perverse subsidy** *n.* A subsidy (= a pecuniary aid directly granted by a government to a party and deemed beneficial to the public) that harms our environment (James et al. 1999, 324). *Comments:* Perverse subsidies include those for agricultural production, commercial fishing, energy use, road transportation, and water consumption (James et al. 1999, 324). For example agricultural subsidies which often harm our environment, average \$82,500 km⁻² in the European Union and \$16,100 km⁻² in the U.S. In contrast, these European countries spend on average less than \$2,000 km⁻² on their national parks and nature preserves.
- ♦ **perversum confusum** See ²group: *perversum confusum*.
- ♦ **perversum simplex** *n.* An attempted mating of one male with another (Lincoln et al. 1985). *cf.* copulation: homosexual copulation.
- ♦ **pessimal** *adj.*
1. Referring to environmental-factor levels that are close to an organism's tolerance level (Lincoln et al. 1985).
 2. Referring to a least favorable condition for an organism (Lincoln et al. 1985).
- ♦ **pessimum** *n.* Conditions outside those for an organism's optimum growth and development or maintenance of a system (Lincoln et al. 1985).
- ♦ **pesticide** See -cide: pesticide.
- ♦ **pet** *n.*
1. Any animal that is domesticated, or tamed, and kept as a favorite, or treated with indulgence or fondness; especially a lamb, or kid, taken into one's house and

reared by hand (Oxford English Dictionary 1972, entries from 1539).

Note: Undomesticated, or untamed, animals, e.g., some fish species, *Gromphadorhina portentosa* (Madagascar Hissing Cockroaches), and some hermit-crab species are, of course, kept as pets as well.

2. An artificially reared plant (Oxford English Dictionary 1972, entries from 1842).
3. "An indulged (and, usually, spoiled) child" (Oxford English Dictionary 1972, entries from 1508).
4. Any person who is indulged, fondled, and treated with special kindness or favor; darling; favorite (Oxford English Dictionary 1972, entries from 1755).

cf. animal: companion animal

- ♦ **PET** See method: positron-emission tomography.

- ♦ **Petit effect** See rare-male-mating advantage.

- ♦ **petric** *adj.* Referring to rock-living communities or species (Lincoln et al. 1985).

cf. ²community: petrochthium, petrodium, phellium

- ♦ **petrichor** See odor: petrichor.

- ♦ **petricole** See -cole: petricole.

- ♦ **petrification** *n.* The process of wood's (or other organic matter's) converting into stone by structural impregnation with dissolved minerals (Morris 1982).

syn. petrifaction

v.i. petrify

[Old French *petrifier* < Latin *petra*, rock < Greek + Latin *facere*, to make]

- ♦ **petrified forest** See fossil: petrified forest.

- ♦ **petrimadicole** See -cole: petrimadicole.

- ♦ **petrimadicolous** See hygroscopic.

- ♦ **petrium** See ²community: petrium.

- ♦ **petrobiont** See -biонт: petrobiont.

- ♦ **petrochthium** See ²community: petrochthium.

- ♦ **petrochthophile** See ¹-phile: petrochthophile.

- ♦ **petrocole** See -cole: petrocole.

- ♦ **petroleum** See ²community: petroleum.

- ♦ **petrodophile** See ¹-phile: petrodophile.

- ♦ **petrology** See study of: lithology.

- ♦ **petrophile** See ¹-phile: petrophile.

- ♦ **pH** See unit of measure: pH.

- ♦ **phaenology** See study of: phenology.

- ♦ **phaenotype** See -type, type: phenotype.

- ♦ **phage** See -phage: bacteriophage.

- ♦ **-phage** *comb. f.* One who, or that which, eats or consumes (Michaelis 1963).

adj. -phagous.

cf. -biont, cannibalism, -cole, parasite, -phage, -phagy,

¹-phile, -troph, -vore, zoite, zoon

n. -phagy

[Greek *phagein*, to eat]

A CLASSIFICATION OF KINDS OF PHAGES^a

- I. monophage
 - A. generic monophage
 - B. specific monophage
 - C. subgeneric monophage
- II. oligophage
 - A. disjunctive oligophage
 - B. sequential oligophage
 - C. systematic oligophage
- III. polyphage

^a Otte and Joern (1977 in May and Ahmad 1983).

acridophage *n.* An organism that feeds on grasshoppers, *e.g.*, *Canis latrans* (Coyote) (Lincoln et al. 1985).

algophage *n.* An organism that feeds on algae, *e.g.*, a snail species (Lincoln et al. 1985).

autophage *n.* A young, precocial bird that can locate and secure its own food (Lincoln et al. 1985).

bacteriophage *n.*

1. An ultramicroscopic, filter-passing agent that has the power of destroying bacteria and of inducing bacterial mutation (Michaelis 1963); a virus that infects bacteria (Campbell 1987, G-2).

syn. phage (Campbell 1987, G-2)

2. An organism that feeds on bacteria, *e.g.*, *Cirrhinus molitorella* (Mud Carp) and a protozoan sp. (Lincoln et al. 1985; Scholtissek 1992, 2).

biophage *n.* An organism that consumes, or destroys, other living organisms, *e.g.*, *Tenodera sinensis* (Chinese Mantis) (Lincoln et al. 1985).

carpophage *n.* An organism that feeds on fruit or seeds, *e.g.*, a weevil species (Lincoln et al. 1985).

cerophage *n.* An organism that feeds on wax, *e.g.*, *Galleria mellonella* (Greater Wax Moth) (Lincoln et al. 1985).

coprophage See -vore: merdivore.

creophage *n.* An organism that feeds on animals, *e.g.*, a carnivorous-plant species *Sarracenia purpurea* (Purple Pitcherplant) (Lincoln et al. 1985).

cytophage *n.* An organism that feeds on cells (Lincoln et al. 1985), *e.g.*, a malaria *Plasmodium*.

dendrophage See -vore: lignivore.

detriophage *n.* An organism that feeds on detritus, *e.g.*, a caddisfly species (Lincoln et al. 1985).

ectophage *n.* An insect larva that hatches from an egg deposited on, or near, a supply of host eggs and feeds upon them (Lincoln et al. 1985), *e.g.*, a larva of a chalcidoid-wasp species.

ectophage *n.* An organism that feeds on the outside of its food source, *e.g.*, a parrot fish that feeds on coral (Lincoln et al. 1985).

endolithophage See -phage: lithophage.

endoophage, ectophage *n.* An insect larva that hatches from an egg deposited within a host egg and feeds upon the contents of this single egg (Lincoln et al. 1985).

endophage See -phage: entophage.

epilithophage See -phage: lithophage.

entomophage See -vore: insectivore.

entophage, endophage *n.* An organism that feeds from within a food source, *e.g.*, a gall-making insect (Lincoln et al. 1985).

epilithophage See -phage: lithophage.

euryphage *n.* An organism that utilizes, or tolerates, a wide variety of foods or food species, *e.g.*, *Ursus americanus* (American Black Bear) (Lincoln et al. 1985).

syn. pleophage, plurivore, polyphage

galliphage See -vore: gallivore.

geophage *n.* An organism that feeds on soil, *e.g.*, an earthworm species (Lincoln et al. 1985).

gerontophage *n.* For example, in some gall-midge species; 10 spider species, a beetle species: An individual that feeds on its own mother (Gould 1976, 24; Lincoln et al. 1985; Seibt and Wickler 1987, 1903).

Comment: In the beetle *Micromalthus debilis*, some parthenogenetic mothers give birth to a single son. This larva attaches to his mother's skin for about 5

days, inserts his head into her genital aperture, and devours her (Gould 1976, 24).

haematophage, haemophage See -vore: sanguivore.

harpactophage *n.* A predator (Lincoln et al. 1985). *cf.* predator

heterophage *n.* A parasite that uses a wide variety of hosts (Lincoln et al. 1985), *e.g.*, *Lymantria dispar* (Gypsy Moth).

hylophage See -vore: lignivore.

ichthyophage See -vore: piscivore.

isophage *n.* An organism that feeds on selected foods or hosts, but not a single species, *e.g.*, a chalcidoid-wasp species (Lincoln et al. 1985).

lepidophage *n.* An organism that feeds on external scales of fish, *e.g.*, *Aspidontus taeniatus* (False Cleaner Fish) (Lincoln et al. 1985).

limiphage, limophage See -vore: limivore.

lithophage *n.*

1. An organism that erodes, or bores, into rock (Lincoln et al. 1985).

Note: "Lithophage" is divided into "epilithophage," "mesolithophage," and "endolithophage" based on the degree that an organism penetrates rock (Lincoln et al. 1985).

2. An organism that consumes small stones; *e.g.*, *Cyanocitta cristata* (Blue Jays), *Gallus gallus* (Domestic Chickens), and other birds that use stones in their gizzards (Lincoln et al. 1985).

macrophage *n.* An organism that feeds on relatively large food particles or prey, *e.g.*, *Panthera leo* (Lions) (Lincoln et al. 1985).

macrophytophage *n.*

1. An organism that feeds on only material of more derived plants, *e.g.*, *Euphydryas phaeton* (Baltimore Checkerspot, a butterfly) (Lincoln et al. 1985).

2. An organism that feeds primarily on coarse detritus and woody debris (*e.g.*, millipedes); distinguished from microphytophage and panphytophage (Hoekstra et al. 1995, 248).

Note: Many millipedes greatly increase the surface area of material available for microbial colonization and stimulate oxidation and leaching (references in Hoekstra et al. 1995, 246).

cf. -vore: herbivore

meliphage See -vore: melivore.

mesolithophage See -phage: lithophage.

microphage *n.* An organism that feeds on relatively minute particles or on very small prey (Lincoln et al. 1985), *e.g.*, a caddisfly species.

microphytophage *n.* An organism that feeds on microflora (predominately fungi and microbial colonies); distinguished from macrophytophage and panphytophage (Hoekstra et al. 1995, 248).

cf. -vore: herbivore

monophage *n.* An organism that uses only one kind of food or feeds upon a single organism species or genus, *e.g.*, *Battus philenor* (Pipevine Swallowtail, a butterfly) (Torre Bueno 1978; Lincoln et al. 1985).

syn. monotroph, univore (Lincoln et al. 1985)

Comment: See monophage-oligophage-polypophage continuum.

mycetophage, mycophage See -vore: fungivore.

myrmecophage *n.* An organism that feeds on ants or termites, *e.g.*, *Orycterus afer* (Aardvark) (Lincoln et al. 1985).

- necrophage** *n.* An organism that feeds on dead organisms, *e.g.*, a carrion-beetle species (Lincoln et al. 1985).
- necrophytophage, nekrophytophage** *n.* An organism that feeds on dead plants, *e.g.*, a fungus species (Lincoln et al. 1985).
cf. -vore: herbivore
- oligophage** *n.*
1. An insect that feeds on a group of related plant orders, a single order, or even a single genus (Folsom and Wardle 1934 in Torre-Bueno 1978).
 2. An organism that uses only a few food species, typically species restricted to a single genus, family, or order, *e.g.*, *Papilio polyxenes* (Black Swallowtail) (Lincoln et al. 1985).
 3. An organism that requires only a small nutrient supply, or that is restricted to a narrow range of nutrients (Lincoln et al. 1985).
 4. An insect that visits only a small variety of plant species (Lincoln et al. 1985).
- See monophage-oligophage-polyphage continuum.
syn. oligotroph (Lincoln et al. 1985)
- oopophage** *n.* An organism that feeds on eggs, *e.g.*, a snake species (Lincoln et al. 1985).
- ophiophage** *n.* An organism that feeds on snakes, *e.g.*, *Geococcyx californianus* (Greater Roadrunner) (Lincoln et al. 1985).
- paedophage** *n.* An organism that feeds on embryos, young of other species (*e.g.*, a chalcidoid-wasp species that parasitizes moth eggs) (Lincoln et al. 1985).
- panphytophage** *n.*
1. An organism that feeds on both less and more derived plant species, *e.g.*, *Oreamnos americanus* (Mountain Goat) (Lincoln et al. 1985).
 2. An organism that feeds on microflora and coarser detritus; distinguished from macrophytophage and microphytophage (Hoekstra et al. 1995, 248).
- pantophage** *n.* An organism that feeds on many kinds of organic material, *e.g.*, *Ursus americanus* (American Black Bear) (Lincoln et al. 1985).
syn. omnivore (Lincoln et al. 1985)
- phycophage** See -phage: algophage.
- phyllophage** *n.* An organism that feeds on leaves, *e.g.*, *Phascolarctos cinereus* (Koala) (Lincoln et al. 1985).
syn. folivore (Lincoln et al. 1985).
- phytophage** *n.* An organism that feeds on living and dead plant material, *e.g.*, a sowbug species (Isopoda) (Lincoln et al. 1985).
syn. herbivore, phytophile (Lincoln et al. 1985)
- plasmophage** *n.* An organism that feeds on body fluid (Lincoln et al. 1985).
- pleophage** See -phage: polyphage.
- pollenophage** *n.* An organism that feeds on pollen, *e.g.*, a bee species (Lincoln et al. 1985).
- polyphage** *n.* An organism that feeds on a wide variety of foods or food species (Lincoln et al. 1985). See monophage-oligophage-polyphage continuum.
syn. euryphage, pleophage, plurivore (Lincoln et al. 1985)
- rhizophage** See -vore: radicivore.
- rhypophage, rypophage** *n.* An organism that feeds on putrid matter or refuse, *e.g.*, a bot-fly species (Lincoln et al. 1985).
- saprophage** *n.* An organism that feeds on dead, or decaying, matter, *e.g.*, a fungus species (Lincoln et al. 1985).

- cf.* -phage: saprophytophage, zoosaprophage; -troph: saprotroph
- saprophytophage** *n.* An organism that feeds on decomposing plant material (*e.g.*, a springtail species, a hexapod) (Lincoln et al. 1985).
- sarcophage** See -vore: carnivore.
- scatophage** See -vore: merdivore.
- stenophage** *n.* An organism that uses, or is tolerant of, only a limited variety of foods or food species (Lincoln et al. 1985).
cf. -phage: euryphage.
- sycophage** *n.* An organism that feeds on figs, *e.g.*, a monkey species (Lincoln et al. 1985).
- tecnophage** *n.* An organism that feeds on its own eggs (Lincoln et al. 1985).
- telmophage** *n.* An organism that feeds on blood from a pool produced by tissue laceration, *e.g.*, a gnat (Lincoln et al. 1985).
syn. pool feeder (Lincoln et al. 1985)
- xylophage** See -vore: lignivore.
- zoosaprophage** *n.* An organism that feeds on decaying animal matter, *e.g.*, *Ursus maritimus* (Polar Bear) (Lincoln et al. 1985).
cf. -phage: saprophage, saprophytophage, zoosaprophage; -troph: saprotroph; -vore: zoosuccivore
- ♦ **-phagia** *comb.f.* The consumption or eating of (Michaelis 1963).
- adj.* -phagous
cf. cannibalism, -phage
[Greek *-phagia* < *phagein*, to eat]
- aphagia** *n.* An organism's lack of eating (Hinde 1970, 269; Dewsberry 1978, 213).
cf. -phagia: hyperphagia
Comment: In laboratory rats, aphagia and hyperphagia can be caused by lesions of different parts of their brains (Dewsberry 1978, 213).
- hyperphagia** *n.* An organism's overeating which can lead to obesity (Hinde 1970, 269; Dewsberry 1978, 213).
cf. -phagia: aphagia
- placentophagia** *n.* In almost all species of placental mammals: A mother's ingestion of her afterbirth (placenta, fluids, and membranes), usually occurring only at delivery of young (Tinklepaugh and Hartman 1930; M. B. Kristal 1980, pers. comm.).
syn. placentophagy (Lehrman in Young 1961)
Comment: This term is sometimes misspelled as placentaphagia.
- ♦ **phagostimulant** See chemical-releasing stimulus: phagostimulant.
- ♦ **phagotroph** See -troph: phagotroph.
- ♦ **-phagy** *comb.f.* The consumption or eating of (Michaelis 1963).
adj. -phagous.
cf. phage
[Greek *-phagia* < *phagein*, to eat]
- autocoprophagy** *n.* For example, in Rabbits and their kin: An animal's consumption of its own feces (Lincoln et al. 1985).
syn. refection (Lincoln et al. 1985)
- autophagy** *adj.* For example, in precocial bird species: A young individual's capability of locating and securing its own food (Lincoln et al. 1985).
- matriphagy** A young animal's consuming its mother (Theodore Evans in Anonymous 1995, November, 34, illustration).
Comments: Aristotle noted spider matriphagy. In *Doaea ergandros* (an Australian social-spider

species), the spiderlings suck nutrient-rich blood from their unresisting mother's leg joints, and eventually dissolve her insides, with their digestive juices, which they consume.

oophagy *n.* For example, in some social-insect species: An individual's eating a conspecific egg (Free et al. 1969 in Fisher and Pomeroy 1990, 801).

cf. cannibalism; egg cannibalism; -cide: infanticide

♦ **phalaenophile** See ¹-phile: phalaenophile.

♦ **phalanx** See ²group: phalanx.

♦ **phallic threat** See display: genital display: genital presentation.

♦ **phallocarp** *n.* A decorative penis sheath used by men in the highlands of New Guinea (Diamond 1996, December, 85).

Comments: Phallocarps are up to 2.3 ft long; are often bright red or yellow; are variously decorated at their tips with fur, leaves, or a forked ornament; and vary in erection angle (Diamond 1996, December, 85).

♦ **phaneric coloration** See coloration: phaneric coloration.

♦ **phaneric mimesis** See mimicry: mimesis: phaneric mimesis.

♦ **phanerogam** *n.*

1. A plant that produces seeds; a seed plant; opposed to a cryptogam (Lawrence 1951, 764).

syn. spermatophyte

Note: Phanerogams include Anthophyta, Conifero-phyta, Cycadophyta, Ginkgophyta, Gnethophyta, and Pteridopermophyta.

2. A member of the former division of plants Phanerogamia that includes plants with flowers and seeds — the angiosperms; distinguished from cryptogam (Michaelis 1963).

adj. phanerogamic, phanerogamous

[French *phanérogame*, ultimately from Greek *phaneros*, visible; *gamos*, marriage]

♦ **phanerogenic** See -genic: phanerogenic.

♦ **phaoplankton** See plankton: phaoplankton.

♦ **pharmacognosy** *n.* Human knowledge of drugs, especially their origins, structures, and chemical constitutions (Michaelis 1963).

[New Latin *pharmacognosia* < Greek *pharmakon*, drug + *gnōsis*, knowledge]

zoopharmacognosy *n.* One species' using a substance(s) produced by another as a defense against parasites (Gibbons 1992a, 921; Rodriguez and Wrangham 1992 in Clayton and Wolfe 1993, 60).

syn. self-medicating behavior, self-medication (Clayton and Wolfe 1993, 60)

cf. anting

Comment: An example of zoopharmacognosy is use of nicotine in its food against bacteria by *Manduca sexta* (Tobacco Hornworm). Possible other examples are use of juice of *Vernonia amygdalina* against protozoans and helminths by *Pan troglodytes* (Chimpanzee), use of a sponge against fungi by *Hexabranchus sanguineus* (Spanish Dancer Nudibranch), use of roots of *Ligusticum* spp. against viruses and bacteria by *Ursus arctos middendorffi* (Kodiak Bear), and use of ants against mites and lice (Clayton and Wolfe 1993).

♦ **pharmacology** See study of: pharmacology.

♦ **pharotaxis** See taxis: pharotaxis.

♦ **pharyngeal gill slits** See organ: pharyngeal gill slits.

♦ **phase** *n.*

1. A characteristic developmental, or behavioral, stage of an organism (Lincoln et al. 1985).

2. A basic unit in cytology (Lincoln et al. 1985).

diplophase *n.* The diploid state of an organism's life cycle (Lincoln et al. 1985).

syn. diplont, zygotophase (Lincoln et al. 1985)

escort phase *n.* For example, in *Odontota dorsalis* (Locust Leafminers, beetles): A long, passive phase in which a male remains with his mate while she feeds, rests, and moves about [coined by Kirkendall 1984, 909].

exponential-growth phase See phase: log-growth phase.

gamophase, haplophase See haplont.

lag-growth phase *n.* A period in which little, or no, population growth occurs and that precedes its exponential growth phase (Lincoln et al. 1985).

log-growth phase, logarithmic-growth phase

n. The period in which maximum population growth occurs, with its number of individuals increasing per unit time (Lincoln et al. 1985).

syn. exponential-growth phase (Lincoln et al. 1985)

cf. phase: lag-growth phase

nomadic phase *n.* In Army Ants: The period of a colony's activity cycle during which it forages more actively for food and moves frequently from one bivouac site to another; the queen does not lay eggs, and most brood individuals are larvae (Wilson 1975, 426, 590).

cf. phase: statary phase

sensitive phase See period: sensitive period.

socialization phase *n.* In some social animal species: The certain stage of an animal's development during which it has specific social contacts important for its socialization, *q.v.* (Immelmann and Beer 1989, 276).

statary phase *n.* A relatively quiescent phase in a social insect colony (Lincoln et al. 1985), *e.g.*, in some army-ant species, during a statary phase, a colony does not move from site to site, its queen lays eggs, and the bulk of its brood is eggs and pupae (Wilson 1975, 426, 596).

cf. phase: nomadic phase

stationary-growth phase *n.* A period of little, or no, population growth that follows an exponential growth period (Lincoln et al. 1985).

cf. lag-growth phase

zygophase See phase: diplophase.

♦ **phase sequence** *n.* A connection of a number of cell assemblies, *q.v.* (Immelmann and Beer 1989, 41).

♦ **phase specificity** *n.* An environmental influence's having an especially lasting effect on an animal's behavioral development (*e.g.*, socialization, imprinting) when this influence occurs during an animal's sensitive period, *q.v.* (Immelmann and Beer 1989, 218).

♦ **phatic** *adj.* Referring to communication that establishes and maintains contact between animals (Sebeok 1962 in Wilson 1975, 217).

cf. cognitive

♦ **phellium** See ²community: phellium.

♦ **phellophile** See ¹-phile: phellophile.

♦ **phen-, pheno** *comb. f.* Referring to something that is apparent; originally used in chemistry, now used in biology as well (Oxford English Dictionary 1972, entry from 1841; Brown, 1956).

[Greek *phaino*, appear, shine, derived from to come to light, cause to appear, show, Oxford English Dictionary 1972]

♦ **phene** See character: phene.

- ♦ **phenetic** *adj.* Referring to overall similarity of taxonomic groups based on many characters selected without regard to their evolutionary history, thus including character states arising from common ancestry, parallel evolution, and convergent evolution (Lincoln et al. 1985).
- ♦ **phenetic method** See method: phenetic method.
- ♦ **phenetic systematics, phenetics** See study of systematics: phenetic systematics.
- ♦ **phengophile** See -ophile: phengophile.
- ♦ **phengophobe** See -phobe: phengophobe.
- ♦ **phenocline** See cline: phenocline.
- ♦ **phenocopy** See -type, type: phenotype: phenocopy.
- ♦ **phenocritic** *n.* Referring to a phase during an organism's development at which two different genotypes begin to diverge morphologically and physiologically (Lincoln et al. 1985).
- ♦ **phenocritical period** See period: phenocritical period.
- ♦ **phenodeme** See deme: phenodeme.
- ♦ **phenodeviant** *n.*
1. A scarce aberrant individual that appears regularly in a population because of the segregation of certain unusual combinations of individually common genes; *e.g.*, a *Drosophila* with a pseudotumor or a missing or defective crossvein, a chicken with crooked toes, or a mammal with diabetes (Lerner 1954 and Milkman 1970 in Wilson 1975, 72, 591).
 2. An individual that deviates phenotypically from its population norm due to special gene combinations such as excessive homozygosity (Lincoln et al. 1985).
- ♦ **phenogenesis** See -genesis: phenogenesis.
- ♦ **phenogenetics** See -genetics: phenogenetics.
- ♦ **phenogram** See -gram: phenogram.
- ♦ **phenology** *n.* The timing of a recurring natural phenomenon (Immelmann and Beer 1989, 218), *e.g.*, the flight of adults of an insect species or the flowering of a plant species (Waldbauer and LaBerge 1985). See study of: phenology.
adj. phenological
Comment: When "phenology" is used in a term such as "flowering phenology," it means flowering time of a plant with regard to one, or more, ecological factors such as climate, drought, and photoperiod.
- ♦ **phenome** See -type, type: phenotype.
- ♦ **phenomenology** See study of: phenology.
- ♦ **phenomenon** *n. pl. phenomena*
1. A thing that appears, or is perceived or observed; an individual fact, occurrence, or change that is perceived by any of one's senses or mind: applied chiefly to a fact, or occurrence, whose cause, or explanation, is in question (Oxford English Dictionary 1972, entries from 1639).
 2. Philosophically, that which one's mind, or sense, directly notes; an immediate object of perception, distinguished from substance or a thing in itself; opposed to noumenon (Oxford English Dictionary 1972, entries from 1788).
[Late Latin *phaenomenon* < Greek *phainomenon* < present participle of *phainesthal*, to appear, passive of *phainein*, to show]
- epiphänomenon** *n.*
1. A causally inconsequential and incidental, or secondary, effect compared to a primary one; *e.g.*, mentality according to mechanistic materialists (Immelmann and Beer 1989, 89).

2. An overt concomitant of a physiological state or process; *e.g.*, urination, defecation, trembling, feather ruffling, or hair erection due to arousal, or activation, of an animal's autonomic nervous system in situations of danger or threat (Immelmann and Beer 1989, 89–90).

syn. *Epiphänomen* (Immelmann and Beer 1989, 89)
Comment: An epiphänomenon might evolve into a behavior with a particular function (Immelmann and Beer 1989, 89–90).

phenomenon of minimum population size of social species *n.* A conspecific animal group's not showing certain adaptive behavior, or a frequency of this behavior, until it reaches a certain size; *e.g.*, in blue-crowned hanging parrots, a group's emitting a full repertory of vocalizations; and in Weaverbirds, a male group's attracting mates (Buckley 1967 and Collias and Collias 1969 in Wilson 1975, 117).

retrorecognition phenomenon *n.* The process that involves (1) observing a fact of nature in the context of an existing explanatory framework; (2) not logically explaining this fact in the existing framework, but still unquestioning and ignoring, or accepting, this fact as a given property of the world, or simply postulating it to be true; and (3) advancing a new theory in which the observed fact now has a compelling and reasoned explanation and, at the same time, is retroactively recognized as an anomaly in the context of the old theory (Lightman and Gingerich 1992, 693–694).

cf. fact: fact-in-itself, reasoned fact

Comment: Examples of retrorecognition phenomena are the continental-fit problem and the adaptation-of-organism problem (Lightman and Gingerich 1992).

suitor phenomenon See behavior: mate guarding behavior: precopulatory mate guarding.

♦ **phenometry** See -metry: phenometry.

♦ **phenon, phenotype** See -type, type: phenotype, phenotype: phenon.

♦ **phenotype matching** *n.* For example, in a sweat-bee species: An individual's identifying a conspecific as kin, or nonkin, by comparing characteristics of its own, or those of kin which it experienced, with this conspecific's characteristics (Sherman and Holmes 1985; Immelmann and Beer 1989, 218).

cf. allele: recognition allele, template

♦ **phenotype switching** *n.* For example, in several microorganism species: A reversible, high-frequency phenotype change, "including oscillating expression (phase variation) or antigenic diversification of surface macromolecules" (Rosengarten and Wish 1989, 315).

♦ **phenotypic flexibility** *n.* An organism's capacity to function in a range of environments which may include plastic and stable responses (Thoday 1953 in Bradshaw 1965, 116).

See developmental homeostasis.

cf. plasticity

♦ **phenotypic plasticity, plasticity** See plasticity: phenotypic plasticity.

♦ **phenotypic polymorphism** See -morphism: polymorphism: phenotypic polymorphism.

♦ **phenotypic selection** See selection: phenotypic selection.

♦ **phenotypic sex determination** See sex determination: phenotypic sex determination.

♦ **phenotypic variance** See variance: phenotypic variance.

- ♦ **pheromone** See chemical-releasing stimulus: semiochemical: pheromone.
- ♦ **1-phile** *comb. f.* In organisms: Thriving in, or living in, a particular habitat (Lincoln et al. 1985).
n. -phile
adj. -philous
cf. anthropophily, -cole, -philo, -vore, -zoite [Greek *-philos*, loving < *phileein*, to love]
- acarophile** *n.* An organism that lives in association with mites (Lincoln et al. 1985).
- acidophile** *n.* An organism that lives in an acidic environment, *e.g.*, a bog plant *Sarracenia purpurea* (Northern Pitcherplant) (Lincoln et al. 1985).
- acrodendrophile** *n.* An organism that lives in tree tops, *e.g.*, thousands of species of tree-canopy organisms in the tropics (Lincoln et al. 1985).
cf. -cole: alsocole, arboricole, arbusticole, fruticole, hylacole, nemoricole, silvicole, thamnocoole; 1-phile: aiphylophile, dendrophile, halorgadophile, hydrophile, hydrolophile, orgadophile
- actophile** *n.* An organism that lives on rocky sea-shores, *e.g.*, some algal, bivalve, seastar, and urchin species (Lincoln et al. 1985).
cf. -cole: calcosaxicole, petrimadicole, petrocule, rupicole; 1-phile: calciphile, chasmophile, lithophile, petrochthophile, petrodophile, petrophile, phellophile
- aerohygrophile** *n.* An organism that lives in high atmospheric humidity, *e.g.*, a cloud-forest organism (Lincoln et al. 1985).
cf. -cole: deserticole, siccocole, xerocole; 1-phile: cheradophile, chersophile, helohyophile, hylodophile, hydrophile, lochnodophile, subxerophile, syrtidophile, telmatophile, xerohyophile, xerophile
- aerophile** *n.* An organism that lives in exposed, windy habitats, *e.g.*, *Bison bison* (American Bison) (Lincoln et al. 1985).
cf. -chore: aerochore
- agrophile** *n.* An organism that lives in cultivated soil, *e.g.*, *Solanum lycopersicum* (Tomato) (Lincoln et al. 1985).
- aigialophile** *n.* An organism that lives in beaches, *e.g.*, *Donax* spp. (Bean Clams) (Lincoln et al. 1985).
cf. -cole: aigicole, amanthicole, ammocole, amnicole, arenicole, argillicole, limicole, liticole, thinicole; 1-phile: amanthophile, ammochthophile, ammophile, anemophile, argillophile, cheradophile, enaulophile, pelochthophile, pelophile, phellophile, psamathophile, psammophile, spiladophile, syrtidophile, thinophile
- aiphylophile** *n.* An organism that lives in evergreen woodlands, *e.g.*, *Coptis groenlandica* (Gold-thread) (Lincoln et al. 1985).
cf. -cole: alsocole, arboricole, arbusticole, fruticole, hylacole, nemoricole, silvicole, thamnocoole; 1-phile: acrodendrophile, dendrophile, halorgadophile, hydrophile, hydrolophile, orgadophile
- aithalophile** *n.* An organism that lives in evergreen thickets, *e.g.*, *Polytrichum juniperinum* (Juniper Moss) (Lincoln et al. 1985).
- aletophile** *n.* An organism that lives on roadside verges or beside railway tracks, *e.g.*, *Trifolium pratense* (Red Clover) (Lincoln et al. 1985).
- alkaliphile** *n.* An organism that lives in alkaline habitats, *e.g.*, *Carex* sp. (sedge) (Lincoln et al. 1985).
- alsophile** *n.* An organism that lives in woody groves, *e.g.*, *Viola sororia* (Meadow Violet) (Lincoln et al. 1985).
cf. -cole: hylacole

- amathophile** *n.* An organism that lives in sandy plains, *e.g.*, *Opuntia fragilis* (Little Prickly-pear) (Lincoln et al. 1985).
syn. amanthophile
cf. -cole: aigicole, amanthicole, ammocole, amnicole, arenicole, argillicole, limicole, liticole, thinicole; 1-phile: aigialophile, ammochthophile, ammophile, anemophile, argillophile, cheradophile, enaulophile, pelochthophile, pelophile, phellophile, psamathophile, psammophile, spiladophile, syrtidophile, thinophile
- ammochthophile** *n.* An organism that lives on, or in, sandy banks, *e.g.*, *Salix exigua* (Sandbar Willow) (Lincoln et al. 1985).
cf. -cole: aigicole, amanthicole, ammocole, amnicole, arenicole, argillicole, limicole, liticole, thinicole; 1-phile: aigialophile, amathophile, ammophile, anemophile, argillophile, cheradophile, enaulophile, pelochthophile, pelophile, phellophile, psamathophile, psammophile, spiladophile, syrtidophile, thinophile
- ammophile** *n.* An organism that lives on, or in sand, or in sandy habitats; *e.g.*, *Annmophila breviligulata* (American Beach Grass) (Lincoln et al. 1985).
cf. -cole: aigicole, amanthicole, ammocole, amnicole, arenicole, argillicole, limicole, liticole, thinicole; 1-phile: aigialophile, amathophile, ammochthophile, anemophile, argillophile, cheradophile, enaulophile, pelochthophile, pelophile, phellophile, psamathophile, psammophile, spiladophile, syrtidophile, thinophile
- ancophile** *n.* An organism that lives in canyon forests, *e.g.*, *Platanus occidentalis* (Eastern Sycamore) (Lincoln et al. 1985).
- androphile, anthropophile** *n.* An organism that lives in proximity to humans, *e.g.*, *Blatella germanica* (German Cockroach) (Lincoln et al. 1985).
- anemophile** *n.*
1. An organism that lives in sand draws, *e.g.*, *Sphex ichneumoneus* (Great Golden Digger Wasp) (Lincoln et al. 1985).
 2. An organism that is dispersed by wind, *e.g.*, *Epilobium angustifolium* (Fireweed) (Lincoln et al. 1985).
- adj.* anemochorous
cf. -cole: aigicole, amanthicole, ammocole, amnicole, arenicole, argillicole, limicole, liticole, thinicole; -chore: anemochore; 1-phile: aigialophile, amathophile, ammochthophile, ammophile, argillophile, cheradophile, enaulophile, pelochthophile, pelophile, phellophile, psamathophile, psammophile, spiladophile, syrtidophile, thinophile
- anheliophile** *n.* An organism that lives in diffuse sunlight, *e.g.*, *Adiantum pedatum* (Northern Maidenhair Fern) (Lincoln et al. 1985).
cf. -cole: lucicole, umbraticole; 1-phile: heliophile, helioxeriophile, lygophile, phengophile, skotophile, sciophile
- anthophile** *n.* An organism that is attracted to, or feeds, on flowers, *e.g.*, many butterfly species (Lincoln et al. 1985).
cf. pollinator
- anthropophile** An insect that bites a Human, sucks his blood, or both (inferred from Lincoln et al. 1985).
- argillophile** *n.* An organism that lives in clay or mud, *e.g.*, *Zappa confluentus* (Mudskipper Goby) (Lincoln et al. 1985).

cf. calcifuge; -cole: aigicole, amanthicole, ammoncule, amnicole, arenicole, argillicole, calcicole, gelicole, geocole, halicole, humicole, limicole, lericole, pergelicole, perhalicole, silicole, terricole, thinicole; ¹-phile: aigialophile, amathophile, ammochthophile, ammophile, anemophile, cheradophile, enaulophile, geophile, gypsophile, nitrophile, pelochthophile, pelophile, psammatophile, psammophile, spiladophile, syrtidophile, thinophile

barophile *n.* An organism that lives under high hydrostatic, or atmospheric, pressure, *e.g.*, a deep-sea fish (Lincoln et al. 1985).

basophile *n.* An organism that lives in alkaline habitats, *e.g.*, *Gypsophila paniculata* (Common Baby's-breath) (Lincoln et al. 1985).

bathophile, bathyphile *n.* An organism that lives in lowlands or in deep sea, *e.g.*, a mangrove species (fig. 25) (Lincoln et al. 1985).

cf. ¹-phile: pontophile

biophile *n.* An organism that lives on other living organisms, *e.g.*, the epiphyte *Tillandsia usenoides* (Spanish-moss) (fig. 14) (Lincoln et al. 1985).

See ³-phile: biophile.

cf. -philia: biophilia

bryophile *n.* An organism that lives in habitats rich in mosses and liverworts, *e.g.*, a mite species (Lincoln et al. 1985).

cf. -cole: bryocole, muscicole, sphagnicole; ¹-phile: sphagnophile

calciphile *n.*

1. An organism that lives in environments rich in calcium salts, *e.g.*, *Gypsophila paniculata* (Common Baby's-breath) (Lincoln et al. 1985).

2. An animal that bores into calcareous shells (Lincoln et al. 1985).

cf. - calcosaxicole, petrimadicole, petrocole, rupicole; ¹-phile: actophile, chasmophile, lithophile, petrochthophile, petrodophile, petrophile, phellophile

carboxyphile *n.* An organism that lives in CO₂-rich habitats, *e.g.*, an alga species (Lincoln et al. 1985).

chalicophile *n.* An organism that lives on gravel slides; *e.g.*, a rock-crawler, an insect (Lincoln et al. 1985).

chasmophile *n.* An organism that lives in rock crevices and fissures, *e.g.*, *Asplenium ruta-muraria* (Wall-rue, a fern) (Lincoln et al. 1985).

cf. - calcosaxicole, petrimadicole, petrocole, rupicole; ¹-phile: actophile, calciphile, lithophile, petrochthophile, petrodophile, petrophile, phellophile

cheiropterophile See ²-phile: chiropterophile.

cheradophile *n.* An organism that lives on wet sandbars; *e.g.*, a tiger-beetle species (Lincoln et al. 1985).

cf. -cole: aigicole, amanthicole, ammocole, amnicole, arenicole, argillicole, limicole, lericole, thinicole; ¹-phile: aigialophile, amathophile, ammochthophile, ammophile, anemophile, argillophile, chersophile, enaulophile, pelochthophile, pelophile, phellophile, psammatophile, psammophile, spiladophile, syrtidophile, thinophile

chersophile *n.* An organism that lives in dry wasteland habitats, *e.g.*, *Artemisia tridentata* (Common Sagebrush) (Lincoln et al. 1985).

cf. -cole: deserticole, siccocole, xerocole; ¹-phile: aerohygrophile, cheradophile, helohylophile, hylodophile, hydrophile, lochnodophile, subxerophile, syrtidophile, telmatophile, xerohylophile, xerophile

chianophile *n.* An organism that lives under prolonged snow cover, *e.g.*, *Cladonia rangiferina* (Reindeer-moss) (Lincoln et al. 1985).

chimonophile *n.*

1. An organism that grows during the (cold) winter, *e.g.*, *Stellaria media* (Common Chickweed, a winter annual plant) (Lincoln et al. 1985).

2. A plant that shows maximum development during the winter (Lincoln et al. 1985).

chionophile *n.* An organism that lives in snow-covered habitats, *e.g.*, *Picea rubra* (Red Spruce) (Lincoln et al. 1985).

chledophile, chomophile *n.* An organism that lives in wasteland habitats and rubbish heaps, *e.g.*, *Verbascum thapsis* (Common Mullein, fig. 11, 12) (Lincoln et al. 1985).

cf. ruderal

chrymosympophile *n.* A lepidopterous larva that benefits from interactions with ants (Lincoln et al. 1985).

cf. ¹-phile: myrmecophile

circumneutrophile *n.* An organism that lives in conditions of about neutral pH (Lincoln et al. 1985).

coniophile *n.* An organism that lives on substrates enriched by dust containing excreta (Lincoln et al. 1985).

conophorophile *n.* An organism that lives in coniferous forests, *e.g.*, *Neodiprion* spp. (Pine Sawflies) (Lincoln et al. 1985).

coprophile *n.* An organism that lives on dung or feces, *e.g.*, *Nicrophorus* sp. (burying beetle) (Lincoln et al. 1985).

cf. -zoite: coprozoite

coryphile, coryphophile *n.* An organism that lives in alpine meadows, *e.g.*, *Erebia* spp. (Alpines, butterflies) (Lincoln et al. 1985).

cf. -cole: caespiticole, leimocole, nomocole, poocole, pratinicole, psicole; ¹-phile: helolochmophile, nomophile, poophile, psilophile, telmatophile

cremnophile *n.* An organism that lives on cliffs, *e.g.*, *Saxifraga* sp. (saxifrage) (Lincoln et al. 1985).

crenophile *n.* An organism that lives in, or near, a spring, *e.g.*, *Nasturtium officinale* (Watercress) (Lincoln et al. 1985).

cryophile *n.* An organism that lives in a cold environment, *e.g.*, a boreal-plant species and an ant species (Wheeler 1930, 11; Lincoln et al. 1985).

syn. frigophile

cf. -tropism: thermotropism: negative thermotropism

dendrophile *n.*

1. An organism that lives in trees, (*e.g.*, *Alouatta* spp. (Howler Monkeys) (Lincoln et al. 1985).

syn. dendrocole

2. An organism that lives in orchards, *e.g.*, *Apis mellifera* (Western Honey Bee) (Lincoln et al. 1985).

cf. -cole: alsocole, arboricole, arbusticole, fruticole, hylacole, nemoricole, silvicole, thamnocoole; ¹-phile: acrodendrophile, aiphylophile, halorgadophile, hydrophile, hydrolophile, orgadophile

drimophile *n.* An organism that lives in salt basins or alkaline plains, *e.g.*, *Nomia melanderi* (Alkali Bee) (Lincoln et al. 1985).

enualophile *n.* An organism that lives in sand dunes, *e.g.*, *Ammophila breviligulata* (American Beach Grass) (Lincoln et al. 1985).

cf. -cole: aigicole, amanthicole, ammocole, amnicole, arenicole, argillicole, limicole, lericole, thinicole; ¹-phile: aigialophile, amathophile, ammochthophile, ammophile, anemophile, argillophilic, cheradophile, pelochthophile, pelophile, phellophilic, psamathophile, psammophile, spiladophile, syrtidophile, thinophile

eremophile *n.* An organism that lives in deserts, *e.g.*, *Heloderma suspectum* (Gila-monster) (Lincoln et al. 1985).

euhydrophile *n.* An organism that lives submerged in fresh water, *e.g.*, *Ceratophyllum* sp. (hornwort) species (Lincoln et al. 1985).

europophile *n.* An organism that lives in, or on, leaf mold, *e.g.*, a millepede species (Lincoln et al. 1985).

eutroglophile See ¹-phile: troglophile.

frigophile See ¹-phile: cryophile.

geophile *n.* An organism that lives in soil (*e.g.*, a springtail species, a hexapod) (Lincoln et al. 1985).

cf. calcifuge; -cole: aigicole, amanthicole, ammocole, amnicole, arenicole, argillicole, calcicole, gelicole, geocole, halicole, humicole, limicole, lericole, pergelicole, perhalicole, silicole, terricole, thinicole; ¹-phile: aigialophile, amathophile, ammochthophile, ammophile, anemophile, argillophilic, cheradophile, enauophile, geophile, gypsophile, nitrophile, pelochthophile, pelophile, psamathophile, psammophile, spiladophile, syrtidophile, thinophile

gypsophile *n.* An organism that lives on chalk, or gypsum-rich, soil, *e.g.*, *Gypsophila* sp. (Baby's-breath, a plant) (Lincoln et al. 1985).

cf. calcifuge; -cole: aigicole, amanthicole, ammocole, amnicole, arenicole, argillicole, calcicole, gelicole, geocole, halicole, humicole, limicole, lericole, pergelicole, perhalicole, silicole, terricole, thinicole; ¹-phile: aigialophile, amathophile, ammochthophile, ammophile, anemophile, argillophilic, cheradophile, enauophile, geophile, gypsophile, nitrophile, pelochthophile, pelophile, psamathophile, psammophile

halophile *n.* An organism that lives in saline habitats, *e.g.*, a starfish species (Lincoln et al. 1985).

heliphile *n.* An organism that lives under high light intensity, *e.g.*, *Euphorbia* spp. (Euphorbs) (Lincoln et al. 1985).

cf. -cole: lucicole, umbraticole; ¹-phile: anheliphile, helioxerophile, lygophile, phenophile, skotophile, sciofile

helioxerophile *n.* An organism that lives under high light intensity and drought, *e.g.*, *Yucca brevifolia* (Joshua-tree) (Lincoln et al. 1985).

cf. -cole: lucicole, umbraticole; ¹-phile: anheliphile, heliophile, lygophile, phenophile, skotophile, sciofile

helohyophile *n.* An organism that lives in wet, or swampy, forests, *e.g.*, *Taxodium distichum* (Bald-cypress, fig. 24) (Lincoln et al. 1985).

cf. -cole: deserticole, siccocole, xerocole; ¹-phile: aerohyophile, cheradophile, chersophile, hylodophile, hydrophile, lochnodophile, subxerophile, syrtidophile, telmatophile, xerohyophile, xerophile

helolochmophile *n.* An organism that lives in meadow thickets, *e.g.*, *Prunus americana* (American Plum) (Lincoln et al. 1985).

cf. -cole: caespitcole, leimocole, nomocole, poocole, pratinicole, psicole; ¹-phile: coryphile, nomophile, poophile, psilophile, telmatophile

helophile *n.* An organism that lives in marshes, *e.g.*, *Typha angustifolia* (Narrow-leaved Cattail) (Lincoln et al. 1985).

helorgadophile *n.* An organism that lives in swampy woodlands; *e.g.*, *Nyssa sylvatica* (Black Tupelo) (Lincoln et al. 1985).

cf. -cole: alsocole, arboricole, arbusticole, fruticole, hylacole, nemoricole, silvicole, thamnocoole; ¹-phile: acrodendrophile, aiphylophile, dendrophile, hydrophile, hylodophile, orgadophile

hemerophile *n.* An organism that lives in Human-influenced, or cultivated, habitats, *e.g.*, *Taraxacum officinale* (Common Dandelion) (Lincoln et al. 1985).

hemichimonophile *n.*

1. An organism that lives under cold conditions, *e.g.*, *Ursus maritimus* (Polar Bear) (Lincoln et al. 1985).

2. A plant species that thrives under cold conditions and begins growth even during frost (Lincoln et al. 1985).

histophile *n.* An organism that inhabits living host tissue, *e.g.*, a filarial-worm species (given as an adjective in Lincoln et al. 1985).

syn. parasite (Lincoln et al. 1985)

hydrophile *n.* An organism that lives in wet, or aquatic, habitats, *e.g.*, mayfly species (Lincoln et al. 1985).

cf. -cole: alsocole, arboricole, arbusticole, fruticole, hylacole, nemoricole, silvicole, thamnocoole; ¹-phile: acrodendrophile, aiphylophile, dendrophile, haloradophile, hylodophile, orgadophile

hydrotribophile *n.* An organism that lives in badlands, *e.g.*, a sunflower species (Lincoln et al. 1985).

hygrophile *n.* An organism that thrives in moist habitats, *e.g.*, an earthworm species (Lincoln et al. 1985).

hydrolophile *n.* An organism that lives in dry, open woodlands, *e.g.*, *Rhus aromatica* (Fragrant Sumac) (Lincoln et al. 1985).

cf. -cole: alsocole, arboricole, arbusticole, fruticole, hylacole, nemoricole, silvicole, thamnocoole; ¹-phile: acrodendrophile, aiphylophile, dendrophile, haloradophile, orgadophile

cf. ¹-phile: hydrophile

hylophile *n.*

1. An organism that lives in forests, *e.g.*, *Strix occidentalis caurina* (Northern Spotted Owl) (Lincoln et al. 1985).

2. An organism that lives, or thrives, in forests (Lincoln et al. 1985).

keratinophile *n.* An organism that lives on horny (keratin-rich) substrates, *e.g.*, *Trichophyton rubrum* (a fungus that infects human nails) (Lincoln et al. 1985).

kinetophile See ²species: kinetophile.

laurophile *n.* An organism that lives in sewers and drains, *e.g.*, *Rattus norvegicus* (Norway Rat) (Lincoln et al. 1985).

lichenophile *n.*

1. An organism that lives on lichens, *e.g.*, a bagworm species (Lincoln et al. 1985).

2. An organism that thrives on lichens or has an affinity for lichen-rich habitats (Lincoln et al. 1985).

cf. -cole: lichenicole

lignophile *n.* An organism that lives on, or in, wood, *e.g.*, *Ganoderma applanatum* (Artist's Mushroom) (Lincoln et al. 1985).

cf. -cole: lignicole; ¹-phile: proxylophile, xylophile

limnodophile *n.* An organism that lives in salt marshes, *e.g.*, *Spartina alterniflora* (Saltmarsh Cordgrass) (Lincoln et al. 1985).
cf. -cole: paludicole, pontohalicole, telmicole; ¹-phile: helophile

limnophile *n.* An organism that lives in lakes or ponds, *e.g.*, *Rana catesbeiana* (American Bull Frog) (Lincoln et al. 1985).
cf. -cole: limnicole

lithophile *n.* An organism that lives in rocky, or stony, habitats, *e.g.*, *Lithobius forficatus* (Brown Centipede) (Lincoln et al. 1985).
cf. -cole: calcosaxicole, petrimadicole, petrocole, rupicole; ¹-phile: actophile, calciphile, chasmophile, petrochthophile, petrodophile, petrophile, phellophile

lochmodophile *n.* An organism that lives in dry thickets, *e.g.*, *Machura pomifera* (Osage-orange) (Lincoln et al. 1985).
cf. -cole: deserticole, siccocole, xerocole; ¹-phile: aerohygrophile, cheradophile, chersophile, helohyophile, hydrolophile, hydrophile, subxerophile, syrtidophile, telmatophile, xerohyophile, xerophile

lochmophile *n.* An organism that lives in thickets, *e.g.*, *Smilax* spp. (Greenbriers) (Lincoln et al. 1985).

lophophile *n.* An organism that lives on hilltops, *e.g.*, *Quercus alba* (White Oak) (Lincoln et al. 1985).

luciphile, photophile *n.* An organism that lives in open, well-lit habitats, *e.g.*, *Euphorbia* spp. (Euphorbs) (Lincoln et al. 1985).
cf. lucifugous, lucipetal

lygophile *n.* An organism that lives in dark, or shaded, habitats, *e.g.*, *Epipactis helleborine* (Broad-leaved Helleborine) (Lincoln et al. 1985).
cf. -cole: lucicole, umbraticole; ¹-phile: anheliphile, heliophile, helioxeriphile, phengophile, skotophile, sciophile

macrothermophile See ¹-phile: thermophile: macrothermophile.

melangeophile *n.* An organism that lives in, or on, black loam, *e.g.*, some earthworm species (Lincoln et al. 1985).

mellitophile *n.* An organism that spends part of its life cycle in association with bees, *e.g.*, *Galleria mellonella* (Greater Wax Moth) (Lincoln et al. 1985). See ²-phile (pollinated by): mellitophile.

mesochthonophile *n.* An organism that lives in midlands (Lincoln et al. 1985).

mesophile, noterophile *n.* An organism that lives under intermediate, or moderate, environmental conditions (Lincoln et al. 1985).
Comment: “Mesophile” is sometimes restricted to an organism that lives under moderate moisture or temperature (Lincoln et al. 1985).

mesothermophile See ¹-phile: thermophile: mesothermophile.

microaerophile *n.* An organism that lives in a free oxygen concentration significantly less than that of the atmosphere (Lincoln et al. 1985).

microphile, microphil *n.* An organism that lives within a narrow temperature range, *e.g.*, *Guarianthe skinneri* (Guaria Morada, an orchid) (Lincoln et al. 1985).

microthermophile See ¹-phile: thermophile: microthermophile.

myrmecophile *n.* “An organism that must spend at least part of its life cycle with ant colonies” (*e.g.*, some species of aphids, beetles, butterflies, and silversharp) (Wilson 1975, 356, 589).

See also ²-phile (pollinated by): myrmecophile below.
cf. ¹-phile: chrysosympophile

namaphile *n.* An organism that lives in brooks and streams, *e.g.*, a caddisfly species (Lincoln et al. 1985).

necrophile, necrophage, saprophyte *n.* An organism that eats dead organic matter (Lincoln et al. 1985).

nitrophile *n.* An organism that lives in soil rich in nitrogenous compounds (Lincoln et al. 1985).
cf. calcifuge; -cole: aigicole, amanthicole, ammonicole, amnicole, arenicole, argillicole, calcicole, gelicole, geocole, halicole, humicole, limicole, liticole, pergelicole, perhalicole, silicole, terricole, thinicole; ¹-phile: aigialophile, amathophile, ammochthophile, ammophile, anemophile, argillophile, cheradophile, enaulophile, geophile, gypsophile, nitrophile, pe洛chthophile, pelophile, psamathophile, psammoophile, spiladophile, syridophile, thinophile

nomophile *n.* An organism that lives in pastures, *e.g.*, *Phleum pratense* (Timothy Grass) (Lincoln et al. 1985).
cf. - caespiticolle, leimocole, nomocole, poocole, pratinicole, psicole; ¹-phile: coryphile, helolochmophile, poophile, psilophile, telmatophile

noterophile See ¹-phile: mesophile.

oceanophile *n.* An organism that lives in oceans, *e.g.*, *Delphinapterus leucas* (Beluga Whale) (Lincoln et al. 1985).

ochthophile *n.* An organism that thrives on banks (Lincoln et al. 1985).

oligonitrophile *n.* An organism that lives in low-nitrogen habitats, *e.g.*, *Drosera rotundifolia* (Round-leaved Sundew) (Lincoln et al. 1985).

ombrophile, ombrophil, pluviophile *n.* An organism that lives in habitats with abundant rain, *e.g.*, *Sequoia sempervirens* (Giant Sequoia) (Lincoln et al. 1985).

opophile *n.* An organism that lives on, or feeds on, sap, *e.g.*, a sap-beetle species (Nitidulidae) (Lincoln et al. 1985).
cf. -vore: phytosuccivore

orgadophile *n.* An organism that lives in open woodlands, *e.g.*, *Rubus* sp. (blackberry) (Lincoln et al. 1985).
cf. -cole: alsocole, arboricole, arbusticole, fruticole, hylacole, nemoricole, silvicolle, thamnocolle; ¹-phile: acrodendrophile, aiphyllophile, dendrophile, haloragadophile, hydrolophile

ornithocorophile *n.* An organism that lives in habitats rich in bird droppings (Lincoln et al. 1985).

orophile *n.* An organism that lives in subalpine, or mountainous, regions, *e.g.*, *Picea pungens* (Colorado Blue Spruce) (Lincoln et al. 1985).

osmophile *n.* An organism that lives in a medium of high osmotic concentration, *e.g.*, *Artemia* sp. (brine-shrimp) (Lincoln et al. 1985).

oxygeophile *n.* An organism that lives in humus-rich habitats, *e.g.*, *Trillium erectum* (Wetdog Trillium) (Lincoln et al. 1985).

oxylophile *n.* An organism that lives in humus, or a humus-rich, habitat, *e.g.*, *Symplocarpus foetidus* (Skunk Cabbage) (Lincoln et al. 1985).
adj. oxylophilous, oxyphilus, oxylyphilus

oxyphile *n.* An organism that lives in humus or humus-marsh habitats, *e.g.*, *Acorus calamus* (Sweetflag) (Lincoln et al. 1985).

paedophile See ¹-phile: pedophile.

pagophile *n.* An organism that lives in foothills; *e.g.*, a sagebrush species (Lincoln et al. 1985).

pediophile *n.* An organism that lives in uplands, *e.g.*, *Pinus ponderosa* (Ponderosa Pine) (Lincoln et al. 1985).

pedophile *Brit. paedophile* *n.* A person who engages in pedophilia, *q.v.* (Hinsie and Campbell 1976, 552; Leary 1998, A11).

pelagophile *n.* An organism that lives in open ocean surface waters, *e.g.*, *Physalia physalis* (Portuguese man-of-war) (Lincoln et al. 1985).

pelochthophile *n.* An organism that lives on mud banks, *e.g.*, a pygmy-mole-cricket species (Lincoln et al. 1985).

cf. -cole: aigicole, amanthicole, ammocole, amnicole, arenicole, argillicole, limicole, lenticole, thinicole; ¹-phile: aigialophile, amathophile, ammochthophile, ammophile, anemophile, argillophile, cheradophile, enaulophile, pelophile, phellophile, psammatophile, psammophile, spiladophile, syrtidophile, thinophile

pelophile *n.* An organism that lives in clay-rich habitats, *e.g.*, *Oenothera argillicola* (Shale-barren Evening Primrose) (Lincoln et al. 1985).

petrochthophile *n.* An organism that lives on rock banks, *e.g.*, *Sedum* sp. (stonecrop) (Lincoln et al. 1985).

cf. -cole: calcosaxicole, petrimadicole, petrocule, rupicole; ¹-phile: actophile, calciphile, chasmophile, lithophile, petrochthophile, petrophile, phellophile

petrodophile *n.* An organism that lives in boulder fields (Lincoln et al. 1985).

cf. -cole: calcosaxicole, petrimadicole, petrocule, rupicole; ¹-phile: actophile, calciphile, chasmophile, lithophile, petrochthophile, petrophile, phellophile

petrophile *n.* An organism that lives on rocks or in rocky habitats, *e.g.*, a lichen species (Lincoln et al. 1985).

cf. -cole: calcosaxicole, petrimadicole, petrocule, rupicole; ¹-phile: actophile, calciphile, chasmophile, lithophile, petrochthophile, petrophile, phellophile

phelophile *n.* An organism that lives on rocky, or stony, ground, *e.g.*, *Argyroxiphium sandwicense* (Silversword) (Lincoln et al. 1985).

cf. -cole: aigicole, amanthicole, ammocole, amnicole, arenicole, argillicole, limicole, lenticole, thinicole; ¹-phile: aigialophile, amathophile, ammochthophile, ammophile, anemophile, argillophile, cheradophile, enaulophile, pelochthophile, pelophile, phellophile, psammatophile, psammophile, spiladophile, syrtidophile, thinophile

phenophile *n.* An organism that lives in light, *e.g.*, a green-plant species (Lincoln et al. 1985).

cf. -cole: lucicole, umbraticole; ¹-phile: anheliothophile, heliophile, helioxerophile, lygophile, skotophile, sciophile

photophile See ¹-phile: luciphile.

phretophile *n.* An organism that lives in water tanks, *e.g.*, a mosquito species (Lincoln et al. 1985).

phycophile *n.* An organism that lives on algae or in algae-rich habitats, *e.g.*, a periwinkle-snail species (Lincoln et al. 1985).

phytophile See -cole: planticole; -phage: phytophage.

planktophile *n.* An organism that lives on plankton (Lincoln et al. 1985).

cf. -troph-: planktotroph

pluviophile See ¹-phile: ombrophile.

poleophile *n.* An organism that lives in urban habitats, *e.g.*, *Periplaneta americana* (American Cockroach) (Lincoln et al. 1985).

polyhalophile *n.* An organism that lives in a wide range of salinities, *e.g.*, *Salmo* sp. (salmon) (Lincoln et al. 1985).

pontophile *n.* An organism that lives in the deep sea, *e.g.*, a deep-sea fish (Lincoln et al. 1985).

cf. ¹-phile: bathophile

poophile *n.* An organism that lives in meadows, *e.g.*, *Thalictrum dioicum* (Early meadow-rue) (Lincoln et al. 1985).

cf. -cole: caespiticole, leimocole, nomocole, poocole, pratinicole, psicole; ¹-phile: coryphile, helolochmophile, nomophile, psilophile, telmatophile

potamophile *n.* An organism that lives in rivers, *e.g.*, *Hippopotamus amphibius* (Hippopotami) (Lincoln et al. 1985).

psammatophile *n.* An organism that lives in the strandline of a sandy seashores, *e.g.*, *Ocypode quadrata* (Atlantic Ghost Crab) (Lincoln et al. 1985).

cf. -cole: aigicole, amanthicole, ammocole, amnicole, arenicole, argillicole, limicole, lenticole, thinicole; ¹-phile: aigialophile, amathophile, ammochthophile, ammophile, anemophile, argillophile, cheradophile, enaulophile, pelochthophile, pelophile, phellophile, psammophile, spiladophile, syrtidophile, thinophile

psammophile *n.* An organism that lives in sandy habits, *e.g.*, *Psammobia vespertina* (Sunset Shell) (Lincoln et al. 1985).

cf. -cole: aigicole, amanthicole, ammocole, amnicole, arenicole, argillicole, limicole, lenticole, thinicole; ¹-phile: aigialophile, amathophile, ammochthophile, ammophile, anemophile, argillophile, cheradophile, enaulophile, pelochthophile, pelophile, phellophile, psammatophile, spiladophile, syrtidophile, thinophile.

pseudosympophile See symbiont: sympophile: pseudosympophile.

pseudoxerophile *n.* An organism that lives in subxeric habitats, *e.g.*, a plant species that exhibits less moisture sensitivity than a true xerophyte (Lincoln et al. 1985).

psilophile *n.* An organism that lives in prairies or savannas, *e.g.*, *Sturnella neglecta* (Western Meadowlark) (Lincoln et al. 1985).

cf. -cole: caespiticole, leimocole, nomocole, poocole, pratinicole, psicole; ¹-phile: coryphile, helolochmophile, nomophile, poophile, telmatophile

psychrophile, psychrophil *n.* An organism that lives at low temperatures, *e.g.*, a species of mountain springtail, a hexapod (Lincoln et al. 1985).

ptenophyllophile *n.* An organism that lives in deciduous forests, *e.g.*, *Cardinalis cardinalis* (Northern Cardinal) (Lincoln et al. 1985).

ptenothalophile *n.* An organism that lives in deciduous thickets, *e.g.*, *Vitis* sp. (grape) (Lincoln et al. 1985).

pyrophile *n.* An organism that lives in ground that has recently been scorched by fire, *e.g.*, *Epilobium angustifolium* (Fireweed) (Lincoln et al. 1985).

pyroxylophile *n.* An organism that lives on burnt wood (Lincoln et al. 1985).

cf. -cole: lignicole; ¹-phile: lignophile, xylophile

rheophile *n.* An organism that lives in running water, *e.g.*, a black-fly species (Lincoln et al. 1985).

cf. rheophobe

- rhizophile** *n.* An organism that grows on roots (Lincoln et al. 1985).
- rhoophile** *n.* An organism that lives in creeks, *e.g.*, *Ondatra zibethicus* (Muskrat) (Lincoln et al. 1985).
- rhyacophile** *n.* An organism that lives in torrents (Lincoln et al. 1985).
- rugophile** *n.* An organism that lives on rough surfaces or surface depressions, *e.g.*, a lichen species (Lincoln et al. 1985).
- sapromyophile** *n.* A fly species that feeds on, oviposits on, or does both on carrion or excrement (Roy and Raguso 1997, 424).
- saprofile** *n.* An organism that lives in humus-rich substrates or on decaying organic matter, *e.g.*, *Mutinus caninus* (Dog Stinkhorn, a fungus) (Lincoln et al. 1985).
cf. scavenger; -zoite: saprozoite
- sathrophile** *n.* An organism that lives on humus or on decaying organic matter (*e.g.*, a puffball species, fungus) (Lincoln et al. 1985).
cf. scavenger; -zoite: saprozoite
- saurophile** See -chore: saurochore.
- sciophile, heliophage, skiophile, umbrophile** *n.* An organism that lives in shaded places, or in habitats of low light intensity, *e.g.*, a moss species (Lincoln et al. 1985).
cf. -cole: lucicole, umbraticole; 1-phile: anheliophile, heliophile, helioxerophile, lygophile, phengophile, skotophile
- scotophile** See -phile: skotophile.
- serpentiphile** *n.* An organism that lives in a serpentine-rich habitat (*e.g.*, certain pine and oak species) (Lincoln et al. 1985).
- siderophile** *n.* An organism that lives in an iron-rich medium (Lincoln et al. 1985).
- skiophile** See -cole: umbraticole, 1-phile: sciophile.
- skotophile** *n.* An organism that lives in darkness, or in darkened places, *e.g.*, a soil-mite species (Lincoln et al. 1985).
cf. -cole: lucicole, umbraticole; 1-phile: anheliophile, heliophile, helioxerophile, lygophile, phengophile, sciophile
- spermophile** *n.* An organism that feeds on seeds, *e.g.*, a weevil species (beetle) or *Spinus tristis* (American Goldfinch) (Lincoln et al. 1985).
- sphagnophile** *n.* An organism that lives on sphagnum moss or in sphagnum-rich habitats, *e.g.*, *Vaccinium* sp. (blueberry) (Lincoln et al. 1985).
cf. -cole: bryocole, muscicole, sphagnicole; 1-phile: bryophile
- spiladophile, stygophile** *n.* An organism that lives on clay or in clay-rich habitats (Lincoln et al. 1985).
cf. -cole: aigicole, amanthicole, ammocole, amnicole, arenicole, argillicole, limicole, luticole, thinicole; 1-phile: aigialophile, amathophile, ammochthophile, ammophile, anemophile, argillophile, cheradophile, enaulophile, pelochthophile, pelophile, phellophile, psamathophile, psammophile, spiladophile, thinophile
- stasophile** *n.* An organism that lives in stagnant water, *e.g.*, an alga species (Lincoln et al. 1985).
- stenothermophile** See 1-phile: thermophile: stenothermophile.
- sterrhophile** *n.* An organism that lives in moorland, *e.g.*, *Erica* sp. (heather) (Lincoln et al. 1985).
- stygophile** See 1-phile: spiladophile.

- subhydrophile** *n.* An organism that lives in habitats that experience periodic fresh-water inundations, *e.g.*, a crayfish species (Lincoln et al. 1985).
- substratohygrophile** *n.* An organism that lives on moist substrates, *e.g.*, a liverwort species (Lincoln et al. 1985).
- subxerophile** *n.* An organism that lives in moderately dry situations, *e.g.*, *Sympyotrichum lowrieanum* (Lowrie's Aster) (Lincoln et al. 1985).
cf. -cole: deserticole, siccocole, xerocole; 1-phile: aerohygrophile, cheradophile, chersophile, helohygrophile, hydrolophile, hydrophile, lochnodophile, syrtidophile, telmatophile, xeroxylophile, xerophile
- sympophile** See symbiont: sympophile.
- syridophile** *n.* An organism that lives on dry sand bars, *e.g.*, a wolf-spider species (Lincoln et al. 1985).
cf. -cole: aigicole, amanthicole, ammocole, amnicole, arenicole, argillicole, limicole, luticole, thinicole; 1-phile: aigialophile, amathophile, ammochthophile, ammophile, anemophile, argillophile, cheradophile, enaulophile, pelochthophile, pelophile, phellophile, psamathophile, psammophile, spiladophile, thinophile
- taphrophile** *n.* An organism that lives in ditches, *e.g.*, a rush species (Lincoln et al. 1985).
- telmatophile** *n.* An organism that lives in wet meadows, *e.g.*, a pitcherplant species (Lincoln et al. 1985).
cf. -cole: caespiticole, leimocole, nomocole, poocole, pratinicole, psicole; 1-phile: coryphile, helolochmophile, nomophile, poophile, psilophile
- termitophile** *n.* An organism that must spend at least part of its life cycle with a termite colony (Hölldobler and Wilson 1990, 644).
- thalassophile** *n.* An organism that lives in the sea, *e.g.*, *Sphyrna mokarran* (Great Hammerhead Shark) (Lincoln et al. 1985).
- thermophile** *n.* An organism that lives in warm conditions (*e.g.*, a microorganism that has a growth optimum above 45°C) (Lincoln et al. 1985).
Comment: A heat-stable enzyme derived from a microbe from Yellowstone National Park drives the polymerase chain reaction (Milstein 1994, 655).
- **eutermophile** *n.* An organism that is tolerant of a wide range of relatively high temperatures (Lincoln et al. 1985).
cf. 1-phile: thermophile: stenothermophile, -therm: eurytherm
- **facultative thermophile** *n.* A thermophile that requires temperature from 50–65°C for optimum growth, but is capable of growth at lower temperatures (Lincoln et al. 1985).
- **hyperthermophile** *n.* A microorganism that can grow at temperatures up to 104°C (220°F) and withstand much higher ones even up to 357°C (700°F) (Broad 1993, 16 November, C1, C15).
Comments: Several species of hyperthermophiles are known from hydrothermal-vent communities; their enzymes, which are active at high temperatures, are used in biotechnology (Broad 1993, 2 November, C1). K. O. Stetter and his colleagues discovered hyperthermophiles in Icelandic hot springs in 1991 (Broad 1993, 16 November, C1).
- **macrothermophile** *n.* An organism that lives in the tropics or other warm habitats, *e.g.*, *Syagrus romanzoffiana* (Queen Palm) (Lincoln et al. 1985).

► **mesothermophile** *n.* An organism that lives in temperate regions, *e.g.*, *Liriodendron tulipifera* (Tuliptree) (Lincoln et al. 1985).

► **microthermophile** *n.* An organism that lives in boreal regions, *e.g.*, *Gulo gulo* (Wolverine); contrasted with macrothermophile (Lincoln et al. 1985).

► **obligate thermophile** *n.* A thermophile requiring temperature from 65–70°C for optimum growth, and is usually unable to grow at temperatures below 40°C (Lincoln et al. 1985).

► **stenothermophile** *n.* An organism that is tolerant of only a narrow range of high temperatures (Lincoln et al. 1985).

cf. ¹-phile: thermophile; eurythermophile, -therm: stenotherm

thinophile *n.* An organism that lives on sand dunes, *e.g.*, a grass species (Lincoln et al. 1985).

cf. -cole: aigicole, amanthicole, ammocole, amnicole, arenicole, argillicole, limicole, luticole, thinicole; ¹-phile: aigialophile, amanthophile, ammochthophile, ammophile, anemophile, argillophile, cheradophile, enauophile, pelochthophile, pelophile, phelloophile, psammatophile, psammophile, spiladophile, syrtidophile

thiophile *n.* An organism that lives in sulfur-rich habitats, *e.g.*, a bacterium species (Lincoln et al. 1985).

cf. -troph: autotroph: chemoautotroph

tiphophile *n.* An organism that lives in ponds, *e.g.*, a turtle species (Lincoln et al. 1985).

troglophile, eutroglobiont *n.* An animal that is frequently found in underground caves, or passages, but not confined to them (Lincoln et al. 1985).

cf. -cole: cavernicole; stygobie; -xene: trogloxene

► **eutroglophile** *n.* A troglophile that reproduces in a cave habitat (Lincoln et al. 1985).

► **subtroglophile** *n.* A troglophile that does not reproduce in a cave habitat (Lincoln et al. 1985).

tropophile *n.* An organism that lives in an environment that undergoes marked periodic fluctuations of light, temperature, and moisture, *e.g.*, a mountain-plant species (Lincoln et al. 1985).

turfophile *n.* An organism that lives in bogs, *e.g.*, a dragonfly species (Lincoln et al. 1985).

umbrophile See ¹-phile: sciophile.

urophile *n.* An organism that lives in habitats rich in ammonia (Lincoln et al. 1985).

xerohyophile *n.* An organism that lives in dry forests (Lincoln et al. 1985).

cf. -cole: deserticole, siccocole, xerocole; ¹-phile: aerohyophile, cheradophile, chersophile, helohyophile, hydrolophile, hydrophile, lochnodophile, subxerophile, syrtidophile, telmatophile, xerophile

xerophile *n.* An organism that lives in dry habitats, *e.g.*, *Larrea tridentata* (Creosote-bush) (Lincoln et al. 1985).

cf. -cole: deserticole, siccocole, xerocole; ¹-phile: aerohyophile, cheradophile, chersophile, helohyophile, hydrolophile, hydrophile, lochnodophile, subxerophile, syrtidophile, telmatophile, xerohyophile

xeropoophile *n.* An organism that lives in heathland, *e.g.*, a bumble-bee species (Lincoln et al. 1985).

xylophile *n.* An organism that lives on, or in, wood, *e.g.*, *Xylocopa virginica* (Eastern Carpenter Bee) (Lincoln et al. 1985).

cf. -cole: lignicole; ¹-phile: lignophile, proxylophile

zodiophile, zoidiophile See ¹-phile: zoophile.

zoophile, zoidiophile, zodiophile *n.* An organism that has an affinity for animals (Lincoln et al. 1985).

♦ **²-phile** *comb. f.* Referring to a plant that is regularly pollinated by a particular agent (*e.g.*, wind, water, birds, or insects).

n. -phile

adj. -gamous, -philous

cf. -lectic; -philo; pollination; -tropic

Comments: The combining form “-gamy” has also been used to indicate kinds of pollination; Faegri and van der Pijl (1979, 34) prefer -phily. A designation of a kind of “-phile,” *e.g.*, cantharophile, to a plant species, does not necessarily indicate that *only* one kind of agent, in this case, only beetles pollinate it.

[Greek *-philos*, loving < *phileein*, to love]

allophile *n.*

1. A plant species that has no morphological floral adaptations for guiding floral visitors and can be utilized by short tongued visitors (Faegri and van der Pijl 1979, 48).

2. A plant species that is pollinated by an agent to which is it not evolutionarily adapted (Lincoln et al. 1985).

cf. ²-phile: euphile, hemiphile

anemophile, aerophile *n.* A plant species that is regularly pollinated by wind (*e.g.*, species of Ashes, Conifers, Elms, Filberts, Grasses, Nettles, Oaks, Potomogetons, Marijuana, Meadowrues, Ragweeds, Rushes, Sedges, and Walnuts) (Faegri and van der Pijl 1979, 34–35).

autophile *n.* A plant species that is self-pollinated, *e.g.*, *Lobelia dortmanna* (Water Lobelia) (Faegri and van der Pijl 1979, 40).

cf. -gamy: autogamy.

cantharophile *n.* A plant species that is regularly pollinated by beetles; *e.g.*, *Amorphophallus* spp., *Calycanthus occidentalis*, *Degeneria* spp., *Magnolia* spp., *Nymphaea citrina*, *Victoria amazonica*, *Uvularia perfoliata*, and some species of fagaceous subtropical and tropical trees (Faegri and van der Pijl 1979, 99–102, 170–171).

Comments: Cantharophiles often have protein- or lipid-rich flowers (Buchmann and Nabhan 1996, 243).

chiropterophile *n.* A plant species that is regularly pollinated by bats (Faegri and van der Pijl 1979, 129–133).

Comments: Bats that feed from flowers include species in the genera *Cynopterus*, *Eidolon*, *Eonycteris*, *Leptonycteris*, *Macroglossus*, and *Megachiroptera*; chiropterophilous plants include *Agave schottii*, *Carnegiea gigantea*, *Crescentia*, *Eucalyptus*, *Kigelia*, *Marcgravia*, *Musa*, and *Parkia clappertoniana* (Proctor and Yeo 1972, 330–337; Faegri and van der Pijl 1979, 123–129).

dientiophile *n.* A plant pollinated by two insect species and having two kinds of flowers, each adapted to each insect species (Lincoln et al. 1985).

dientomophile *n.* A plant species that is regularly pollinated by two insect species (Lincoln et al. 1985).

drosophile, drosophile *n.* A plant species that is regularly pollinated by dew (Lincoln et al. 1985).

entomophile *n.* A plant species that is regularly pollinated by insects (Faegri and van der Pijl 1979).

Comments: Thousands of species of plants are entomophiles. Many kinds of insects pollinate, including some ant, beetle, and thrips species and many bee, fly, and wasp species.

eophile *n.* A species that has morphological floral adaptations for attracting and guiding specialized floral visitors, e.g., *Campsis radicans* (Trumpet creeper) (Faegri and van der Pijl 1979, 48; Lincoln et al. 1985).
cf. 2-phile: allophile, hemiphile

hemiphile *n.* A plant species with morphological floral adaptations that allow floral visitors with intermediate degrees of specialization to obtain its floral resources (Faegri and van der Pijl 1979, 48).

cf. 2-phile: allophile, euphile

hydrophile *n.* A plant species that is regularly pollinated by fresh, or salt, water (Faegri and van der Pijl 1979, 40).

Comment: Hydrophiles might be rare because pollen is usually damaged by immersion in water (Buchmann and Nabhan 1996, 248).

► **ephydrophile** *n.* A hydrophile that is pollinated on the surface of water (e.g., *Callitricha autumnalis*, *Vallisneria spirialis*, or species of *Ruppia*) [coined by Delpino, 1868–1875, in Faegri and van der Pijl 1979, 40, 169].

► **hyphydrophile** *n.* A hydrophile that is pollinated in water (e.g., *Callitricha hamulata* or species of *Ceratophyllum*, *Halophila*, or *Najas*) [coined by Delpino, 1868–1875, in Faegri and van der Pijl 1979, 40].

lepidopterophile *n.* A plant species that is regularly pollinated by Lepidoptera (Lincoln et al. 1985).

cf. 2-phile: phalaenophile, psychophile, sphingophile
malacophile *n.* A plant species that is regularly pollinated by snails and slugs (e.g., possibly a species of *Rohdea*) (Faegri and van der Pijl 1979, 119).

Comments: The existence of malacophily is moot (Faegri and van der Pijl 1979, 119).

melittophile *n.* A plant species that is regularly pollinated by bees (e.g., thousands of taxa including *Astragalus depressus*, *Coronilla emerus*, *Cytisus scoparius*, and *Orchis maculata* and species of *Aconitum*, *Bartsia*, *Cattleya*, *Centrosema*, *Delphinium*, *Galeopsis*, *Linaria*, *Melampyrum*, *Pedicularis*, *Prunus*, *Rosa*, *Rubus*, *Salvia*, *Thunbergia*, and *Trifolium*) (Faegri and van der Pijl 1979, 110–115, 168, 180–184, 188–197).

micromelittophile *n.* A plant species that is regularly pollinated by small bees (Lincoln et al. 1985).

micromyiophile *n.* A plant species that is regularly pollinated by small flies (Lincoln et al. 1985).

cf. 2-phile: myiophile

microzoophile *n.* A plant species that is regularly pollinated by small animals (Lincoln et al. 1985).

monophile *n.* A plant that is pollinated by only one, or a few closely related, species (Faegri and van der Pijl 1979, 48).

cf. -lectic: monolectic; 2-phile: oligophile, polyphile

myiophile, myophile *n.* A plant taxon that is regularly pollinated by flies (e.g., *Hedera helix*, *Theobroma cacao*; and species of *Aruncus*, *Circaeae*, *Ilex*, *Mentha*, and *Veronica*) (Faegri and van der Pijl 1979, 102–106).

syn. myiophile (Lincoln et al. 1985)

cf. 2-phile: sapromyiophile

myrmecophile *n.* A plant species that is regularly pollinated by ants; e.g., *Glaux maritima*, *Orthocarpus pusillus*, and *Polygonum cascadense* (Dahl and Hadac 1940, etc., in Faegri and van der Pijl 1979, 110).

cf. pollination: ant pollination

necrocoleopterophile *n.* A plant species that is regularly pollinated by carrion beetles (Lincoln et al. 1985).

oligophile *n.* A plant that is pollinated by a few related taxa (Faegri and van der Pijl 1979, 48).
cf. -lectic: oligolectic; 2-phile: monophile, polyphile

ombrophile *n.* A plant that is pollinated by rain, e.g., in a flower that fills with rain water and whose pollen floats up in the water to its stigma (Hagerup 1950 in Faegri and van der Pijl 1979, 41).
cf. pollination: rain pollination

Comment: The significance of rain pollination is questionable (Daumann 1970 in Faegri and van der Pijl 1979, 41).

ornithophile *n.* A plant taxon that is regularly pollinated by birds (Faegri and van der Pijl 1979, 123).

Comments: Birds involved in “ornithophily” include the Brush-tongued Honeyparrot (Loriuke), Bulbuls, Honeyeaters, Hummingbirds, Sugarbirds (Honeycreepers, Quits), and Sunbirds; ornithophilous plants include *Salvia splendens* and species of *Aloe*, *Bombax*, *Columnea*, *Cuphea*, *Erythrina*, *Eucalyptus*, *Fuchsia*, *Heliconia*, *Iris*, *Lobelia*, *Malva viscus*, *Monarda*, *Mimulus*, *Poinsettia*, *Puya*, *Rhododendron*, *Quassia*, *Spathodea*, and *Tropaeolum* (Faegri and van der Pijl 1979, 123–129, 184). Ornithophiles usually have colorful, large, and sturdily built flowers whose ovules are not easily damaged by birds’ probing bills and feet (Buchmann and Nabhan 1996, 251).

phalaenophile *n.* A plant species that is regularly, or exclusively, pollinated by moths (e.g., *Calonyction bona nox*, *Cestrum nocturnum*, *Lonicera periclymenum*, *Pancratium maritimum*, and species in *Impatiens* and *Yucca*) (Faegri and van der Pijl 1979, 117–119, 175).

cf. 2-phile: lepidopterophile, psychophile, sphingophile

Comments: *Angraecum sesquipedale*, which has a nectar spur up to 30 cm long is pollinated by a hawk-moth *Xanthopan morgani forma praedicta* which has a tongue about 30 cm long (Faegri and van der Pijl 1979, 118). *Angraecum longicalcar* has a nectar spur that is nearly 40 cm long (Kritsky, 1991, 209).

polyphile *n.* A plant that is pollinated by many taxa (Faegri and van der Pijl 1979, 48).

cf. -lectic: polylectic; 2-phile: monophile, oligophile

protozoophile *n.* A plant species that is regularly pollinated by protozoa and microscopic animals (Lincoln et al. 1985).

psychophile *n.*

1. A plant species that is regularly pollinated by diurnal Lepidoptera (Lincoln et al. 1985).

2. A plant species that is regularly pollinated by butterflies (e.g., *Nigritella nigra*; or species in *Buddleia*, *Lantana*, and *Pblox*) (Faegri and van der Pijl 1979, 115, 203; Lazri and Barrows 1984; Venables and Barrows 1985).

cf. 2-phile: lepidopterophile, phalaenophile, sphingophile

sapromyiophile, sapromyiophile *n.* A plant species that is regularly pollinated by flies that are attracted to carrion and feces (e.g., *Arum maculatum*, *A. nigrum*, *Asarum vulgare*, and species in *Arisaema*, *Aristolochia*, *Ceropegia*, and *Darlingtonia*) (Faegri and van der Pijl 1979, 103–105, 173).

syn. sapromyiophile (Lincoln et al. 1985)

sphegophile *n.* A plant species that is regularly pollinated by sphingids (hawkmoths) or other nocturnal Lepidoptera (Lincoln et al. 1985).

zoophile *n.* A plant species that is regularly pollinated by animals (Lincoln et al. 1985).

♦**³-phile** *comb.f.*

biophile *n.* An element, e.g., calcium, iron, or sulfur, that is concentrated in a living organism [coined by V. M. Goldschmidt, geochemist (1937) in Fyfe (1996, 448)].

See ¹phile: biophile.

Comment: Most new minerals in the marine sedimentary environment are biocatalyzed (H. Lowenstam in Fyfe 1996, 448).

♦**philia** *comb.f.*

1. A tendency toward: *hemophilia* (Michaelis 1963).
2. An excessive affection, or fondness for: *necrophilia* (Michaelis 1963).

syn. *phily* (Michaelis 1963)

[< Greek *-philia*, loving < *phileein*, to love]

beetlephilia *n.* A person's affection for beetles (inferred from Evans and Bellamy 1996, 163).

biophilia *n.*

1. A person's "innate tendency to focus on life and lifelike processes" [coined by Wilson 1984, 1].
2. A person's positive attitude toward natural diversity and nature itself (Buchmann and Nabhan 1996, 243).

coprophilia *n.* A person's love of feces or filth (Hinsie and Campbell 1975, 163).

necrophilia *n.* A person's reaching orgasm with a dead Human (Hinsie and Campbell 1975, 490).

paraphilia *n.* A person's sexual perversion (*i.e.*, any sexual practice that deviates from the normal such as any abnormal means of achieving genital orgasm) (Hinsie and Campbell 1975, 543, 562).

Comments: Perversions include algolagnia, coprophilia, exhibitionism, fetishism, masochism, necrophilia, sadism, transvestism, urolagnia, and voyeurism (Hinsie and Campbell 1975, 562).

♦**pedophilia** *Brit. paedophilia* *n.* A person's love of children, implying, or indicating, a sexual attraction towards or sexual interactions with them (Hinsie and Campbell 1975, 552).

syn. *paedophilia erotica* (Kraft-Ebling), pederosis (Forel) (both in Hinsie and Campbell 1975, 552).

cf. drug: triptorelin

urophilia *n.* A person's pathologic love for, or interest in, urine (Hinsie and Campbell 1975, 801).

syn. urolagnia (Hinsie and Campbell 1975, 801)

♦**philo-, philo** *comb.f.* "Loving; fond of" (Michaelis 1963).

cf. ^{1,2}-phile

[< Greek *-philos*, loving < *phileein*, to love]

♦**philopatry** *n.* An animal's tendency to remain at certain places or at least to return to them for feeding and resting (Wilson 1975, 337, 340, 591).

♦**philoprogenitive** *adj.* Prolific; referring to an organism that produces large numbers of offspring (Lincoln et al. 1985).

♦**philosopher** *n.*

1. A student, or specialist, in philosophy (Morris 1982).
2. A person who lives and thinks according to a certain philosophy, *q.v.* (Morris 1982).
3. A person who is calm and rational under any circumstances (Morris 1982).

cf. study of: philosophy

♦**philosophical psychology** See study of: psychology: philosophical psychology.

♦**philosophy** See study of: philosophy.

♦**philosophy of the mind** See study of: philosophy: philosophy of the mind.

♦**-phobe** *comb.f.* "One who fears or has an aversion to" (Michaelis 1963).

adj. phobic

cf. ¹-phile, phobia, phobic

[Late Latin < Greek *phobos*, fearing < *phobeesthai*, to fear]

calciphobe, basifuge, calcifuge *n.* A plant that is intolerant of soils rich in calcium salts (Lincoln et al. 1985).

chianophobe *n.* An organism that is intolerant of prolonged snow cover (Lincoln et al. 1985).

chionophobe *n.* An organism that is intolerant of snow-covered habitats (Lincoln et al. 1985).

halophobe *n.* An organism that is intolerant of saline habitats, *e.g.*, *Citrus xsinensis* (Sweet Orange) (Lincoln et al. 1985).

heliophobe *n.* An organism that is intolerant of high light intensity (Lincoln et al. 1985).

syn. skiophile, umbrophile

cf. ¹-phile: heliophile

hydrophobe *n.* An organism that is intolerant of water or wet conditions, *e.g.*, *Quercus alba* (White Oak) which is killed by long-term standing water over its roots (Lincoln et al. 1985).

cf. ¹-phile: hydrophile

adj. hydrophobic

hygrophobe *n.* An organism that is intolerant of moist conditions (Lincoln et al. 1985).

myrmecophobe *n.* An organism that repels ants, or termites, *e.g.*, a *Formica*-ant species that drives away the ant *Prenolepis imparis* (Lincoln et al. 1985).

cf. ¹-phile: myrmecophile

oxyphobe, basophile *n.* An organism that thrives in alkaline habitats, or is intolerant of acidic conditions (Lincoln et al. 1985).

phengophobe *n.* An organism that thrives in, or has an affinity for, light (Lincoln et al. 1985).

photophobe *n.* An organism that is intolerant of, or avoids, full light, *e.g.*, a scorpion species (Lincoln et al. 1985).

adj. lucifugous, photopathic, photophobic, photophobous, photophygous (Lincoln et al. 1985)

cf. ¹-phile: photophile

pluviophobe *n.* An organism that is intolerant of abundant rainfall, *e.g.*, a cactus species that rots under conditions that are too moist (Lincoln et al. 1985).

cf. -phobe: rheophobe

poleophobe *n.* An organism that is intolerant of urban habitats, *e.g.*, a tree species that cannot grow well in urban air pollution (Lincoln et al. 1985).

pyrophobe *n.*

1. An organism that is intolerant of soil conditions produced by fire (Lincoln et al. 1985).

2. A plant that cannot re-establish itself following a fire (Lincoln et al. 1985)

rheophobe *n.* An organism that is intolerant of too much water, *e.g.*, a cactus species (Lincoln et al. 1985).

cf. -phobe: hydrophobe; ¹-phile: rheophile

thermophobe *n.* An organism that is intolerant of high temperatures, *e.g.*, *Saintpaulia ionantha* (African-violet) (Lincoln et al. 1985).

xerophobe *n.* An organism that is intolerant of dry conditions, *e.g.*, *Colocasia esculenta* (Taro) (Lincoln et al. 1985).

♦**phobia** *n.*

1. A person's compulsive and persistent fear of any specified type of object, stimulus, or situation (Michaelis 1963).

2. Any strong aversion or dislike (Michaelis 1963).
- A

SOME HUMAN PHOBIAS ^a	
NAME	STIMULUS
acrophobia (<i>syn.</i> altophobia ^b , hypsophobia ^b , hypsiphobia ^b)	high places
aerophobia ^c (<i>syn.</i> aviaphobia)	flying
agoraphobia (<i>syn.</i> cenophobia ^b , kenophobia ^b)	open spaces
aichinophobia	sharp objects
ailurophobia	cats
androphobia	men
anemophobia	cyclones ^c
anthrophobia	people
apeirophobia	infinity
apiphobia (<i>syn.</i> apiophobia, mellissophobia)	bees ^c
arachneophobia (<i>syn.</i> arachnophobia)	spiders ^c
astraphobia	lightning ^b , thunderstorms
astrophobia	stars
autophobia	self, being alone
ballistophobia	missiles
bathophobia	depths
batrachophobia	frogs or reptiles ^c
brontophobia (<i>syn.</i> keraunophobia)	thunderstorms ^c
carsinomaphobia ^b (<i>syn.</i> cancer phobia ^c , carcinophobia ^b , carcinomatophobia ^b , cancerphobia ^b , cancerophobia ^b)	cancer
chionophobia	snow
claustrophobia (<i>syn.</i> clesiophobia, cleithrophobia, clithrophobia)	confined spaces
cynophobia (knophobia)	dogs
demophobia	crowds
emetophobia (<i>syn.</i> emitophobia)	vomiting ^c
erythrophobia	red
equinophobia (<i>syn.</i> hippophobia)	horses ^c
gamophobia	marriage
haptephobia	being touched
hemophobia	blood
hypnophobia	sleep
kinesophobia	movement
lalophobia	speaking
lilapsophobia	hurricanes and tornadoes ^c
musophobia (<i>syn.</i> muriphobia ^b)	mice
myrmecophobia	ants ^c
mysophobia	contamination
necrophobia ^d (<i>syn.</i> death phobia ^c)	dead bodies or death ^d
neophobia	new things
nyctophobia	night, darkness
ophidiophobia	reptiles ^a
ophidiophobia (<i>syn.</i> ophiophobia, ophiciophobia, herpetophobia)	snakes ^c
ornithophobia	birds ^c
pedophobia	infants or children
phonophobia	noise
psychrophobia	cold
pyrophobia	fire
sociophobia	social situations
taphephobia	being burned alive
thalassophobia	ocean or sea
thanatophobia	death
toxicophobia	poison
zoophobia	animals

^a Michaelis (1963).^b Ash (1996, 47).^c Ash (1996, 47), who indicates that there is no scientific name for fear, or aversion, to rats.^d Morris (1982).^e Hinsie and Campbell (1976). These authors also list and discuss these phobias for which they give common names: bathroom phobia (*syn.* toilet phobia), bug phobia, doorknob phobia, hypochondriacal phobia, impregnation phobia, insect phobia, landscape phobia (*syn.* agoraphobia), light-and-shadow phobia, live-burial phobia, poisoning phobia, school phobia, street phobia, traumatic phobia, and vehicle phobia.

3. A morbid fear associated with morbid anxiety (Hinsie and Campbell 1976 569).
cf. -phobe, phobic
See the following table.
[Late Latin < Greek *phobos*, fear]
- neophobia** *n.* For example, in *Felis catus* (Domestic Cats), Humans, and *Rattus norvegicus* (Norway Rats): An individual's avoidance of a novel object (Barnett 1963 in Dewsbury 1978, 63; Bradshaw 1986, 614).
- ♦ **phobic** *comb. f.*
1. Intolerant of (Lincoln et al. 1985).
 2. Lacking affinity for (Lincoln et al. 1985).
cf. -phobe, ¹-phile
- ♦ **phobo-** *comb. f.*
1. Referring to evident fear (Lincoln et al. 1985).
 2. Referring to negation of an operative prefix, *e.g.*, in phobophototaxis which means negative phototaxis (Lincoln et al. 1985).
cf. -phobe
- ♦ **phobotaxis** See *taxis*: phobotaxis.
- ♦ **phonological loop** See working memory (comments).
- ♦ **phonophobia** See -phobia: phonophobia.
- ♦ **phonotaxis** See *taxis*: phonotaxis.
- ♦ **phoresy** See symbiosis: phoresy.
- ♦ **phoretic behavior** See behavior: phoretic behavior.
- ♦ **phorophyte** See epiphyte.
- ♦ **phosphate group** See group: functional group: phosphate group.
- ♦ **phosphene** *n.* One of the colorful patterns that one sees when one closes one's eyes and gently presses against one's eyeball (Holden 1999, 17 September, 1845).
Comment: The direct stimulation of one's visual cortex from pressed eyeballs produces phosphenes (Holden 1999, 17 September, 1845).
- ♦ **phosphorescence** *n.*
1. A material's emitting light without sensible heat; also, the light so emitted (Michaelis 1963).
 2. A mineral substance's continuing to shine in darkness after exposure to light; distinguished from fluorescence (Michaelis 1963).
adj. phosphorescent
cf. bioluminescence
- ♦ **photoautotroph** See -troph-: photoautotroph.
- ♦ **photocliny** *n.* An organism's response to incident-light direction (Lincoln et al. 1985).
- ♦ **photodynamics** See study of: dynamics: photodynamics.
- ♦ **photogenic** See -genic: photogenic.
- ♦ **photogrammetry** See study of: -metry: photogrammetry.
- ♦ **photoharmosis** See -harmosis: photoharmosis.
- ♦ **photoheterotroph** See -troph-: photoorganotroph.
- ♦ **photohoramotaxis, photohorotaxis** See *taxis*: photohoramotaxis.
- ♦ **photokinesis** See kinesis: photokinesis.
- ♦ **photolithotroph** See -troph-: photolithotroph.
- ♦ **photoorganotroph** See -troph-: photoorganotroph.
- ♦ **photopathic** See -phobe: photophobe.
- ♦ **photoperiod** See period: photoperiod.
- ♦ **photophile** See ¹-phile: photophile.
- ♦ **photophobe** See -phobe: photophobe.
- ♦ **photophobotaxis** See *taxis*: photophobotaxis.
- ♦ **photophobous, photophygous** See -phobe: photophobe.
- ♦ **photoreceptor** See receptor: photoreceptor.
- ♦ **photosynthesis** See biochemical pathway: photosynthesis.
- ♦ **"photosystem-I photosynthesis"** See biochemical pathway: "photosystem-I photosynthesis."
- ♦ **"photosystem-II photosynthesis"** See biochemical pathway: "photosystem-II photosynthesis."
- ♦ **phototaxis** See *taxis*: phototaxis.
- ♦ **phototoxicity** *n.* An organism's being sensitive to light (Lincoln et al. 1985).
adj. photonic, phototonus
- ♦ **phototroph** See -troph-: phototroph.
- ♦ **phototropism** See -tropism: phototropism.
- ♦ **phototropotaxis** See *taxis*: phototaxis: phototropotaxis.
- ♦ **phragmotic** *n.* For example, in some ant, bee, termite, and frog species: An animal's using part of its body to block its burrow (Halliday and Adler 1986, 38, 148; Hölldobler and Wilson 1990, 641).
adj. phragmotic
- ♦ **Phrap** See program: Phrap.
- ♦ **phreatobiology** See study of: biology: phreatobiology.
- ♦ **phreatocole** See -cole: phreatocole.
- ♦ **Phred** See program: Phred.
- ♦ **phretium** See ²community: phretium.
- ♦ **phretophile** See ¹-phile: phretophile.
- ♦ **phycobiont** See -biot: phycobiont.
- ♦ **phycobilin** See molecule: accessory pigment: phycobilin.
- ♦ **phycocoenology** See study of: phycocoenology.
- ♦ **phycology** See study of: phycology.
- ♦ **phycophage** See -phage: phycophage.
- ♦ **phycophile** See ¹-phile: phycophile.
- ♦ **phylacobiosis** See -biosis: parabiosis.
- ♦ **-phylectic, phylic** *adj.* Of, or referring to a phylum, genetic type, or strain (Michaelis 1963).
syn. racial (Michaelis 1963)
n. -phyly
cf. ²group: diphyletic group, holophyletic group, paraphyletic group, polyphyletic group
[Greek *phyletikos* < *phyletēs*, tribesman < *phylē*]
- diphyletic** *adj.* Referring to a group that is derived from two distinct ancestral lineages; referring to a group that is comprised of descendants of two different ancestors; contrasted with monophyletic and polyphyletic (Lincoln et al. 1985).
n. diphyle
- homoplyletic** *adj.* Referring to a group of taxa that share similar characters that have been inherited from the same ancestral species (Lincoln et al. 1985).
n. homoplyly
- monophyletic** *adj.* Referring to the process of a taxon's descending from a common ancestor; contrasted with diphyletic and polyphyletic (Hennig 1950 in Mayr 1982, 228).
cf. ²group: monophyletic group
- polyphyletic** *adj.* Referring to a taxon that is derived from two, or more, distinct ancestral lineages; contrasted with diphyletic and monophyletic (Lincoln et al. 1985).
- ♦ **phylectic evolution** See ²evolution: phyletic evolution.
- ♦ **phylectic extinction** See ²extinction: phyletic extinction.
- ♦ **phylectic gradualism** See gradualism: phyletic gradualism.

- ♦ **phytic group** See ²group: phytic group.
- ♦ **phytic inertia** See phylogenetic inertia.
- ♦ **phytic speciation** See speciation: phytic speciation.
- ♦ **phytic tree** See -gram: phylogenetic tree.
- ♦ **phytic trogloxene** See -xene: trogloxene.
- ♦ **PHYLIP** See program: Phylogenetic Inference Package.
- ♦ **phytistics** *n.* Concepts of phylogenetic relationship based on both cladogenesis and evolutionary divergence (Lincoln et al. 1985).
- n.* phylist
- adj.* phytistic
- ♦ **phytioplankton** See plankton: phytiplankton.
- ♦ **phytobiology** See study of: biology: phytobiology.
- ♦ **phytophage** See -phage: phytophage.
- ♦ **phytosphere** See -sphere: phytosphere.
- ♦ **phylo-, phyl** *comb. f.* “Tribe; race; species” (Michaelis 1963).
[Greek *phylē, phylon*, tribe]
- ♦ **PhyloCode** *n.* A formalized code of phylogenetic nomenclature that names organisms for their clades rather than using the Linnaean system (*q.v.*) (Brown 1999, 991; Withgott 2000, 646; www.ohiou.edu/phylocode 2000).
cf. hierarchy: Linnaean hierarchy
Comments: The PhyloCode is a set of rules that guides how organism groups shall be named and how names shall change as a result of future data. Presently, codes legislated by international committees (one each for bacteriology, botany, and zoology) govern the naming of organisms using the Linnaean system (of nomenclature) (Withgott 2000, 646). The PhyloCode redefines “acceptable name,” “accepted name,” “conserved name,” “converted name,” “established name,” “homonym,” “pre-existing name,” “protologue,” and “suppressed name” (www.ohiou.edu/phylocode 2000). In the PhyloCode, *e.g.*, the herb *Prunella vulgaris* (Selfheal) and hundreds of other plants, that currently have the specific epithet “*vulgaris*,” would simply be called *vulgaris*, each with a tag to its clade in a master directory with phylogenetic data (Brown 1999, 991). Some researchers propose that the PhyloCode should be universally adopted in place of the Linnaean system (*q.v.*).
- ♦ **phylogenesis** See -genesis: phylogenesis.
- ♦ **phylogenetic** See genetic: phylogenetic.
- ♦ **phylogenetic adaptation** See ³adaptation: ²evolutionary adaptation (def. 4).
- ♦ **Phylogenetic Analysis Using Parsimony** See program: Phylogenetic Analysis Using Parsimony.
- ♦ **phylogenetic biology** See study of: biology: phylogenetic biology.
- ♦ **phylogenetic group** See ²group: phytic group.
- ♦ **phylogenetic homology** See homolog: phylogenetic homology.
- ♦ **phylogenetic inertia** *n.*
 1. The deeper properties of a population (including preadaptation and basic genetic mechanisms) that determine the extent to which its evolution can be deflected in one direction or another, as well as the amount by which its rate of evolution can be speeded or slowed (Wilson 1975, 32–33, 592).
 2. Underlying genetic mechanisms and preadaptations that determine the direction and rate of evolutionary change (Lincoln et al. 1985).
- syn.* phytic constraint, phytic inertia (Gould and Lewontin 1979, 594)
- cf.* ³adaptation: ²evolutionary adaptation: preadaptation; prime mover
Comments: “High phylogenetic inertia” implies resistance to evolutionary change; “low phylogenetic inertia,” a relatively high degree of lability (Wilson 1975, 32–33, 592). Evolutionists invoke phylogenetic inertia to explain why Humans are not optimally designed for upright posture, why no molluscs fly in the air, and why no insects are as big as Elephants (Gould and Lewontin 1979, 594).
- ♦ **Phylogenetic Inference Package** See program: Phylogenetic Inference Package.
- ♦ **phylogenetic morphology** See morphology: phylogenetic morphology.
- ♦ **phylogenetic noise** *n.* One’s misinterpretation of phylogenetic relationships due to convergent evolution (Lincoln et al. 1985).
- ♦ **phylogenetic rates of evolution** See rate: phylogenetic rates of evolution.
- ♦ **phylogenetic relationship** *n.* Organisms’ affinity based on recency of common ancestry; evolutionary relationship (Lincoln et al. 1985).
- ♦ **phylogenetic relict** See ²species: relict species.
- ♦ **phylogenetic scale** See *scala naturae*.
- ♦ **phylogenetic-species concept I, II, III** See ²species: phylogenetic-species concept I, II, II.
- ♦ **phylogenetic systematics** See study of: systematics: phylogenetic systematics.
- ♦ **phylogenetic tree** See -gram: phylogenetic tree.
- ♦ **phylogeny** *n.*
 1. The origin and evolution of phyla, tribes, or species; ancestral evolution of an organism type; distinguished from ontogeny (Oxford English Dictionary 1972, entries from Darwin 1872).
 2. The evolutionary history of a particular group of organisms (Wilson 1975, 591).
 3. “The evolutionary history of a lineage, conventionally (though not ideally) depicted as a sequence of successive adult stages” (Gould 1977, 484).
- syn.* phylogenesis (Lincoln et al. 1985)
- adj.* phylogenetic
- cf.* -genesis, ontogeny
[German *phylogenie* < Greek *phylōn* tribe + *-geneia*, birth, origin]
- ♦ **phylogerontic period** See acme: paracme.
- ♦ **phylogram** See -gram: phylogenetic tree.
- ♦ **phylon** *n.* Line of descent (Lincoln et al. 1985).
See ²group: a taxonomic classification of groups: phylum (table).
- ♦ **phylotypic body plan** *n.* The body organization shared by all members of an animal phylum (Gerhard & Krischner 1997, 296).
Comment: Researchers have described phylotypic body plans anatomically and in terms of compartments of expression of selector genes (a second anatomy visible when a researcher treats an embryo with colored reagents that reveal locations of RNAs and proteins encoded by selector genes) (Gerhard & Krischner 1997, 296).
- ♦ **phylum** See ²group: a taxonomic classification of groups (table).
- ♦ **-phyly** See -phytic.

- ♦ **physical anthropology** See study of: anthropology: physical anthropology.
- ♦ **physical environment** *n.* The abiotic component (structural and chemical factors) of an ecosystem (Lincoln et al. 1985).
- ♦ **physical map** See map: physical map.
- ♦ **physical polyethism** See polyethism: physical polyethism.
- ♦ **physical psychology** See study of: psychology: physical psychology.
- ♦ **physical science** See study of: science: physical science (Michaelis 1963).
- ♦ **physicalism** *n.*
 1. The false idea that inheritance is due to forces or excitations, rather than to “concrete materials supplied by maternal egg cells and paternal pollen cells” (Mayr 1982, 79, 720–721).
Note: His, Loeb, Bateson, and Johannsen were physicalists.
cf. corpuscularist, preformationist
 2. Application of methodology of the physical sciences (chemistry and physics) to biology; *e.g.*, one’s expecting a law to be equally valid for all similar sets of phenomena (Mayr 1982, 846).
 3. An emphasis on and belief in certain principles that are dominant in classical physics such as essentialism, determinism, and so forth (Mayr 1997, 309).
cf. essentialism, idealism, law, materialism, organicism, vitalism

Comments: Because so-called “biological laws” usually have exceptions, it is more appropriate to designate “generalities,” instead of “laws,” in biology (Mayr 1982, 846). The schools of physicalism and vitalism debated about how to explain the phenomenon of living (having life) (Mayr 1997, 4–6). Some physicalists tried to explain life from the standpoint energy, *e.g.*, an unequal distribution of energy, or the movement of atoms and molecules. The physicalist movement (*syn.* physicalism) flowered in the 19th century (Mayr 1997, 4–5). Some of the physicalists ruled out the existence of a vital force (a property that cannot be found in inert matter) in organisms. Physicalism did not successfully explain any processes and phenomena that are characteristic of living organisms, and a school of vitalism arose which attempted to do so.
- ♦ **physically controlled community** See ²community: physically controlled community.
- ♦ **physico-theology** See natural theology.
- ♦ **physics** See study of: physics.
- ♦ **physics envy** *n.* The belief that employing the mathematical methodology of the physical sciences will enhance the reputation of one’s own field (Paul Bickart in Hitt 1992).
- ♦ **physiogenesis** See -genesis: physiogenesis.
- ♦ **physiognomic dominant** See ²species: physiognomic dominant.
- ♦ **physiographic climax** See ²community: climax: physiographic climax.
- ♦ **physiological clock** See clock: physiological clock.
- ♦ **physiological genetics** See study of: genetics: physiological genetics.
- ♦ **physiological temperature regulation** See temperature regulation: physiological temperature regulation.
- ♦ **physiological isolation** See isolation: reproductive isolation.
- ♦ **physiological longevity** *n.* “The maximum life span of an organism that dies of old age” (Lincoln et al. 1985).
- ♦ **physiological psychology** See study of: psychology: physiological psychology.
- ♦ **physiological race, physiological form** *n.* A race characterized by physiological properties (Lincoln et al. 1985).
- ♦ **physiological specialization** *n.* Evolution of a species into two, or more, physiological races (Lincoln et al. 1985).
- ♦ **physiological system** See ²system: physiological system.
- ♦ **physiology** See study of: physiology.
- ♦ **physogastry** *n.* For example, in termite queens, queens of some ant species: Excessive enlargement of an abdomen (Lincoln et al. 1985).
- ♦ **phytalfauna** See fauna: phytalfauna.
- ♦ **-phytium** *comb.f.* Referring to a plant community. See ²community.
- ♦ **phyto-, -phyt-** *comb.f.* “Plant, or related to vegetation” (Michaelis 1963). [Greek *phyton*, plant]
- ♦ **phytoalexin** *n.* In more derived-plant species: An antifungal agent produced by a plant that helps to protect it (Müller and Börger 1941 in Harborne 1982, 239–240).
- ♦ **phytobenthos** See ²community: benthos: phytobenthos.
- ♦ **phytobiology** See study of: biology: botany.
- ♦ **phytobiont** See biont: phytobiont; -cole: plant-cole.
- ♦ **phytochemical ecology** See study of: ecology: chemical ecology.
- ♦ **phytochemistry** See study of: taxonomy: phytochemistry.
- ♦ **phytocoenology** See study of: phytocoenology.
- ♦ **phytocenose** See -coenosis: phytocenosis.
- ♦ **phytoecology** See study of: ecology: phytoecology.
- ♦ **phytoedaphon** See ²community: phytoedaphon.
- ♦ **phytogamy** See -gamy: phytogamy.
- ♦ **phylogenesis** See -genesis: phylogenesis.
- ♦ **phylogenetic** See -genic: phylogenetic.
- ♦ **phytogeogenesis** See -genesis: phytogenesis.
- ♦ **phytogeography** See study of: geography: biogeography: phytogeography.
- ♦ **phytophotography** See -graphy: photophotography.
- ♦ **phytology** See study of: botany.
- ♦ **phytome** See ²community: phytome.
- ♦ **phytomimesis** See mimesis: phytomimesis.
- ♦ **phytoneuston** See neuston: phytoneuston.
- ♦ **phytopalaeontology** See study of: botany: paleobotany.
- ♦ **phytopathology** See study of: pathology: phytopathology.
- ♦ **phytophage** See -phage: phytophage.
- ♦ **phytophenology** See study of: phenology: phytophenology.
- ♦ **phytopophile** See ¹-phile: phytopophile.
- ♦ **phytoplanktivore** See -vore: molluscivore.
- ♦ **phytoplankton** See plankton: phytoplankton.
- ♦ **phytosociology** See study of: phytocoenology.
- ♦ **phytostrote** *n.* An organism that migrates, or disperses, through the agency of plants (Lincoln et al. 1985).

- ♦ **phytosuccivore** See -vore: phytosuccivore.
- ♦ **phytotelmic** *adj.* Referring to an organism that inhabits small water pools within, or upon, plants (Lincoln et al. 1985).
- ♦ **phytoteratology** See study of: teratology: phytoteralogy.
- ♦ **phytotopography** See study of: geography: phytotopography.
- ♦ **phytotroph** See -troph-: autotroph.
- ♦ **pick** See tool: pick.
- ♦ **picoplankton** See plankton: picoplankton.
- ♦ **Piedmont Province** See geological province: Piedmont Province.
- ♦ **pigmentation rule** See law: Gloger's rule.
- ♦ **piloerection** *n.* A mammal's erecting its fur, or hair, in connection with threatening another animal (Heymer 1977, 81) or physiological arousal (Immelmann and Beer 1989, 221).
cf. feather ruffling
- ♦ **pinnacles of social evolution** See ²group: pinnacles of social evolution.
- ♦ **pinnigrade** See -grade: pinnigrade.
- ♦ **pinnigrade locomotion** See locomotion: pinnigrade locomotion.
- ♦ **pioneer** See ²community: pioneer; ²species: pioneer.
- ♦ **piping** See animal sounds: piping.
- ♦ **piracy** See parasitism: cleptoparasitism.
- ♦ **pirate** See robber.
- ♦ **piscicole** See -cole: piscicole.
- ♦ **piscivore** See -vore: piscivore.
- ♦ **pitfall trap** See trap: pitfall trap.
- ♦ **pituitary gland** See gland: pituitary gland.
- ♦ **PK** See kinesis: psychokinesis.
- ♦ **PKDB** See database: *Internationale Paläoklima-Datenbank* (Appendix 3).
- ♦ **place** *n.* A particular point, or portion of space, especially that part of space occupied by, or belonging to, a thing under consideration; a definite locality or location (Michaelis 1963).
See behavior: place.
cf. region

Comments: I list a few of the millions of places of biological interest below. These sites are described in more detail on the World Wide Web.

Acadia National Park, Maine, U.S.

Addo Elephant National Park *n.* A national park in the Eastern Cape of South Africa (South African National Parks 2009).

Comments: The 164,000-ha Park now has *Circellium bacchus* (Addo Flightless Dung Beetles) and over 450 *Loxodonta africana* (African Elephants) as well *Canis mesomelas* (Black-backed Jackals), *Diceros bicornis* (Black Rhinoceros), *Francolinus capensis* (Cape Francolin), and *Syncerus caffer* (Cape Buffalo) (South African National Parks 2009).

Appalachian Mountains *n.*

1. The present mountain system of eastern North America, extending from the Gaspé Peninsula (Québec, Canada) through Alabama (U.S.) (Michaelis 1963).

Notes: This system contains the Appalachian Plateau Province (*q.v.*), Blue Ridge Province (*q.v.*), Piedmont Province (*q.v.*), and Ridge-and-Valley Province (*q.v.*), which include the Allegheny Mountains, Blue Ridge Mountains, Great Smoky Mountains, Green Mountains, Shenandoah Mountains, and White Mountains. Mt. Mitchell

(6,684 ft, North Carolina) is the highest peak. The present Appalachian Mountain system is a product of gentle uplift and erosion of rock of varying resistance.

2. The past three mountain systems of Eastern North America that are now highly eroded and mostly under thick sediments of the Atlantic Coastal Plain and continental shelf (Stanley 1989, 214).
3. Nontechnically, the Ridge-and-Valley Province of the Eastern U.S. (Stanley 1989, 216).

Note: The original Appalachians formed mainly in the Paleozoic Era, resulting from three mountain-building events starting in the Ordovician (about 470 Ma ago) when Africa moved close to North America (Stanley 1989, 214, illustration).

[possibly after *Apalachee* Indians, a Choctaw name (Stewart and Borovac 1994)]

Appalachian Trail *n.* A 2,158-mi-long hiking trail in Eastern U.S. in the Appalachians from Baxter Park Mountain, Maine southwest to Amicola Falls, Georgia (Robberson 1996, B3).

syn. Appalachian National Scenic Trail (Reader's Digest 1996, map 5)

Comments: From approximately northeast to southwest, this trail runs from Maine through Georgia.

Altamira Cave, Spain

arboretum *n., pl. arboreta*

1. "A place devoted to the cultivation and exhibition of rare trees; a botanical tree-garden" (Oxford English Dictionary 1972).
2. "A place for the scientific study and public exhibition of many species of trees and shrubs" (Morris 1982).

Comments: Currently, some arboreta do more than these definitions indicate. For example, the U.S. National Arboretum also performs research on non-woody plants; develops new cultivars; implements new technologies for the plant trade; and collects, propagates, maintains, distributes, evaluates, and preserves representative levels of inherent genetic diversity of woody landscape plants as part of the National Plant Germplasm System (United States National Arboretum 2010). Garrett Park, Maryland, U.S., is a suburban community which designated itself an arboretum in 1977 (Town of Garrett Park 2010). This town defines an arboretum as "a varied collection of trees and shrubs selected, grown, and labeled for a specific purpose." This includes providing shade, beautiful flowers, fine fall color, and education of citizens regarding the plants. The Arnold Arboretum of Harvard University, U.S., is the oldest public arboretum in North America and one of the world's leading centers for the study of plants (Arnold Arboretum of Harvard University 2010). Arboretum Trsteno in Croatia was already in existence by 1492 (Arboretum Trsteno 2010).

[Latin *arboreum*, a place grown with trees < *arbor*, tree]

Area de Conservación Guanacaste (ACG) *n.*

A 110,000-ha area of cloud forest, dry forest, and rainforest and 43,000 ha of Pacific Ocean in northwest Costa Rica, Central America (http://janzen.sas.upenn.edu/caterpillars/RR/rincon_rainforest.html, 2001).

Comment: The ACG crosses nine life zones from the dry Pacific coastal plain through the Atlantic rainforests.

Banff National Park, Canada

Battle Creek Cypress Swamp *n.* A 100-acre nature sanctuary in Calvert County, Maryland, U.S. which contains a swamp dominated by *Taxodium distichum* (Baldcypress, fig. 24, Maryland Department of Natural Resources 2002).

Comments: This preserve might be thousands of years old and be descended from Miocene Baldcypress swamp. The preserve is in the northern limit of the range of Baldcypress.

Barro Colorado Island (BCI) *n.* The Smithsonian Tropical Research Institute's primary site for study of lowland moist tropical forest (www.si.edu/organiza/centers/stri/about.htm).

Comments: BCI is a 1500-ha island that has been under continuous study since 1923 (www.si.edu/organiza/centers/stri/about.htm). The Institute is also the custodian of five adjacent mainland peninsulas, which, with the island, form the 5400-ha Barro Colorado Nature Monument.

Belt Woods Natural Environmental Area (BWNEA) *n.* A 624-acre, wildlife preserve in Maryland, U.S., which contains old-growth forest, including large oaks and *Liriodendron tulipifera* (Tuliptrees) and farm fields and is a critical habitat for Neotropical songbirds and many other organisms (State of Maryland 1996).

Comment: Old-growth forest is currently very rare in the U.S. Coastal Plain Province. *Flute's Journey: The Life of a Wood Thrush* is a popular children's book about birds and the BWNEA (Cherry 1997).

Big Thicket National Preserve, Texas, U.S.
Biscayne National Park, Florida, U.S.

biodiversity hotspot *n.* A region that is especially rich in endemic species, is low in pristine vegetation, is threatened by human activities, and deserves special protection (Myers 1999, March–April, 35; Boroughs 1999, May–June, 15; Cincotta et al. 2000, 990).

cf. place: major-tropical-wilderness area, Megadiversity Countries

Comments: Norman Myers, Oxford ecologist, formulated the concept of biodiversity hotspot in 1988 (Myers 1999, March–April, 35; Cincotta et al. 2000, 990, map of hotspots). His 1988 list contains 25 biodiversity hotspots which occupy 12% of Earth's land, yet contain more than 50% of its terrestrial species. The 25 biodiversity hotspots are (1) Tropical Andes, (2) Mesoamerica, (3) Caribbean, (4) Atlantic Forest Region, (5) Chocó-Darién-Western Ecuador, (6) Brazilian Cerrado, (7) Central Chile, (8) California Floristic Province, (9) Madagascar, (10) Eastern Arc Mountains and Coastal Forests of Tanzania and Kenya, (11) West African Forests, (12) Cape Floristic Region, (13) Succulent Karoo, (14) Mediterranean Basin, (15) Caucasus, (16) Sundaland, (17) Wallacea, (18) Philippines, (19) Indo-Burma, (20) Mountains of South-Central China, (21) Western Ghats and Sri Lanka, (22) Southwest Australia, (23) New Caledonia, (24) New Zealand, and (25) Polynesia and Micronesia. Australia has 15 national biodiversity hotspots announced in October 2003, which include Border Ranges North and South (Queensland and New South Wales), Midlands of Tasmania, and Victorian Volcanic Plain (Australian Government Department of the Environment, Water, Heritage and the Arts 2010, map of Australian hotspots). Conservation International announced five more biodiversity hotspots in 2005, making a total of 34 such regions (Roach 2005). As

a group the 34 hotspots, contain about half of all animal and plant species and cover about 15.7% of Earth's surface area. All five of the newly-designated hotspots have already lost 70% of their original natural habitats. Because particular locations can be rich in some taxa but poor in others, one taxon's abundance is not necessarily a good predictor of the abundance of another taxon (Alcock 2006, 212). For example, the number of bee species in an area is not necessarily positively correlated with the number of orchid species in that area.

Blackwater Falls State Park, West Virginia, U.S.

brownfield site *n.* A site that people previously used for development and that is currently abandoned, such as a factory site, quarry, railway, and road (New 2009, 145).

Comment: A brownfield site can be a habitat of a threatened or endangered species (New 2009, 146).

Burgess Shale *n.* Shale in British Columbia, Canada, with beautifully preserved fossils of soft-bodied fauna from the Late Early Cambrian, similar to those from Chengjiang (Erwin et al. 1997, 132–133; illustration, 128–129).

Bwindi National Park *n.* A 331-km² park in Uganda established in 1991 to conserve a population of Mountain Gorillas (Anonymous 2001).

Comments: There might have been 300 Mountain Gorillas in this park in 2001 (Fisher 2001, A3).

Calvert Cliffs *n.* A group of highly fossiliferous cliffs that extends for about 30 mi along the Chesapeake Bay in Calvert County, Maryland, U.S. (Ashby 1995, 1; fig. 36 in this book).

Comment: Calvert Cliffs bear protistan, plant, and both invertebrate and vertebrate animal fossils (fig. 18) from the Miocene Epoch (5–24 Ma ago).

Canyonlands National Park, Utah, U.S.

Certified Wildlife Habitat *n.* A yard that has cover places, food and water sources, and young-rearing places for wildlife (native organisms of all kinds) and sustainable gardening practices and that is certified by the National Wildlife Federation (National Wildlife Federation 2010).

Comments: Thousands of people in the U.S. have Certified Wildlife Habitats.

Chauvet Grotto *n.* A cave in Vallon-Pont-d'Arc, France, with Aurignacian depictions of animals and Humans that date between 30,300 and 32,400 yr old, making these human paintings the oldest known (Thomas, 1995, A30; Folger 1996, January, 70–71, photograph).

Comments: Jean-Marie Chauvet and friends discovered the paintings in this Grotto in 1994 (Thomas, 1995, A30). There are more than 300 images including those of birds, bison, butterflies, mammoths, rhinoceroses, and the Sorcerer. The paintings were dated from pieces of charcoal on the ground, samples of pigment from paintings, and carbon in torch marks on cave walls. Before the discovery of Chauvet Grotto, anthropologists thought the most ancient cave paintings were in Cosquer Grotto, near Marseille, France, which date from 27,110 yr ago.

Chengjiang, Yunnan Province, China *n.* A location with beautifully preserved fossils of soft-bodied fauna from the Late Early Cambrian, including

a number of forms from extinct phyla (Erwin et al. 1997, 132; illustration, 128–129).

cf. Burgess Shale

Chicxulub Crater *n.* A 180-km-wide crater in the Yucatán Peninsula region caused by a meteorite that fell to Earth about 65 Ma ago at the end of the Cretaceous Period (Sharpton et al. 1993, 1564; Kerr 1997, 28 February, 1265).

cf. hypothesis: single-impact hypothesis

Comments: This meteorite came close to puncturing the Earth's crust and drove blocks of earth into the air near the crater and smaller particles as far as 2,000 km from the its impact site and produced tiny particles that went around the world (exhibit, U.S. Museum of Natural History, 2002). The impact further caused a tsunami about 1 km high and likely caused spontaneous wildfires around the Earth and a darkness around the Earth for about 1 yr. The impact apparently killed off many species of unicellular organisms (Kerr 1997, 28 February, 1265). The effect of this meteorite on Earth's life is not fully understood (Stanley 1989, 509). It might have produced an impact-caused winter that killed off the last dinosaurs and many marine groups; however, their ecosystems were already deteriorating, perhaps due to long-term climatic changes.

Cibola National Forest, New Mexico, U.S.

Dartmoor National Park, United Kingdom

Death Valley National Park *n.* A U.S. national park in California and Nevada of over 3.3 million acres (<http://www.nps.gov/deva/>, 2003).

Comments: This park includes badlands, canyons, gulches, Joshua Tree forests, the lowest dry land in the Western Hemisphere (Badwater, 282 ft below sea level) and mountaintop pine forests (Miller 2003, TR9). There has been full-scale mining in Death Valley.

Denali National Park, Alaska, U.S.

Dinosaur National Monument, U.S.

During Yuriakh *n.* An archeological site in Siberia with artifacts that are perhaps as old as 260,000 yr (Holden 1997, 1268, map; Waters et al. 1997, 1281).

Ediacara Hills *n.* Hills in Southern Australia that harbor a large number of Ediacaran fossils (*q.v.*) (Wright 1997, March, 54).

El Cimatario National Park, Mexico

Everglades, The *n.* A wet grassland that is up to 75 mi wide and extends over 100 mi from the Kissimmee River and Lake Okeechobee in south-central Florida to its southern shores (Michaelis 1963; Kritcher and Morrison 1988, 87).

Comments: The Everglades is essentially a very wide, shallow river that flows very slowly from the north to the south (Michaelis 1963; Kritcher and Morrison 1988, 87; Friends of the Everglades 2000). Most of the area is a marsh. The Everglades also has coastal mangrove forests (fig. 25), patches of Baldcypress and other trees, called cypress heads, and hammocks (*q.v.*) with subtropical forest which occur in the higher and drier areas. Everglades National Park is the southern area of the original Everglades. Starting in the 1950s, people caused many environmental disasters in the Everglades by draining areas, digging canals, polluting from farms, pumping out water, and so forth. Currently, the Army Corps of Engineers and others are trying to restore many parts of this habitat with the \$7.8-billion Everglades Restoration Project (Associated Press 1999, 8 April, A21). People drained about 50% of the Everglades. Compared to the 1930s,

the current populations of nesting wading birds are very low in the Everglades. The Everglades Restoration Page (Nova Southeastern University's Oceanographic Center 2002) provides much information about the history of the Everglades and related topics.

Galápagos Islands *(gal la pa GOSE) n.* A group of islands and islets about 650 mi off the coast of Ecuador (Jackson 1993).

syn. *Encantadas* (Bewitched Islands, because of the way in which strong and variable currents made navigation difficult), *Insulae de los Galopergos* (Islands of the Tortoises) (Jackson 1993, 1).

Comments: There are 13 large islands (over 10 km²), 8 smaller islands, and about 40 islets, totaling 3,029 mi² (Jackson 1993; Terraquest 2001). The Galápagos Islands formed about 3 through 5 Ma ago. In 1535, the Bishop of Panama (Fray Tomás de Berlanga) "discovered" the Islands, when ocean currents carried him and his crew there on their becalmed ship. Buccaneer Ambrose Cowley gave many of the Islands English names after fellow pirates or English noblemen who helped the pirates. In 1835, Charles Darwin visited Floreana, Isabela, San Cristóbal, and Santiago where he collected finches and mockingbirds. He published "On The Origin of the Species by Natural Selection" in 1859, using some of the data (especially mockingbird and tortoise information) that he obtained on these Islands. In 1959, people founded the Charles Darwin Research Station, on the Islands. They equipped a modern research vessel and christened her Beagle II. On the 100th Anniversary of the publication of Darwin's *Origin of Species*, the Galápagos Islands became Ecuador's first National Park, and the nonprofit Charles Darwin Foundation was established to assist in the preservation of the islands. The Islands are famous, important sites for biological studies. The Islands have seven vegetation zones and many endemic species. Biota of the Islands includes about 600 native vascular-plant taxa (species, subspecies, and varieties), about 190 introduced vascular-plant species, 22 reptile species, 78 bird species, 14 mammal species (including six native mammal species), about 2,000 species of terrestrial (including freshwater) invertebrates, and 1,900 species of native marine invertebrates. About 12,000 people lived on the Islands in 1990.

[Spanish *galápagos*, tortoises]

Galápagos National Park, Ecuador

Gombe National Park, Tanzania

Geological Site of Specific Scientific Interest (Geological SSSI)

Great Smoky Mountains National Park, North Carolina, Tennessee, U.S.

Gunflint Formation *n.* A Canadian geological formation that dates to 2 Ga ago, is found on the north shore of Lake Superior, and contains microscopic fossils (Tyler and Barghoorn 1954 in Ravven 1990, 98).

Gunnung Leuser National Park *n.* A park in Sumatra (Ferber 2000, 19 May, 1148).

Comment: This park is the last stronghold of Orangutans, *q.v.*, but people are endangering them by actively and illegally logging the park (Ferber 2000, 19 May, 1148).

Hubbard Brook Experimental Forest (HB EF)

n. A log-term ecological Research Site in the White Mountains of Central New Hampshire, U.S. (United

States Department of Agriculture Forest Service 2008).

Joshua Tree National Park, California, U.S.

Jurassic Coast *n.* A World Heritage Site of 95 mi of stunning coastline from East Devon through Dorset, United Kingdom, which records 185 Ma of Earth's history based on fossil and rock data from the Cretaceous, Jurassic, and Triassic Periods (Jurassic Coast 2009).

Kahuzi-Biéga National Park *n.* A 600,000-ha park in the Democratic Republic of Congo established in 1980 to conserve a population of *Gorilla beringei beringei* (Mountain Gorillas) (Anonymous 2001; United Nations Educational, Cultural, and Scientific Organization 2001).

Comment: This park is a vast area of primarily tropical forest, and it contains two spectacular extinct volcanoes, Kahuzi and Biega (Anonymous 2001).

Kitty Todd Nature Preserve *n.* An 850-acre reserve in Ohio, U.S., that contains the globally endangered Black Oak Savanna Community and a concentration of rare Ohio species including, *Chondestes grammacus* (Lark Sparrow), *Lupinus perennis* (Wild Lupine), and *Lycaeides melissa samuelis* (Karner Blue Butterfly) (The Nature Conservancy 2009, fig. 37 in this book).

Lascaux Cave *n.* Limestone caverns of Lascaux, France that contain magnificent Pleistocene paintings from about 17,000 years ago (Milner 1990, 266).

Comments: In 1963, authorities closed this Cave to tourists because they produced moisture that enabled patches of algae to grow on the paintings (Milner 1990, 266–267). In 1984, France opened Lascaux II for tourists. This is a painstaking replica of the original Lascaux Cave.

major-tropical-wilderness area *n.* One of three areas of tropical forest that is more pristine than all other areas of such forest and that exhibits a high degree of species endemism (Cincotta et al. 2000, 990).

cf. place: biodiversity hotspot

Comments: Primatologist Russell Mittermeier developed the concept of "major-tropical-wilderness area" in 1988 (Cincotta et al. 2000, 990); the three such areas are "Congo Basin," "New Guinea/Melanesian Islands," and "Upper Amazonia/Guyana Shield," which cover 6.3% of Earth's terrestrial surface

Megadiverse Countries *n.* Seventeen countries that have more than two-thirds of all known species and the majority of coral reefs, tropical rainforests, and other priority ecosystems (Australian Government Department of the Environment, Water, Heritage and the Arts 2010).

Comments: These countries cover less than 10% of Earth's surface, but they have about 70% of its biodiversity (Australian Government Department of the Environment, Water, Heritage and the Arts 2010). Russell Mittermeier developed the concept of megadiverse countries in 1988 as a way to prioritize conservation action. For example, he found that four countries have two-thirds of primate species, and he expanded his analysis to include Amphibia, Aves, Mammalia, Plantae, Reptilia, and selected insect taxa. The countries are Australia, Brazil, China, Colombia, Democratic Republic of the Congo (formerly Zaire), Ecuador, India, Indonesia, Madagascar, Malaysia, Mexico, Papua New Guinea, Peru, the Philippines, South Africa, the U.S., and Venezuela.

Mistaken Point *n.* A formation of sandstone and siltstone in southeast Newfoundland that juts into the Atlantic and harbors Ediacaran fossils (Wright 1997, March, 54).

Monarch Butterfly Biosphere Reserve, Reserva de la Biosfera Mariposa Monarca

n. A preserve for overwintering Monarch butterflies in central Mexico created in 1986 (Monarch Butterfly Sanctuary Foundation 2000).

Monte Verde, Chile *n.* The oldest accepted site of human habitation in the Americas (Gibbons 1997, 1256–1257).

cf. Clovis People, Monte-Verde People (Appendix 1)

Monteray Bay National Marine Sanctuary, California, U.S.

Moody Swamp *n.* A swamp along the Altamaha River, Georgia, U.S., which contains a virgin forest of *Pinus palustris*, *q.v.* (Raver 2000, D8).

Mount Rainier National Park, Washington, U.S.

Mount Sneffels Wildernesss, Colorado, U.S.

Napali Coast State Park, Hawai'i, U.S.

Namib Desert *n.* A desert along the coast of Namibia, Africa (Erongo Region ICZM Project, 2000).

Comments: This is a very old desert with many endemic organisms including the gymnosperm *Welwitschia mirabilis* (Gnetophyta) and four species of terrestrial birds (Erongo Region ICZM Project 2000). Dune reptiles include *Bitis peringueyi* (Southern Namib Sand Adder), *Meroles anchietae* (Southern Slipface Lizard), and *Palmatogecko rangei* (Palmato Gecko). Their famous behaviors are foot-lifting, licking fog water off themselves, sand diving, and side-winding.

Niwot Ridge *n.* A Long-term Ecology Research Network Site and a United Nations Educational, Scientific and Cultural Organization (UNESCO) Biosphere Reserve located about 35 km west of Boulder, Colorado (University of Colorado at Boulder 2008).

Comment: The entire Niwot Ridge study site is above 3000 m elevation and has alpine tundra, cirques and talus slopes, glacial lakes and moraines, a glacier, patterned ground, and permafrost (University of Colorado at Boulder 2008).

Old Crossman Pit *n.* A fossil site in Sayreville, New Jersey, U.S., with many plant species preserved as possibly billions of fossils (Yoon 1999, 21 December, D20).

Olympic National Park, Washington, U.S.

Oyamel Forest *n.* An *Abies* (fir) forest in central Mexico where Monarch butterflies overwinter (Monarch Butterfly Sanctuary Foundation 2000).

cf. The Monarch Butterfly Sanctuary Foundation (Appendix 2).

Comment: This forest is in jeopardy due to logging (Yoon 2000, 12 September, D1).

Ozark National Scenic Riverways *n.* An 80,000-acre national park along 134 mi of the Jacks Fork River in the Ozark Highlands, U.S. (Hubbell 2003, www.nps.gov/ozar/).

Comments: This park has a karst geology (including many caves), rare plants (some of which are ice-age relicts), and many other organisms (Hubbell 2003). This park was last logged in 1940s and includes Barn Hollow Conservation Area.

national wildlife refuge (NWR) *n.* One of about 538 U.S. wildlife preserves which include over 94 million acres in many different ecosystems (<http://>

mpa.gov/mpaservices/inv_status/sup1d_doi_fws.html, 2003).

Comments: All U.S. states have at least one national wildlife refuge (Debnam 2003, SC10). Pelican Island NWR, established in 1903, is the first NWR. The largest refuge is Alaska's Arctic National Wildlife Refuge (NWR), and the smallest is Minnesota's Mille Lacs NWR. Other refuges are Chincoteague NWR, Virginia; Kodiak NWR, Alaska; National Elk Refuges, Wyoming; and Okefenokee NWR in Florida and Georgia, U.S.

Pacific Ocean Preserve *n.* An underwater nature preserve of 84 million acres around the northwestern Hawaiian Islands (Associated Press 2000, A23). *cf.* coral reef

Comments: The Clinton Administration created this preserve in 2000 (Associated Press 2000, A23). It helps to preserve wildlife in nearly 70% of the coral reefs in the U.S., as well as on atolls, on remote islands, and in submerged lagoons. President Clinton called it "a special place where the sea is a living rainbow."

Pacific Rim National Park, Vancouver Island, Canada

park *n.*

1. A tract of land that people set aside for public use (Morris 1982, 903).
2. A public, natural environment that people set aside for cultural, natural, or both qualities, and that is usually administered, managed, and owned by a public institution (after Maller et al. 2005, 46).

[Middle English, royal land set aside for hunting < Old French, *parc*]

Parque Nacional Arikok, Aruba

Pilbara Sediments *n.* Slightly metamorphosed sedimentary rocks in Western Australia that are about 3,250 Ma old and contain elemental carbon that may be remains of early life on Earth (Holland 1997, 38).

Comment: The structures that might be the oldest stromatolite fossils are from the Pilbara Shield, Australia, in rocks 3.4–3.5 Ga old (Stanley 1989, 255–256, illustration).

Redwood National Park, California, U.S.
Shark Bay, Australia

Shenandoah National Park, Virginia, U.S.
Site of Specific Scientific Interest (SSSI) *n.*

A protected place of conservation concern in the United Kingdom (inferred from New 2009, 16).

Tongass National Forest *n.* The 17-million-acre temperate rain forest in Southeast Alaska, U.S. (www.fs.fed.us/r10/tongass/, 2000).

Comments: This is the largest temperate rain forest and the U.S.' largest national forest; much of it is old-growth forest (Malusa 1999, 46; www.fs.fed.us/r10/tongass/, 2000). Parts of this forest receive up to 160 in of precipitation per yr.

Tonto National Forest, Arizona, U.S.

Valley of the Butterflies *n.* The only natural forest of *Liquidambar orientalis* in Europe and a rare congregation and mating site of the arctiid moth *Panaxia quadripunctaria* which is located on the Greek Island of Rhodes (Petanidou et al. 1991, 124). *syn.* Petaloudes (Greek, butterfly)

Comments: This site is a major tourist attraction for people who come to see the colorful moths. Because of a marked, tourism-related moth population decline, officials took several key conservation measures to protect the moths (Petanidou et al. 1991,

124). A person(s) who named the Valley evidently considered these moths to be butterflies.

Virunga National Park *n.* An 809,000-ha national park in the Virunga Volcano Region (*q.v.*) in the Democratic Republic of Congo, established in 1925 to protect *Gorilla beringei beringei* (Mountain Gorillas) (Anonymous 2001).

syn. Albert National Park (former name), *Parc National des Virunga* (Anonymous 2001)

Virunga Volcano Region *n.* An approximately 300-km² area in eastern Africa which is separated into three adjacent national parks in three countries: Mgahinga Gorilla National Park in Uganda, Volcano National Park in Rwanda, and Virunga National Park in the Democratic Republic of Congo (Rutagarama 2001).

Comments: There might have been 358 *Gorilla beringei beringei* (Mountain Gorillas) in the Region in 2001 (Fisher 2001, 6 March, A3). The Region has eight lushly vegetated volcanoes.

Volcano National Park *n.* A mountainous park in the Virunga Volcano Region (*q.v.*) in Rwanda where *Gorilla beringei beringei* (Mountain Gorillas) live (Fisher 2001, A3).

Comments: Officials closed this park in the 1990s because of war and reopened it in 1997 (Fisher 2001, A3). This Park harbors the Karisoke Research Center, founded by Dian Fossey for Gorilla research in 1967. About 450 Mountain Gorillas lived in the Park in 1960; 254, in 1981; 324, in 1989.

Voyageurs National Park, Minnesota, U.S.

White Mountains, California, U.S.

White Mountains National Forest, New Hampshire, U.S.

Wicken Fen *n.* A nature preserve in Southeastern England of major ecological importance (National Trust 2009).

Comments: The Fen, with its over 8,020 animal, fungus, and plant species, is one of the richer habitats in England (National Trust 2009). This preserve has habitats such as dykes, fen meadows, grassland, pools, reed communities, sedge beds, and woodland.

Wolong Nature Reserve *n.* The largest nature preserve (500,000 acres) in China where endangered *Ailuropoda melanoleuca* (Giant Pandas) live (Environment News Services 2001; Revkin 2001, A6).

Comments: China created this Reserve in 1975 to protect wild Giant Pandas; about 10% of China's Pandas live in this preserve. In 1986, only about 72 Giant Pandas lived in the Reserve. It harbors angiospermous trees (including bamboo) and gymnospermous trees. People have destroyed the forests of this preserve at an alarming pace since 1975.

World Heritage Site *n.* One of 890 properties that form part of the cultural and natural heritage which the World Heritage Committee considers as having outstanding universal value (UNESCO World Heritage Centre 2010).

Yosemite National Park, California, U.S.

♦ **place imprinting** See learning: imprinting: place imprinting.

♦ **placenta** See organ: placenta.

♦ **placentophagia** See -phagia: placentophagia.

♦ **placer mining** *n.* In *Macaca fuscata* (Japanese Macaques): An individual's method of separating wheat grains from sand by throwing a wheat-sand mixture

into water and scooping the floating wheat from the water surface (Wilson 1975, 171).

cf. tradition

♦ **plagio-, plagi** *comb. f.* “Oblique; slanting” (Michaelis 1963).

[Greek *plagios*, oblique]

♦ **plagioclimax** See ²community: climax: plagioclimax.

♦ **plagiosere** See ²succession: plagiosere.

♦ **plan** *n.*

1. A detailed method, program, or scheme worked out beforehand to accomplish an objective (Morris 1982).

2. A proposed, or tentative, goal or project (Morris 1982).

[French < *planter*, to plant < Latin *plantare* < *planta*, sole of a foot]

Biodiversity Action Plan (BAP) *n.* An internationally recognized conservation program that addresses the problem of threatened species and habitats and seeks to protect and restore biological systems (Joint Nature Conservation Committee 2007).

Comments: The BAP derives from the 1992 Convention on Biodiversity (Joint Nature Conservation Committee 2007). Different countries have BAPs, and the United Kingdom BAP describes the United Kingdom’s biological resources and has a detailed plan for the protection of these resources (New 2009, 75).

recovery plan *n.* A proposed set of measures that serves as a guide for management and recovery of one, or more, associated, species, endangered species, threatened species, or a combination of them (Boersma et al. 2001 in New 2009, 58).

syn. action plan, action statement, management plan
Comment: Recovery plans differ enormously in their complexities, lengths, and scopes (New 2009, 58). Recovery plans include the detailed Karner Blue recovery plan of 239 pages for the U.S. (New 2009, 58, 75), *Maculinea* Butterfly recovery plan for Europe, carabid recovery plan and Weta recovery plan for New Zealand (New 2009, 59). Some organizations, e.g., New Zealand’s Department of Conservation differentiates formally between action plans and recovery plans (New 2009, 63, 67).

♦ **planet** *n.*

1. One of the celestial bodies that revolves around the Sun (Michaelis 1963).

Notes: From the Sun outwards, the planets are Mercury and Venus (the inferior planets); Earth; Mars, Jupiter, Saturn, Uranus, Neptune, and Pluto (the superior planets) (Michaelis 1963). Asteroids are between Mars and Jupiter. In 2006, the International Astronomical Union redefined “planet” with regard to the Sun Solar System. This definition reclassified Pluto as a minor planet.

2. A large celestial body that revolves around a star (Svitil 2000, March, 29).

Comments: Researchers found the first planet that revolved around a Sun-like star outside of our Solar System in 1995 (Svitil 2000, March, 29). As of January 2000, researchers found a total of 29 such planets, including three that are in a solar system. Two of these planets may have temperatures from 108 through 130° F, which might be conducive to life. Researchers first found planets around pulsars in 1991.

[Old French *planeta* < Late Latin *planeta* < Greek *planētēs*, wander < *planēsthai*, to wander]

Planet of 51 Pegasi *n.* A planet that rotates around the star 51 Pegasi in the constellation Pegasus,

50 light-years from Earth (Mayor and Queloz, 1995 in Ganz 1997, 1257–1258).

Comments: This is the first planet that orbits a Sun-like star found by researchers (Svitil 2000, March, 29).

♦ **-planetic** *adj.*

1. Referring to a species that has motile, or swimming, stages (Lincoln et al. 1985).

2. Motile (Lincoln et al. 1985).

n. plantism

diplanetic *adj.* Referring to an organism that has two motile stages during its life cycle (Lincoln et al. 1985).

monoplanetic *adj.* Referring to an organism that has a single motile stage during its life cycle (Lincoln et al. 1985).

polyplanetic *adj.* Referring to an organism that has a more than two motile stages and intervening resting stages during its life cycle (Lincoln et al. 1985).

♦ **plankter, plankt, plankton** See plankton.

♦ **planktobiont** See biont: planktobiont.

♦ **planktohyponeuston** See neuston: hyponeuston: planktohyponeuston.

♦ **plankton** *n. pl., sing. plankter, plankt, plankton*

1. Aquatic organisms that drift, or float, with currents, waves, and so forth; are unable to influence their own general courses; and range in size from micro-organisms through jellyfish; distinguished from benthos (modified from Michaelis 1963).

Comments: Aquatic plankton occur in fresh water, brackish water, and salt water (Michaelis 1963, Ali and Lord 180, Schindler et al. 1997, 249).

2. Aquatic, or aerial, organisms that are unable to maintain their general positions, or distributions, independent of water, or air, movement (Lincoln et al. 1985).

adj. planktonic

cf. ²community: benthos; nekton; pleuston; seston; -xene: planktoxene

Comments: A plankter is an individual planktonic organism, e.g., a zooplankter or a phytoplankter (Lincoln et al. 1985). Plankton are classified by size, type of organism, habitat, and other characteristics (Lincoln et al. 1985).

[German < Greek neuter of *planktos*, drifting, wandering]

aeroplankton, aerial plankton *n. pl.* Plankton that are freely suspended in air and dispersed by wind (Lincoln et al. 1985).

bacterioplankton *n.* Bacterial species found in plankton (Steiner 2001, 2497).

Comment: Most bacterial plankton are less than 1 µm across (Lampert and Sommer 1997 in Steiner 2001, 2497).

collaplankton See plankton: kollaplankton.

euplankton See plankton: holoplankton.

haliplankton, haloplankton *n. pl.* Marine, or inland saltwater, plankton (Lincoln et al. 1985).

hekistoplankton *n. pl.* Flagellated nanoplankton (Lincoln et al. 1985).

heleoplankton *n. pl.* Plankton of small ponds and marshy habitats (Lincoln et al. 1985).

hemioplankton See plankton: meroplankton.

hidroplankton *n. pl.* Plankton that achieve buoyancy using surface secretions (Lincoln et al. 1985).

holoplankton, euplankton *n. pl.* Plankton that are permanent members of a plankton community (Lincoln et al. 1985).

cf. plankton: meroplankton

hyphalomyraplankton, hyphalmyroplankton *n. pl.*

1. Plankton of brackish water (Lincoln et al. 1985).
2. Floating organisms of saline waters (Lincoln et al. 1985).

hypoplankton *n. pl.* Plankton that live close to a sea bed or lake floor (Lincoln et al. 1985).

knephoplankton *n. pl.* Plankton of the twilight zone at from about 30 through 500 m deep (Lincoln et al. 1985).

cf. plankton: phaoplankton, skotoplankton

kollaplankton, collaplankton *n. pl.* Plankton that are buoyant due to their gelatinous envelopes (Lincoln et al. 1985).

kremastoplankton *n. pl.* Plankton that possess modified appendages, or surface structures, that reduce their rates of sinking (Lincoln et al. 1985).

limnoplankton *n. pl.* Plankton of freshwater lakes and ponds (Lincoln et al. 1985).

macroplankton *n. pl.* Plankton that are 20 through 200 mm in diameter (Lincoln et al. 1985).

megaloplankton *n. pl.* Plankton that are larger than 10 mm in diameter (Lincoln et al. 1985).

megaplankton *n. pl.* Plankton that are 200 through 2,000 mm in diameter (Lincoln et al. 1985).

meroplankton *n. pl.* Organisms that are temporary members of a planktonic community (Lincoln et al. 1985).

cf. plankton: holoplankton

mesoplankton *n. pl.* Plankton that are 0.2 through 20 mm in diameter (Lincoln et al. 1985).

microplankton *n. pl.* Plankton that are 20 through 200 µm in diameter (Lincoln et al. 1985).

monoton plankton *n. pl.* Plankton very heavily dominated by one species (Lincoln et al. 1985).

cf. plankton: pantomictic plankton, polymictic plankton, and prevalent plankton.

morphoplankton *n. pl.* Plankton that are rendered buoyant by their anatomical specializations, such as oil droplets or gas vesicles, or in which their rate of sinking is reduced by their structural features or diminutive body size (Lincoln et al. 1985).

nanoplankton *n. pl.* Plankton that have a body diameter of 2 through 20 µm (Lincoln et al. 1985).

neidioplankton *n. pl.* Plankton with some form of swimming apparatuses (Lincoln et al. 1985).

pantomictic plankton *n. pl.* Plankton that are not dominated by any particular species (Lincoln et al. 1985).

cf. plankton: monoton plankton, polymictic plankton, prevalent plankton

periodic plankton *n. pl.* Organisms that enter plankton only at certain times of the day, month, or season (Lincoln et al. 1985).

phaoplankton, phaeoplankton *n. pl.* Surface plankton of the upper photic zone (Lincoln et al. 1985).

cf. plankton: knephoplankton, scotoplankton

phylltioplankton *n. pl.* Plankton that are rendered buoyant by hydrostatic means (Lincoln et al. 1985).

phytoplankton *n. pl.* Photosynthetic plankton (Curtis 1983, 1103).

Comment: Many algal species are phytoplankton, and kinds such as unicellular algae and flagellates (Chlorophyceae) are small enough to be consumed

by zooplankton such as *Ceriodaphnia* and *Daphnia* (Crustacea) (Steiner 2001, 2495).

[Greek *phyton*, plant + plankton]

picoplankton *n. pl.* Planktonic organisms from 0.2 through 2.0 µm in diameter (Lincoln et al. 1985).

planktophyte *n. pl.* A planktonic plant; an individual phytoplankton (Lincoln et al. 1985).

polymictic plankton *n. pl.* Plankton that have several dominant or abundant species (Lincoln et al. 1985).

cf. plankton: monoton plankton, pantomictic plankton, prevalent plankton

potamoplankton *n. pl.* Plankton of slow moving streams and rivers (Lincoln et al. 1985).

prevalent plankton *n. pl.* Plankton dominated by one particular species that comprises at least half of the total plankton of the area (Lincoln et al. 1985).

cf. plankton: monton plankton, pantomictic plankton, polymictic plankton

pseudoplankton, tychoplankton *n. pl.* Organisms that are not normally plankton, but occur accidentally with plankton (Lincoln et al. 1985).

rheoplankton *n. pl.* Plankton associated with running water (Lincoln et al. 1985).

saproplankton *n. pl.* Plankton that inhabit water rich in decaying organic matter (Lincoln et al. 1985).

skotoplankton *n. pl.* Plankton that live in darkness below the photic zone (Lincoln et al. 1985).

cf. plankton: knephoplankton, phaoplankton

stagnoplankton *n. pl.* Plankton and floating vegetation of stagnant water bodies (Lincoln et al. 1985).

tychoplankton See plankton: pseudoplankton.

zooplankton *n. pl.* Nonphotosynthetic plankton (Curtis 1983, 1110).

Comments: Zooplankton in freshwater systems include *Ceriodaphnia* and *Daphnia* (Crustacea) (Steiner 2001, 2497).

[Greek *zoe*, life + plankton]

♦ **planktont** See plankter.

♦ **planktophile** See ¹-phile: planktophile.

♦ **planktophyte** See plankton: planktophyte.

♦ **planktotroph** See -troph-: planktotroph.

♦ **planktoxene** See -xene: planktoxene.

♦ **planned multiple-comparisons procedure**

See statistical test: multiple-comparisons test: planned multiple-comparisons procedure.

♦ **planogamete** See gamete: planogamete.

♦ **planomenon, ephaptomenon, rhizomenon**

n. “All free living organisms,” *i.e.*, those not attached to a substrate (Lincoln et al. 1985).

♦ **planont** See gamete: planont.

♦ **plant biogeography** See study of: geography: biogeography: phytogeography.

♦ **plant-defense guild** See guild.

♦ **plant immunity** See immunity: plant immunity.

♦ **“plant piercers”** See ²group: functional feeding group: “plant piercers.”

♦ **plant-pollinator landscape** *n.* Long-term mutualistic evolution of pollinators and their floral hosts (Buchmann and Nabhan 1996, 251).

[coined as “plant/pollinator landscape” by J. L. Bronstein (1994) in Buchmann and Nabhan (1996, 251)]

♦ **plant sociology** See study of: plant sociology.

♦ **plant teratology** See study of: teratology: plant teratology.

♦ **planticole** See -cole: planticole.

♦ **plantigrade** See -grade: plantigrade.

♦ **plantigrade locomotion** See locomotion: plantigrade locomotion.

- ♦ **plant's-dilemma hypothesis** See hypothesis: plant's-dilemma hypothesis.
- ♦ **planula** *n., pl. planulae* (plan NEW la, plan NEW lee) A solid group of cells similar to embryonic stages of Porifera and Cnidaria (Strickberger 1996, 609). See animal names: planula.
adj. planular, planulate
[New Latin < Latin, diminutive of *planus*, flat]
- ♦ **plasia, -plasis, -plasy** *comb. f.* "Growth; development; formative action" (Michaelis 1963).
adj. -plastic
[Greek *plasis*, molding < *plassein*, to mold, form]
- anaplasia, anaplasia** *n.*
1. The progressive phase in an organism's ontogeny prior to its attaining maturity (Lincoln et al. 1985).
 2. An evolutionary state characterized by increasing vigor and diversification of organisms (Lincoln et al. 1985).
- See dedifferentiation.
- cataplasia, cataplasia** *n.* An evolutionary state characterized by decreasing vigor (Lincoln et al. 1985).
- metaplasia** *n.*
1. An evolutionary state characterized by maximum vigor and diversification of organisms (Lincoln et al. 1985).
syn. metaplasia (Lincoln et al. 1985)
 2. One type of tissue's changing into another (Lincoln et al. 1985).
- ♦ **plasmagene** See gene: plasmagene.
- ♦ **plasmagynogamous fertilization** See fertilization: plasmagynogamous fertilization.
- ♦ **plasmagynogamy** See -gamy: plasmagynogamy.
- ♦ **plasmaheterogamous fertilization** See fertilization: plasmaheterogamous fertilization.
- ♦ **plasmaheterogamy** See -gamy: plasmaheterogamy.
- ♦ **plasmaisogamous fertilization** See fertilization: plasmaisogamous fertilization.
- ♦ **plasmaisogamy** See -gamy: plasmaisogamy.
- ♦ **plasmatogamy** See -gamy: plasmogamy.
- ♦ **plasmid** *n.* An autonomous, extrachromosomal, covalently closed circular (rarely linear), double-stranded, self-replicating DNA molecule found in most bacterial species and in some eukaryote species (Ledberg 1952 in Rieger et al. 1991).
cf. organelle: plastid
Comments: Linear plasmids occur in organisms including *Saccharomyces cerevisiae* (Baker's Yeast), *Streptomyces*, and *Zea mays* (Corn) (Rieger et al. 1991). In Corn, linear plasmids are in mitochondria. Plasmids often confer an evolutionary advantage to their hosts, e.g., antibiotic resistance or colicin production (King and Stansfield 1985).
- episome** *n.* A bacterial plasmid that can exist in two states within a cell, either independently in its cytoplasm or, following insertion, as an integral part of its chromosomes (Thompson 931 and Jacob and Wollmann 1958 in Rieger et al. 1991).
- F plasmid** *n.* A conjugative, circular plasmid that mediates mating in *Escherichia coli* (Rieger et al. 1991).
syn. F factor, F sex factor (Rieger et al. 1991)
Comments: An F plasmid can transfer itself from one bacterial strain to another and can mobilize portions of its hosts' chromosomes (Rieger et al. 1991). Adaptive mutation in *Escherichia coli* involves F plasmids (Galitski and Roth 1995, 421).

- Ti plasmid** *n.* A plasmid in the bacterium *Agrobacterium tumefaciens* that causes plant tumors called crown galls (Campbell et al. 1999, 384).
Comments: Researchers use genetically-engineered Ti plasmids as vectors, which do not cause plant tumors, to introduce new genes into plants (Campbell et al. 1999, 384).
[Ti after tumor inducing (Campbell et al. 1999, 384)]
- ♦ **plasmid engineering** See technology: recombinant-DNA technology.
- ♦ **plasmodium** *n.* In true slime molds (Myxomycetales): A life-cycle stage in which a mass of tissue, with multiple nuclei but no distinct cell boundaries, groups and spreads by nuclear division and accretion of cytoplasm (Wilson 1975, 591).
cf. pseudoplasmodium
- ♦ **plasmogamy** See -gamy: plasmogamy.
- ♦ **plasmon** See -type, type: plasmon.
- ♦ **plasmophage** See -phage: plasmophage.
- ♦ **plasmotype** See -type, type: plasmon.
- ♦ **plastic strain** *n.* An irreversible physical, or chemical, change in a living organism produced by stress (Lincoln et al. 1985).
- ♦ **plasticity** *n.*
1. An organism's genetic and environmentally determined variation (Salisbury 1940 in Bradshaw 1965, 116).
Note: Salisbury's usage is ambiguous because "his subsequent examples were all of environmentally determined modifications" (Bradshaw 1965, 116).
 2. An organism's capacity to vary morphologically and physiologically in response to environmental changes; this does not include variation that is "directly genetic in origin" (Bradshaw 1965, 116).
Notes: Because these changes are physiological in origin, all plasticity is fundamentally physiological (Bradshaw 1965, 116). "Plasticity" does not have any implications concerning the adaptive value of changes that occur, although many types of plasticity may have important adaptive effects.
 3. An organism's capacity to vary morphologically, physiologically, and behaviorally in response to environmental changes (Lincoln et al. 1985).
See plasticity: phenotypic plasticity, phenotypic plasticity: plasticity.
- developmental plasticity** See plasticity: phenotypic plasticity.
- phenotypic plasticity** *n.*
1. Heritable phenotypic variation among conspecific individuals (that are not necessarily genetically identical with respect to the focal character) elicited by variation in environmental conditions; e.g., morphological variation within cichlid-fish populations (Gause 1947 and Gupta and Lewontin 1982 in Gordon 1992, 256).
Note: This definition is similar to that for "norm of reaction" (*q.v.*) which stipulates that the conspecifics are of the same genotype.
 2. A single genotype's ability to produce more than one alternative form of morphology, physiological state, behavior, or a combination of these things, in response to environmental conditions (West-Eberhard 1989, 249; Futuyma 1998, 70).
syn. plasticity (West-Eberhard 1989)
cf. plasticity: phenotypic plasticity: norm of reaction

Note: This is a widely used definition. The alternative forms can be adaptive (Via et al. 1995 in Futuyma 1998, 439).

3. In quantitative genetics, differences between populations in their gene-environment interactions (Sterns 1982 and Via and Lande 1985 in Gordon 1992, 257).

Note: This kind of phenotypic plasticity may not contribute to interindividual differences within a population or generation; rather, it causes one generation as a whole, on the average, to look different from the preceding one (Gordon 1992, 257–258).

4. Morphological changes in successive generations (Lynch 1984 in Gordon 1992, 257).
5. The capacity for marked variation in an organism's phenotype as a result of environmental influences on its genotype during its development (Lincoln et al. 1985).

cf. developmental homeostasis

syn. developmental plasticity (Evans and Wheeler 2001, 62)

Note: Evans and Wheeler (2001, 62) divide developmental plasticity into polyphenisms and reaction norms (*q.v.*).

6. Variation among individuals within a population in response to environmental conditions (Meyer 1987 in Gordon 1992, 258).
7. In quantitative genetics, the difference in mean value of a phenotypic character from one population to another when it is caused by different reaction norms (Gordon 1992, 257).

cf. ³adaptation: ¹physiological adaptation

Comments: Darwin (1881, 6) speculated about phenotypic plasticity prior to the naming of this phenomenon (Gordon 1992, 255). West-Eberhard (1989, 250) and (Gordon 1992, 262) note that there is a bewildering and inconsistent profusion of terms for classifying kinds of “phenotypic plasticity.” Gordon (1992) discusses how to measure phenotypic plasticity, its relationship to evolution, and how the diverse meanings of “phenotypic plasticity” can obfuscate evolutionary discussion.

► **flexibility** *n.* Phenotypic plasticity that involves reversible change in an organism (Bradshaw 1965 and Smith-Gill 1983 in Gordon 1992, 256).

► **norm of reaction** *n.* “Heritable phenotypic variation among individuals of a single genotype, elicited by variation in environmental conditions” (Gause 1947 and Gupta and Lewontin 1982 in Gordon 1992, 256).

syn. reaction norm (Futuyma 1998, 440)

cf. reaction norm

Comment: “Norm of reaction” has a meaning similar to some definitions of “phenotypic plasticity” (*q.v.*). Norms of reaction vary from one through more than one phenotype per species. Different genotypes often differ in their norms of reaction; also, different genotypes can produce the same phenotype (Futuyma 1998, 39, 249, 439–440).

► **plasticity** *n.* Phenotypic plasticity that involves irreversible change in an organism (Bradshaw 1965, 116; Smith-Gill 1983 in Gordon 1992, 256).

► **polyphenism** *n.* One of a set of discrete phenotypic developmental classes that a single genotype can produce as a reaction to its environment; *e.g.*, queens and workers of Western Honey Bees (Evans and Wheeler 2001, 62).

♦ **plasticity of the phenotype** See phenotypic plasticity.

♦ **plastid** See organelle: plastid.

♦ **plastidule** *n.* “A subcellular building block, conceived by Haeckel as the basic unit of life” (Lincoln et al. 1985).

♦ **plastodeme** See -deme: plastodeme.

♦ **plastoecodeme** See -deme: plastoecodeme.

♦ **plastogamy** See -gamy: plastogamy.

♦ **plastogene** See gene: plastogene.

♦ **plate tectonics** See ²theory: theory of plate tectonics.

♦ **platykurtic distribution** See distribution: platykurtic distribution.

♦ **play, playing** *n.*

1. An individual organism's active bodily exercise; brisk and vigorous action of its body, limbs, or both, as in fencing, leaping, swimming, and clapping hands (Oxford English Dictionary 1972, entries from 725).

Note: This is an obsolete definition (Oxford English Dictionary 1972).

2. For example, in the Capercaillie (bird): A cock's gestures that attract a hen (Oxford English Dictionary 1972, entry from 1875).

3. A person's action of lightly and briskly wielding or plying (as a weapon in a contest) (Oxford English Dictionary 1972, entries from Beowulf).

4. A person's exercise, or action, for amusement or diversion (Oxford English Dictionary 1972, entries from *ca.* 1000).

5. A person's carrying on, or playing, a game (Oxford English Dictionary 1972, entries from *ca.* 1450).

6. In young of some bird and mammal species, adults of some carnivore, rodent, primate, dolphin, and whale species: “A set of pleasurable activities, frequently but not always social in nature, that imitate the serious activities of life without consuming serious goals” (Wilson 1975, 164), *e.g.*, subsong of some bird species or inventive acrobatics of primates (Immelman and Beer 1989, 223).

7. In some animal species: “Any activity that is exaggerated or discrepant, divertive, oriented, marked by novel motor patterns, or combinations of such patterns, and that appears to the observer to have no immediate function” (Darling 1937, Loizos 1966, 1967, and Hutt 1966 in Wilson 1975, 165).

8. In some animal species: “Any behavior that involves probing, manipulation, experimentation, learning, and the control of one's own body as well as the behavior of others, and that also, essentially, serves the function of developing and perfecting future adaptive responses to the physical and social environment” (Groos 1898, Lorenz 1950, 1956, Klopfer 1970 in Wilson 1975, 1965).

Note: Three forms of basic play are “creative improvisation,” “play-fighting,” and “object manipulation” (Fagan, 1983, 72).

cf. exploration: pure exploration; problem solving: pure problem solving.

9. In some animal species: Behavior that has these structures: (1) sequences of acts shown by adults may be reordered, (2) individual acts of a sequence may be exaggerated, (3) certain acts from within a sequence may be repeated many times, (4) a normal sequence of movements may be terminated earlier than usual as a result of the introduction of irrelevant activities, (5) some movements may be both exaggerated and repeated, and (6) individual movements within a total sequence may never be completed (Loizos 1966 in Dewsbury 1978, 64).

See need: play.

syn. play behavior

v.i., v.t. play

Comments: “Play” may allow young animals to practice and perfect motor patterns and social skills that will be important in their adult lives (Dewsbury 1978, 64). “Play” is a category of behavior that defies precise definition (Immelman and Beer 1989, 223).

foreplay *n.* Precopulatory behavior (Immelman and Beer 1989, 62).

Comment: Using “play” in this term is perhaps ill-advised because precopulatory behavior is not necessarily a form of play (Immelman and Beer 1989, 62).

functional play *n.* For example, in young children and young of some species of nonhuman mammals: Either undirected (*e.g.*, kicking, crawling, jabbering) or directed behavior toward simple objects (*e.g.*, touching or grasping), involving exercising muscles, sense organs, and coordination (Tembrock 1961 in Heymer 1977, 72).

mock hunting *n.* An animal’s play that shows prey-capture movements and frequent manipulation of a surrogate prey object, *e.g.*, in a cat that plays with a wool ball or a young lion that plays with its sibling (Heymer 1977, 94).

syn. hunting games (Heymer 1977, 94)

object play *n.* Play in which a lone animal interacts with an inanimate object, toys, or a heterospecific, *e.g.*, playing with a mouse by a *Felis catus* (Domestic Cat) (Immelman and Beer 1989, 224).

social play *n.* Play involving two, or more, conspecifics, or heterospecifics, that treat one another as conspecifics, *e.g.*, a Domestic Dog’s and Domestic Cat’s “wrestling” (Immelman and Beer 1989, 224).

♦ **play dialect** See dialect: play dialect.

♦ **play face** See facial expression: play signal.

♦ **play fighting** *n.* For example, in kittens, *Macaca mulatta* (Rhesus Macaques), puppies: Play with frequent agonistic behavior (Wilson 1975, 294).

Comments: Unlike true conflicts, animals’ social play does not decide which animal wins a disputed resource. “Play-fights” are not injurious, nor do they lead to prolonged mutual avoidance by the players (Fagan, 1983, 72). Juvenile *Macaca fuscata* (Japanese Macaques) play-fight in Jigokudani Monkey Park, Japan (fig 38).

♦ **play mother** See mother: play mother.

♦ **play signal** See facial expression: play signal.

♦ **play song** See animal sounds: song: subsong.

♦ **playing a game** *n.* In game theory, an organism’s interacting with other organisms, its environment, or both, in ways that relate to promotion of its fitness (Maynard Smith 1982, 2), *e.g.*, in Bacteria or Primates (Axelrod and Hamilton 1981).

♦ **playing dead, playing opossum, playing possum** See behavior: defensive behavior: playing dead.

♦ **pleio-, pleo-** *comb. f.* “More” (Lincoln et al. 1985; Brown 1956).

[Greek *pleon*, more]

♦ **pleiocyclic** See cyclic: pleiocyclic.

♦ **pleiomorphic** See -morphic: pleiomorphic.

♦ **pleiomorphism** See -morphism: polymorphism: pleiomorphism.

♦ **pleiotropic gene** See gene: pleiotropic gene.

♦ **pleiotropism argument, pleiotropism hypothesis, pleiotropism theory** See hypothesis:

hypothesis of divergent evolution of animal genitalia: pleiotropism hypothesis.

♦ **pleiotropy** *n.*

1. The same gene’s, or set of genes’, control of more than one of an organism’s “seemingly unrelated” phenotypic characteristic; such as a single gene’s effect on both red-blood cell morphology or a person’s general health with regard to sickle-cell anemia (Wilson 1975, 591).

2. The phenomenon whereby a change at one genetic locus can bring about a variety of seemingly unrelated phenotypic changes (Dawkins 1982, 292).

syn. multiple-gene effects, multiple-gene inheritance, pleiotropism (Lincoln et al. 1985)

cf. epistasis; hypothesis: one-gene-one-character hypothesis; inheritance: multifactorial inheritance

Comment: “Pleiotropy” is probably the rule rather than the exception in gene control of traits (Dawkins 1982, 292).

[Greek *pleiōn*, more + *trophē*, nourishment]

antagonistic pleiotropy *n.* The microevolutionary process in which a gene (or group of genes) is beneficial under one set of environmental conditions and detrimental under another set (Cooper and Lenski 2000, 736).

Comment: Antagonistic pleiotropy and mutation accumulation both produce microevolution. Cooper and Lenski (2000, 736) were able to determine that the former accounted for a major part of the evolution in a laboratory culture of *Escherichia coli* which they grew on a minimal-nutrient diet with glucose as the carbon source for over 20,000 generations over a period of about 8 yr.

♦ **pleioxenous parasite** See parasite: pleioxenous parasite.

♦ **pleioxeny** See -xeny: pleioxeny.

♦ **plenitude, principle of** See principle: plenitude, principle of.

♦ **“plentiful-food hypothesis”** See hypothesis: hypotheses regarding the origin of the Cambrian explosion: “plentiful-food hypothesis.”

♦ **pleometrosis** See -metrosis: pleometrosis.

♦ **pleomorph, pleomorphic, pleiomorphic, pleomorphism, pleomorphous** See -morphic: pleomorphic.

♦ **pleophage** See -phage: pleophage.

♦ **pleophyletic group** See ²group: polyphyletic group.

♦ **pleotroph** See phage: pleotroph.

♦ **plesio-** *comb. f.* Near.

[Greek *plesios*, near]

♦ **plesiobiosis** See -biosis: plesiobiosis.

♦ **plesiomorph** See -morph: plesiomorph.

♦ **plethodontid receptivity factor (PRF)** See chemical-releasing stimulus: semiochemical: pheromone: plethodontid receptivity factor.

♦ **pleuriilignosa** See ²community: pleuriilignosa.

♦ **pleuston, pleustont** *n. pl.* Aquatic organisms that remain permanently at a water surface by their own buoyancy, normally positioned partly in water and partly in air; *e.g.*, *Lemna* and *Wolffia* species (plants) (Lincoln et al. 1985).

adj. pleustonic

cf. nekton, neuston, plankton

♦ **p level** See *p*: “stipulated *p*.”

♦ **-ploid** *comb. f.* “Having a (specified) number of chromosomes” (Michaelis 1963).

n. -ploidy

[Greek *-ploos*, fold + OID]

♦ **ploidy** *comb.f.*

cf. -ploid, ploidy

allodiploidy *n.* An individual's, or somatic cell's, having one set of chromosomes from a parent of one species and one set from a parent of another species (Bell 1982, 501).

cf. -ploidy: allopolyploidy

allopoloidy *n.* An individual's, or somatic cell's, having one, or more, sets of chromosomes from a parent of one species and another set(s) from a parent of another species (Bell 1982, 501).

n. allopolyploid, polyploid hybrid

cf. -ploidy: allodiploidy, allopolyploidy, panallopoloidy

allopolyploidy *n.* An individual's, or somatic cell's, having more than one set of chromosomes from a parent of one species and more than one set from a parent of another species (Bell 1982, 501).

syn. allopolyploid, polyploid hybrid

cf. -ploidy: allodiploidy

allotetraploidy *n.* Tetraploidy resulting from the doubling of the chromosomes of an allotetraploid (Mayr 1982, 957).

aneuploidy *n.*

1. An individual's, or somatic cell's, having one, or more, whole chromosomes more, or less, than its species' regular chromosome complement (Bell 1982, 502).

2. An individual's, or somatic cell's, having a chromosome complement that is not a simple multiple of its species' basic haploid number (Bell 1982, 502).

cf. -ploidy: heteroploidy, hyperploidy, hypoploidy; -somy: trisomy

autodiploidy *n.* Diploidy in which both sets of chromosomes are from conspecific parents (Bell 1982, 502).

cf. -ploidy: autopolyploidy

autopoloidy *n.* An individual's, or somatic cell's, having two, or more, sets of chromosomes all derived from conspecifics (Bell 1982, 502).

cf. -ploidy: autodiploidy, autopolyploidy, panautopoloidy

autopolyploidy *n.* Polyploidy in which more than one set of chromosomes is from each of two conspecific parents (Bell 1982, 502).

cf. -ploidy: autodiploidy, autopolyploidy

cryptic polyploidy, semicryptic polyploidy *n.* An organism's showing little, or no, phenotypic manifestation of differences in its ploidy levels (Lincoln et al. 1985).

diploidiploidy *n.* Reproduction in which both males and females arise from diploid zygotes arising from fertilized eggs.

syn. diplo-diploidy

cf. -ploidy: haplodiploidy

diploidy, synkaryotoky *n.* In most sexually reproducing species: A cell's, or an organism's, having a chromosome complement consisting of two copies (called homologs) of each chromosome (Lincoln et al. 1985).

cf. -ploidy: autodiploidy, haploidy

Comment: A diploid cell, or organism, usually arises as the result of the union of two sex cells, each bearing just one copy of each chromosome. Thus, the two homologs in each chromosome pair in a diploid cell are of separate origin, one derived from its mother and the other from its father (Wilson 1975, 582).

dysploidy *n.* An individual's, or somatic cell's, having a chromosome complement that bears no obvious relationship to its polyploid series (Lincoln et al. 1985).

euploidy *n.* Polyploidy with an exact multiple of a basic chromosome number (Lincoln et al. 1985).

haplodiploidy *n.* A genetic system in which haploid unfertilized eggs usually produce males and diploid fertilized eggs usually produce females (Wilson 1975, 415).

See sex determination: haplodiploidy.

cf. -ploidy: diplodiploidy; parthenogenesis: arrhenotoky

adj. haplodiploid

syn. haplo-diploidy

Comment: In haplodiploidy, males have no fathers or sons, but they have grandfathers.

haploidy *n.* For example, in most sex cells, most male Hymenoptera and other kinds of haplodiploid animals: An individual's, or cell's, having only one set of chromosomes none of which is homologous (Wilson 1975, 585).

syn. hemiplody (Lincoln et al. 1985)

adj., n. haploid

cf. -ploidy: diploidy, monoploidy, pentaploidy, polyplody, tetraploidy, triploidy; parthenogenesis: arrhenotoky

hemiallopolyploidy *n.* An organism's being "a polyploid hybrid (allopolyploid) having chromosome sets derived from two species that are not fully intersterile" (Lincoln et al. 1985).

hemiautoploidy *n.* An organism's being "a polyploid derived from intraspecific hybrids or by the differentiation of the chromosome sets of successful panautopoloids" (Lincoln et al. 1985).

hemiploidy See -ploidy: haploidy.

heteroploidy *n.* A population's having aneuploid, diploid, and euploid individuals (Lincoln et al. 1985). See -ploidy: aneuploidy.

hyperploidy *n.* An individual's, or somatic cell's, having one, or more, chromosomes, or chromosome segments, in addition to its species' usual chromosome complement (Lincoln et al. 1985).

cf. -ploidy: aneuploidy, hypoploidy

hypoploidy *n.* An individual's, or somatic cell's, having one, or more, chromosomes, or chromosome segments, less than its species' usual chromosome complement (Lincoln et al. 1985).

cf. -ploidy: aneuploidy, hyperploidy

mixoploidy *n.* In mosaic and chimaera individuals: Different cells', or tissues' having different chromosome numbers (Lincoln et al. 1985).

monoploidy *n.* A somatic cell's, or individual's, having one set of chromosomes rather than the two sets that are typical of its species (Lincoln et al. 1985).

cf. -ploidy: diploidy, haploidy, pentaploidy, tetraploidy, triploidy; -somy: monosomy, trisomy

multiploid *n.* In some succulent plant species with crassulacean acid metabolism: An individual's having a simultaneous presence of three, or more, integer multiples of its diploid DNA complement in all of its tissues (De Rocher et al. 1990, 99).

panallopoloidy *n.* "A true allopolloid" (Lincoln et al. 1985).

panautopoloidy *n.* "A true autoploid" (Lincoln et al. 1985).

pentaploidy *n.* An individual's, or somatic cell's, having five sets of homologous chromosomes rather

than its species' more usual one, or two, chromosomes (Bell 1982, 511).

cf. -ploidy: diploidy, haploidy, monoploidy, tetraploidy, triploidy

polyploidy *n.* An individual's, or somatic cell's, having more than two sets of homologous chromosomes (Mayr 1982, 769).

cf. ²evolution: instantaneous evolution; speciation: instantaneous speciation

Comment: About 47% of all flowering plants (Stebbins and Ayala 1985, 74) and some vertebrate species, including 12 genera of frogs and toads, are polyploid (Müller 1925 and other references in Ptacek et al. 1994, 898).

pseudopolyploidy *n.*

1. Chromosomal number doubling without a corresponding increase in genetic material (Lincoln et al. 1985).

2. "A numerical relationship of chromosome sets in groups of related species that leads to the erroneous inference that they are polyploids" (Lincoln et al. 1985).

semicryptic polyploidy See -ploidy: cryptic polyploidy.

tetraploidy *n.* An individual's, or somatic cell's, having four sets of homologous chromosomes rather than its species' usual one, or two, chromosomes (Bell 1982, 511).

cf. -ploidy: diploidy, haploidy, monoploidy, pentaploidy, triploidy

triploidy *n.* An individual's, or somatic cell's, having three sets of homologous chromosomes rather than its species' usual one, or two, chromosomes (Bell 1982, 511).

cf. -ploidy: diploidy, haploidy, monoploidy, pentaploidy, tetraploidy

♦ **ploidy** *n.* The number of sets of homologous chromosomes present in an organism, somatic cell, or gamete (Lincoln et al. 1985).

adj. ploid

cf. -ploid, -somy

♦ **plant**

diplont *n.*

1. The diploid stage of an organism's life cycle (Lincoln et al. 1985).

syn. diplophase, zygotophase. (Lincoln et al. 1985)

2. An organism with a life cycle in which the direct products of meiosis act as gametes (Lincoln et al. 1985).

haplont *n.*

1. The haploid phase of an organism's life cycle (Lincoln et al. 1985).

syn. gamophase, haplophase (Lincoln et al. 1985)

2. An organism that is diploid as a zygote and haploid in its other phase (Lincoln et al. 1985).

plot effect See effect: cage effect (Comments).

♦ **plump** See ²group: plump.

♦ **plural breeding** See breeding: plural breeding.

♦ **pluralism** *n.*

1. The view that, although natural selection is the most important evolutionary mechanism, other mechanisms, including other evolutionary ones as well, are responsible for organisms' attributes; contrasted with panselectionism (Gould and Lewontin 1979, 589).

2. "In modern Darwinian jargon, the belief that evolution is driven by many agencies, not just natural selection" (Dawkins 1982, 292).

Comment: Charles Darwin held this view (Gould and Lewontin 1979, 589).

♦ **pluriparity** See -parity: pluriparity.

♦ **plurivore** See -vore: plurivore.

♦ **pluviophile** See ¹-phile: pluviophile.

♦ **pluviophobe** See -phobe: pluviophobe.

♦ **polychotomy** *n.* An unresolved taxon evolutionary radiation (Gray et al. 1991, 1980).

♦ **PMS** See syndrome: premenstrual syndrome.

♦ **PMS-dysphoria disorder** See syndrome: premenstrual-stress-dysphoria disorder.

♦ **PNA** See nucleic acid: peptide-nucleic acid, PNA.

♦ **PNA world** See world: PNA world.

♦ **pneumotaxis** See taxis: pneumotaxis.

♦ **pnoium** See ²community: pnoium.

♦ **POC, POC theory** See ³conflict: parent-offspring conflict.

♦ **pod** See ²group: pod.

♦ **poecilandry** *n.* A species' having more than one form of male; contrasted with poecilogyny (Lincoln et al. 1985).

adj. poecilandric

♦ **poecilo-, poikilo-** *comb. f.* "Various, variable" (Lincoln et al. 1985).

[Greek *poikilos*, variegated]

♦ **poecilogony, poikilogony** *n.*

1. Development in which adult stages of related taxa are virtually identical but juvenile stages are highly divergent (Lincoln et al. 1985).

adj. poecilogonic

2. Intraspecific variation in duration of an organisms' ontogenetic stages induced by environmental factors (Lincoln et al. 1985).

♦ **poecilogyny** See -gyny: poecilogyny.

♦ **poetic** *adj.* Referring to human communication that evokes complex, personal emotional images, allusory in nature, triggering memories and impulses based upon past associations that can be spelled out only with great difficulty when messages are kept exclusively cognitive in nature (Sebeok 1962 in Wilson 1975, 217).

cf. cognitive

♦ **poikilodynamic hybrid** See hybrid: poikilodynamic hybrid.

♦ **poikilogony** See poecilogony.

♦ **poikilotherm** See -therm: poikilotherm.

♦ **point analysis** See method: single-point analysis.

♦ **"point-count method"** See method: "point-count method."

♦ **point mutation** See ²mutation: gene mutation.

♦ **pointer** See dog: pointer.

♦ **"poisonous-gas hypothesis"** See hypothesis: hypotheses regarding the Permian mass extinction: "poisonous-gas hypothesis."

♦ **Poisson distribution** See distribution: Poisson distribution.

♦ **Poisson process** *n.* "A random event in time" (Lincoln et al. 1985).

♦ **Poisson-lognormal curve** See curve: rank-abundance curve: Poisson-lognormal curve.

♦ **poium** See ²community: poium.

♦ **polar** *adj.* Referring to Earth's Frigid Zones which are within the northern and southern polar circles (Arctic Circle, 66°33' north, and Antarctic Circle, 66°33' south); contrasted with temperate, tropical, subtropical (Lincoln et al. 1985).

Comment: The northern parts of Alaska, Canada, Finland, Greenland, Norway, Siberia, and Sweden are in the polar region.

♦ **polar body** *n.* A minute cell that contains a set of sister chromatids and very little cytoplasm and that is formed during meiosis in oogenesis (Curtis 1983, 1103).

♦ **polar molecule** See molecule: polar molecule.

♦ **polarity** *n.*

1. The directional differentiation, or trend, within a system (Lincoln et al. 1985).
2. The direction of evolution, or change, within a morphoclone or transformation series (Lincoln et al. 1985).

♦ **poleophile** See ¹-phile: poleophile.

♦ **poleophobe** See -phobe: poleophobe.

♦ **poleotolerant** *n.* Referring to an organism that is tolerant of urban habitats (Lincoln et al. 1985).

♦ **Pollard-Yates Method** See method: Pollard-Yates Method.

♦ **pollen-donation hypothesis** See hypothesis: pollen-donation hypothesis.

♦ **pollenophage** See -phage: pollenophage.

♦ **pollen flower** See organ: flower: pollen flower.

♦ **pollen storer** *n.* A bumble-bee species that stores pollen in its abandoned cocoons (Wilson 1975, 430, 592).

cf. pouch maker

Comment: From time to time, an adult female removes pollen from the cocoons and places it into a larval cell in the form of a liquid mixture of pollen and honey (Wilson 1975, 430, 592).

♦ **pollination** *n.*

1. An agent's transferring pollen from an anther to a flower's receptive area (stigma); loosely meaning fertilization of a seed plant (Oxford English Dictionary 1972, entries from 1885; Lincoln et al. 1985).
2. An agent's transferring pollen from a gymnosperm's sporophyll the micropyle of an ovule (Campbell et al. 1999, 566).

syn. fertilization (Lincoln et al. 1985)

cf. fertilization, ²-phile; gamy: allogamy, amphigamy, autoallogamy, chasmogamy, cleistogamy, gneisiogamy, mychogamy, phytogamy, xenogamy

Comments: "Pollination" is sometimes spelled as "pollinization" or "pollenization." Pollination agents include water, wind, and organisms. Some other kinds of "pollination" that are not defined below under "pollination" include "bat pollination," "bee pollination," "beetle pollination," "bird pollination," "butterfly pollination," "fly pollination," and "moth pollination." See ²-phile for examples of these kinds of pollination. Pollen collecting by insects does not always result in pollination; e.g., sweat bees can collect corn pollen without pollinating it (pers. obs.). Wind is a main pollinator of grasses and gymnosperms. Basal lineages of modern insect pollinators originated during the Jurassic probably as generalists on gymnospermous seed plants (Labandeira 1998, 58). The Web site of the University of Arizona, Department of Geoscience, contains much information about pollen and many links to other web sites regarding pollen (<http://geo.arizona.edu/palynology/pid00010.html>, 2000).

[Latin *pollen*, fine dust]

abiotic pollination *n.* Pollination by agents other than organisms, e.g., wind and water (Faegri and van der Pijl 1979, 34).

adelphogamy See pollination: self-pollination.

ant pollination *n.* Pollination by ants (Dahl and Hadać 1940, etc., in Faegri and van der Pijl 1979, 110).

cf. ²-phile: myrmecophile

biotic pollination *n.* Pollination by organisms, e.g., insects, birds, or lemurs (Faegri and van der Pijl 1979, 42).

buzz pollination *n.* In many bee species: An bee's shaking pollen out of poricidal anthers by rapidly contracting her pterothoracic flight muscles and causing the anthers to vibrate (Orsono-Mesa 1947, 465; McGregor 1976, 359, illustration; Buchmann and Cane 1989, 289).

syn. sonication (Buchmann and Cane 1989, 289; Batra, 1993a); vibratile pollination (Buchmann 1978 in Buchmann and Cane 1989, 293) vibration (*vibración*) (Orsono-Mesa 1947, 465)

Comments: Bumble bees and other kinds of bees (but not Honey Bees) buzz pollinate some ericaceous plants (e.g., Blueberries, Cranberries, and Huckleberries) and solanaceous plants (Deadly Nightshades, Potatoes, and Tomatoes) (Buchmann and Nabhan 1996, 243). Bees also buzz pollinate flowers with nonporicidal anthers (Houston 1991, 96). [after the buzzing sound that a bee makes during this kind of pollination]

capricification *n.* Fig-flower pollination by insects (Lincoln et al. 1985).

cross-pollination *n.* Pollination of a flower with pollen from a conspecific plant (Lincoln et al. 1985).

syn. xenogamy

See fertilization: cross-fertilization; -gamy: allogamy. *cf.* pollination: exendotrophy, self-pollination

ethodynamic pollination *n.* Pollination in which a pollinator loads pollen from a ripe anther, carries the pollen on its body, moves to a stigma, and directly transfers pollen on the stigma (Galil 1973 in Faegri and van der Pijl 1979, 43).

cf. pollination: topocentric pollination

Comment: This occurs in a few flower-animal associations, e.g., in yucca and yucca-moth species (Faegri and van der Pijl 1979, 43).

exendotropy *n.* A flower's being pollinated by pollen from another flower of the same, or different, plant (Lincoln et al. 1985).

cf. pollination: cross-pollination, self-pollination, sib pollination

geitonogamy See pollination: self-pollination.

gravity pollination *n.* Pollination when pollen falls on a flower's stigma from its own anthers or those of another flower (Faegri and van der Pijl 1979, 137).

hand-pollination *n.* A person's pollinating a plant, often a crop plant, using a small paint brush or other object (Buchmann and Nabhan 1996, 247).

mess-and-soil pollination *n.* Beetle pollination accompanied by blundering around on a flower, chewing on its floral parts, eating its pollen, and defecating on it (Buchmann and Nabhan 1996, 249).

parasite pollination *n.* Pollination of a flower by an insect species that eats its developing ovules, e.g., in Yucca and Yucca Moths (Kerner 1898, Stirton 1976 in Faegri and van der Pijl 1979, 72–73).

rain pollination *n.* Pollination of a flower by rain (Hagerup 1950 in Faegri and van der Pijl 1979, 41).

cf. ²phile-: ombrophile

rendezvous pollination *n.* Pollination that is ensured, or increased, by insect copulation on a flower (Faegri and van der Pijl 1979, 75).

cf. ²phile-: hydrophile

self-pollination *n.*

1. Pollination of a flower with its own pollen (Lincoln et al. 1985).
syn. autogamy, selfing
 2. Pollination of a flower with pollen from another flower of the same plant (Lincoln et al. 1985).
syn. adelphogamy and sib pollination (Lincoln et al. 1985), autogamy and geitonogamy (Usher 1998), selfing
cf. pollination: cross-pollination, exendotrophy, sib pollination
- sib pollination** See pollination: self-pollination.
- sonication** See pollination: buzz pollination.
- topocentric pollination** *n.* A frequent kind of pollination in which a pollinator unwittingly contacts pollen and stigmas (Galil 1973 in Faegri and van der Pijl 1979, 43).
cf. pollination: ethodynamic pollination
- ♦ **vibration, vibratile pollination, vibración** See pollination: buzz pollination.
- water pollination** *n.* Pollination of a flower by water's moving pollen to its stigma (Haumann-Merck 1912 in Faegri and van der Pijl 1979, 40–41).
cf. ²-phile: hydrophile
- wind pollination** *n.* Pollination of a flower by wind's moving pollen to its stigma (Faegri and van der Pijl 1979, 34).
cf. ²-phile: anemophile
- ♦ **pollination ecology** See study of: ecology: pollination ecology.
- ♦ **pollination syndrome** See syndrome: pollination syndrome.
- ♦ **pollinator** *n.* An agent (*e.g.*, animal, water, or wind) that effects pollination of a flower.
cf. ²-phile for flowers adapted to different kinds of pollinators
- Comments:* The most common animal pollinators are bees (Buchmann and Nabhan 1996, 274). Other pollinating animals include some bat, some beetle, some bird, many butterfly, many fly, some mammal, many moth, some slug and snail, many wasp, some thrips spp. and a lizard sp. Bird pollinators include Honeycreepers, Hummingbirds, and Sunbirds. Mammal pollinators include Flying Foxes, Honey Possums, and Sugar Gliders. Bumble Bees are frequent flower pollinators, and they often rest on flowers overnight or when they are cold as is this queen *Bombus ternarius* (Tricolored Bumble Bee) on an October day in Vermont, U.S. (fig. 9).
- major pollinator** *n.* A pollinator that is well adapted to a particular flower species and effects much of its pollination; *e.g.*, bats are major pollinators of *Ceiba pentandra* (Kapok) (Baker et al. 1971 in Faegri and van der Pijl 1979, 43).
- minor pollinator** *n.* A pollinator that tends to visit a flower after its major pollinator(s) has foraged on the flower and takes what resources remain; *e.g.*, moths, hummingbirds, and bees are minor pollinators of *Ceiba pentandra* (Kapok) (Baker et al. 1971 in Faegri and van der Pijl 1979, 43, 206).
- ♦ **pollinia, pollinium** See organ: pollinium.
- ♦ **pollinivore** See -vore: pollinivore.
- ♦ **poly-** *comb.f.*
 1. "Many; several; much" (Michaelis 1963).
 2. "Excessive; abnormal" (Michaelis 1963).
[Greek *polys*, much, many]
- ♦ **polyacmic** See -acmic: polyacmic.
- ♦ **polyandry** See mating system: polyandry.
- ♦ **polyandry, degree of** See degree of polyandry.
- ♦ **polybrachygamy** See mating system: polybrachygamy.
- ♦ **polycalic** See -domous: polydomous.
- ♦ **polyclimax** See climax: polyclimax.
- ♦ **polycyclic** See cyclic: polycyclic.
- ♦ **polycyclic aromatic hydrocarbon** See molecule: polycyclic aromatic hydrocarbon.
- ♦ **polycyclic parthenogenesis** See parthenogenesis: polycyclic parthenogenesis.
- ♦ **polydemic** *adj.* Referring to a species that occurs in different areas (Lincoln et al. 1985).
- ♦ **polydomous** See -domous: polydomous.
- ♦ **polyembryony** *n.* For example, in some species of parasitic wasps: Reproduction in which an egg laid in a host gives rise to undifferentiated cells that each develop into a genetically identical sibling (Thornhill and Alcock 1983, 37).
cf. parthenogenesis
- ♦ **Polyergistic** See -genic: polygenic.
- ♦ **Polyestric species, polyoestric species** See ²species: polyestric species.
- ♦ **Polyestrous** See estrous: polyestrous.
- ♦ **Polyestrous species, polyoestrous species** See ²species: polyestrous species.
- ♦ **Polyethism** *n.*
 1. Age-, or caste-, related division of labor among members of a society (Wilson 1975, 299, 592).
Note: An individual animal might show more than one role, or only one role, during its life (Immelmann and Beer 1989, 225).
 2. An animal's establishing preferences, especially regarding ecological conditions, *e.g.*, attachment to a specific habitat type (Immelmann and Beer 1989, 225).
syn. behavioral polymorphism (Immelmann and Beer 1989, 227)
cf. learning: imprinting: habitat imprinting; -morphism: dimorphism, polymorphism
- age polyethism** *n.* For example, in *Apis mellifera* (Western Honey Bees), many other social-insect species, and *Heterocephalus glaber* (Naked Mole Rats): Society members' changing their labor roles as they age (Wilson 1971a in Wilson 1975, 299, 577; Jarvis 1981).
syn. temporal polyethism (Wilson 1971, 470)
- caste polyethism** *n.* For example, in social-insect species and *Heterocephalus glaber* (Naked Mole Rats): Polyethism with regard to caste (Jarvis 1981).
- physical polyethism** See polyethism: caste polyethism.
- temporal polyethism** See polyethism: age polyethism.
- ♦ **Polyfactorial** See -genic: polygenic.
- ♦ **Polyfactorial inheritance, polygenic inheritance** See inheritance: multifactorial inheritance.
- ♦ **Polygamy** See mating system: polygamy.
- ♦ **Polygene** See gene: polygene.
- ♦ **Polygenetic** See -genic: polygenic.
- ♦ **Polygenic** See -genic: polygenic.
- ♦ **Polygenic character** See character: polygenic character.
- ♦ **Polygenic inheritance** See inheritance: multifactorial inheritance.
- ♦ **Polygeny** See inheritance: multifactorial inheritance.
- ♦ **Polygoneutism** See -voltine: multivoltine.
- ♦ **Polygynandry** See mating system: polygynandry.

- ◆ **polygynopaedium** See -paedium: polygynopae-dium.
- ◆ **polygyny** See -gyny. See mating system: polygamy: polygyny.
- ◆ **polygyny, degree of** See degree of polygyny.
- ◆ **polygyny-polyandry** See mating system: polygyny-polyandry.
- ◆ **polygyny threshold** See model: Orians-Verner model of polygyny.
- ◆ **polyhalophile** See ¹-phile: polyhalophile.
- ◆ **polylectic** See -lectic: polylectic.
- ◆ **polymerase chain reaction** See method: polymerase chain reaction.
- ◆ **Polymerization** *n.* In chemistry, the formation of a molecule composed of many similar, or identical, molecular subunits (given as a polymer in Raven and Johnson 1989, G-18).
Comment: Polymerization makes larger molecules from smaller ones. Polymerization sometimes involves removing water molecules from monomers that join; *i.e.*, it involves condensation.
[from polymer < Greek *polymerōs*, manifold < *polys*, many + *meros*, part]
- ◆ **polymictic plankton** See plankton: polymictic plankton.
- ◆ **polymorph** See -morph: polymorph.
- ◆ **polymorphic** See -morphic: polymorphic.
- ◆ **polymorphic-behavior hypothesis** See hypothesis: population-limiting hypotheses: polymorphic-behavior hypothesis.
- ◆ **polymorphism** See -morphism: polymorphism.
- ◆ **polymorphism-dependent homology** See homology: paramorphic homology.
- ◆ **polyoestrus** See estrus: polyoestrus.
- ◆ **polyovular** See -ovular: polyovular.
- ◆ **polyoxybiot** See -biot: polyoxybiot.
- ◆ **polypeptide** See molecule: polypeptide.
- ◆ **polyphage** See -phage: polyphage.
- ◆ **polyphasic species** See ²species: polyphasic species.
- ◆ **polyphasic taxonomy** See study of: taxonomy: polyphasic taxonomy.
- ◆ **polyphasy** See ²species: polyphasic species.
- ◆ **polyphenic population** See population: polyphenic population.
- ◆ **polypheny** See population: polyphenic population.
- ◆ **polyphile** See ²-phile: polyphile.
- ◆ **polyphytic group** See ²group: polyphytic group.
- ◆ **polyplanetic** See -planetic: polyplanetic.
- ◆ **polyploid hybrid** See -ploidy: allopolyploidy.
- ◆ **polyploid variety** See -ploidy: autopolyploidy.
- ◆ **polyploidy** See -ploidy: polyploidy.
- ◆ **polysaccharide** See molecule: -saccharide: polysaccharide.
- ◆ **polysomy** See -somy: polysomy.
- ◆ **polyspermy** See -spermy: polyspermy.
- ◆ **polystenohaline** See -haline: polystenohaline.
- ◆ **polytaxis** *n.* Discontinuous change (Lincoln et al. 1985).
cf. taxis
- ◆ **polytene chromosome** See chromosome: polytene chromosome.
- ◆ **polytherm, polythermic** See -therm: polytherm.
- ◆ **polytoky** See -toky: polytoky.

- ◆ **polytopy** *n.* A character's arising independently in two, or more, separate localities or geographical areas (Lincoln et al. 1985).
syn. polytopism (Lincoln et al. 1985)
adj. polytopic
- ◆ **polytroph** See -troph: polytroph.
- ◆ **polytropy** See -tropy: polytropy.
- ◆ **polytypic evolution** See ²evolution: polytypic evolution.
- ◆ **polytypic species** See ²species: polytypic species.
- ◆ **polyvoltine** See -voltine: polyvoltine.
- ◆ **polyxenic parasite** See parasite: pleioxenous parasite.
- ◆ **polyxeny** See -xeny: pleioxeny.
- ◆ **polyzoic** See -zoic: polyzoic.
- ◆ **pomeridanus** *adj.* Referring to the afternoon (Lincoln et al. 1985).
cf. crepuscular, diurnal, matinal, nocturnal
- ◆ **pomology** See study of: pomology.
- ◆ **pontic** *adj.* Referring to the deep sea (Lincoln et al. 1985).
- ◆ **pontium** See ²community: pontium.
- ◆ **pontothalicole** See -cole: pontothalicole.
- ◆ **pontophile** See ¹-phile: pontophile.
- ◆ **poocole** See -cole: poocole.
- ◆ **pool** *n.* "Any combining of efforts or resources: a typists pool" (Michaelis 1963).
cf. punctuated equilibrium
- ◆ **gene pool** *n.* All the genes in a population (Wilson 1975, 585).
- ◆ **meme pool** *n.* All of the memes in a population (Dawkins 1977).
cf. gene pool
- ◆ **pool feeder** See -phage: telmophage.
- ◆ **poop** See elimination: defecation.
- ◆ **poophile** See ¹-phile: poophile.
- ◆ **Popperian method** See method: Popperian method.
- ◆ **¹population** *n.*
 1. The total number of persons that inhabit a country, town, or other area (Oxford English Dictionary 1972, entries from 1612).
 2. A set of organisms that belong to the same species and occupy a clearly delimited area at the same time (Oxford English Dictionary 1972, entries from 1803; Wilson 1975, 9).
 3. In sexually reproducing organisms: A set of organisms capable of freely interbreeding with one another under natural conditions (Wilson 1975, 9).

Note: Organism populations evolve culturally, genetically, or both, not individual organisms (National Academy of Sciences and Institute of Medicine 2008, 4).
See society: modular society: discontinuous-modular society.
cf. deme, -patric, group
- ◆ **balanced-hermaphrodite population** *n.* A population composed solely of hermaphrodites; contrasted with unbalanced-hermaphrodite population (Lincoln et al. 1985).
- ◆ **biotically-sympatric population** *n.* A population that occupies the same habitat within the same geographical area; contrasted with neighboring-sympatric population (Lincoln et al. 1985).
- ◆ **buffered populations** *n. pl.* Populations that interact in such a way as to maintain each others' density within certain limits (Lincoln et al. 1985).

closed population *n.* A population without input of new genetic variation, except that from mutation; contrasted with open population (Lincoln et al. 1985).

diphenic population *n.* A population with two discontinuous phenotypes that lack genetic foundation (Lincoln et al. 1985).

cf. ¹population: leptophenic population, mesophenic population, monophenic population, polyphenic population

n. diphenism, dipheny

equilibrium population *n.*

1. "A population in which gene frequencies are at equilibrium" (Lincoln et al. 1985).
2. A population with a stable size in which death and emigration rates are balanced by birth and immigration rates (Lincoln et al. 1985).

evolutionarily-stable population *n.* A population whose "genetic composition is restored after a disturbance, provided the disturbance is not too large" (Maynard Smith 1982, 204).

Comment: An evolutionarily-stable population can be genetically monomorphic or polymorphic (Maynard Smith 1982, 204).

floater population *n.* Part of a population of a territorial species composed of individuals without territories that live perilous vagabond existences along the margins of their preferred habitats, *e.g.*, a Lemming "march" (Wilson 1975, 83).

leptophenic population *n.* A population with a narrow range of continuous-phenotypic variation (Lincoln et al. 1985).

cf. ¹population: diphenic population, mesophenic population, monophenic population, polyphenic population

n. leptophenism, leptopheny

Mendelian population, panmictic unit *n.* A group of interbreeding individuals that share a common gene pool (Lincoln et al. 1985).

merohermaphroditic population, metahermaphroditic population *n.* A population with equal numbers of hermaphrodite and unisexual individuals (Lincoln et al. 1985).

mesophenic population *n.* A population with only a moderately broad range of continuous-phenotypic variation (Lincoln et al. 1985).

n. mesophenism, mesopheny

cf. ¹population: diphenic population, leptophenic population, monophenic population, polyphenic population

metahermaphroditic population See ¹population: merohermaphroditic population.

metapopulation *n.*

1. A set of populations that belong to the same species and exist at the same time; by definition, each population occupies a different area (Levin 1970 in Alvarez-Buylla and García-Barrios 1993, 201; Wilson 1975, 588).
2. A set of local populations which interact via conspecific individuals that move among them (Hanski and Gilpin 1991 in New 2009, 91).

Comments: Researchers originally developed the concept of metapopulation largely from studies of butterfly distributions across landscapes (New 2009, 84). Hanski (1999 in New 2009, 93) enumerated five characteristics of a metapopulation. Metapopulations require different conservation measures than do large, widespread populations.

► **"archipelago metapopulation"** *n.* A metapopulation comprising a group of small populations (New 2009, 93).

► **"mainland-island metapopulation"** *n.* A metapopulation that has a large, essentially secure "reservoir" population ("mainland") and one, or more, small populations ("islands") (New 2009, 92). *syn.* continent-island model, mainland-island system

microdichopatric population *n.* A population that coexists in the same locality as one, or more, other populations, but occupies different microhabitats (Lincoln et al. 1985).

microparapatric population *n.* A population that coexists in the same locality as and has gene flow with one, or more, other populations and occupies different adjacent microhabitats (Lincoln et al. 1985).

monomorphic population *n.* A population that consists almost exclusively of a single morph, with other morphs in very low frequencies (Campbell 1990, 447).

monophenic population *n.* A population with a single phenotype (Lincoln et al. 1985).

cf. ¹population: diphenic population, leptophenic population, mesophenic population, polyphenic population

n. monophenism, monopheny

neighboringly-sympatric population *n.* A population that inhabits different habitats within the same geographical area (Lincoln et al. 1985); contrasted with biotically-sympatric population.

open population *n.* A population that is freely exposed to gene exchange with other populations; contrasted with closed population (Lincoln et al. 1985).

panmictic population *n.* A population in which mating is completely random (Wilson 1975, 590).

syn. deme (Lincoln et al. 1985)

polyphenic population *n.*

1. A population with extensive phenotypic variation that lacks genetic fixation (Lincoln et al. 1985).
2. A population with several discontinuous phenotypes (phenes) that lack genetic foundation (Lincoln et al. 1985).
3. A population with environmentally cued alternative phenotypes (West-Eberhard 1989, 251).

n. polyphenism, polypheny

cf. ¹population: diphenic population, leptophenic population, mesophenic population, monophenic population

unbalanced-hermaphrodite population *n.*

A population composed of a majority of hermaphrodites with varying degrees of maleness, or femaleness, and by a minority of pure male and female individuals; contrasted with balanced-hermaphrodite population (Lincoln et al. 1985).

♦ **²population** *n.*

1. Statistically, the "totality of individual observations about which inferences are to be made, existing anywhere in the world or at least within a definitely specified sampling area limited in space and time" (Sokal and Rohlf 1969, 9).
2. Statistically, the "whole group of items or individuals under investigation" (Lincoln et al. 1985).

cf. observation, sample of observations, variable

universe *n.* A subset of a particular population (Sokal and Rohlf 1969, 9).

- ♦ **population biology** See study of: biology: population biology.
- ♦ **population bomb** *n.* Earth's huge human population and its impact on this planet (inferred from Myers 1999, March–April, 36).
Comment: Paul Ehrlich published his controversial book *The Population Bomb* in 1968.
- ♦ **population bottleneck** *n.* A sharp decrease in size of a population with consequent reduction in its gene-pool size (Lincoln et al. 1985).
cf. bottleneck effect
- ♦ **population cage** *n.* A type of cage invented by Teissier and l'Héritier, in which *Drosophila* populations of various sizes and various genetic heterogeneities could be continued for many generations without the input of new alien genes (Mayr 1982, 574).
Comment: This was a major technological advance for the studies of *Drosophila* population biology (Mayr 1982, 574).
- ♦ **population cycle** *n.* A more, or less, regular abundance fluctuation of a species' population (Lincoln et al. 1985).
- ♦ **population density** See density: population density.
- ♦ **population dynamics** See study of: dynamics: population dynamics.
- ♦ **population ecology** See study of: ecology: population ecology.
- ♦ **population fitness** See fitness: population fitness.
- ♦ **population genetics** See study of: genetics.
- ♦ **population growth** See growth: population growth.
- ♦ **population-limiting hypotheses** See hypothesis: population-limiting hypotheses.
- ♦ **population-niche concept** See niche (def. 7).
- ♦ **population outbreak** See year: wasp year.
- ♦ **population regulation** See regulation: population regulation.
- ♦ **population size (*n*, *N*, *n*, *N*)** *n.* The number of items, or individuals, in a finite population (Lincoln et al. 1985).
- effective population size (*N_e*)** *n.*
 1. The size of an ideal, theoretical, randomly breeding population that would lose its heterozygosity at the same rate as an actual population under consideration (Wilson 1975, 77, 583; Freeman and Herron 2004, 217).
 2. The number of breeding adults in a population (Freeman and Herron 2004, 616).*syn.* effective population number
Comments: The *N_e* is almost always smaller than the actual population size (Freeman and Herron 2004, 217). The *N_e* is particularly sensitive to differences in the number of reproductively active females compared to males. When the sex ratio is not 1:1, *N_e* can be estimated as $N_e = (4N_f N_m) / (N_f + N_m)$, where *N_f* is the number of females, and *N_m* is the number of males.
- ♦ **population structure** *n.* Population composition according to age, genetic makeup, and gender of individuals (Lincoln et al. 1985).
cf. life table
- ♦ **population systematics** See study of: systematics: population systematics.
- ♦ **population thinking** *n.* A school of thought that asserts that there is no "typical" individual organism and mean values measuring individuals' traits are abstractions (Mayr 1982, 46, 682).
- cf.* essentialism, typological thinking
- Comments:* This school emphasizes that "every individual in a sexually reproducing species is uniquely different from all others, with much individuality even existing in uniparentally reproducing ones." Confusion about organismal variation results from the failure to apply population thinking consistently (Mayr 1982, 46, 682).
- ♦ **population variance** See variance: population variance.
- ♦ **Populus** See program: Populus.
- ♦ **porphyrin** See molecule: porphyrin.
- ♦ **port-wine stain** *n.* A purplish birth mark on human skin (Greenhouse 2003, A8).
Comments: Port-wine stains can be large enough to cover much of a person's face which can cause major discrimination against such a person (Greenhouse 2003, A8, illustration). About one in 3,000 children are born with port-wine stains. They are caused by dilated capillaries under skin, and often can be treated by laser surgery.
- ♦ **position effect** See effect: position effect.
- ♦ **positive assortative mating** See mating: assortative mating.
- ♦ **positive binomial distribution** See distribution: binomial distribution: positive binomial distribution.
- ♦ **positive chemotaxis** See taxis: chemotaxis: positive chemotaxis.
- ♦ **positive eugenics** See eugenics: positive eugenics.
- ♦ **positive feedback** See feedback: positive feedback.
- ♦ **positive phototaxis** See taxis: phototaxis: phototaxis.
- ♦ **positive reinforcement** See reinforcement: positive reinforcement.
- ♦ **positive reinforcer** See reinforcer: positive reinforcer.
- ♦ **positive rheotaxis** See taxis: rheotaxis: positive rheotaxis.
- ♦ **positive skewness** See skewness: positive skewness.
- ♦ **positron-emission tomography** See method: positron-emission tomography.
- ♦ **post-** *prefix*
 1. "After in time or order; following" (Michaelis 1963).
 2. "Chiefly in scientific terms, after in position; behind" (Michaelis 1963).*[Latin *post*, behind, after]*
- ♦ **post-Darwinism** *n.* The attempt to produce "a theory that can predict particular biological events in ecological and evolutionary time" (Wilson 1975, 64).
Comments: "The ultimate success of an event cannot be predicted....;" "Post-Darwinism" is a new phase of evolutionary thinking dating from about 1960, taking up where "The Modern Synthesis" left off in some areas of thought (Wilson 1975, 64).
- ♦ **postadaptation, postaption** See ³adaptation: ^{1,2}evolutionary adaptation.
- ♦ **postclimax** See ²community: climax: postclimax.
- ♦ **postclisere** See ²succession: postclisere.
- ♦ **postcopulatory behavior, postcopulatory play** See behavior: copulatory behavior: postcopulatory behavior.
- ♦ **postcopulatory mate guarding** See behavior: mate guarding: postcopulatory mate guarding.

- ♦ **postcornual-skin gland** See gland: postcornual-skin gland.
- ♦ **poster coloration** See coloration: poster coloration.
- ♦ **poster signal** See signal: poster signal.
- ♦ **postinteractive niche** See niche: realized niche.
- ♦ **postlinguistic signal** See signal: postlinguistic signal.
- ♦ **postmating isolation** See isolation: postmating isolation.
- ♦ **post-menopausal zest** *n.* A woman's period of well-being when perimenopause ends and menopause starts (Wallis 1995, 51).
syn. pits to peak phenomenon (Sheehy in Wallis 1995, 51)
[coined by Margaret Mead (Wallis 1995, 51)]
- ♦ **postpartum** *adj.* Referring to a phenomenon that occurs after parturition (Lincoln et al. 1985).
- ♦ **post-translational gene silencing (PTGS)** *n.* An organism's stopping the production of a particular gene product after it apparently detects double-stranded RNA, or some other aberrant nucleic acid, in its cell(s) (inferred from Gura 2000, 804).
cf. method: RNA interference
syn. co-suppression (in plants), RNA interference (RNAi, flies, worms), quelling (fungi) (Gura 2000, 804)
Comments: PTGS might be an ancient self-defense mechanism against infections by transposons and viruses. Double-stranded RNA, or some other aberrant nucleic acid, in a host's cell might trigger PTGS. It occurs in, *e.g.*, *Caenorhabditis elegans* (round worm), *Neurospora crassa* (Red Bread Mold), *Nicotiana tabacum* (Tobacco), *Petunia* sp. (petunia), and *Solanum lycopersicum* (Tomato) and possibly in *Danio rerio* (Zebra Fish) and Mammals (Gura 2000, 804–808).
- ♦ **posture** *n.* “The relative disposition of parts of anything;” especially a person's position and carriage of his, or her, limbs and body as a whole; “attitude; pose” (Oxford English Dictionary 1972, entries from 1606).
cf. behavior, display, sleep position
- cleaning-invitation posture** *n.* The posture of a cleaning customer (fish) that communicates to a cleaner that the customer is ready to be cleaned (Heymer 1977, 136).
- cut-off posture** *n.* A submissive posture that decreases, or stops, aggressive stimuli from an opponent, *e.g.*, a primate's looking away from, rather than directly at, an opponent (Hinde 1970, 681).
- humped posture** *n.* In some cat species: A threat display involving an individual's raising its back into a hump (Lorenz 1951 in Heymer 1977, 48).
- limp posture** *n.* In carnivores and rodents: A passive posture, or “transport catalepsy” involving a slightly bent back, and hanging head and legs shown by young when it is carried by the back of its neck by its parent (Leyhausen 1965, 1975 in Heymer 1977, 176).
cf. neck bite
- nose-up posture** See display: upward stretch.
- nursing posture, nursing position** *n.* In Mammals: A young's body position that it adopts during suckling and is adjusted to its mother's body position within certain limits and its species characteristics (Immelmann and Beer 1989, 204–205).
- obelisk position** *n.* In some dragonfly species: The posture of a perching individual that holds its abdomen nearly straight up (Dunkle 1989, 10).

Comment: This posture helps to reduce overheating by reducing the amount of sunlight that falls on a dragonfly's abdomen (Dunkle 1989, 10).

- ♦ **submissive postures** *n.* Human ritualized submissive behavior, *e.g.*, greetings, bowing, tipping one's hat, falling to one's knees, or falling to the ground (Heymer 1977, 51).
cf. submission
- ♦ **tail posture** See display: tail display.
- ♦ **wheel posture** *n.* In Damselflies and Dragonflies (Odonata): A copulation posture in which a male holds a female by the rear part of her head, or her thorax, while she bends her abdomen downward and forward while receiving sperm from his secondary genitalia, which are on his second abdominal segment (Heymer 1966, 1973 in Heymer 1977, 137; Dunkle 1989, 11, 51; Dunkle 1990, 25).
syn. wheel position (Dunkle 1989, 11)
Comment: The abdomen of a male and female form a heart shape when some species are in the wheel posture.
- ♦ **postventitious** *adj.* “Delayed in development” (Lincoln et al. 1985).
- ♦ **postzygotic isolating mechanism** See mechanism: isolating mechanism: postzygotic isolating mechanism.
- ♦ **potamic** *adj.* Referring to rivers or transport by river currents (Lincoln et al. 1985).
- ♦ **potamincole** See -cole: potamincole.
- ♦ **potassium** See ²community: potassium.
- ♦ **potamodromous** See -dromous: potamodromous.
- ♦ **potamology** See study of: potamology.
- ♦ **potamon** *n.* The lower reaches of rivers and streams (Lincoln et al. 1985).
adj. potamous
cf. rhithron
- ♦ **potamophile** See ¹-phile: potamophile.
- ♦ **potamoplankton** See plankton: potamoplankton.
- ♦ **potential, potentiality** *n.*
 1. A physiological difference, or change of, electrical state in a part of an organism, *e.g.*, nerve membrane (Immelmann and Beer 1989, 229).
 2. An animal's tendency; its probability of showing a particular behavior (Immelmann and Beer 1989, 229).
- ♦ **action potential** *n.*
 1. A transient electric potential change across a membrane (Curtis 1983, 1086).
Note: In a nerve cell, an action potential results in transmission of a nerve impulse, and in a muscle cell, it results in contraction (Curtis 1983, 1086).
 2. A transient, self-regenerating electrical event that is propagated down a neuron membrane when it is depolarized (Gould 1982, 74); firing of a neuron (Immelmann and Beer 1989, 199).
syn. nerve impulse (Immelmann and Beer 1989, 2), nerve spike
 3. “The probability of occurrence of a specific behavior pattern” (Immelmann and Beer 1989, 2).
Note: This is a somewhat obsolete ethological term (Immelmann and Beer 1989, 2).
- ♦ **generator potential** *n.* A graded electrical potential of receptor cells that results from environmental energy that is converted into a graded electric potential (McFarland 1985, 169).

membrane potential *n.* The electrical difference between a nerve fiber's inside and outside (Immelmann and Beer 1989, 229).

residual-reproductive potential *n.* The general "currency" that animals spend at particular times in their lives (Daly and Wilson 1983).

resting potential *n.* The electric potential across the membrane of an inactive, living neuron (McFarland 1985, 167).

resource-holding potential (RHP) *n.*

1. An individual organism's potential for obtaining, or retaining, a resource based on its fighting ability [coined by Parker 1974 in Maynard Smith 1976, 44].
2. An individual organism's potential for obtaining, or retaining, a resource based on one, or more, relevant attributes which include fighting ability, physical position with regard to the resource, posturing, size, strength, timing of its relevant behavior, vocalization quality, and weaponry (Parker and Rubenstein 1981, 221, 223–224).

specific-action potential, specific-action potentiality (SAP) *n.* An animal's readiness to show a particular behavior (Immelmann and Beer 1989, 2). *cf.* energy: action-specific energy

Comment: Specific-action potential has been replaced by "behavioral tendency," "response tendency," or "response probability" by most writers (Immelmann and Beer 1989, 2).

♦ **potonuon** See nuon: potonuon.

♦ **pouch-brood** See brood: pouch-brood.

♦ **pouch maker** *n.* A bumble-bee species that builds special wax pouches adjacent to groups of larvae and fills them with pollen (Wilson 1975, 430, 592). *cf.* pollen storer

♦ **pout face** See facial expression: pout face.

♦ **pouting, pouting behavior** See behavior: pouting.

♦ **Pouyannian mimicry** See mimicry: Pouyannian mimicry.

♦ **power, power of a statistical test** *n.* The probability of rejecting a null hypothesis when it is, in fact, false; power = 1 - probability of a type-II error (*q.v.*) (= one's nonrejection of a false null hypothesis) (Siegel 1956, 10; Thomas and Juanes 1996, 856, who discuss the importance of statistical power analysis in animal behavior and list many computer programs that calculate statistical power and Websites that relate to it).

syn. statistical power (Hedrick 1999, 317)

Comment: Power is a function of α (*q.v.*), effect size (*q.v.*), and sample size (N) (Milinski 1977, 1978). Johnson (1996, 860) discusses the overestimation of the role of statistical-power analysis in science.

♦ **power grip** See grip: power grip.

♦ **power set** *n.* The theoretical upper limit of a combinatorial message which is the set of all possible combinations of its subsets (Wilson 1975, 188).

♦ **PPAL** See document: PPAL.

♦ **praecocial** See -cial: precocial.

♦ **pragmatics** See study of: study of signals: pragmatics.

♦ **prairie** See habitat: prairie.

♦ **Prais-Winsten Technique** See statistical test: Prais-Winsten Technique.

♦ **pratal** *adj.* Referring to grassland and meadowland (Lincoln et al. 1985).

♦ **pratinicole** See -cole: pratinicole.

♦ **pratum** See ²community: pratum.

♦ **pre-, prae-** *prefix*

1. "Before in time or order; prior to; preceding" (Michaelis 1963).
2. "Before in position; anterior" (Michaelis 1963).
3. "Preliminary to; preparing for" (Michaelis 1963). [Latin *prae*, before]

♦ **preadaptation** See ³adaptation: ²evolutionary adaptation: preadaptation.

♦ **prebiological, prebios, prebiotic** See biotic: prebiotic.

♦ **precaudal gland** See gland: precaudal gland.

♦ **preceptive behavior** See behavior: soliciting behavior.

♦ **precipice** See habitat: cliff.

♦ **precipitation** *n.*

1. In meteorology, moisture deposition (as drizzle, hail, rain, sleet, snow, etc.) from Earth's atmosphere upon its surface (Michaelis 1963; Allaby 1994).

Note: Cloud bursts are dramatic during summer monsoon rainstorms in the desert near Tucson, Arizona, U.S. (fig. 39).

2. In meteorology, the amount of water (as rain, snow, etc.) deposited on Earth's surface from its atmosphere (Michaelis 1963).

3. Deposition of dust, or other substances (e.g., pollution), from air (Allaby 1994).

♦ **acid precipitation** *n.*

1. Precipitation of water with a pH less than 5.6 (Krebs 1985, 694).

2. Precipitation of water with a pH less than about 5.0, which is the value produced when naturally occurring carbon dioxide, sulphate, and nitrogen oxides dissolve into water droplets in clouds (Allaby 1994).

See acid deposition.

syn. acid rain (a confusing synonym because precipitation includes hail, mist, sleet, and snow as well as rain)

Comments: Acid precipitation may be caused naturally (e.g., by gases or aerosols ejected by volcanoes) or anthropogenically (e.g., from burning fuels) (Allaby 1994). Acid-precipitation effects on plants, soils, and surface waters are complex, their severity depending on the form of deposition and the pH and natural buffering of soil and water into which acid precipitation falls. Acid rain washes rapidly from plant surfaces, but can affect soil. Acid mist tends to coat leaves and is more harmful than acid rain. Acid precipitation has reduced, or eliminated, fish populations in thousands of lakes (Krebs 1985, 695). Starting in the 1980s, countries in North America and Northern Europe have been enacting regulations to reduce smokestack emissions of sulfur dioxide in an effort to curb acid precipitation and its harmful effect on our environment (Yoon 1999, 7 October, A22). People know little about what, if any, biological recovery had occurred by 1999.

♦ **precinctive** *adj.* Referring to a group of organisms confined to a geographic area under discussion (Sharp 1900, 91 in Frank and McCoy 1990, 1).

cf. autochthonous; ¹endemic; immigrant; indigenous; insular; introduced; ²species: endemic species [Latin *praecinctus*, present participle of *praecingere*, to gird, encircle]

♦ **precipitation gauge** See instrument: precipitation gauge.

- ♦ **precision** *n.* In statistics, “the closeness of repeated measurements of the same quantity” (Lincoln et al. 1985).
- ♦ **precision grip** See grip: precision grip.
- ♦ **preclimax** See ²community: climax: preclimax.
- ♦ **preclisere** See ²succession: preclisere.
- ♦ **precluding of bonds** *n.* Humans’ finding it difficult to become peers in a certain endeavor because of past encounters with one another in a situation in which they were not peers, *e.g.*, professors’ and their former students’ becoming academic colleagues or siblings’ becoming spouses (Tiger and Fox 1971 in Wilson 1975, 79).
- ♦ **precocial** See -cial: precocial.
- ♦ **precocious** *adj.* Referring to an event that occurs usually early in an organism’s development (Lincoln et al. 1985).
- ♦ **precopulatory chasing, precopulatory driving** *n.* In Bovidae without display circling: A bull’s chasing a cow for some distance in a straight line and then striking her with his outstretched forelegs (foreleg kicking) (Heymer 1977, 176).
Comment: Similar behavior occurs in some dove and pigeon spp. (Heymer 1977, 176).
- ♦ **precoital behavior** See behavior: precoital behavior.
- ♦ **precopulatory behavior** See courtship.
- ♦ **precopulatory mate guarding** See behavior: mate guarding: precopulatory mate guarding.
- ♦ **predation** *n.*
1. Human “plundering or pillaging; depredation” (Oxford English Dictionary 1972, entries from 1460).
 2. In many animal species: An individual’s relatively quick killing and at least partial consumption of its prey (Lincoln et al. 1985).
- cf.* parasitism, predator
- micropredation** *n.* A small predator’s partial consumption of a large prey (Lincoln et al. 1985).
- group predation** *n.* For example, in Army Ants, *Canis lupus* (Gray Wolves), Driver Ants, Humans (*e.g.*, Pygmies), Pelicans: A conspecific group’s cooperating in hunting and retrieving of living prey (Wilson 1975, 585).
- ♦ **predator** *n.* An organism that relatively quickly kills and eats another organism, *e.g.*, an ambush bug that kills and eats a bee or *Panthera leo* (Lion) that kills and eats an antelope (Wilson 1975, 592).
See ²group: functional feeding group: predators.
syn. harpactophagous (Lincoln et al. 1985)
Comments: Aranoid spiders (fig. 40) are key predators in many habitats.
cf. forager, parasite, predation
- ambush predator** *n.* A predator that awaits its prey and ambushes it rather than stalking it, *e.g.*, a praying mantid (Heymer 1977, 109).
syn. sit-and-wait predator (a confusing synonym)
Comment: Some researchers do not recommend using this term.
- keystone predator** See ²species: keystone species.
- micropredator** *n.* An organism that feeds on a prey that is larger than itself and to which it temporarily attaches, *e.g.*, a tick (Lincoln et al. 1985).
Comment: Many biologists would consider this tick to be a “parasite,” not a “predator.”
- ♦ **“predator hypothesis”** See hypothesis: hypotheses regarding the origin of the Cambrian explosion: “predator hypothesis.”

A CLASSIFICATION OF PREDATORS^a

- I. actively-searching predator
- II. ambush predator (*syn.* sit-and-wait predator)
- III. “clinger”
- IV. “cruising predator” (*syn.* actively-foraging predator, cruising forager)
- V. “fast predator”
- VI. flier
- VII. intensive predator (intensive forager)
- VIII. mobile predator
- IX. percher
- X. pursuer (*syn.* type-I predator)
- XI. saltatory predator
- XII. “search-and-chase predator”
- XIII. “search-and-destroy predator”
- XIV. searcher (*syn.* type-II predator)
- XV. sit-and-wait predator (*syn.* ambush predator)
- XVI. “slow predator”
- XVII. sprinter
- XVIII. stayer
- XIX. stationary predator
- XX. “swimmer”
- XXI. widely-foraging predator

^a This table reflects how many researchers have classified predators and synonymized their names. Predator terms have been in a state of confusion. Terms within quotes were composed by me as far as I know.

- ♦ **predator warning call** See call: predator warning call.

- ♦ **predatory aggression** See aggression: predatory aggression.

- ♦ **predatory drive** See drive: predatory drive.

- ♦ **predatory model** See ³model: predatory model.

- ♦ **predict** *v.t.*

1. To state, tell about, or make known in advance, especially to do so using special knowledge: *predict the weather* (Morris 1982).
2. In statistics, to determine the value of a dependent variable by one or more independent variables (Sokal and Rohlf 1969, 443–444).

Notes: Statisticians and others may say that an independent variable *predicts* the value of a dependent one, *e.g.*, X_1 predicts Y ; or X_1 is a predictor of Y (Sokal and Rohlf 1969, 443–444). This means that one can determine or estimate the values of Y from values of X_1 . It does not definitely indicate that X_1 causes Y to have its particular values. For example X_1 may be correlated with another variable such as X_2 which causes Y to change in magnitude. To determine whether an independent variable affects the magnitude of a dependent variable, a researcher should perform the correct manipulative experiment.

3. To foretell on the basis of experience, observation scientific reason, or a combination of these factors (Mish, 1991).

Notes: Scientists test some hypothesis that cannot be directly tested by testing directly related subhypotheses (often called predictions) which are testable. If the researchers find that their data are consistent with one or more subhypotheses related to a main untestable hypothesis, they conclude that they have data that are consistent with the main hypothesis as well (pers. obs.).

cf. expect, prediction

[Latin *praedictus*, past participle of *praedicere* < *prae-* pre- + *dicere*, to say]

♦ **prediction** *n.*

1. "The act of predicting" (Morris 1982).
2. "Something foretold or predicted; a prophecy" (Morris 1982).
3. A subhypothesis often called a "prediction" that a researcher tests as a way of indirectly testing a focal main hypothesis (pers. obs.).

See predict.

n. predictiveness

adj. predictive, predictively

Comment: Many authors have confused "logical prediction" with "temporal prediction" (Mayr 1997, 53).

♦ **logical prediction** *n.*

1. Prediction that can be made because individual observations conform with a theory or scientific law (Mayr 1982, 57); contrasted with temporal prediction.
2. In science, prediction of the outcome of an experiment or natural phenomenon when a particular constellation of factors exists (Mayr 1997, 53).

♦ **temporal prediction** *n.* Prediction from the present to the future that is infrequently impossible in many biological situations (Mayr 1982, 57); contrasted with logical prediction.

syn. chronological prediction (Mayr 1997, 53)

Comment: Science can rarely make a temporal prediction (Mayr 1997, 54). The future course of evolution on Earth is unpredictable.

♦ **prediction equation** *n.* In quantitative genetics,

any equation that defines the relationship between the selection differential (*S*) and the response to selection (*R*) (Hartl and Clark 1997, 410).

cf. response to natural selection (Freeman and Herron 2004, 313)

Comments: A general prediction equation that applies to many forms of selection is $R = h^2S$ (Hartl and Clark 1997, 410); where h^2 is the realized heritability which is identical to narrow-sense heritability (h^2 , *q.v.*) defined by regression; *S* is the selection differential ($= \mu_s - \mu$, where μ_s = the mean phenotype of the selected parents, and μ = the mean phenotype of the entire parental population). Galen (1996, 120) used the prediction equation to predict the rate at which a change in pollinator abundance may have caused floral-morphology divergence in *Polemonium viscosum* (Alpine Skypilot). In that species, natural selection due to bumble bees increased the corolla flare by 9% in one generation.

♦ **prediction error** See error: prediction error.

♦ **predictor variable** See variable: independent variable.

♦ **predominant species** See ²species: predominant species.

♦ **preening** See grooming.

♦ **preference** *n.*

1. A person's liking, or estimation, of one thing before, or above, another; prior favor or choice (Oxford English Dictionary 1972, entries from 1656).
2. A consuming organism's likelihood of choosing one resource item (= component) over others from a set in which each item type occurs with equal frequency (Johnson 1980, 66).

Notes: In theory, a researcher can rank the items from least preferred through most preferred (Johnson 1980, 66).

3. An individual organism's, or species', being drawn to specific environmental features; *e.g.*, temperature

ranges, humidity ranges, light ranges, foods, or habitats (Immelmman and Beer 1989, 231).

4. An individual animal's choosing a particular conspecific individual over another in a social interaction, *e.g.*, mate choice (Immelmman and Beer 1989, 231).

♦ **partial preference** *n.* In some predatory- and parasitic-animal species: An individual's preying upon, or parasitizing, a less profitable prey item when it has the option of utilizing a more profitable one (Krebs and McCleery 1984 in Putters and Assem 1988, 933).

♦ **preferential species** See ²species: preferential species.

♦ **preferred ambient temperature** See temperature: preferred ambient temperature.

♦ **preferred body temperature** See temperature: preferred ambient temperature.

♦ **preferred niche** See niche: preferred niche.

♦ **preformationism** See -genesis: biogenesis (comment); ³theory: encasement theory.

♦ **pregnancy** *n.*

1. A mother Human's being with child; gestation (Oxford English Dictionary 1972, entries from 1598).
2. A mother mammal's carrying a growing fetus in her uterus.

adj. pregnant

cf. gravid

♦ **pseudopregnancy** *n.* In some mammal species:

A nonpregnant female's having physiological changes associated with pregnancy, such as cessation of ovarian cycling (estrus), due to copulation stimulation that gives rise to her hormonal changes (Immelmman and Beer 1989, 237–238).

♦ **prehensile** *adj.* Referring to an animal's organ that is adapted for gripping, *e.g.*, a monkey's tail or upper lip of a *Dicerorhinoceros* (Black Rhinoceros) (Lincoln et al. 1985; Robinson and Challinor 1995, 222).

♦ **preimaginal conditioning** See learning: conditioning: preimaginal conditioning.

♦ **preinteractive niche, prospective ecospace** See niche (def. 7).

♦ **prelinguistic signal** See signal: prelinguistic signal.

♦ **preparedness** See learning disposition.

♦ **premarin** See hormone: premarin.

♦ **prematuring isolation** See isolation: premating isolation.

♦ **premenstrual-stress-dysphoria disorder** See syndrome: premenstrual-stress-dysphoria disorder.

♦ **premenstrual syndrome** See syndrome: premenstrual syndrome.

♦ **prenatal learning** See learning: prenatal learning.

♦ **preprogrammed behavior** See behavior: instinct.

♦ **pubertal, prepupal** *adj.* Referring to an animal's condition that occurs, or exists, before its puberty (Lincoln et al. 1985).

cf. puberty

♦ **presaturation dispersal** See dispersal: presaturation dispersal.

♦ **prescient forager** See forager: prescient forager.

♦ **prescriptor** *n.* A signal component that designates the appropriate action for the responder to follow (Marler 1961 in Wilson 1975, 217).

cf. appraisor

- ♦ **presentation** See display: presentation.
- ♦ **presentation time** See time: presentation time.
- ♦ **presenting** See behavior: soliciting behavior: presenting.
- ♦ **preservation** *n.* Human maintenance of individual organisms, populations, or species by planned management and breeding programs (Lincoln et al. 1985). *cf.* conservation.
- ♦ **presociality** See sociality: presociality.
- ♦ **prestige custom** *n.* A person's demonstration of his, or her, economic wealth with things such as a large, attractive automobile or house; hospitality; or potlatch in Kawikul Indians (Heymer 1977, 132).
- ♦ **prevailing climax** See ²community: climax: prevailing climax.
- ♦ **prevalent plankton** See plankton: prevalent plankton.
- ♦ **prevernal** *adj.* Referring to early spring (Lincoln et al. 1985). *cf.* vernal
- ♦ **prey** *n.* An organism that is killed relatively quickly and partly, or entirely, consumed by a predator (Lincoln et al. 1985). *cf.* predation, predator
Comment: Many researchers include pollen grains, seeds, seedlings, and spores as prey.
- ♦ **prey-catching behavior** See behavior: prey-catching behavior.
- ♦ **prey parasite** See parasite: prey parasite.
- ♦ **prey parasitism** See parasitism: cleptoparasitism.
- ♦ **prey set** *n.* "The total range of prey items utilized by a predator" (Lincoln et al. 1985).
- ♦ **prey stealing** See parasitism: cleptoparasitism.
- ♦ **prezygotic-isolating mechanism** See mechanism: isolating mechanism: prezygotic-isolating mechanism.
- ♦ **PRF** See chemical-releasing stimulus: semiochemical: pheromone: plethodonid receptivity factor.
- ♦ **primaparity** See -parity: primaparity.
- ♦ **primary** See primordial.
- ♦ **primary consumer** *n.* "A heterotrophic organism that feeds directly on a primary producer" (Lincoln et al. 1985).
- ♦ **primary-defensive behavior** See behavior: defensive behavior: primary-defensive behavior.
- ♦ **primary discontinuity** See discontinuity: primary discontinuity.
- ♦ **primary drive** See drive: primary drive.
- ♦ **primary host** See ³host: definitive host.
- ♦ **primary intergradation** See zone: intergradation zone.
- ♦ **primary instinct** See behavior: instinctive behavior: primary instinct.
- ♦ **primary monogyny** See -gyny: monogyny (comment).
- ♦ **primary parasitism** See parasitism: primary parasitism.
- ♦ **primary producer** See producer.
- ♦ **primary production, primary productivity** See production.
- ♦ **primary queen** See caste: queen: primary queen.
- ♦ **primary reproductive** See caste: primary reproductive.
- ♦ **primary sex ratio** See ratio: sex ratio: primary sex ratio.
- ♦ **primary-sexual character, primary-sexual characteristic** See character: sexual character: primary-sexual character.

- ♦ **primary social dominance** See dominance (social): primary social dominance.
- ♦ **primary speciation** See speciation: primary speciation.
- ♦ **primatology** See study of: primatology.
- ♦ **prime mover (of social evolution)** *n.* An ultimate factor, or influence (phylogenetic inertia or environmental pressure) that determines the direction and, velocity of evolutionary change in social behavior and, thus, determines the determinants of social organization (Wilson 1975, 32, 592).
- ♦ **primer pheromone** See chemical-releasing stimulus: semiochemical: pheromone: primer pheromone.
- ♦ **primeval** *adj.* Referring to the earliest times, or the beginning of the Universe (Lincoln et al. 1985).
- ♦ **priming** See memory: priming.
- ♦ **priming stimulus** See ²stimulus: priming stimulus.
- ♦ **primitive** See ancestral.
- ♦ **primitive character** See character: ancestral character, plesiomorph.
- ♦ **primitive eusociality** See sociality: primitive eusociality.
- ♦ **primitive similarity, symplesiomorphy** *n.* Taxa's common possession of homologous "primitive" characters or character states (Lincoln et al. 1985). *cf.* character: plesiomorph: symplesiomorph
- ♦ **primitive species** See ²species: primitive species.
- ♦ **primitive trait** See character: ancestral character, plesiomorph.
- ♦ **primordial** See primitive.
- ♦ **principal-components analysis** See method: principal-components analysis.
- ♦ **principle** *n.*
 1. A fundamental truth, or proposition, on which many others depend; a primary truth that comprehends, or forms the basis, of many subordinate truths; a general tenet, or statement, that forms the ground for, or a ground for, or is held to be essential to, a system of thought or belief; a fundamental assumption that forms the basis of a chain of reasoning (Oxford English Dictionary 1972, entries from 1380).
 2. In physics, a highly inclusive theorem, or law, that admits numerous special applications, or is exemplified in a number of cases (Oxford English Dictionary 1972, entries from 1710).
 3. "An established mode of action or operation in natural phenomena: the *principle* of relativity" (Michaelis 1963).
 4. A generalization useful as a guide to understanding or study (Mayr 1982, 37–45).
syn. concept, generalization, rule (Mayr 1982, 37–45)
Note: This definition seems appropriate for wide use. Principles in biology are sometimes referred to as "laws," but this is not a preferred use of "law" (Mayr 1982, 37–45).
 5. "The intellectual framework of a theory or a generalized way of looking at a phenomenon" (Moore 1984, 475).
syn. concept, theory
cf. axiom, dictum, doctrine, dogma, effect, law, Morgan's canon, rule, theorem, theory, truism
Comments: See "law" for kinds of biological dictums, laws, principles, rules, etc. Below, I define some of the many terms that contain the word "principle;" all of these terms do not necessarily represent (biological) principles.

[Latin *principium*, a beginning]

Allee effect *n.* The density of an organism population varies according to the spatial distribution of its individuals (degree of aggregation), and both over-crowding and under-crowding may be suboptimal (Lincoln et al. 1985).

syn. Allee law, Allee principle

anthropic principle *n.* Our understanding of the world is a function of our abilities to understand the world (Barrow and Tipler 1986 in Ruse 1993, 59).

August Krogh principle *n.* “For a large number of problems there will be some animal of choice, or few such animals, on which it can be most conveniently studied” (Krogh 1929 in Lehner 1979, 21); in other words, particular animal species (compared to alternative species) are the better, or best, ones for testing certain hypotheses.

[named after August Krogh by Krebs (1975 in Lehner 1979, 21)]

Bateman's principle *n.*

1. In *Drosophila melanogaster*: Male reproductive success is positively correlated with number of copulations (Bateman 1948, 364; Oberhauser 1988, 1384).

Note: Oberhauser's (1988, 1384) work with Monarch Butterflies supports this principle; she also discusses exceptions to it.

2. Reproductive success is more variable in the sex (usually males) that makes the smaller investment in gametes (Bateman 1948, 364).

3. Reproductive success is more variable in the sex (usually males) that makes the smaller parental investment (*q.v.*) (Trivers 1972, 138; Wilson 1975, 324–325).

syn. Bateman effect (Wilson 1975, 327)

cf. bearing-and-caring

Bernard's dictum *n.* “The stability of the internal environment [of an organism] is the condition for free and independent Life” (Bernard 1859 in McFarland 1985, 238).

syn. Bernard's principle, *milieu intérieur*

[after Claude Bernard (1813–1878), physiologist]

bilateral-primary-linkage principle *n.* In Athapaskan Dogrib Indians: In times of famine, local bands coalesce with temporarily better off ones (Helm 1968 in Wilson 1975, 554).

cicada principle *n.* In *Magicicada* spp. (Periodical Cicadas): The hypothesis that an individual decreases its chance of being eaten by being part of a large group of conspecific and heterospecific cicadas; this is because a predator (glutton) can become totally satiated from consuming part of such a group, but many more group members escape predation in a larger group compared to a smaller one when the number of predators remains the same (Beamer 1931 in Lloyd and Dybas 1966a, 134; Lloyd and Dybas 1966b, 469; Brown 1975, 143).

Comments: “The cicada principle” is a special case of “the gluttony principle,” *q.v.* Research with 13-yr Periodical Cicadas supports this hypothesis (Williams et al. 1993, 1143).

competitive exclusion, competitive-exclusion principle *n.* See principle: Gause's principle.

constant-environment principle *n.* Any population allowed to reproduce itself in a constant environment will attain a stable age distribution (Wilson 1975, 92).

Gause's principle *n.* No two species have the same ecological niche (Gause 1932; Gause 1934 in Odum 1969, 231); “complete competitors cannot co-exist” (Hardin 1960 in Krebs 1985, 254).

syn. competitive-exclusion principle (Krebs 1985, 254); Gause's hypothesis, Gause's law, Gause's rule; Grinnell's axiom (Lincoln et al. 1985); Volterra-Gause principle (Hutchinson 1957 in Griesemer 1992, 234)

Comments: This concept was first clearly demonstrated experimentally by Gause (1934 in Odum 1969, 231). It was never formally defined by Gause, and was suggested in Darwin's writing and indicated in writing by Grinnell (1904) and Monard (1920); thus, “the competitive-exclusion principle” might be a preferable name (Krebs 1985, 254). Closely related species can have very similar niches (Odum 1969, 231). Hutchinson (1957, 418, in Griesemer 1992, 237) tried to rescue this principle from apparent circularity “by reformulating it as an empirical claim: realized niches do not intersect.” In 1960, Slobodkin referred to Gause's principle as “Gause's Axiom” to emphasize its immunity to test (Slobodkin 1995, 384).

[after G. F. Gause, Russian ecologist]

gluttony principle *n.* A prey organism decreases its chance of being eaten by being part of a large group of conspecific organisms because a predator (glutton) can become totally satiated from consuming part of such a group, but many more group members escape predation in a larger group compared to a smaller one when the number of predators remains the same (Brown 1975, 143).

cf. principle: cicada principle

handicap principle See hypothesis: handicap principle.

Hardy-Weinberg law *n.* Allele frequencies in a population do not change from generation to generation if there is no natural selection and pairing of mates is random (Wilson 1975, 63), demonstrating that meiosis and recombination do not alter gene frequencies (Lincoln et al. 1985).

syn. genetic equilibrium (Lincoln et al. 1985), Hardy-Weinberg equilibrium, Hardy-Weinberg principle

Comment: “Two alleles (*a* and *a'*) will remain at the same frequency in a population from generation to generation unless their frequency is affected by immigration, mutation, selection, nonrandom mating, or errors of sampling” (Hardy 1908; Provine 1971 in Mayr 1982, 554).

Herrnstein's principle of quantitative hedonism *n.* Domestic Pigeons trained at two disks, one located to the left and the other to the right, will try one as opposed to the other in precise proportion to the percentage of times each disk reinforces them with food when they peck the disk (Herrnstein 1971a in Wilson 1975, 266).

Horn's principle *n.* The concept that, in some animal species, food-supply variability in space and time is the prime factor for colonial roosting and nesting (Horn 1968; Wilson 1975, 52–53, 525).

Comment: When food is more or less evenly distributed and can be defended economically, it is energetically most efficient to have exclusive territories; but when it occurs in unpredictable patches, it is most efficient to collapse territories to roosting, or nest, sites and forage as a group (Horn 1968; Wilson 1975, 52–53, 525).

MacArthur-Hamilton-Leigh principle *n.* In bisexual species, a parent ideally does not produce

equal numbers of each sex; rather, it should make equal investments of time, energy, and other resources in its group of daughters and group of sons (MacArthur 1965, Hamilton 1967, and Leigh 1970 in Wilson 1975, 317).

Comment: This principle supersedes Fisher's principle.

maximum-power principle *n.* A system design that survives and is organized to bring in energy as quickly as possible and use it to feed back into itself to bring in more energy (Odum et al. 1988, 31).

migration principle *n.* The intensity of the programmed migratory activity of a species is inversely related to the stability of its preferred habitat (Wilson 1975, 104).

parsimony *n.* The principle, dating from at least the 14th century, that an explanation that requires the fewest undocumented assumptions should be preferred over more complicated hypotheses that required more assumptions for which evidence is lacking (Futuyma 1998, 96).

cf. Morgan's canon; Ockham's razor; law: law of parsimony; principle: parsimony

Comments: Cladistic parsimony holds that among the various phylogenetic trees that one can imagine for a group of taxa, the one best supported by evidence is the one that requires one to postulate the fewest evolutionary changes (Futuyma 1998, 96).

principle of allocation *n.*

1. A speculative proposition stating that animals' major requirements differ greatly in the amounts of time and energy that are profitable to devote to them measured in the currency of genetic fitness (Wilson 1975, 143, 324).

Note: As a rule, these requirements descend in immediacy as: food, antipredation, and reproduction (Wilson 1975, 143, 324).

2. Every organism allocates its resources to various essential activities which can be categorized as maintenance, growth, and reproduction (Willson 1983, 5).

principle of antithesis *n.* Animal signals that are opposite in meaning are often conveyed by expressions, or postures, that are opposites, e.g., postures of a friendly and angry *Canis familiaris* (Domestic Dog) or facial expressions of a happy and angry person (Darwin 1872 in McFarland 1985, 398).

principle of commonality *n.* A character state that has the widest distribution among the taxa that comprise a more derived taxon is considered to be the most ancestral (Lincoln et al. 1985).

principle of composition *n.* All homologous structures are composed of the same kinds of elements, e.g., individual hand bones in Primates (Mayr 1982, 462).

See principle: principle of connections.

principle of connections *n.* When one is in doubt as to the homology of structures in widely different organisms, consider the relative positions and dependency of the structures, e.g., "the humerus will always lie between the shoulder articulation, and the bones of the lower arm (radius and ulna)" (Mayr 1982, 462).

Comment: "The principle of composition" is auxiliary to "the principle of connections." These two principles are used for decisions on homology at present. "The entire modern method of establishing homologies throughout the vertebrate series or throughout

the arthropods is ultimately based on Geoffroy's method [these principles]" (Mayr 1982, 462).

principle of continuity *n.* The erroneous concept that there are no gaps between species in trees of relatedness (Strickberger 2000, 8).

Comment: Baron Gottfried Wilhelm von Leibniz (1646–1716) expressed this idea as "Nature makes no leaps" (Strickberger 2000, 8). To account for gaps, he proposed that species had become extinct and others transformed into different species.

principle of correlation of parts *n.* A generalization attributed to Cuvier that proposes that each organ of an organism's body is functionally related to every other organ, and the harmony and well-being of the organism results from their cooperation (Mayr 1982, 460).

principle of expendable surplus *n.* An organism has more of a particular thing (e.g., offspring or resources) than is necessary for optimal fitness promotion in a given environment; e.g., sexually reproducing species would not increase their fitnesses for an appreciable period by becoming parthenogenetic (Mayr 1982, 599).

principle of isostasy *n.* The concept that "continents float in hydrodynamic equilibrium on a substratum of denser material;" contrasts with the theory of plate tectonics (Hallam 1975, 11).

principle of metabolic conservation *n.* The generalization that a species tends to eliminate the biochemical steps required for the synthesis of a kind of nutrient compound (vitamin) that is readily available in its diet; thus, enzymatic protein and energy can be diverted for other, more urgent functions (Wilson 1975, 161).

principle of mosaic evolution *n.* Different components of the phenotypes of a species may evolve at highly unequal rates (Dollo 1888, Lamarck 1809, 58, and Abel 1924, 21, in Mayr 1982, 579, 613). *syn.* mosaic evolution, mosaic-inheritance theory (Mayr 1982, 579, 613); nonharmonious-character transformation (Lincoln et al. 1985)

principle of plenitude *n.*

1. The idea (doctrine) that God in "the ampleness of his mind had surely created any creature that was possible;" that is, all possible creatures exist (Mayr 1982, 319, 326, 347).

Note: Extinction of a species violated this doctrine which was adhered to by most of the leading thinkers in the 17th and 18th centuries including Leibniz (Mayr 1982, 319, 326, 347).

2. An ecosystem that is delicately balanced and full of exactly the right number of species (Bakker 1985, 72).

syn. plenitude (Mayr 1982, 326)

[Old French < Latin *plenitudo* < *plenus*, full]

principle of progressive development *n.* Chambers' (1844) idea that "(1) fauna of the world evolved through geological time, and (2) that the changes were slow and gradual and in no way correlated with any catastrophic events in the environment" (Mayr 1982, 382–383).

cf. gradualism, punctuated equilibrium.

principle of reproductive success *n.* Per unit time, all things being equal, a parthenogenetic species can generate twice as many female reproductives as a sexually reproducing species that wastes half of its zygotes in producing males (Mayr 1982, 599).

cf. cost: cost of sex

Comments: The principle of reproductive success suggests that natural selection should favor parthenogenes rather than sexual reproduction, but some researchers believe that the latter enables environmental tracking with genetically variable offspring and this accounts for the predominance of sexually reproducing species (Williams 1975 and Maynard Smith in Mayr 1982, 599). For other possible benefits of sex, see hypothesis: hypotheses of the evolution and maintenance of sex.

principle of objectivity *n.* The concept that an objective world exists outside of the influence of subjective human perception (Mayr 1997, 34).

Comments: Most scientists believe in this principle (Mayr 1997, 34).

principle of stimulus relevance *n.* The associated strength of a cue with its group of consequences (reinforcer) depends partly upon the nature of the consequences (Capretta 1961 in McFarland 1985, 337).

principle of stringency *n.* A speculative proposition that animals' time-energy budgets evolve so as to fit their times of greatest stringency, such as periods of food shortage (Wilson 1975, 142).

principle of topological continuity *n.* Small changes in an organism species' external environment species lead to small changes in the species via evolution, which in turn lead to small changes in its external environment (inferred from Lewontin 2000, 126).

Comment: A qualitative alteration in the species may also occur in addition to topological continuity (Lewontin 2000, 126).

principle of use and disuse See law: Lamarck's first law.

reafference principle *n.* A concept that attempts to explain the regulation and interaction of internal signals and sensory signals in directing and coordinating an animal's movements: An animal's central nervous system (processing unit) stores an efference copy that fixes a reference value (*Sollwert*) of parameters required to execute the animal's movement. This information guides its response until the reafference from its motor unit to the processing unit indicates accordance with its *Sollwert*; if during its movement execution the animal encounters a disturbance, the animal reexamines its efference copy in relation to the new information and corrects its movements until it reaches its goal (von Holst and Mittelstaedt 1950 in Heymer 1977, 141; Immelmann and Beer 1989, 243). *cf.* -ference: afference, efference, reafference; ³theory: inflow theory, outflow theory

Comment: This is an extension of outflow theory.

social-tolerance principle *n.* A species' social tolerance has evolved to fit its optimal population density and optimal population structure (Lidicker 1965, Eisenberg 1967 and Christian 1970 in Wilson 1975, 102).

survival of the stable *n.* A principle that indicates that some groups of atoms (e.g., a Banana, an Elephant, the Matterhorn, or a raindrop) last long enough on Earth to be observed and named (Dawkins 1977, 13).

Comment: Darwin's "survival of the fittest" is a special case of this principle (Dawkins 1977, 13).

xenophobia principle, xenophobic principle *n.* "The strongest evoker of aggressive response in animals is the sight of a stranger, especially

a territorial intruder" (Klopman 1968 and Southwick 1969 in Wilson 1975, 249, 286).

you-first principle *n.* "An individual is safest by allowing other individuals to take the risk of entering a hazardous or unfamiliar area first" (Wittenberger 1981, 622).

♦ **priority** *n.* "The most direct, obvious objective indicated by an animal's behavior; the proximal objective that *appears* to be directing, or 'motivating,' the animal" (Hand 1986).

♦ **prisoner's-dilemma game** See game: prisoner's-dilemma game.

♦ **prize** See award.

♦ **pro- prefix**

1. Forward; to, or toward, the front from a position behind; forth (Michaelis 1963).
2. "Forth from its place; away" (Michaelis 1963).
3. "To the front of; forward and down" (Michaelis 1963).
4. "Forward in time or direction" (Michaelis 1963).
5. "In front of" (Michaelis 1963).
6. "In behalf of" (Michaelis 1963).
7. "In place of" (Michaelis 1963).
8. "In favor of" (Michaelis 1963).
9. "Prior; occurring earlier in time" (Michaelis 1963). [Greek *pro-* < *pro*, before, forward, for, in front

♦ **proaposematic coloration** See coloration: proaposematic coloration.

♦ **probabilistic model** See ⁴model: stochastic model.

♦ **probability, likelihood** *n.* The statistical chance that a particular event will occur (Lincoln et al. 1985). *cf.* potential: specific-action potential

Comment: The probability of an impossible event is zero, and that of an inevitable event is 1 (Lincoln et al. 1985).

transition probability *n.* The estimated probability that one particular behavior (e.g., A) will be followed by another particular behavior (e.g., B) (Immelmann and Beer 1989, 317–318). *cf.* analysis: stochastic analysis.

♦ **probability level** See p: "stipulated p."

♦ ¹**probe** *n.* In surgery, an instrument for exploring cavities, wounds, etc. (Michaelis 1963). [Late Latin *proba*, proof < Latin *probare*]

nucleic-acid probe *n.* A short, single-stranded nucleic acid that is complementary to another strand of nucleic acid (Campbell et al. 1999, 368). *Comment:* This probe is used in identifying a gene (Campbell et al. 1999, 368).

♦ ²**probe** *n.* A short sequence of DNA that is designed to recognize only one specific other sequence of DNA (= a marker) (Rensberger 1995, A10). *Comment:* Probes are used in DNA fingerprinting.

♦ **probiogenesis** See -genesis: biogenesis: probiogenesis.

♦ **problem solving, reasoning** *n.* For example, in Primates: An individual's finding the solution to a problem (e.g., recognizing oddity, or matching to a sample) by using inference, or insight, as opposed to trial-and-error learning (Immelmann and Beer 1989, 233). *cf.* learning

pure-problem solving *n.* An animal's working out a solution to a difficult circumstance without entailing pleasurable learning of rules and variations in doing so (Bruner 1968 in Wilson 1975, Wilson 1975, 165).

♦ **procaryotic** See prokaryotic.

♦ **procedural representation** See representation: procedural representation.

♦ **procedure** *n.*

1. A manner of proceeding, or acting, in any course of action (Michaelis 1963).
2. "A course of action; a proceeding" (Michaelis 1963). *cf.* method, program

correction procedure *n.* In a study of simultaneous-discrimination learning in primates: an investigator's presenting a subject with a stimulus configuration identical to that of the previous trial (*i.e.*, the stimulus position remains the same), after the subject makes an incorrect choice (Dewsberry 1978, 328).

guidance procedure *n.* In a study of simultaneous-discrimination learning in primates, an investigator's forcing a subject to make a correct choice after the subject makes an incorrect choice because the investigator gives the subject no alternative choice (Dewsberry 1978, 328).

noncorrection procedure *n.* In a study of simultaneous-discrimination learning in primates, an investigator's ending a trial with a subject's incorrect choice (Dewsberry 1978, 328).

♦ **proceptive behavior** See behavior: proceptive behavior.

♦ **proceptivity, female** See behavior: proceptive behavior.

♦ **process** *n.*

1. A course, or method, of operations for producing something (Michaelis 1963).
2. A series of continuous actions that bring about a given result, condition, or both (Michaelis 1963).
3. "A forward movement; progressive or continuous proceeding; passage; advance; course" (Michaelis 1963).

magnification process *n.* An establishment of dominance hierarchies in which an individual's repeatedly successful encounters with others increase the probability of its success in later encounters, and make its contest with a timid animal still more of a mismatch (Chase 1973, 1974 in Wilson 1975, 295).

Markoff process *n.*

1. An event occurrence's being influenced to some degree by the nature of immediately preceding events, such that the event's occurrence is different than chance alone (Lincoln et al. 1985; Immelmann and Beer 1989, 295).

cf. order

2. A stochastic process in which future development is determined only by its present state and is independent of this state's developmental mode (Lincoln et al. 1985).

cf. chain: Markoff chain

random process *n.* A process governed in part by a chance, or random, mechanism (Lincoln et al. 1985).

syn. stochastic process (Lincoln et al. 1985)

vacancy-chain process *n.*

1. The process by which a series of people sequentially use the same resource; *e.g.*, person-1 obtains an apartment, he leaves it, then person-2 rents it, he leaves it, then person-3 rents it, etc. (Chase et al. 1988, 1265).
2. The process by which a series of hermit crabs use the same shell sequentially (Chase et al. 1988, 1265).

♦ **process of intercompensation** *n.* "The operation of only one or a small number of control factors at

a time, with other mechanisms coming into play only if the primary ones are removed by an amelioration of environmental conditions (Wilson 1975, 25).

♦ **procession** See ²group: procession.

♦ **prochonium** See ²community: prochonium.

♦ **prochronism** *n.* The general truth: "Organisms carry, in their forms, evidences of their past growth" (Bateson 1979, 242).

Comment: "Prochronism" is to "ontogeny" as "homology" is to "phylogeny" (Bateson 1979, 242).

♦ **proclimax** See ²community: climax: proclimax.

♦ **procrypsis** See -cryspsis: procrypsis.

♦ **proctodeal food** See food: proctodeal food.

♦ **proctodeal trophallaxis** See trophallaxis: proctodeal trophallaxis.

♦ **producer** *n.*

1. An autotrophic organism, usually a photosynthesizer, that contributes to the net primary productivity of a community (Curtis 1983, 1104).

syn. autotroph, primary producer (Lincoln et al. 1985)

cf. -troph-: autotroph

2. An organism that synthesizes complex organic substances from simple inorganic ones (Lincoln et al. 1985).

cf. -troph-: autotroph

3. An individual, or species, that obtains a resource through making a behavioral investment; contrasted with scrounger [coined by Barnard and Sibly 1981, 543].

Notes: For examples of producers and scroungers, see scrounger under S in this book.

syn. autotroph, primary producer (Lincoln et al. 1985)

♦ **¹production** *n.* The process by which two, or more, ingredients are combined to form a new product; *e.g.*, plants combine soil nutrients, water, carbon dioxide, and sunlight to form organic matter during photosynthesis (Odum et al. 1988, 29).

Comment: Odum et al. (1988, 29) also define "gross production" and "net production."

♦ **²production** *n.* The rate at which energy is stored by photosynthetic and chemosynthetic activity of producer organisms (chiefly green plants) in the form of organic substances which can be used as food materials in an ecological system, community, or part thereof; this rate is often measured as grams per square meter per day (Odum 1969, 68, 71).

syn. basic productivity, primary production, primary productivity, productivity, rate of production

gross-primary productivity (GPP) *n.* The total productivity (measured as the total rate of photosynthesis) including the organic matter used up in respiration during a measurement period (Odum 1969, 68).

syn. gross-primary production (GPP), total assimilation, total photosynthesis

net-biome production *n.* Net-primary productivity and the losses of carbon that result from fires, heterotrophic respiration, insect-induced mortality, logging, and other anthropogenic and natural disturbances (Bolin et al. 1999, 1851).

net-primary productivity *n.* The total productivity (measured as the total rate of storage of organic matter in plant tissues) in excess of plant respiratory utilization during a measurement period (Odum 1969, 68).

abbr. NNP (Delucia et al. 1999, 1177)

syn. apparent photosynthesis, net assimilation, net-primary production

secondary productivity, secondary production *n.* The rates of energy storage at consumer and decomposer trophic levels, which become smaller at successively higher levels (Odum 1969, 68).

Comment: There is only one kind of “secondary production,” because consumers use food that is already produced, with appropriate losses, and convert it to different tissues by one, overall process. The total energy flow at heterotrophic levels, which is analogous to gross production of autotrophs, should be designated as “assimilation,” not “production” (Odum 1969, 69).

♦ **productivity** See production.

♦ **proepisematic** See -episematic: proepisematic.

♦ **profundal** *adj.* Referring to a deep zone of a lake below the level of effective light penetration, and hence green plants (Lincoln et al. 1985).

♦ **progalvanotaxis** See taxis: galvanotaxis: progalvanotaxis.

♦ **progamete** See gamete: progamete.

♦ **progamic sex determination** See sex determination: progamic sex determination.

♦ **progamous** See -gamous: progamous.

♦ **progenesis** See -genesis: paedogenesis; heterochrony: progenesis.

♦ **progenitor** *n.* An ancestor (Lincoln et al. 1985).

♦ **progeny** *n.* Offspring of a single mating or an asexually reproducing organism (Lincoln et al. 1985). *cf.* seed

♦ **progesterone** See hormone: progestin.

♦ **progestin-induced hermaphroditism** See hermaphroditism: progestin-induced hermaphroditism.

♦ **progestins** See hormone: progestins.

♦ **program** *n.*

1. A definite plan, or scheme, of any intended proceedings; an outline, or abstract, of something to be done, whether or not in writing (Oxford English Dictionary 1972, entries from 1837).
2. A procedure for solving a problem, including collection of data, date processing, and results presentation; this procedure may be one coded for a computer as a computer program (Morris 1982).

Comments: Computer packages, computer programs, and other programs follow this entry. Taxonomic programs include BIOSYS-1, Hennig-86, MacClade, PAUP, and PHYLI (Shaffer et al. 1991, 287–288).

behavioral program *n.* The genetically and individually stored information that structures an animal's central nervous system, or is temporarily stored there, and that governs the manner and flexibility in which the animal's behavior adjusts to its environment (Immelmann and Beer 1989, 233–235).

cf. strategy

Comment: Immelmann and Beer (1989) discuss conceptual differences between “computer program” and “behavioral program.”

[derived from computer-science language]

► **closed-behavioral program** *n.* In less derived invertebrates: A behavioral program that is primarily governed by genetically stored information (Immelmann and Beer 1989, 234).

► **open-behavioral program** *n.* In more derived invertebrates and in Vertebrata: A behavioral program that is primarily governed by individually acquired information (Immelmann and Beer 1989, 234).

Canary 1.1.1 *n.* A computer program that generates a power spectrum (plot of sound intensity vs. frequency) (Marshall and Cooley 2000, 1315).

CLIMEX *n.* A mathematical program that describes a taxon's responses to moisture and temperature, using biological data, distribution data, or both, to derive a population growth index and stress indices related to temperature and moisture conditions (New 2009, 115–116).

CLUSTAL W *n.* A computer program used for aligning amino-acid sequences (Thompson et al. 1994 in Tomitani et al. 1999, 162).

digital organism (DO) *n.* A computer program that self-replicates, mutates, and adapts by a process similar to natural selection (Lenski et al. 1999, 661).

Comments: Digital organisms compete for central-processing-unit (CPU) time which is the fuel needed for their replications. A DO mutates at random and evolves in a defined computational environment. Each DO has a genome length measured as the number of sequential instructions in its program, and so forth. Digital organisms offer opportunities to test generalizations about living systems that may extend beyond the organic life that biologists usually study, including possible extraterrestrial life (Lenski et al. 1999, 661–662).

► **complex digital organism** *n.* A digital organism that is selected to perform mathematical operations that accelerate replication through a set of defined ‘metabolic’ rewards; contrasted with simple digital organism (Lenski et al. 1999, 661).

► **simple digital organism** *n.* A digital organism that is selected solely for rapid replication; compared to a complex DO, it does no mathematical operations; contrasted with complex digital organism (Lenski et al. 1999, 661).

DNAML Computer Program *n.* A computer program that uses the maximum likelihood method for producing phylogenetic trees (Niesbach-Klösgen et al. 1987, 214).

genetic program *n.* An organism's genes that influence only particular or all of its phenotypic traits (Mayr 1982, 44).

► **closed-genetic program** *n.* An organism's genetic program that controls one of its behaviors and is reasonably resistant to any changes during the organism's life (Mayr 1982, 612).

► **open-genetic program** *n.* An organism's genetic program that controls behaviors, *e.g.*, those involved in choosing food, or habitats, that have flexibility and allow incorporation of learning (Mayr 1982, 612).

Google Earth *n.* A program that displays a virtual Earth globe, maps, and other information (Google 2009).

Comments: Google Earth's original name is EarthViewer 3D (Google 2009). A free version of Google Earth has limited functionality.

HENNIG-86 *n.* A computer program developed by J. S. Farris and used to produce parsimonious phylogenetic trees (Mayr and Ashlock 1991, 320).

syn. Hennig86 (Shaffer et al. 1991, 288)

[named after Willi Hennig, a German entomologist and pioneer in the development of cladistic analysis]

i-Tree *n.* A peer-reviewed, public-domain suite of computer programs from the U.S. Department of Agriculture Forest Service (USDAFS) that provides

analysis and benefits-assessment tools for urban forestry (<http://www.itreetools.org/index.shtml>).

Comments: i-Tree tools help communities of all sizes to strengthen their urban forest management and advocacy efforts by quantifying the structure of community trees and the environmental services that trees provide (<http://www.itreetools.org/index.shtml>). i-Tree has the utilities i-Tree Species, i-Tree Storm, and i-Tree Vue (beta). The USDAFS released i-Tree in 2006. The Davey Tree Expert Company, International Society of Arboriculture, National Arbor Day Foundation, Society of Municipal Arborists, and the USDAFS have entered into a cooperative partnership to continue to develop, disseminate, and provide technical support for i-Tree.

MacClade *n.* A phylogenetic analysis program for the Apple Macintosh that displays phylogenetic trees on the screen (Maddison and Maddison 1998, history page).

Comments: David and Wayne Maddison finished version 1 of MacClade in 1986 which evolved into version 3.07 by 1999. It contains many tools for the analysis and manipulation of phylogenies and character evolution (Mayr and Ashlock 1991, 321; <http://phylogeny.arizona.edu/macclade.html>).

MAPMAKER 3.0 *n.* An interactive computer package used for constructing primary genetic-linkage maps of experimental and natural organism populations (Lander et al. 1987 in Bradshaw et al. 1995, 763).

MAPMAKER/QTL *n.* A computer package used for making maps of quantitative genes (Lincoln et al. 1992 in Kim and Rieseberg 1999, 965).

MCID Elite® *n.* A comprehensive, flexible computer imaging system (Imaging Research Incorporated, 2002).

Comment: This software is an advanced platform that features discrete monitors for images and data, a macro editor, support for a wide range of peripheral devices, and wizards (Imaging Research Incorporated, 2002). For example, a researcher can use MCID Elite® to analyze the color hue, intensity, and saturation of a Three-spined Stickleback (Canolin 1999, 1262).

MOLPHY *n.* A computer program used for performing a maximum-likelihood analysis (Adachi and Hasegawa 1996 in Tomitani et al. 1999, 162).

MOO *n.* “A computer program that creates a virtual space in which many users can be connected simultaneously, and interact with each other by speaking and acting” (e.g., waving, smiling, or pointing) (<http://netspace.students.brown.edu/MendelWeb/MWmoo.info.html>, 2000).

cf. BioMoo Center

Comments: A MOO is object-oriented, meaning that inside a MOO everything, including the user, is represented as an “object;” thus, a user can interact not only with other users but with objects in the space as well (<http://netspace.students.brown.edu/MendelWeb/MWmoo.info.html>, 2000).

[MOO, multiple-user dimension, object oriented (Anderson 1994, 900)]

motor program *n.* “A self-contained unit of behavior of which fixed-action patterns are a conceptually crucial special case” (Gould 1982, 163).

National Atmospheric Deposition Program (NADP) *n.* A program that operates about 200 wet-precipitation collectors throughout the continental U.S. (Williams et al. 2002, 185).

neighbor joining *n.* A computer program that tries to find the most parsimonious evolutionary tree (one with the minimum number of mutations) by continually pairing sequences so that it minimizes the total amount of change in a tree (Barinaga 1992, 687; Gibbons 1992, 874).

Organelle Genome Megasequencing Program (OGMP) *n.* A comprehensive effort to sequence the mtDNAs of Protista (Gray et al. 1999, 1477; <http://megasun.bch.umontreal.ca/OGMP/>).

Phrap *n.* A computer program that assembles the gene sequences that emerge from the program Phred into overlapping sequences (Wade 1998, 10 March, C5).

cf. program: Phred

Comments: Other computer programs used in gene sequencing are Blast, Genscan, and RepeatMasker (Wade 1998, 10 March, C5).

Phred *n.* A computer program that scans the output of a gene-sequencing machine and calls the order of the bases along with the level of confidence that can be placed in each call (Wade 1998, 10 March, C5).

cf. program: Phrap

Phylogenetic Analysis Using Parsimony (PAUP) *n.* A computer program developed by

David L. Swofford and used to produce the most parsimonious dendrogram of taxa from a data set (Shaffer et al. 1991, 287–288).

Comments: PAUP has undergone several revisions. It is based on the assumption that the most parsimonious tree is the most likely to mimic what happened during evolution (Gibbons 1992, 874). Some systematists debate whether PAUP always produces the most parsimonious tree.

Phylogenetic Inference Package (PHYLIP)

n. A package of computer programs developed by J. Felsenstein that is used to produce phylogenetic trees (Mayr and Ashlock 1991, 320).

[*Phylogenetic Inference Package*]

Populus *n.* A group of computer simulation programs regarding ecology, evolution, and population biology produced by Donald Alstad of the University of Minnesota (<http://www.cbs.umn.edu/eeb/faculty/AlstadDonald/>) (Alstad 2005).

Streets *n.* A computer program within i-Tree (*q.v.*) that is used for street-tree analysis and management and that uses tree-inventory data to determine the \$U.S. value of the annual environmental and aesthetic benefits of street trees, including air-quality improvement, CO₂ reduction, energy conservation, property value increase, and storm-water control (http://itreetools.org/street_trees/introduction_step1.shtml).

Swarm *n.* A package of computer programs for multi-agent simulation of complex systems being developed at The Santa Fe Institute (www.santafe.edu/projects/swarm).

Comments: Swarm is intended to be a useful tool for researchers in a variety of disciplines, especially artificial life (www.santafe.edu/projects/swarm). Swarm’s basic architecture is the simulation of collections of concurrently interacting agents. This architecture implements a large variety of agent-based models.

Terraserver-USA *n.* A free, online program, formerly called Microsoft TerraServer, that displays aerial and satellite imagery of Earth (Microsoft Corporation 2005).

[after both Latin, *terra*, earth, land and the terabytes of images stored in the program's Web site (Microsoft Corporation 2005) + server]

The Observer *n.* A computer program for collection and analysis of observational data (Noldus 1991, 415; www.diva.nl/noldus).

Tinbergenian research programme *n.* Nikolaas Tinbergen's four main questions about animal behavior as a group: (1) why does the animal show a behavior with regard to the immediate causation of the behavior (function, physiology), (2) why does an animal show a behavior at a particular time in its life with regard to the developmental causation of the behavior, (3) why does an animal show a behavior with regard to short-term adaptation to its environment (ecology), and (4) why does an animal show a behavior with regard to its long-term adaptation to its environment (Dewsbury 1978, 5–7, Wiley 1997, 752)? *syn.* four why's of animal behavior (Dewsbury 1978, 5–7)

Wagner 78 *n.* A computer program that uses the Wagner algorithm to construct a dendrogram (Wagner tree) (Kluge and Farris 1969 in Wiley 1981, 176). *cf.* procedure: distance-Wagner cluster analysis

Comments: Wagner's original method uses apomorphic characters to link subtaxa based on their relative degrees of apomorphy. Wiley (1981, 177–192) describes how the Wagner algorithm works.

[after Warren Herbert Wagner, Jr., botanist]

♦ **programmed behavior** See behavior: instinct.

♦ **programmed-cell death** See death: apoptosis.

♦ **programmed instruction** See learning: programmed learning.

♦ **programmed learning** See learning: programmed learning.

♦ **progress** *n.*

1. Evolutionary advancement "to better and better conditions, continuous improvement" (Oxford English Dictionary 1933 in McKinney 1987).

syn. advancement, improvement, mechanical enhancement (Oxford English Dictionary)

Notes: This is considered to be an incorrect definition from a scientific standpoint. Nonevolutionarily, "progress" implies direction, if not advancement toward a goal, but neither direction, nor goal, is provided by evolutionary mechanisms (Futuyma 1986, 8).

2. An increase in efficiency, or effectiveness, of certain adaptations within lineages (Futuyma 1993, 1153). *cf.* Darwin's admonition; *scala naturae*

Comment: Gould (1985 in McKinney 1987) suggests that "progress" be replaced with the more objective, less offensive, "improvement." McKinney argues that "progress" is not offensive as an evolutionary term. Dawkins discusses progress with regard to evolutionary scaling and the adjectives "higher" and "lower." Progress continues to concern evolutionists, especially those interested in macroevolution, and it continues to be controversial (Ruse 1993, 59).

absolute progress *n.* Evolutionary "improvement" up a scale of fixed value; a directed evolutionary change toward that which is better; contrasted with comparative progress (Ruse 1993, 55).

Comment: Absolute progress is a controversial concept. Enthusiasts for absolute progress generally think that Humans come out on top (Ruse 1993, 55–58).

comparative progress *n.* Adaptive advance of one line of organisms over others; contrasted with absolute progress (Ruse 1993, 55).

Comment: Comparative progress is a controversial concept. At the micro-level biologists generally agree that it occurs, but there is much debate about its precise nature and extent (Ruse 1993, 55, 58). The arms race, *q.v.*, is classified as a type of comparative progress.

♦ **progressionism** *n.* The assertion made by some of Cuvier's followers that "a brand new creation had taken place after each catastrophe, and that each succeeding creation reflected the changed conditions of the world" (Mayr 1982, 374).

Comment: In a way, progressionism is a creationist reshaping of the *scala naturae*, *q.v.* (Mayr 1982, 374).

[This assertion was designated as "progressionism" by Rudwick (1972) (Bolwer 1976 in Mayr 1982, 374).]

♦ **progressive holism** See holism: progressive holism.

♦ **progressive development, principle of** See principle: principle of progressive development.

♦ **progressive deviation, principle of** See law: von-Baer's laws.

♦ **progressive provisioning** See provisioning: progressive provisioning.

♦ **progressive selection** See selection, directional selection.

♦ **progressive succession** See ²community: ²suc-cession (def. 1).

♦ **progressive uniformitarianism** See ³theory: uniformitarianism: progressive uniformitarianism.

♦ **progyny** See gyny: protogyny.

♦ **prohydrotaxis** See taxis: positive hydrotaxis.

♦ **project** *n.* A research undertaking (Morris 1982), an education program, or both.

Animal Rights Law Project *n.* A project at Rutgers University School of Law concerned with the rights of nonhuman animals (www.animal-law.org/, 2000).

Comments: This project (1) trains law students in lawyering skills, such as case and statutory analysis and litigation techniques and strategies, in the context of cases involving animal rights issues, or the intersection between human and animal rights; (2) produces legal materials to try to help people who cannot afford legal assistance in their efforts to help nonhumans; and (3) offers courses that seek to foster and facilitate general social discourse about animal rights and the Humans–nonhuman-animal relationships (www.animal-law.org/, 2000). This Project's website contains a large amount of information concerning animal rights.

Biological Dynamics of Forest Fragment

Project (BDFFP) *n.* A collaborative research effort between Brazil's National Institute for Amazonian Research (INPA) and the Museum of Natural History, Smithsonian Institution, that is undertaking an experimental study of the process of habitat fragmentation in the Amazon Basin (Didham 1997, 57; 1999, www.si.edu/biodiversity/bdffp.htm).

Comment: Researchers initiated this Project in 1979, and study sites are near Manaus, Brazil (Hamilton 1999, 129).

Deep Green Project *n.* A 5-yr research project that ended in 1999 and had the aim of mapping the entire evolutionary tree of plants (Brown 1999, 990;

Weiss 1999, 5 August, A5; www.ucjeps.herb.berkeley.edu/bryolab/greenplantpage.html).

Comment: This project involved over 200 scientists from 12 countries (Weiss 1999, 5 August, A5).

Forgotten Pollinators Campaign *n.* A project, based at the Arizona-Sonora Desert Museum, Tucson, U.S., that “is a multi-media effort to call international attention to the critical role pollination plays in putting food on our plates, and in maintaining healthy wild communities around the globe (www.desertmuseum.org/fp/, 2000).

Comments: The Campaign aims to inform conservationists, growers, the public, and scientists about the animals that pollinate economically important crops and rare plants (www.desertmuseum.org/fp/, 2000). The Campaign also works to call attention to the threats faced by many populations of wild and managed bees, butterflies, moths, and bats and other pollinators. One in every three bites of food that Humans eat is made possible by a bee or other animal pollinator.

Fungal Mitochondrial Genome Project (FMGP) *n.* A comprehensive effort to sequence the mtDNAs of Fungi (Gray et al. 1991, 1477; <http://megasun.bch.umontreal.ca/People/lang/PMGP/>).

Human Genome Initiative *n.* A worldwide research effort to analyze the structure of human DNA and determine the location and sequence of the estimated 100,000 human genes (www.gdb.org/, 2000).

Human Genome Project (HGP) *n.* An international research effort, officially begun in 1990, to map the entire human genome, producing genetic maps, physical maps, and a complete nucleotide sequence maps of human chromosomes (Lander 1996, 536; Campbell et al. 1999, 376; <http://www.ornl.gov/hgmis/>, 2000).

cf. gene (table)

Comment: The Human Genome Project completed basic sequencing of the entire human genome in 2003 with the benefit of rapid technological advances that accelerated this research (<http://www.ornl.gov/hgmis/>, 2000). The project's goals included identifying all of the human genes, determining the sequences of the 3 billion base pairs that make up human DNA, storing this information in databases, developing tools for data analysis, transferring related technologies to the private sector, and addressing the ethical, legal, and social issues (ELSI) that might arise from the project.

♦ **prokaryogamety** See meiosis.

♦ **prokaryote** See -karyote: prokaryote.

♦ **prokaryotic sex** See sexual reproduction: prokaryotic sex.

♦ **prolactin** See hormone: prolactin.

♦ **prolactin-release inhibiting factor** See hormone: prolactin-release inhibiting factor.

♦ **proliferation** *n.* “Multiplication; growth; cell division; reproduction” (Lincoln et al. 1985).

♦ **prolonged-searching polygyny** See mating system: polygyny: scramble-competition polygyny: prolonged-searching polygyny.

♦ **promiscuity** *n.*

1. The condition of being promiscuous; indiscriminate mixture, confusion; promiscuousness (Oxford English Dictionary 1971, entries from 1849).
2. Promiscuous sexual union, as among some races of low civilization (Oxford English Dictionary 1971, entries from 1865).

See mating system: polybrachygamy.

adj. promiscuous

[French *promiscuité*]

♦ **promiscuous mating effort** See effort: reproductive effort: mating effort: promiscuous mating effort.

♦ **promunturium** See ²community: promunturium.

♦ **pronking** See display: pronking.

♦ **proovigenic parasite** See -parasite: proovigenic parasite.

♦ **propaganda pheromone** See chemical-releasing substance: pheromone: propaganda pheromone.

♦ **propaganda substance** See chemical-releasing stimulus: propaganda substance.

♦ **propagation** *n.*

1. “Vegetative increase” (Lincoln et al. 1985).
2. Sexual, or asexual, multiplication (Lincoln et al. 1985).

v.i. propagate

♦ **propagule** *n.*

1. “Any kind of reproductive particle” that may be a part of either sexual, or asexual, reproduction (Dawkins 1982, 293).

syn. diaspora, propagulum (Lincoln et al. 1985)

2. The minimum number of individuals of a species required for colonization of a new, or isolated, habitat (Lincoln et al. 1985).

cf. seed

♦ **property** *n.* An attribute, or quality, that belongs to a person or thing; in earlier uses, sometimes a special, or distinctive, quality, a peculiarity; in later uses, often a quality, or characteristic, in general, without reference to its essentialness or distinctiveness (Oxford English Dictionary 1972, entries from 1303); any attribute, feature, or character (Lincoln et al. 1985).

♦ **phototaxis** See taxis: phototaxis: photophototaxis.

♦ **proportion rule** See law: Allen's rule.

♦ **Proposed Priority Assessment List** See document: Proposed Priority Assessment List.

♦ **proprioceptor** See ²receptor: proprioceptor.

♦ **“prove a hypothesis”** *v.t.* To attempt to demonstrate beyond a shadow of a doubt, or actually show, that an experimental hypothesis is correct.

Comments: Technically, one should not “prove a hypothesis,” one tests a hypothesis. If one tests and rejects a null hypothesis, one should *provisionally* accept the corresponding experimental hypothesis. Biologists sometimes say “I accepted such-and-such a hypothesis.” This is shorthand for saying, I tried to reject the hypothesis, but could not with my available data. Technically, it is more accurate to say, “I could not reject the hypothesis,” or “The hypothesis was not rejected.”

cf. accept a null hypothesis

♦ **pro-, pro-** *prefix* Referring to a positive condition (Lincoln et al. 1985).

♦ **prosaerotaxis** See taxis: aerotaxis: prosaerotaxis.

♦ **proschairlimnetic** *adj.* Referring to organisms occasionally found in plankton in fresh water (Lincoln et al. 1985).

♦ **proschemotaxis** See taxis: chemotaxis: proschemotaxis.

♦ **prosody** *n.* A person's nonverbal communication including tone, tempo, rhythm, loudness, pacing, and other aspects of voice that modify the meaning of words (Wilson 1975, 556).

[Greek *pros-*, to + *ōidē*, a song]

- ♦ **prosopagnosia** *n.* A human brain disorder that stops a person from naming someone from facial features alone whether, or not, the features change substantially over the years (Axelrod and Hamilton 1981).
- ♦ **prospective** *adj.*
1. Referring to something that looks to, or has regard, for the future; operative with regard to the future (Oxford English Dictionary 1972, entries from 1800).
 2. Referring to something that looks forward, or that a person looks forward to; prospective; expected, hoped for; future (Oxford English Dictionary 1972, entries from 1829); “potential; possible; probable” (Lincoln et al. 1985).
- cf.* realized
- ♦ **prospective ecospace** See niche: fundamental niche.
- ♦ **prosphototaxis** See taxis: positive phototaxis.
- ♦ **prostitution** *n.*
1. A woman's offering of her body to indiscriminate lewdness for hire (especially as a practice or institution); whoredom, harlotry (Oxford English Dictionary 1972, entries from 1553).
Note: Zuckerman and Yerkes first used this “loaded term” in connection with nonhuman primates in the 1930s (Waal 1989, 210).
 2. A person's devotion to an unworthy or base use; degradation, debasement, corruption (Oxford English Dictionary 1972, entries from 1647).
- syn.* venality (Michaelis 1963)
cf. mating system: maternal-benefit polyandry [Latin *prostitutus*, past participle of *prostituere* < *pro-*, forward + *statuere*, to place]
- ♦ **prostitution polyandry** See mating system: polyandry: maternal-benefit polyandry.
- ♦ **protandrous hermaphrodite** See hermaphrodite: protandrous hermaphrodite.
- ♦ **protandry** *n.*
1. In some species of solitary bees, butterflies, mayflies, and mosquitoes: Males' tending to mature sooner and emerge from their natal nests sooner than females (Thornhill and Alcock 1983, 97).
 2. A hermaphroditic organism's assuming a functional male condition during its development before reversal to a functional female state (Lincoln et al. 1985).
 3. The maturation of a flower's anthers before its stigma is receptive to pollination (Usher 1996, 304).
syn. protandism, proterandry (Lincoln et al. 1985)
cf. protogyny
- ♦ **protean behavior** See behavior: escape behavior: protean behavior.
- ♦ **protean display** See display: protean display.
- ♦ **protected threat** See behavior: threat behavior: protected threat.
- ♦ **protective call** See animal sounds: call: alarm call.
- ♦ **protective coloration** See coloration: protective coloration.
- ♦ **protective mimicry** See mimicry: protective mimicry.
- ♦ **protein** See molecule: protein.
- ♦ **protein kinase** See enzyme: protein kinase.
- ♦ **proteinoid** See molecule: proteinoid.
- ♦ **protelean** *adj.* Referring to an organism that is parasitic when immature and free living as an adult, *e.g.*, a rhipiphorid beetle (Lincoln et al. 1985).
- ♦ **proterandry** See protandry.
- ♦ **proterogenesis** See hypothesis: proterogenesis.

- ♦ **proterogyny** See -gyny: protogyny: proterogyny.
- ♦ **prothetely** See ²heterochrony: progenesis: prothetely.
- ♦ **Protist Image Database** See database: Protist Image Database.
- ♦ **protistology** See study of: protistology.
- ♦ **proto-** *prefix* First, original.
- ♦ **probiont** See -biont: probiont.
- ♦ **probios** See -bios: probios.
- ♦ **protocaryotic** See prokaryotic.
- ♦ **protocell** See cell: protocell.
- ♦ **protooperation** See symbiosis: protocooperation.
- ♦ **protogamy** See -gamy: protogamy.
- ♦ **protogene** See gene: protogene.
- ♦ **protogenesis** See -genesis: protogenesis.
- ♦ **protogenic** See -genic: protogenic.
- ♦ **protogynous hermaphrodite** See hermaphrodite: protogynous hermaphrodite.
- ♦ **protogyny** See -gyny: protogyny.
- ♦ **protokaryotic** See -karyote: prokaryote.
- ♦ **protomitochondrial genome** See genome: protomitochondrial genome.
- ♦ **protomorphic** See -morphic: protomorphic.
- ♦ **protoplasm** *n.*
1. The fluid in living cells considered to be the ultimate building material of all living things and the real agent of all physiological processes (Mayr 1982, 654).
syn. sarcode (Dujardin 1935 in Mayr 1982, 654)
Note: Many biologists held idea that protoplasm was such an agent from about 1835 to 1935.
 2. The part of a cell, outside its nucleus, containing cell fluid and many kinds of organelles (Mayr 1982, 654).
syn. protoplasm theory, protoplasm theory of life (Mayr 1982, 654)
Comment: “Cytoplasm” is replacing the term “protoplasm” (Mayr 1982, 654).
[coined by Purkinje (1839 in Mayr 1982, 654)]
- ♦ **protosexual** See sexual: protosexual.
- ♦ **protospieces** See ²species: protospieces.
- ♦ **prototroph** See -troph-: prototroph.
- ♦ **protozoology** See study of: zoology: protozoology.
- ♦ **protozoophile** See ²-phile: protozoophile.
- ♦ **protroph** See -troph-: prototroph.
- ♦ **prove** *v.t.* To test extensively and elegantly, but not falsify, a hypothesis (Moore 1984, 475).
syn. demonstrate beyond all reasonable doubt
- ♦ **provenance** *n.* A place of origin (Lincoln et al. 1985).
- ♦ **provincial science** See study of: science: provincial science.
- ♦ **provisioning** *n.*
1. A person's providing food or another thing (Michaelis 1963).
 2. A person's taking measures, or making preparations for something in advance (Michaelis 1963).
- ♦ **brood provisioning** *n.* For example, in some bee, wasp, and other insect species: A parent's providing conditions that promote its young's development before its egg hatches, including establishing and maintaining sheltering burrows, nests, or cocoons, and gathering a food supply, or a mother's laying the eggs in the vicinity of enough food for her hatchling(s) (Immelmann and Beer 1989, 37).
syn. provisioning (Lincoln et al. 1985)

food provisioning *n.* One animal's feeding another, including a parent's feeding its young, a male's feeding a female as part of courtship (courtship feeding), and colony members' feeding one another (trophallaxis) (Immelmann and Beer 1989, 110).
cf. feeding; courtship feeding

mass provisioning *n.* For example, in Dung Beetles (Scarabaeoidea), *Necrophorus* (Burying Beetles), many bee and wasp species: A parent's provisioning a larva with one large meal (all that it eats before it pupates) before it hatches from its egg; contrasted with progressive provisioning (Wilson 1975, 588; Vander Wall 1990, 5).

Comment: Mass provisioning and progressive provisioning are on a continuum (Vander Wall 1990, 5).

nest provisioning *n.* For example, in many vertebrate species: Progressive provisioning in which a parent returns to its nest regularly and feeds its developing offspring (Lincoln et al. 1985).

progressive provisioning *n.* For example, in *Apis mellifera* (Western Honey Bee), *Bombus* spp. (Bumble Bees), Paper Wasps, and Yellowjackets (wasps): An individual's providing a larva with many small, sequential meals (Wilson 1975, 592).

Comments: In progressive provisioning an adult actively feeds a developing larva, either by regurgitating small quantities of partially digested food or by placing the larvae on recently delivered food items (Vander Wall 1990, 5).

♦ **proxemics** See study of: proxemics.

♦ **proximate causation of behavior** See causation: proximate causation: proximate causation of behavior.

♦ **proximate cause, causation** See causation: proximate causation; stimulus: zeitgeber.

♦ **proximate factor** See factor: ultimate factor; causation: ultimate causation; stimulus: zeitgeber.

♦ **proximate function of behavior** See function: proximate function of behavior.

♦ **proxyophile** See ¹-phile: proxyophile.

♦ **psamathium** See ²community: psamathium.

♦ **psamathophile** See ¹-phile: psamathophile.

♦ **psammobiont** See -cole: arenicole.

♦ **psammofauna** See fauna: psammofauna.

♦ **psammogenous** See -genous: psammogenous.

♦ **psammolittoral** *adj.* Referring to a sandy shore (Lincoln et al. 1985).

♦ **psammon** *n.*

1. Organisms that live in, or move through, sand (Lincoln et al. 1985).

cf. -cole: amnicole, arenicole

2. Interstitial biota (Lincoln et al. 1985).

syn. mesopsammon (Lincoln et al. 1985)

cf. benthos

♦ **psammophile** See ¹-phile: psammophile.

♦ **psammosere** See ²succession: psammosere.

♦ **psephonecrocoenosis** See -coenosis: psephonecrocoenosis.

♦ **pseudaposematic coloration** See coloration: pseudaposematic coloration.

♦ **pseudepisematic character** See character: episematic character: pseudepisematic character.

♦ **pseudergate** See caste: pseudergate.

♦ **pseudo-, pseud-** *comb. f.*

1. False; pretended (Michaelis 1963).

2. Counterfeit; not genuine (Michaelis 1963).

3. Closely resembling (Michaelis 1963).

4. Illusory; apparent (Michaelis 1963).

5. Abnormal; erratic (Michaelis 1963).

[Greek *pseudes*, lie]

♦ **pseudoallele** See allele: pseudoallele.

♦ **pseudoallelism** *n.* For example, in some microorganism and *Drosophila* species, *Zea mays* (Corn): The phenomenon in which genes (pseudoalleles), that are closely adjacent to one another on the same chromosome, behave like alleles in certain genetic crosses but not in others (Mayr 1982, 755, 798–799).

♦ **pseudoanisogamy** See -gamety: pseudoanisogamy.

♦ **pseudoapomorph** See -morph: pseudoapomorph.

♦ **pseudocaste** See caste: pseudocaste.

♦ **pseudocoelom** See coelom: pseudocoelom.

♦ **pseudoclinal** See clone: pseudoclone.

♦ **pseudoclinal society** See ²society: pseudoclinal society.

♦ **pseudocoelom, pseudocoelome** See coelom: pseudocoelom.

♦ **pseudoconditioning** See learning: conditioning: pseudoconditioning.

♦ **pseudocopulation** See copulation: pseudocopulation.

♦ **pseudocopulatory behavior** See copulation: pseudocopulation.

♦ **pseudoepisematic character** See character: episematic character: pseudoepisematic character.

♦ **pseudoextinction** See extinction: phyletic extinction, pseudoextinction.

♦ **pseudogamy** See -gamy: pseudogamy; parthenogenesis: gynogenesis.

♦ **pseudogene** See gene: pseudogene.

♦ **pseudogonochorism, pseudohermaphroditism** See hermaphrodisim: pseudohermaphrodisim.

♦ **pseudohybrid** See hybrid: pseudohybrid.

♦ **pseudomixis** See -gamy: pseudogamy.

♦ **pseudoparasitism** See parasitism: pseudoparasitism.

♦ **pseudoperiphyton** See ²community: periphyton: pseudoperiphyton.

♦ **pseudopheromone** See chemical-releasing stimulus: semiochemical: allelochemic: pseudopheromone.

♦ **pseudoplankton** See plankton: pseudoplankton.

♦ **pseudoplasmodium** *n.* "The motile, sluglike organism formed by the aggregation of the amebas of cellular slime molds" (Wilson 1975, 593).

♦ **pseudopolygyny** See -gyny: pseudopolygyny.

♦ **pseudopolyploid** See -ploid: -polyploid: pseudopolyploid.

♦ **pseudopregnancy** See pregnancy: pseudopregnancy.

♦ **pseudopsychology** See study of: psychology: pseudopsychology.

♦ **pseudoreciprocitity** See altruism: reciprocal altruism: pseudoreciprocitity.

♦ **pseudoreplication** See replication: pseudoreplication.

♦ **pseudoseasonal polymorphism** See -morphism: polymorphism: pseudoseasonal polymorphism.

♦ **pseudosematic character** See character: pseudepisematic character.

♦ **pseudosexual behavior** See behavior: sexual behavior: pseudosexual behavior.

♦ **pseudosound** See ¹sound: pseudosound.

♦ **pseudospecies** See ²species: pseudospecies.

♦ **pseudosympophile** See symbiont: symphile: pseudosympophile.

♦ **pseudotroglobiont** See -biont: pseudotroglobiont.

♦ **pseudovigar** See ²species: pseudovigar.

- ♦ **pseudovicarism** See vicarism: pseudovicarism.
- ♦ **pseudoxerophile** See ¹-phile: pseudoxerophile.
- ♦ **psi**, ψ See degree of satisfaction.
- ♦ **psicole** See -cole: psicole.
- ♦ **psilicole** See -cole: psilicole.
- ♦ **psilile** *n.* An organism that lives in savanna, or prairie, communities or habitats (Lincoln et al. 1985).
adj. psilic
[Greek *psilos*, bare, smooth]
- ♦ **psilium** See ²community: psilium.
- ♦ **psiloaedic** See -paedic: psiloaedic.
- ♦ **psilophile** See ¹-phile: psilophile.
- ♦ **psittosis** See ²group: psittosis.
- ♦ **psolidomeiomology** See study of: psolidomeiomology.
- ♦ **psyche** *n.*
 1. Human soul, mind, or intelligence (Michaelis 1963).
 2. In psychoanalysis, the aggregate of a person's mental components including both his conscious and unconscious states, and often regarded as an entity functioning apart from, or independently, of his body (Michaelis 1963).

[Greek *psychē*, soul, breath of life < *psychein*, to breathe]
- ♦ **Psyche** *n.* In Greek and Roman mythology, a maiden who, after many tribulations caused by Aphrodite's jealousy, is united with her lover, Eros, and accorded a place among the gods as a personification of the soul (Michaelis 1963).
- ♦ **psychiatry** *n.* The branch of medicine that deals with diagnosis, treatment, and prevention of human mental disorders (Michaelis 1963); in particular, with disorders that arise from physical and organic causes (Collocot and Dobson 1974).
n. psychiatrist
adj. psychiatric
- ♦ **psychic** *n.*
 1. A person who is sensitive to extrasensory phenomena (Michaelis 1963).
 2. "A spiritualistic medium" (Michaelis 1963).
 3. *adj.* Referring to minds or souls (Michaelis 1963).
 4. "Mental, as distinguished from physical and physiological" (Michaelis 1963).
 5. Referring to, or designating, human mental phenomena that are, or appear, to be independent of normal sensory stimuli, such as clairvoyance, telepathy, and extrasensory perception (Michaelis 1963).
 6. Referring to a person's being sensitive to mental, or occult, phenomena (Michaelis 1963).

syn. psychical (Michaelis 1963)
[Greek < *psychē*. See psycho-.]
- ♦ **psychism** *n.* The doctrine that living matter has attributes not recognized in nonliving matter; the distinctive attributes or "mentality" of living organisms (Collocot and Dobson 1974).
- ♦ **psycho-, psych-, psychy-** *comb. f.* "Mind; soul; spirit" (Michaelis 1963).
[Greek *psychikos* < *psychē*, soul, breath of life < *psychein*, to breathe]
- ♦ **psychoacoustics** See study of: acoustics.
- ♦ **psychoanalysis** See analysis: psychoanalysis.
- ♦ **psychobiology** See study of: biology: psychobiology.
- ♦ **psychochemical** *n.* A drug, or compound, capable of acting directly on a brain and affecting consciousness and behavior (Michaelis 1963).
adj. psychochemical (Michaelis 1963)

- ♦ **psychodynamics** See study of: dynamics: psychodynamics.
- ♦ **psychogenesis** See -genesis: psychogenesis.
- ♦ **psychogenetic** See -genetic: psychogenetic.
- ♦ **psychogenetics** See study of: genetics: psychogenetics.
- ♦ **psychogenic** See -genic: psychogenic.
- ♦ **psychogenic social regulation** See regulation: social regulation: psychogenic social regulation.
- ♦ **psychognosis** See study of: psychognosis.
- ♦ **psychokinesis** See kinesis: psychokinesis.
- ♦ **psychological castration** See castration: psychological castration.
- ♦ **psychology** *n., pl. psychologies*
 1. A person's "aggregate of the emotions, traits, and behavior patterns regarded as characteristic of an individual, type, period, group, particular experience, etc." (Michaelis 1963).
 2. "A work on psychology" (Michaelis 1963).

adj. psychological, psychologic
adv. psychologically
abbr. psych., psychol.
See study of: psychology, for many branches of psychology and psychological schools of thought.
- ♦ **faculty psychology** *n.* "The concept that a person has a mind composed of such distinguishable powers or faculties as intellect, will, memory, and feeling" (Storz 1973, 96).
- ♦ **psychology of personality** See study of: psychology.
- ♦ **psychometry, psychometrics** See study of: -metry: psychometry.
- ♦ **psychomotor** *adj.* In physiology, of, or referring to, muscular movements that result from, or are caused by, mental processes (Michaelis 1963).
- ♦ **psychopathology** See study of: pathology: psychopathology.
- ♦ **psychopharmacological drug** See drug: psychopharmacological drug.
- ♦ **psychopharmacology** See study of: pharmacology: psychopharmacology.
- ♦ **psychophile** See ²-phile: psychophile.
- ♦ **psychophysics** See study of: physics: psychophysics.
- ♦ **psychophysiology** See study of: physiology: psychophysiology.
- ♦ **psychric** *adj.* Referring to low temperatures or cold habitats (Lincoln et al. 1985).
- ♦ **psychro-** *comb. f.* "Cold" (Michaelis 1963).
[Greek *psychros*, cold]
- ♦ **psychrophile** See ¹-phile: psychrophile.
- ♦ **psychophobia** See -phobia: psychophobia.
- ♦ **ptenophyllum** See ²community: ptenophyllum.
- ♦ **ptenophyllophilie** See ¹-phile: ptenophyllophilie.
- ♦ **ptenothalium** See ²community: ptenothalium.
- ♦ **ptenothalophile** See ¹-phile: ptenothalophile.
- ♦ **pteridology** See study of: pteridology.
- ♦ **PTGS** See post-translational gene silencing
- ♦ **ptilopaedic** See -paedic: ptilopaedic.
- ♦ **puberty** *n.*
 1. A person's state, or condition, of becoming functionally capable of producing offspring, which is characterized by growth of hair on one's pubes and facial hair in males (Oxford English Dictionary 1972, entries 1382).
 2. In Humans, the period during which one becomes physiologically capable of reproduction (Michaelis 1963).

Comments: Human puberty appears to begin around 6 yr of age (McClintock and Herdt in Marano 1997, C1) and involves a whole series of physical and psychosocial events. A landmark event of puberty is maturation of sexual organs (Marano 1997, C6). In the U.S., at age 8 yr, 48.3% of the black girls and 14.7% of the white girls had begun developing breasts, pubic hair, or both (based on a study of 17,000 girls age 3 through 12 yr, with 9.6% being black, Marcia E. Herman-Giddens et al. in Associated Press 1997, A2). On the average, menstruation occurred at 12.16 yr in Blacks and 12.88 yr in Whites. "Puberty" is rarely used to refer to a plant that reaches the stage of flowering or bearing fruit (Oxford English Dictionary 1972).

cf. sexual attraction, sexuality.

[Latin *pubertas* < *pubes*, *puberis*, an adult]

♦ **pubic presentation** See display: genital display.

♦ **puddle, puddling** See behavior: puddling.

♦ **puddling** See ²group: puddling.

♦ **Pulitzer Prize** See award: Pulitzer Prize.

♦ **pulsar** *n.* A stellar source of radio waves, characterized by the rapid frequency and regularity of the wave bursts; a rotating neutron star about 10 km in diameter (Mitton 1993).

Comment: Depending on its type, a pulsar emits wave bursts every 1 millisecond through every 4 sec (Mitton 1993).

♦ **punctuated equilibrium** *n.* An organism lineage that changes gradually (while it is in an equilibrium), but also shows rapid, episodic times of speciation (= punctuations) during geological time (Eldredge and Gould 1972, 84; Futuyma 1986, 401–402).

cf. evolution: Falconer-style evolution, punctuational evolution; gradualism: phyletic gradualism; hypothesis: hypothesis of punctuated equilibrium

Comments: To explain punctuated equilibria, Eldredge and Gould (1972) proposed that most evolutionary change occurs rapidly in small, localized populations in concert with the acquisition of reproductive isolation. A new form that has achieved sexual isolation expands from its site of origin into the range of its unchanged parent species. The new form then becomes sufficiently abundant and widespread to be recovered in the fossil record. Gould (1982c, 84) suggests that punctuated equilibrium is the predominant mode and tempo of evolutionary change.

[coined as "punctuated equilibria" by Eldredge and Gould (1972, 84)]

♦ **punctuational evolution** See ²evolution: punctuational evolution.

♦ **Punnett's theory of mimicry** See mimicry, mimetic polymorphism.

♦ **pupa** See animal names: pupa; caste: reproductive: nymph.

♦ **pupigerous** *adj.* Referring to something that contains a pupa (Lincoln et al. 1985).

♦ **pupillary response** See response: pupillary response.

♦ **pupiparity** See -parity: pupiparity.

♦ **pupivore** See -vore: pupivore.

♦ **pure-blending inheritance, theory of** See ³theory: theory of pure-blending inheritance.

♦ **pure-dominance polygyny** See mating system: polygyny: pure-dominance polygyny.

♦ **pure-epigamic selection** See selection: epigamic selection: pure-epigamic selection.

♦ **pure-evolutionarily stable strategy** See strategy: evolutionarily stable strategy: pure evolutionarily stable strategy.

♦ **pure exploration** See exploration: pure exploration.

♦ **pure fact** See fact: pure fact.

♦ **pure line, pure strain** *n.*

1. A genetically uniform, *i.e.*, a homozygous, population (Mayr 1982, 959).

2. Descendants of a single homozygous parent produced by inbreeding or self-fertilization (Lincoln et al. 1985).

syn. pure strain (Lincoln et al. 1985)

♦ **pure mathematics** See study of: mathematics: pure mathematics.

♦ **pure-problem solving** See problem solving: pure-problem solving.

♦ **purifying selection** See selection: purifying selection.

♦ **Purkinje shift** *n.* A person's eye's spectral sensitivity changes with light intensity, *e.g.*, red appears to fade before blue as light intensity diminishes (Purkinje 1825 in McFarland 1985, 202).

[after Johannes Evangelista Purkinje, Czech physiologist]

♦ **purposive behavior** See behavior: purposive behavior.

♦ **purposive behaviorism** See behaviorism: purposive behaviorism.

♦ **purposiveness** *n.* The controversial concept that a nonhuman animal has a mental idea, or conception, of a goal for its behavior (Thorpe 1963, 5).

cf. Behaviorism, directiveness, intent

♦ **putting-through method** See method: putting-through method.

♦ **pursuit-deterrant signal** See signal: pursuit-deterrant signal.

♦ **pushup** See display: pushup.

♦ **puzzle box** *n.* Any cage-like container used to investigate an animal's learning, memory, other cognitive abilities, or a combination of these attributes; *e.g.*, a maze (*q.v.*), Skinner box, or Wisconsin-general-test apparatus (Immelmann and Beer 1989, 240).

♦ **Skinner box** *n.* A puzzle box used in operant-conditioning studies, consisting of a receptacle for an experimental animal, a "manipulandum" (a disc at which a pigeon can peck, a lever that a mouse, or rat, can press, etc.), a "reward dispenser" that delivers food or water as reinforcement, and sometimes a means for presenting a particular stimulus (Immelmann and Beer 1989, 271).

[after B. F. Skinner (1938) who refined the Skinner box originated by Thorndike (1911) (Immelmann and Beer 1989, 271).]

♦ **Wisconsin-general-test apparatus** *n.* A puzzle box developed by Harlow (1949) and composed of a cage from which an animal can reach out to uncover one of two, or more, containers presented to it on a sliding tray; one container has a reward item and the other(s) does not; the containers have differently marked lids; and one observes the animal from behind a one-way screen (Immelmann and Beer 1989, 328).

♦ **pyramid of biomass** See ecological pyramid: pyramid of biomass.

- ♦ **pyramid of energy** See ecological pyramid: pyramid of energy.
- ♦ **pyramid of numbers** See ecological pyramid: pyramid of numbers.
- ♦ **pyramidal system** See ²system: pyramidal system.
- ♦ **pyric** *adj.* Referring to fire (Lincoln et al. 1985).
- ♦ **Pyrite** See mineral: Iron Pyrite.
- ♦ **pyrium** See ²community: pyrium.
- ♦ **pyrogen** *n.* A substance that causes fever when introduced into, or released in, an animal's body (Bligh and Johnson 1973, 952).
- bacterial pyrogen** *n.* Any pyrogen from a bacterium, *e.g.*, an endotoxin (Bligh and Johnson 1973, 952).
- endogenous pyrogen** *n.* A heat-labile substance formed in an animal's body tissues and which, when released, causes fever by acting upon its central-nervous system (Bligh and Johnson 1973, 952).

Comment: Cells exposed to an endotoxin may produce and release endogenous pyrogens (Bligh and Johnson 1973, 952).

- ♦ **endotoxic pyrogen** *n.* A heat-stable pyrogen from the cell wall of a Gram-negative bacterium (Bligh and Johnson 1973, 946).

Comment: All examined endotoxins contain lipopolysaccharides of high molecular weight (Bligh and Johnson 1973, 946).

- ♦ **leucocytic pyrogen** *n.* An endogenous pyrogen released from leucocytes under experimental conditions (Bligh and Johnson 1973, 952).

- ♦ **pyrophile** See ¹-phile: pyrophile.
- ♦ **pyrophobe** See -phobe: pyrophobe.
- ♦ **pyrophobia** See -phobia: pyrophobia.
- ♦ **pyrophosphate** See molecule: pyrophosphate.
- ♦ **pyroxylophile** See ¹-phile: pyroxylophile.
- ♦ **pythmic** *adj.* Referring to lake bottoms (Lincoln et al. 1985).

q

- ♦ **Q-K ratio** *n.* The ratio of pheromone emitted (*Q*) to the threshold concentration at which a receiving animal responds (*K*); *Q* is measured as the number of molecules released in a burst, or in number of molecules per unit time, and *K* is measured in molecules per unit of volume (Bossert and Wilson 1963 in Wilson 1975, 185, 235).
- ♦ **QS** See sleep: active sleep.
- ♦ **QTL** See gene locus: quantitative-trait locus.
- ♦ **quack, quacking** See animal sounds: quack.
- ♦ **quadrivoltine** See voltine: quadrivoltine.
- ♦ **qualitative** *adj.* “Descriptive; non-numerical;” contrasts with quantitative (Lincoln et al. 1985).
- ♦ **qualitative character** See character: qualitative character.
- ♦ **qualitative inheritance** See inheritance: qualitative inheritance.
- ♦ **qualitative-multistate character** See character: qualitative-multistate character.
- ♦ **qualitative variable** See variable: qualitative variable.
- ♦ **quality** *n.* “In evolutionary biology the extent to which a particular mate, habitat, resource, or context can enhance an individual’s inclusive fitness” (Wittenberger 1981, 620).
- ♦ **quality of complexity** *n.* A compilation of certain aspects of an animal’s internal and external milieu (including hunger, time of day, weather conditions, available prey, and estimated prey-capture probability) into a unitary consideration, or whole complex, that permits the animal to behave differently under different conditions (Volkelt 1914, 1937, in Heymer 1977, 101).
- ♦ **quantitative** *adj.* “Numerical; based on counts, measurements, ratios, or other values;” contrasts with qualitative (Lincoln et al. 1985).
- ♦ **quantitative character** See character: quantitative character.
- ♦ **quantitative ethology** See study of: ³ethology: quantitative ethology.
- ♦ **quantitative genetics** See study of: genetics: quantitative genetics.
- ♦ **quantitative inheritance** See inheritance: quantitative inheritance.
- ♦ **quantitative-multistate character** See character: quantitative-multistate character.
- ♦ **quantitative-trait locus** See gene locus: quantitative-trait locus.
- ♦ **quantitative variable** See variable: quantitative variable.

- ♦ **quantum evolution** See ²evolution: quantum evolution.
- ♦ **quantum speciation** See speciation: saltation.
- ♦ **quartet** See ²group: quartet.
- ♦ **quasi-cell** See organized structure: quasi-cell.
- ♦ **quasi-normal mutation** See ²mutation: quasi-normal mutation.
- ♦ **quasi-sociality** See sociality: quasi-sociality.
- ♦ **quasi-steady-state model** See hypothesis: hypotheses of the beginning and evolution of the Universe: quasi-steady-state model.
- ♦ **queen** *n.*
 1. A woman who is the chief ruler of a state and has the same rank and position as a king (Oxford English Dictionary 1972, entries from 825).
 2. A king’s wife or consort (Oxford English Dictionary 1972, entries from *ca.* 893).
 3. A woman of preeminence, or authority, in a specified sphere (Oxford English Dictionary 1972, entries from 1552).

See animal names: queen; caste: queen.
cf. female
- ♦ **queen control** *n.* In social insects: A queen’s inhibitory influence on reproductive activities of workers and other queens (Hölldobler and Wilson 1990, 642).
- ♦ **queen substance** See chemical-releasing stimulus: semiochemical: pheromone: queen pheromone.
- ♦ **queen-worker conflict** See ³conflict: queen-worker conflict.
- ♦ **queenright** *adj.* Referring to a social-insect colony, with a functional queen (Wilson 1975, 593).
ant. orphan, queenless (C. K. Starr, pers. comm.)
- ♦ **quelling** See post-translational gene silencing.
- ♦ **quiescence** *n.* An organism’s temporary resting phase characterized by its reduced activity, inactivity, or developmental cessation (Lincoln et al. 1985).
adj. quiescent
- ♦ **quiet sleep** See sleep: quiet sleep.
- ♦ **quinarian** *n.* A taxonomist who thinks that all taxa in a classification should have five units (Mayr 1982, 241, 846).
Comment: This belief is based on the idea that biology is made “scientific” by making it quantitative or by making it obey definite “laws” (Mayr 1982, 241, 846).
- ♦ **quinarianism** *n.* The taxonomic beliefs of quinarians, *q.v.*
- ♦ **quinone** See toxin: quinone.
- ♦ **quiver dance** See dance: bee dance: quiver dance.

♦quivering *n.*

1. A person's shaking, trembling, or vibrating, with a slight but rapid vibration, often by persons under the influence of an emotion or other thing (Oxford English Dictionary 1972, entries from 1490 as a verb).
2. A person's trembling his voice (Oxford English Dictionary 1972, entry from 1875).

3. A male stickleback fish's striking a female with rapid quivering movements of his snout which causes her spawning (Pelkwijs and Tinbergen 1937 in Heymer 1977, 1958).

♦**quorum sensing** See communication: quorum sensing.

r

♦ **r** See rate; *r*; coefficient: coefficient of relatedness, regression coefficient.

♦ **̄r** See factor: dilution factor.

♦ **R** See response to selection

♦ **rabbity** See ²group: rabbity.

♦ **rabble** See ²group: rabble.

♦ **¹race** *n.*

1. A conspecific group of organisms that is characterized by a common character or characters (Oxford English Dictionary 1972, entries from 1500). See ²species: subspecies.
2. A group of organisms that have descended from a common ancestor (Oxford English Dictionary 1972, entries from 1549).
3. An animal breed or stock; a particular species variety (Oxford English Dictionary 1972, entries from 1580).
4. One of the large divisions of organisms (Oxford English Dictionary 1972, entries from 1580).
5. A genus, species; kind of organism (Oxford English Dictionary 1972, entries from 1596).

See stock.

cf. ²group

Comments: Taxonomically, a “race” is now a subdivision of a “species.” Some biologists prefer not to use “race” due to sociopolitical connotations of this word. Instead, some workers use “population” or “strain.”

biological race, race *n.*

1. An intraspecific group of organisms that is characterized by conspicuous biological properties (Lincoln et al. 1985).
2. One, of two or more sympatric conspecific populations, that differs biologically, but not morphologically, from others and does not interbreed with another such population due to different food preferences, host preferences, or behavior cycles (Lincoln et al. 1985).

climatic race *n.* A plant phenotype that evolved under a particular climatic regime, *e.g.*, members of a species of pine that live at different altitudes of the Himalayas and have different degrees of frost tolerance due to microevolution (Mayr 1982, 560).

See -type: ecotype.

ecological race *n.* An intraspecific category characterized by conspicuous ecological properties (Lincoln et al. 1985).

geographical race See ²species: subspecies.

host race, hostile race *n.* A genetic race of a parasite species that occurs on, or in, a particular host species (Lincoln et al. 1985).

inversion race *n.* A naturally occurring population that is characterized by a particular chromosome inversion or inversions (Lincoln et al. 1985).

physiological race *n.* An intraspecific category characterized by conspicuous physiological properties (Lincoln et al. 1985).

substrate race *n.* A local race with a characteristic coloration resembling its substratum’s coloration (Lincoln et al. 1985).

♦ **²race** *n.* In some animal species, including Humans: An individual’s running (Oxford English Dictionary 1972, entries from 1325).

arms race *n.* “The sequence of mutual counteradaptations of two coevolving organisms, such as a predator and its prey” (Lincoln et al. 1985).

cf. ²evolution: coevolution; hypothesis: Red Queen hypothesis

Comment: In an arms race, which is a type of comparative progress, *q.v.*, organisms compete and evolve, throwing up methods of attack and defense in a way that is analogous to human weapon development (Ruse 1993, 55).

♦ **raciation** *n.* The evolution of new races within a species (Lincoln et al. 1985).

♦ **radar** *n.* An electronic device that locates objects by beaming radio-frequency impulses that are reflected back from objects, and determines their distance by measuring the time elapsed between impulse transmission and reception (Michaelis 1963).

[portmanteau word < *radio detection and ranging*]

♦ **radar angel** See angel: radar angel.

♦ **radar tag** *n.* A radar transmitter that enables a person to determine the location of an object near, or carrying, the transmitter (Caldwell 1997, February, 42).

Comments: In 1997, the smallest radar tag was a diode attached to 3-in-long superfine aluminum wire (Caldwell 1997, February, 42, illustration). Jens Roland and other researchers used this tag for butterflies.

♦ **radiation** See adaptive radiation.

♦ **radicicole** See -cole: radicicole.

♦ **radicivore** See -vore: radicivore.

♦ **radio tracking** See biotelemetry.

♦ **radioactive dating** See method: dating method: radioactive dating.

♦ **radioactive isotope** See isotope: radioactive isotope.

♦ **radiocarbon dating** See method: dating method: radiocarbon dating.

♦ **radiodating** See method: dating method: radioactive dating.

- ◆ **radio transmitter** See instrument: radio transmitter.
- ◆ **raft** See ²group: raft.
- ◆ **rafter** See ²group: rafter.
- ◆ **rafting** *n.* Dispersal of terrestrial organisms, sediment, rock, or other material across water on floating objects (Lincoln et al. 1985).
- ◆ **rag** See ²group: rag.
- ◆ **rage copulation** See copulation: rage copulation.
- ◆ **rain forest** See ²community: rain forest.
- ◆ **rain pollination** See pollination: rain pollination.
- ◆ **rain shadow** *n.* The region on the downwind side of a mountain that receives little rain because the winds rise as they pass over the mountain, cool, and drop most of their moisture before they reach the other side (Stanley 1989, 665).
Comment: A rain shadow can also be many miles downwind from a mountain group, such as the rain shadow in the Green Ridge State Forest, Maryland, caused by the higher mountains of the Appalachian Plateau about 20 miles west (pers. obs.).
- ◆ **rain washoff** *n.* A pesticide's removal due to rain.
- ◆ **rainfastness** *n.* A measure of a pesticide's "stickiness" to a substrate with regard to removal by rain.
- ◆ **rake** See ²group: rake.
- ◆ **ramage** See ²group: ramage.
- ◆ **ramet** *n.* A member, or modular member, of a clone that may follow an independent existence if separated from its parent (Lincoln et al. 1985).
cf. genet, ortet
- ◆ **ramicole** See -cole: ramicole.
- ◆ **ramification** See ²group: ramification.
- ◆ **Rammelzeit** See estrus: *Rammelzeit*.
- ◆ **ramp difference** See difference: ramp difference.
- ◆ **random** *adj.*
 1. In statistics, referring to a datum in a sample of data, all of which have an equal chance of being drawn from the sample (Sokal and Rohlf 1969, 73).
 2. Referring to a phenomenon that is haphazard, having no recognizable pattern (Lincoln et al. 1985).
cf. nonrandom; random sequence of events; sample: haphazard sample, random sample
- ◆ **random distribution** See distribution: random distribution.
- ◆ **random effect** See effect: main effect: random effect.
- ◆ **random error** See error: random error.
- ◆ **random factor** See effect: main effect: random effect.
- ◆ **random fixation** See fixation: random fixation.
- ◆ **random genetic drift** See genetic drift: random genetic drift.
- ◆ **random mating** See mating: random mating.
- ◆ **random mutation** See ²mutation: random mutation.
- ◆ **random-number table** *n.* A table of numbers in which the probability of any number's occurring at any one time is constant and independent of all other tabled values (Hodgman 1963, 237–243).
syn. random numbers (Lincoln et al. 1985)
- ◆ **random process** See process: random process.
- ◆ **random sample** See sample: random sample.
- ◆ **random sequence of events** *n.* A limited set of events in which there is no way that one can predict which kind of event within the set will occur next, and the system obeys the regularities of probability (Bateson 1979, 242).
cf. stochastic sequence of events
- ◆ **random variable** See variable: random variable.

- ◆ **random walk** *n.* A change in gene frequencies in a population that results from random genetic drift; contrasted with directional selection, disruptive selection, or stabilizing selection that results from natural selection (inferred from Carroll 2000, 31).
- ◆ **randomly amplified-polymorphic-DNA marker** See marker: randomly-amplified-polymorphic-DNA marker.
- ◆ **randomized-block design** See experimental design: randomized-block design.
- ◆ **rangale** See ²group: rangale.
- ◆ **¹range** *n.* "A row, line, or series of things" (Oxford English Dictionary 1972, entries from 1511).
- ◆ **host range, host list** *n.* All the host species that a kind of parasite infects (Lincoln et al. 1985).
- ◆ **²range** *n.*
 1. The extent to which variation in something is possible; the limits between which something may vary in amount or degree (Oxford English Dictionary 1972, entry from 1818).
 2. In statistics, a measure of variation within a data set, given by the difference between minimum and maximum values (Sokal and Rohlf 1969, 49).
- ◆ **climate envelope** *n.* The ranges of climatic variables that a species experiences (New 2009, 112).
syn. climatic envelope (New 2009, 114)
- ◆ **geologic range** *n.* The time span between the base of the period, or epoch, of a taxon's first appearance and the upper boundary of the interval of its last appearance (Flessa et al. 1975, 75).
Comments: A taxon's geological range is an estimate of its time on Earth because of imperfections of the fossil record. For example, the arthropod order Agnostida has a geological range of 135 Ma from the Lower Cambrian through the Upper Ordovician (Flessa et al. 1975, 76).
- ◆ **tolerated-ambient-temperature range** *n.* The ambient-temperature range within which an animal can maintain its body core temperature by means of autonomic thermoregulatory processes, within certain limits for its species or the individual under consideration (Bligh and Johnson 1973, 958).
- ◆ **³range** *n.*
 1. The geographical area that a particular species occupies; the period that a species has been extant (Oxford English Dictionary 1972, entries from 1856).
 2. The variation in depth occupied by a marine animal (Oxford English Dictionary 1972, entries from 1856).
 3. The area that an individual animal occupies or has occupied.
cf. area, dominion, territory
- ◆ **activity range** *n.* "The area covered by an animal in the course of its day to day existence" (Carpenter 1952b, 246).
cf. range: home range; territory
- ◆ **home range** *n.*
 1. An area that an animal learns thoroughly and patrols regularly (Seton 1909, Burt 1943 in Wilson 1975, 256, 586).
Note: If part of a "home range" is defended, this part is a "territory" (Wilson 1975, 256, 586).
 2. The area within which an animal confines its activities during all, or part, of its annual cycle (Wittenberger 1981, 616).
 3. The area that an animal habitually travels in the course of its normal activities; a home range may

be undefended and convey no privileged access to resources (Dewsbury 1978, 96).

syn. home realm (Lincoln et al. 1985)

cf. territory

Comments: Territories of other animals may, or may not, be in a focal animal's "home range." This term has been misused (Brown 1987, 299). The home range of a Grizzly Bear can be up to 1600 km² (Weithrich, 1966, 493).

total range *n.* "The entire area covered by an individual animal in its lifetime" (Goin and Goin 1962 in Wilson 1975, 256).

cf. territory

♦ **range composition** *n.* The extent of a taxon's occurrence and its degree of probable isolation and potential for mating among populations (Kudrna 1986 in New 2009, 23).

♦ **ranivore** See -vore: ranivore.

♦ **¹rank** *n.* A class of animals, or things, in a scale of comparison; "hence relative status or position, place" (Oxford English Dictionary 1972, entries from 1605).

cf. hierarchy: dominance hierarchy

basic rank *n.* The dominance relationship between two monkeys that is unaffected by influence of kin, or other group members (Kawai 1958 in Wilson 1975, 294; Immelmann and Beer 1989, 26).

cf. rank: dependent rank

dependent rank *n.*

1. In some monkey species: The ranking outcome resulting from interaction of two individuals that is influenced by their kinship (Kawai 1958 in Wilson 1975, 294).
2. For example, in *Corvus monedula* (Jackdaws) and Primates: The rank status of an individual that is influenced by its social group (Immelmann and Beer 1989, 26–27).

cf. rank: basic rank

dominance rank *n.* An animal's location within a dominance hierarchy (J. L. Hand, pers. comm.).

syn. rank, status (J. L. Hand, pers. comm.)
Comment: In Humans, dominance rank can be acquired by some fortuitous factor, such as birth or ethnic group, or through specific achievement or significant contribution to one's group (Storz 1973, 267).

♦ **²rank, taxonomic level, taxonomic rank** *n.*

A taxon's position in a classification hierarchy (Lincoln et al. 1985).

♦ **rank-abundance curve** See curve: rank-abundance curve.

♦ **rank correlation** See correlation: rank correlation.

♦ **rank demonstration** *n.* An animal's behavior that maintains and strengthens its position in a dominance hierarchy (Heymer 1977, 140).

♦ **rank mimicry** See mimicry: rank mimicry.

♦ **rank order, ranking order** See hierarchy: dominance hierarchy.

♦ **ranked variable** See variable: ranked variable.

♦ **Ranz** See estrus: *Ranz*.

♦ **rapacious, ravenous, voracious** *adj.* Referring to an organism that feeds on prey (Lincoln et al. 1985).

♦ **RAPD marker** See marker: randomly-amplified polymorphic-DNA marker.

♦ **rape** *n.*

1. A person's act of taking anything by force; violent seizure (of goods), robbery (Oxford English Dictionary 1971, entries from 1400).

2. A person's act of carrying away a person, especially a woman, by force (Oxford English Dictionary 1972, entries from 1400).

3. A person's violating, or ravishing, a woman (Oxford English Dictionary 1972, entries from 1481).

Note: "Rape" is now used to refer to children and men as well.

v.t. rape

cf. copulation: forced copulation; mating: homosexual mating

Comment: Many behaviorists prefer to use "forced copulation," rather than "rape," for nonhuman animals because "rape" has so many emotional connotations (Wittenberger 1981, 615; Gowaty 1982); thus, I give definitions of "rape" and "forced copulation" in non-human animals under "forced copulation."

[Latin *rapere*, to rape]

♦ **rapid-eye movement** See movement: rapid-eye movement.

♦ **rapid-eye-movement sleep** See sleep: stage-1 sleep.

♦ **rapid-food-avoidance conditioning** See learning: conditioned learning: rapid-food-avoidance conditioning.

♦ **rapid-leaf movement** See movement: rapid-leaf movement.

♦ **rapping behavior** See behavior: rapping behavior.

♦ **raptorial** See -orial: raptorial.

♦ **rare** See frequency: rare.

♦ **rare-male-mating advantage, rare-male advantage** *n.* For example, in *Adalia bipunctata* (Two-spotted Ladybirds), several *Drosophila* species, *Nasonia vitripennis* (Jewel Wasps), *Poecilia reticulata* (Guppies), and *Tribolium castaneum* (Red Flour Beetles): Uncommon males with certain traits are more likely to elicit mating from females than will common males with other traits (Petit 1951 in Lichtenberger et al. 1987, 203; Ehrman and Propper 1978, 216; O'Donald and Majerus 1988, 571; Salceda and Anderson 1988, 9870).

syn. minority effect, Petit effect (Lichtenberger et al. 1987, 203), rare-male advantage (Thornhill and Alcock 1983, 78), rare-male effect (Partridge 1988, 525)

Comments: "Mate competition" among rare males and "female-mate choice" are likely to have different importances in "rare-male-mating advantage" among species (Thornhill and Alcock 1983, 78; Partridge 1988, 535). Most studies of "rare-male-mating advantage," thus far, have been laboratory ones; this phenomenon is likely to have extremely limited evolutionary significance (Partridge 1988, 536).

♦ **Rare or Threatened Australian Plant** See ²species: Rare or Threatened Australian Plant.

♦ **rarity** *n.*

1. "The quality of being rare, uncommon, or infrequent; infrequency" (Michaelis 1963).

2. A wide array of organism spatial and temporal patterns of abundance, from being sparsely populated with a wide geographic range through being a point endemic with a dense local population (Kunin and Gaston 1993, 298).

Comment: Species have been classified as rare based on their range extents; number of sites, or grid squares, inhabited; habitat, or niche, restrictions; edge-of-range uncommonness; frequency in censused areas; and population densities where found (Kunin and Gaston 1993, 298). Many insect species are indeed rare, but people have classified some species, e.g., *Austromerope*

poultoni (Western Australian Earwig), as rare by mistake because they did not use correct discovery methods (New 2009, 29).

cf. frequency, local

♦ **rasorial** See -orial: rasorial.

♦ **Rassenkreis** See ²species: polytypic species.

♦ **rat race** See hypothesis: Red Queen hypothesis.

♦ **ratchet hypothesis, ratchet mechanism** See hypothesis: hypotheses of the evolution and maintenance of sex: ratchet hypothesis.

♦ **rate** *n.*

1. The “measure of a thing by its relation to a standard,” *e.g.*, 50 mi per hr in an automobile (Michaelis 1963).

2. A proportional, or comparative, amount or degree: a high speed, *e.g.*, 90 mi per hr in an automobile (Michaelis 1963).

evolutionary rate *n.* “The speed of evolutionary change” (Lincoln et al. 1985).

extinction rate *n.* The number of species in a particular habitat, or area, that becomes extinct per unit time; contrasted with percent extinction and total extinction rate (Lincoln et al. 1985).

immigration rate *n.* The number of new species that arrive in a given area, or habitat, per unit time (Lincoln et al. 1985).

instantaneous-growth rate *n.* A population’s growth rate at a point in time (Lincoln et al. 1985).

maximum-population-growth rate *n.* The greatest growth rate that a population can achieve in a particular environment (Wilson 1975, 82).

syn. optimum yield (Lincoln et al. 1985)

cf. rate: *r*, *r*_{max}

Comment: This rate occurs at a population size that is one half of its carrying capacity (Wilson 1975, 82).

net-reproductive rate (*R*₀) *n.* The average number of female offspring produced by each female during her entire lifetime (Wilson 1975, 90, 590).

percent extinction *n.* The number of families that go extinct divided by the total number of families in existence during a particular stratigraphic stage; contrasted with extinction rate and total extinction rate (Benton 1995, 55–56).

Comment: Measures of percent extinction usually can be high when species richnesses are low (Benton 1995, 55–56).

phylogenetic rates of evolution *n.* Rates at which a single character, or complexes of characters, evolve within individual lineages (Simpson 1944, 1953 in Futuyma 1986, 397).

cf. rate: taxonomic rates of evolution

♦ ***r*, *r* value** *n.*

1. (b – d) (= birth rate – death rate) in the equation of population growth per unit time: $dN/dt = bN - dN = (b - d)N = rN$.

Note: *r* for Humans is up to 0.03 per yr; Rhesus Monkeys, 0.16 per yr; and Norway Rats, 0.015 per day (Wilson 1975, 81).

2. “The fraction by which a population is growing in each instant of time” (Wilson 1975, 587).

syn. biotic potential, intrinsic rate of increase, Malthusian parameter, rate of natural increase (Lincoln et al. 1985); little *r*

Note: Some workers reserve the terms “biotic potential,” or “intrinsic rate of increase,” for *r*_{max}.

cf. coefficient: coefficient of relatedness, *r*; rate: maximum-population-growth rate, *r*_{max}

Comment: Some workers reserve the terms “biotic potential,” or “intrinsic rate of increase,” for *r*_{max}; *r* is usually less than the *r*_{max} (*q.v.*) because a population usually grows under suboptimal conditions in nature.

♦ ***r*_m, *r*_{max}** *n.* The theoretical maximum per capita intrinsic rate of increase that a population can achieve in an optimum environment that is physically ideal, with abundant space and resources, free of predators and competitors, etc. (Wilson 1975, 81).

cf. maximum-population-growth rate, *r*

rate of natural increase See rate: *r*.

taxonomic rates of evolution *n.* “Rates at which taxa with different characteristics replace one another” (Simpson 1944, 1953 in Futuyma 1986, 397). *cf.* rate: phylogenetic rates of evolution

total-extinction rate *n.* The number of families that went extinct in relation of the duration of particular stratigraphic stage; contrasted with extinction rate and percent extinction rate (Benton 1995, 56).

Comment: Using total extinction rate can diminish or enhance the magnitudes of extinction events compared to using other measures of extinction rate (Benton 1995, 56).

♦ **ratio** *n.*

1. The relation between two similar magnitudes with respect to quantity, determined by the number of times one contains the other, integrally or fractionally (Oxford English Dictionary 1972, entries from 1660); *e.g.*, the ratio of 3 to 7 is expressed as 3:7 or 3/7 (Michaelis 1963).

2. “Relation of degree, number, etc.; proportion; rate” (Michaelis 1963).

fecundity ratio *n.* The ratio of pregnant, or ovigerous, females, or other specified group, to the total number of females in a population (Lincoln et al. 1985).

fertility ratio *n.* The ratio of offspring to adult females in a population (Lincoln et al. 1985).

Mendelian ratio *n.* The expected allele ratio in offspring generations according to Mendel’s law of segregation (Lincoln et al. 1985).

sex ratio *n.*

1. The ratio of males to females in a group of conspecific organisms, *e.g.*, 1:1, 4:1 (Lincoln et al. 1985).

2. The number of males per 100 females (Lincoln et al. 1985).

Comments: Sex ratio is also expressed as the number of males divided by the number of females (Ehrlich et al. 1984, Table 1).

► **operational sex ratio** *n.* The ratio of males to fertilizable females at a moment in a population (Emlen and Brown 1980 in Ehrlich et al. 1984, 528).

► **primary sex ratio** *n.*

1. The sex ratio of just-fertilized eggs (Wittenberger 1981, 620).

2. The number of males per 100 females at zygote formation (Lincoln et al. 1985).

► **realized sex ratio** *n.* In flying insects, the ratio of males to females in a demographic unit that participate in the adult flight of a single generation in a demographic unit (Ehrlich et al. 1984, 528).

Comment: There are “unresolved complexities in the definition of realized sex ratio, in its determination, and in its application to the calculation” of effective population size (Ehrlich et al. 1984, 528).

► **secondary sex ratio** *n.* “Sex ratio of offspring at the time they become independent of their parents” (Wittenberger 1981, 621).

► **spanandrous sex ratio** *n.* A strongly female-biased sex ratio that is associated with inbreeding species (Balachowsky 1949 in Hamilton 1967).

► **tertiary sex ratio** *n.* "The number of males per 100 females at sexual maturity" (Lincoln et al. 1985).

◆ **ratio cline** See cline: ratio cline.

◆ **ratio scale** See scales of measurement.

◆ **rationalism** *n.*

1. A view, opposed to empiricism, or sensationalism, that regards reason, rather than sense, as the foundation of our certainty of knowledge (Oxford English Dictionary 1972, entries from 1857).
2. The view, dating from Plato, that human behavior is a result of rational and voluntary processes, with individuals' being free to choose whatever course of action their reasoning dictates (McFarland, 361).

cf. associationism, materialism

◆ **Rauschzeit** See estrus: *Rauschzeit*.

◆ **raw data** See data: raw data.

◆ **ray** *n.*

1. "A line of propagation of any form of radiant energy" (Michaelis 1963).
2. "A stream of particles spontaneously emitted by a radioactive substance" (Michaelis 1963).

cosmic ray *n.* An extremely energetic elementary particle that travels through the Universe at practically the speed of light (Mitton 1993).

syn. cosmic radiation, cosmic wave

Comments: V. F. Hess first discovered cosmic rays during a balloon flight in 1912 (Mitton 1993). Cosmic rays are the only particles we can detect that have traversed our Galaxy. Very high-energy cosmic rays might come from quasars and active galactic nuclei. Lower-energy cosmic rays are generated within our Galaxy in pulsars and supernova explosions and remnants. Solar flares produce very low-energy cosmic rays which increase in intensity at times of maximum solar activity. Cosmic rays may have provided energy used in synthesis of organic molecules before the origin of life on Earth (Strickberger 1996, 115).

◆ **Rayleigh test** See statistical test: Rayleigh test.

◆ **re-** *prefix*

1. Back: rebound, remit (Michaelis 1963).
2. "Again; anew; again and again" (Michaelis 1963). [Latin *re-*, back, again]

◆ **reaction** *n.*

1. A system's, or organ's, response to an external stimulus (Oxford English Dictionary 1972, entries from 1896).
2. An organism's activity change in response to a stimulus (Lincoln et al. 1985).

cf. response

alarm reaction (A-R) *n.* All of an organism's non-specific responses to a sudden exposure to stimuli to which it is not adapted (Seyle 1950; Lincoln et al. 1985).

avoiding reaction See kinesis: klinokinesis.

chain reaction *n.* An organism's sequence of instinctive movements (Spencer 1899, Loef 1905 in Heymer 1977, 96).

disgust reaction *n.* In some mammal species, including Humans: An individual's contracting its pharyngeal musculature, salivating, and having feelings that resemble those accompanying vomiting (von Holst and von St. Paul 1960 in Heymer 1977, 60).

Comment: "Disgust" is an anthropomorphic word when used to describe nonhuman animals.

general-emergency reaction *n.* Part of an animal's general-adaptation syndrome that involves

rapid changes in its body, e.g., taking in extra oxygen by breathing deeply and releasing glucogen from its liver, that occur after it is suddenly faced with a situation in which it has to take some sort of rapid action, such as fleeing or fighting (Cannon 1929 in Dawkins 1980, 56).

cf. syndrome: general-adaptation syndrome

shoulder reaction *n.* In Humans and other anthropoid apes: An ape's leaning slightly forward, pulling in its head toward its shoulders, and pulling up its shoulders as a fright reaction due to a noise (Spindler 1958 in Heymer 1977, 160).

spook reaction *n.* In *Astatotilapia bloyeti* (a cichlid fish): Panic of adults caused by models of conspecifics without the sheen of a normal healthy fish's epithelium [coined by Seitz 1940 in Heymer 1977, 77].

trance reaction See playing dead.

◆ **reaction chain** See chain: action chain.

◆ **reaction norm** *n.* An animal's normal reaction pattern with regard to a directional stimulus that involves the animal's continuing to move independently of the stimuli (Heymer 1977, 142).

See plasticity: phenotypic plasticity: norm of reaction.

◆ **reaction time** See time: reaction time.

◆ **reaction type** See -type, type: phenotype.

◆ **reafference** See -ference: reaffERENCE.

◆ **reafference principle** See principle: reference principle.

◆ **realism** *n.*

1. The philosophical doctrine that adheres to objective, or absolute, existence of universals (Oxford English Dictionary 1972, entries from 1838).

Notes: This doctrine was chiefly expounded by Thomas Aquinas and is opposed to "nominalism" and "conceptualism" (Oxford English Dictionary 1972). "Realism" was the dominant philosophy of the scholastics that involves determining truth by logic, not by observing from experiments (Mayr 1982, 92).

2. The philosophical belief in the real existence of matter as the object of perception (natural realism), which is opposed to idealism; also the view that the physical world has independent reality and is not ultimately reducible to universal mind or spirit (Oxford English Dictionary 1972, entries from 1836).

3. A person's inclination, or attachment, to what is real; tendency to regard things as they really are; any view or system, contrasted with "idealism" (Oxford English Dictionary 1972, entries from 1817).

4. A person's attribution of objective existence to a subjective conception (Oxford English Dictionary 1972); the philosophical doctrine, opposed to nominalism, that abstract concepts have objective existence and are more real than concrete objects (Michaelis 1963).

5. The doctrine that things have reality apart from our conscious perception of them; opposed to idealism (Michaelis 1963).

n. realist

[Old French < Late Latin *realis* < Latin *res*, thing]

◆ **realized** *adj.* Actual (Lincoln et al. 1985).

cf. prospective

◆ **realized heritability** See ²heritability (comments).

◆ **realized niche** See niche: realized niche.

◆ **realized sex ratio** See ratio: sex ratio: realized sex ratio.

◆ **real theorizing** *n.* The postulational-deductive process used in scientific discovery (Wilson 1975, 27).

♦ rearing *n.*

1. Tending a child during his early life stages; bringing up (Morris 1982).
2. Tending growing organisms (Morris 1982).

captive rearing *n.* A person's breeding a species in captivity as part of *ex situ* conservation (New 2009, 175).

cf. in situ conservation

Comment: This is a highly interventionist form of conservation and can be problematic due to genetic and phenotypic changes that can occur in captive environments, as well as other factors (New 2009, 175–176).

♦ rearing territory See territory: rearing territory.**♦ reasoning** See problem solving.**♦ recapitulation** See law: biogenetic law.**♦ received view** See ⁴model: deductive-nomological model.

♦ receiver *n.* An individual organism whose behavior is altered by a signal that it receives (Dewsbury 1978, 99). See ¹system: communication system.

cf. signaler

♦ recent *adj.* Still existing; extant (Lincoln et al. 1985). See extant.

cf. extinct, fossil

♦ reception See modality.

♦ receptive field *n.* The area from which any unit, in a sensory system, receives input that changes its activity (Immelmann and Beer 1989, 244).

♦ receptivity, female receptivity *n.* In many animal species: Responses of a female toward a mate that include those necessary and sufficient for fertile copulation, including active co-operation in intromission (Beach 1976 in Dewsbury 1978, 237; Hinde 1982, 155). *cf. attractivity, proceptivity*

♦ receptor *n.* A molecule with a highly specific affinity for a substance, *e.g.*, a hormone, that binds to it (Oxford English Dictionary 1972, entries from 1900; Immelmann and Beer 1989, 245).

♦ receptor *n.*

1. The terminal structure of an afferent neuron that is specialized to receive external and internal stimuli and transmit them to a vertebrate's spinal cord and brain (Michaelis 1963).
2. An organism's means of detecting a kind of stimulus, composed of parts of one or more cells (McFarland 1985, Chapter 11).

cf. modality, sense organ

Comment: McFarland (1985, Chapter 11) reviews kinds of animal receptors.

AMPA receptor *n.* A common synaptic connection between brain cells which plays a role in learning and memory (Gary Lynch in Hall 1998, 49). *cf. drug: ampakine*

chemoreceptor *n.* A receptor that perceives chemical stimuli, especially olfactory and gustatory ones; *e.g.*, the taste-and-smell receptor or blood-glucose-concentration receptor (Heymer 1977, 48).

endoreceptor, enteroceptor See ³receptor: interoceptor.

exteroceptor *n.* An animal's receptor (*e.g.*, eye, ear, or touch receptor) that responds to external stimuli (Michaelis 1963).

[Latin *exterus*, external + (re)ceptor]

G-protein-linked receptor *n.* A plasma-membrane receptor that is composed of a G-protein-linked-receptor protein (*q.v.*) and that works with the

help of a G protein and another protein (usually an enzyme) (Campbell et al. 1999, 193, illustration).

Comments: Many different signal molecules use G-protein-linked receptors, including epinephrin and many other hormones, neurotransmitters, and yeast-mating factors (Campbell et al. 1999, 192). These receptors are extremely widespread and have diverse functions in embryonic development, sensory perception. G proteins and G-protein-linked receptors may have evolved in early microbes.

interoceptor *n.* In Vertebrates: A sensory nerve ending that responds to stimuli originating in an animal's viscera, or other internal organs (Michaelis 1963), and registers variables, *e.g.*, blood pressure, body temperature, degree of stomach fullness, hydration state, oxygen debt, or blood acidity (Immelmann and Beer 1989, 156).

syn. endoreceptor (Immelmann and Beer 1989, 156), enteroceptor

cf. ³receptor: proprioceptor

[internal + O + receptor]

intracellular receptor *n.* A receptor found within a cell (*e.g.*, in the cytosol or nucleus) as opposed to in a cell membrane (Campbell et al. 1999, 194).

Comment: Intracellular receptors include those that respond to steroid and thyroid hormones of animals, nitric oxide (NO), and certain small signal molecules used by Bacteria (Campbell et al. 1999, 194).

ion-channel receptor *n.* A plasma-membrane receptor composed of a transmembrane protein that opens and allows the flow of a specific kind of ion across the plasma membrane when a specific signal molecule binds to the extracellular side of the protein (Campbell et al. 1999, 195).

Comment: Ion-channel receptors that are controlled by electrical signals and those that are controlled by ligands are very important in nervous systems (Campbell et al. 1999, 194).

N-methyl-D-aspartate receptor (NMDA receptor) *n.* In Mammals, a receptor that turns on after receiving an electrical discharge from its own cell and N-methyl-D-aspartate (Lemonick 1999, 13 September, 57–58; Tang et al. 1999, 64).

Comment: NMDA receptors function in learning and memory formation and sensitizing an animal's brain to drugs including amphetamines, cocaine, and heroin (Lemonick 1999, 13 September, 57–58). These receptors are nearly identical in cats, Humans, mice, rats, and other mammals.

NMDA receptor 2B (NR2B) *n.* A component of a vertebrate's MNDA receptor (Lemonick 1999, 58; Tang et al. 1999, 64).

Comment: This component is very active in young mice compared to older ones (Lemonick 1999, 58). It is found primarily in an animal's forebrain and hippocampus, where explicit, long-term memories are formed.

photoceptor *n.* A sensory receptor with pigments that are chemically modified by light and give rise to an electrical potential when stimulated by light (McFarland 1985, 169; Immelmann and Beer 1989, 220).

proprioceptor *n.*

1. In Vertebrates: An interoceptor in an individual's muscles, tendons, and joint tissues that registers its body position, movement, and strain (Immelmann and Beer 1989, 156).

2. For example, in Insects: An interoceptor in a stretch receptor, or chordotonal organ, that registers its body position, movement, and strain (Chapman 1971, 618).

[New Latin < Latin *proprius*, one's own + o + *receptor*]

sensory receptor *n.* A specialized nerve cell responsible for transducing and transmitting information (McFarland 1985, 169).

thermoreceptor, temperature sensor *n.* A neuronal structure that is differentially sensitive to temperature and responds to a maintained temperature with a characteristic sustained impulse frequency (Bligh and Johnson 1973, 956).

Comment: A thermoreceptor may respond weakly to strong nonthermal stimuli (Bligh and Johnson 1973, 956).

tyrosine-kinase receptor *n.* A plasma-membrane receptor that attaches a phosphate to a protein tyrosine with the use of tyrosine kinase (Campbell et al. 1999, 193; 194, illustration).

Comments: The tyrosine kinase catalyzes the transfer of phosphate groups from ATP to tyrosine on a substrate protein (Campbell et al. 1999, 193–194). One tyrosine-kinase receptor may activate 10, or more, intracellular proteins simultaneously and trigger as many different transduction pathways and particular cellular responses. Abnormal tyrosine-kinase receptors cause some kinds of cancer.

- ◆ **recessive allele** See allele: recessive allele.
- ◆ **recessiveness** *n.* In diploid organisms: An allele's not showing its effects if its corresponding dominant allele is also present (Dawkins 1982, 285).

cf. allele: recessive allele; dominance (genetic): incomplete dominance

- ◆ **reciprocal altruism** See altruism: reciprocal altruism.

- ◆ **reciprocal cross** See cross: reciprocal cross.

- ◆ **reciprocal feeding** See trophallaxis.

- ◆ **reciprocal genes** See gene: complementary gene.

- ◆ **reciprocal hybrid** See hybrid: reciprocal hybrid.

- ◆ **reciprocal translocation** See ²translocation: reciprocal translocation.

- ◆ **reciprocally altruistic behavior, reciprocation** See altruism: reciprocal altruism.

- ◆ **reciprocity** *n.* In some cooperatively breeding bird species, e.g., a bee-eater species (Meropidae), *Ceryle rudis* (Pied Kingfishers) and possibly *Corcorax melanorhamphos* (White-winged Choughs): A mature bird's forming a bond, or alliance, with a young bird because of its future value as a helper (Ligon 1983 in Heinsohn 1991, 1097, 1099).

See altruism: reciprocal altruism.

strong reciprocity *n.* An animal's both cooperating and punishing a noncooperating animal (Jensen et al. 2007b, 107).

- ◆ **recognition** *n.*

1. A person's perceiving that some thing, person, etc., is the same as he previously knew; a person's mental process of identifying what he has previously known; the result of these processes (Oxford English Dictionary 1972, entries from 1798).
2. An individual animal's ability to discriminate one, or a group of conspecific or heterospecific, organisms from one another or other groups (pers. obs.).
3. An individual animal's differential treatment of different conspecific, or heterospecific, organisms due

to its perceived differences between, or among, them (Cheney and Seyfarth 1986, 1722).

4. An individual animal's ability to differentiate between, or among, stimulus categories that are properties of things, including places and individual animals; distinguished from mere sensory discrimination (Immelmann and Beer 1989, 246).

Comment: "Recognition" can be a misleading term if one takes it to imply "consciousness" (Mayr 1963 in Immelmann and Beer 1989, 287).

group recognition *n.* An animal's ability to discriminate a particular conspecific, or group of conspecifics, from a group of other conspecifics, e.g., *Lasioglossum zephyrum* (sweat bees) and *Apis mellifera* (Western Honey Bees) that discriminate between colony members and other conspecifics or Starfish-eating Shrimp or desert sowbugs that discriminate their mates from other conspecifics (Wilson 1975, 205).

cf. recognition: individual recognition

individual recognition *n.* In some bird and prawn species; *Canis familiaris* (Domestic Dogs), *Lasioglossum zephyrum* (sweat bees), *Odocoileus hemionus columbianus* (Black-tailed Deer), *Oryctolagus cuniculus* (European Rabbits), *Petaurus breviceps* (Sugar-gliders), and possibly in a woodlouse (isopod) species: An individual's ability to discriminate other animals (usually conspecifics) as individuals (e.g., distinguishing individuals A, B, and C from each other) (Beer 1970 in Dewsbury 1978, 160; Barrows 1975a). *syn.* personal recognition (Wilson 1975, 517), truly-personal recognition

cf. recognition: group recognition

kin recognition *n.*

1. An animal's ability to discriminate genetic kin from non-kin (using individual, group recognition, phenotype matching, or combination of these abilities) (Immelmann and Beer 1989, 165).

Note: This kind of kin recognition has been reported in *Apis mellifera* (Western Honey Bee), a desert woodlouse (isopod), *Lasioglossum zephyrum* (sweat bee), and more derived vertebrates including some bird species, Humans, *Urocitellus beldingi* (Belding's Ground Squirrel), and some other mammal species; however, Grafen (1991c) argues that only one species has been convincingly shown to have a recognition system that works specifically for kin.

2. An animal's "differential treatment of conspecifics as a function of their genetic relatedness" (Sherman and Holmes 1985, 437; Cheney and Seyfarth 1986, 1722).
3. An animal's ability to discriminate genetic kin from nonkin by using genetic similarity detection (Grafen 1991a, b).

Comment: Grafen (1990) explains how certain previous studies may have confused "kin recognition" with "species recognition" or "group recognition." A series of papers discusses the meaning of "kin selection" and related topics (Blaustein et al. 1991; Grafen 1991a,b,c; Byers and Bekoff 1991; Stuart 1991).

mate recognition *n.* For example, in some bird and mammal species, sowbugs, and Starfish-eating Shrimp: An individual's discrimination of its mate from other conspecifics which can involve either individual recognition or group recognition (Wilson 1975, 205).

cf. system: specific-mate-recognition system

neighbor recognition *n.* An animal's differential treatment of a conspecific relative, or nonrelative, as

- a function of its familiarity with it (Caley and Boutin 1987, 60).
- parent-offspring recognition** *n.* A parent's differential treatment of its offspring, or vice versa, based on individually distinctive cues (Medwin and Beecher 1986, 1627).
- personal recognition** See recognition: individual recognition.
- species recognition** *n.* An animal's determination of another animal as a conspecific by its exchanging species-specific stimuli and responses with the other animal, particularly prior to mating (Lincoln et al. 1985; Immelmann and Beer 1989, 287).
- ♦ **recognition allele** See allele: recognition allele.
- ♦ **recognition concept of species, recognition species concept** See ²species (def. 33).
- ♦ **recognition gene** See gene: recognition gene.
- ♦ **recognition label** See discriminator.
- ♦ **recognition pheromone** See chemical-releasing stimulus: semiochemical: pheromone: recognition pheromone.
- ♦ **recognized individual** See individual: recognized individual.
- ♦ **recognizing individual** See individual: recognizing individual.
- ♦ **recombinant** *n.* A new individual organism, or cell, that arises from recombination (*q.v.*) (King and Stansfield 1985).
- ♦ **recombinant DNA** See nucleic acid: deoxyribonucleic acid: recombinant DNA.
- ♦ **recombinant-DNA technology** See technology: recombinant-DNA technology.
- ♦ **recombinant-inbred line (RI line)** *n.* An inbred line, derived independently from an F_2 generation produced from crossing two unrelated, inbred, progenitor lines (King and Stansfield 1985).
Comments: Each RI line has a characteristic combination of genes with a different pattern of alternative alleles at multiple loci. Researchers have fixed chance recombinants in a homozygous state in a group of strains derived from two unrelated, but highly inbred progenitor strains (King and Stansfield 1985).
- ♦ **recombinant-RNA technology** See technology: recombinant-RNA technology.
- ♦ **recombination** *n.* In sexually reproducing organisms: Occurrence of progeny with combinations of genes other than those of their parents due to independent reassortment, crossing over, or both during meiosis and zygote formation (King and Stansfield 1985).
cf. gene conversion, recombinant
- ♦ **recombination frequency, recombination fraction** *n.*
 1. The number of recombinants versus the total number of progeny of an organism (Lincoln et al. 1985).
 2. The mean frequency with which two particular alleles are separated by recombination (Lincoln et al. 1985).
- ♦ **recombinational load** See genetic load: recombinational load.
- ♦ **recombinational repair** See repair: recombinational repair.
- ♦ **recon** See gene: recon.
- ♦ **reconnaissance observation** See observation: reconnaissance observation.
- ♦ **recording error** See observer error: recording error.
- ♦ **recovery plan** See plan: recovery plan.
- ♦ **¹recruitment** *n.*
1. A reinforcement to a group of persons (Oxford English Dictionary 1972, entries from 1824).
2. The act, or process, of recruiting a military force or a class of persons (Oxford English Dictionary 1972, entries from 1843).
3. The influx of new organism members by reproduction, or immigration, into a population (Lincoln et al. 1985).
- ♦ **²recruitment** *n.* In some ant, bee, termite, and wasp species: "A special form of assembly by which members of a society are directed to some point in space where work is required" (Wilson 1975, 211, 213, 594).
syn. alarm behavior (sometimes, Wilson 1965, 1065); recruitment behavior
- tandem running** *n.* In some ant species: A type of chemical recruitment communication in which one follower runs closely behind a leader, frequently contacting the leader's abdomen with her antennae (Hingston 1929, Hölldobler 1971a, Wilson 1959a, in Wilson 1975, 55, 596).
- ♦ **recruitment limitation** *n.* A species' failure to colonize (= recruit in) all sites favorable for its growth and survival (Hubbell et al. 1999, 554).
cf. hypothesis: hypotheses of species richness: recruitment-limitation hypothesis
- ♦ **recruitment-limitation hypothesis** See hypothesis: hypotheses of species richness: recruitment-limitation hypothesis.
- ♦ **recruitment pheromone** See chemical-releasing stimulus: semiochemical: pheromone: recruitment pheromone.
- ♦ **recruitment trail** See odor trail: recruitment trail.
- ♦ **rectilinear evolution** See ²evolution: rectilinear evolution.
- ♦ **recurrent selection** See selection: recurrent selection.
- ♦ **recursive** *adj.* Referring to a relationship among a series of causes, or arguments, such that the sequence comes back to the starting point (Bateson 1979, 242).
cf. lineal
- ♦ **recursiveness** *n.*
 1. In linguistics, the possibility of repeating a pattern without limit in constructing a sentence; *e.g.*, Dick went to the store, Tom went to the store, etc. (Immelmann and Beer 1989, 246).
 2. In some bird species: An individual's singing repeated syllable insertions (Immelmann and Beer 1989, 246).
- ♦ **red-king hypothesis** See hypothesis: maximum-homology hypothesis.
- ♦ **Red Data Book** See document: Red Data Book.
- ♦ **Red Queen hypothesis, red queen model** See hypothesis: hypotheses of the evolution and maintenance of sex: Red Queen hypothesis.
- ♦ **redirected activity, redirected behavior, redirection** See behavior: displacement behavior: redirected behavior.
- ♦ **Red List** See document: Red List.
- ♦ **redirected aggression** See aggression: redirected aggression.
- ♦ **reducing agent** See agent: reducing agent.
- ♦ **¹reduction** *n.*
 1. In chemistry, a process that deprives a compound of oxygen (Michaelis 1963).
 2. In chemistry, an atom's or molecule's gaining one or more valence electrons; ceasing to share its electrons with a more electronegative atom or compound; or decreasing its positive valence (Michaelis 1963).

3. In chemistry, a compound's loss of oxygen, gain of hydrogen, or gain of electrons (King and Stansfield 1985).

v. reduce

Comment: Reduction is also the state resulting from these processes.

[“Reduction” is derived from the electrical effects of adding one, or more, electrons to an atom or compound. When an electron is added to a cation, the electron reduces the amount of the cation’s positive charge. Thus, *adding* an electron to a cation is called *reduction* (Campbell 1990, 183).]

♦**reduction** *n.* An organism line’s producing, or evolving, simpler structures from more complex ones (Lincoln et al. 1985).

cf. elaboration; ²evolution

♦**reduction division, reduction-division** *n.*

“One of the two meiotic divisions, usually the first one, in which the number of chromosomes is halved” (Mayr 1982, 748, 959).

Comment: This phenomenon was anticipated by Galton (1876 in Mayr 1982, 696) and first given a full and completely correct description by Hertwig (1890 in Mayr 1982, 761–762).

♦**reduction of polymorphy** See effect: Hagedoorn effect.

♦**reductionism** *n.*

1. Assertion that “the theories and laws formulated in one field of science (usually a more complex field or one higher in the hierarchy) can be shown to be special cases of theories and laws formulated in some other branch of science” (Mayr 1982, 62).
2. The theory that all complex phenomena can be explained by reducing them to their simplest possible terms and that all biological phenomena can be explained by simple physical laws (Lincoln et al. 1985).

Note: This theory is erroneous (Mayr 1997, 18). For example, animal territoriality cannot be explained by laws of physics and chemistry alone.

3. One’s showing that an animal’s behavior is consequent on its “physiological mechanisms, which in turn, can be understood in terms of their physics and chemistry” (Immelmann and Beer 1989, 247).

cf. holism, organicism

Comments: Mayr (1982, 62) is not aware of any biological theory that has ever been reduced to a physicochemical theory. Bateson (1979, 244) remarks that reductionism becomes a vice when it goes beyond one’s finding the simplest, most economical, and (usually) most elegant explanation that will account for particular data, and it is accompanied by an overly strong insistence that the simplest explanation is the only one.

♦**constitutive reductionism** *n.* Assertions that “the material composition of organisms is exactly the same as that found in the inorganic world” and “that none of the events and processes encountered in the world of living organisms is in any conflict with the physico-chemical phenomena at the level of atoms and molecules” (Mayr 1982, 60).

syn. reduction (Mayr 1982, 59, who notes that this term has been used in at least three different ways)

cf. emergence (Mayr 1982, 835)

Comment: Constitutive reductionism is accepted by modern biologists (Mayr 1982, 60).

♦**evolutionary reductionism** *n.* Humans’ developing principles regarding biological evolution [evidently coined by Alexander 1987, 14].

♦**explanatory reductionism** *n.* A form of analysis asserting that one cannot understand a whole system “until one has dissected it into its components, and again these components into theirs, down to the lowest hierarchical level of integration” (Mayr 1982, 60).

♦**redundancy** *n.*

1. In information theory, the occurrence of more signs than are necessary to encode a particular message; the ratio of the difference between the most efficient coding and the observed coding to the most efficient coding (Wilson 1975, 200; Immelmann and Beer 1989, 247).
2. Multiple mapping of sensory input in a vertebrate’s brain that enables it to have considerable recovery capacity from neural damage (Immelmann and Beer 1989, 247).

♦**redundant** *adj.* Referring to the third base pair of a triplet in genetic code which usually can be any of the four possible base pairs without changing the kind of amino acid coded for by the triplet (Gould 1985c).

♦**redundant character** See character: redundant character.

♦**refaunation** *n.* The reintroduction of an animal or animal-like organism, *e.g.*, a symbiotic gut microorganism, into a host from which it had been removed (Lincoln et al. 1985).

♦**refection** See -phagy: autocoprophagy.

♦**reference person** *n.* A person for whom another person shows consistent preference despite opportunities offered for frequent contact with other persons; *e.g.*, a child’s reference person is usually its mother (Heymer 1977, 44).

♦**referent** *n.* An organism that is chosen by a conspecific as a standard by which it classifies strangers as kin or nonkin; a referent can range from being the organism itself to its entire group (Wilson 1987, 12).

cf. allele: recognition allele; phenotype matching; recognition; template

♦**reflex** *n.*

1. An involuntary action of a muscle, gland, or other organ caused by the excitation of a sensory nerve that is transmitted to a nerve center, and thence ‘reflected’ along an efferent nerve to the organ in question (Oxford English Dictionary 1972, entries from 1833).

2. An involuntary response made to a stimulus and which proceeds in a clearly prescribed fashion; a reflex comprises numerous reflex arcs, each composed of a receptor organ that responds to a stimulus, an afferent pathway that conducts an action potential from the receptor to synapses and ganglion cells of a central nervous system, and an efferent pathway that carries an impulse to an effector organ that processes an appropriate response (Verplanck 1957).

3. The simplest form of reaction to a stimulation that is normally automatic, involuntary, and stereotyped (Storz 1973, 235; McFarland 1985, 239).

syn. reflex action (Oxford English Dictionary 1972), reflex arc (some authors), reflex behavior (McFarland 1985)

4. “A simple stimulus-response circuit by which a particular input is inevitably followed, with little or no intervening processing, by a unitary output, *e.g.*, a human knee-jerk reflex” (Gould 1982, 72).

cf. reflex center

Babinski reflex *n.* In adult apes, Human infants: An individual's raising its big toe and fanning out its other toes when the side of its foot is stimulated (Dewsbury 1978, 136; Gregory and Zangwill 1987, 68). [after Joseph Babinski, 1857–1932, French neurologist (Gregory and Zangwill 1987)]

chain reflex *n.* One of the reflexes in an individual animal's reflex sequence that is caused by one reflex activating the next (Immelmann and Beer 1989, 2). *cf.* ³theory: chain-reflex theory

clamping reflex See reflex: grasp reflex.

clasp reflex See reflex: grasp reflex.

conditional reflex, conditional response, conditioned reflex, conditioned response See learning: conditioning: Pavlovian conditioning.

delayed reflex *n.* An animal's reflex that follows a stimulus after a time lag, *e.g.*, a tongue strike at prey of a toad, or frog, and that is not corrected after it begins (T-phenomenon, Hinsche 1935 in Heymer 1977; Heymer 1977, 143).

diving reflex *n.* A person's showing an abrupt heart-rate drop and concomitant lower blood pressure, constriction of peripheral blood vessels that sends blood to his brain, ceasing his automatic urge to breath, and changing brain metabolism that allows him to go without oxygen for several minutes; this occurs in infants through adults (Gould 1982, 513).

expulsion reflex *n.* In frogs and toads: An individual's opening its mouth wide and moving its forelegs forward from the side in a wiping movement after eating an oversized, or unpalatable, object (Hering 1896, etc., in Heymer 1977, 202).

syn. wiping reflex (Heymer 1977, 202)

grasp reflex, grasping reflex *n.*

1. A premature, or newborn, Human infant's closing his fingers about an object, such as an adult's finger, in an orderly sequence, with great strength in some individuals (Precht 1955 and Hassenstein 1973 in Heymer 1977, 82).

2. For example, in batrachians, many arboreal-mammal species: An animal's reflex flexion of its fingers, or toes, and adductuve gripping of its arms or legs in response to touch on the palms of its hand or soles of its feet (Immelmann and Beer 1989, 45).

syn. clamping reflex (Heymer 1977, 82); clasp reflex (Immelmann and Beer 1989, 45)

knee-jerk reflex *n.* A person's extending his lower leg after being tapped in his lower knee area (Gould 1982, 72).

lordosis reflex See lordosis.

monosynaptic reflex *n.* An animal's reflex that involves one afferent and one efferent nerve and a single synapse between them in the individual's lower spinal cord, *e.g.*, a human knee jerk (Immelmann and Beer 1989, 248).

optomotor reflex *n.* In many animal species, *e.g.*, *Betta splendens* (Siamese Fighting Fish); some praying-mantid species, and *Rattus norvegicus* (Norway Rats): An individual's attempting to maintain its entire body, or part of its body, in a constant position with regard to a moving environment, *e.g.*, an individual's attempting to stay in a constant position with regard to stripes on the walls of a revolving cylinder (optomotor apparatus) in which it is placed (McFarland 1985, 250).

syn. optokinetic response (Dewsbury 1978, 176)

orientating reflex See response: orientating response.

rooting reflex *n.* A newborn human baby's turning his head and forming his mouth when his cheek is stimulated (Dewsbury 1978, 136).

cf. reflex: Babinski reflex

startle reflex *n.* A person's involuntary body twitching due to a surprising stimulus (McFarland 1985, 239).

unconditioned reflex *n.* An unlearned reflex; *e.g.*, pupillary reflex, knee jerk, salivary reflex, or clasp reflex (Immelmann and Beer 1989, 248).

cf. learning: conditioning: Pavlovian conditioning

Unken reflex *n.* In some amphibian species: A defensive posture in which an animal's body is arched inward with its head and tail lifted upward (Halliday and Alder 1986, 34, 148).

Comments: Some very toxic frogs show Unken reflexes, closing their eyes and bending their heads and legs back over their bodies which exposes the bright colors on their bellies and foot bottoms (Brodie 1989, 96). *Taricha* spp. (newts) expose the red coloration of the undersides of their hind feet, tail, and venter. [after the *Unke*, the German name for the European Fire-bellied Toad (Brodie 1989, 96)]

wiping reflex See reflex: expulsion reflex.

♦ **reflex action, reflex arc, reflex behavior** See reflex.

♦ **reflex bleeding** *n.* For example, in many coccinellid, ithomiine-butterfly, lampyrid, lycid, and meloid beetle species: An individual's facile bleeding when it is irritated that may indicate to a potential predator that it is toxic, distasteful, or both (Matthews and Matthews 1978, 334; Eisner et al. 1997, 9725, illustration).

♦ **reflex center** *n.* All of the synapses and ganglion cells in an animal's central nervous system that are parts of reflex arcs that make up a reflex (Heymer 1977, 143).

cf. reflex

♦ **reflex model of behavior** See ⁴model: reflex model of behavior.

♦ **reflexology** *n.* The view that a human brain is an "input-output machine" that makes very complex responses to the world, but is essentially responding to its demands (Hilts 1997, C5).

Comment: In contrast to reflexology, Rodolfo Llinas views a human brain as a prediction machine (Hilts 1997, C5). It makes elaborate mental maps that are reliable enough to enable a Human to predict what might lie ahead in space and time.

♦ **reflex theory** See ³theory: reflex theory.

♦ **refractory period** See period: refractory period.

♦ **refuge** *n.* An area in which prey may escape from, or avoid, a predator (Lincoln et al. 1985). See refugium.

♦ **refugium** *n., pl. refugia*

1. An area that has escaped major climatic changes typical of its geographic region as a whole and acts as a refuge for biota previously more widely distributed (Lincoln et al. 1985).

2. An isolated habitat that retains environmental conditions that were once widespread (Lincoln et al. 1985).

syn. refuge (Lincoln et al. 1985)

♦ **regeneration** See reproduction (def. 1, note).

cf. -morphosis: epimorphosis

♦ **region** *n.* An area of the Earth distinguished by its fauna, flora, or both (after Michaelis 1963).

cf. place

Carolinian zone *n.*

1. The forests along Carolina coasts in the U.S. (Reid 1985, 24).
- Note:* This term is no longer commonly used for this area (Reid 1985, 24).
2. A life zone from the Carolinas north including southern Ontario, Canada (C. H. Merriam 1898 in Reid 1985, 24).

Note: This term is no longer commonly used for this entire area, but is commonly used to refer to the original forests and present habitats of southern Ontario, also known as Carolinian Canada, *q.v.* (Reid 1985, 24).

[after Carolina because the essentially same eastern deciduous forest extends south to the Carolinas]

Carolinian Canada *n.* An originally mostly forested area of Ontario that stretches south from the Rouge River Valley in Toronto through Middle Island in Lake Erie (Reid 1985, 23).

syn. banana belt, Carolinian zone, deciduous-forest zone (Reid 1985, 23)

Comments: This area is the warmest one in Canada and supports the northern edge of the eastern deciduous forest (Reid 1985). Habitats in the forest include prairie, savanna, wetlands, and upland woodlands. Organisms found nowhere else in Canada live here including: Badger, Blackgum, Creeping Fragile Fern, Cucumbertree (endangered), Eastern Mole, Green-dragon, Karner Blue Butterfly (endangered), Kentucky Coffeetree, Oswego Tea, Pawpaw, Sassafras, Southern Flying Squirrel, Swamp Rose Mallow, Tuliptree, Virginia Bluebells, and Virginia Opossum. Two hundred species of Canada's plants and one third of Canada's endangered organisms occur only in Carolinian Canada. The Carolinian Canada Program is working to protect this region.

faunal region *n.* An area of the Earth in which organisms generally show closer relationships to each other as a whole, than to organisms of other areas (Klots 1958, 21).

Comment: World faunal regions are the "Ethiopian Region" (most of Africa), "Indo-Australian Region" (the tropical Asiatic lands, from India and Malaya through the Australian area), "Holarctic Region" (Arctic and temperate regions of both the Old and New Worlds, including all of Europe, the northern edge of Africa, Asia south to northern India and Burma, and North America, excluding Mexico except for several areas in central Mexico), and "Neotropical Region" (most of Mexico and Central and South America) (Klots 1958, 21). The Holarctic Region is composed of the Nearctic Region (North America) and the Palearctic Region (Europe and Asia).

life zone *n.* An area within a faunal region with characteristic biota (Klots 1958, 21).

Comments: Life zones in eastern North America, north of Mexico, include the Arctic-Alpine Zone, Canadian Zone, Hudsonian Zone, Lower Austral Zone, Tropical Zone, and Upper Austral Zone (Klots 1958, 21, map). The Tropical Zone is technically in the U.S. subtropics.

♦ **regional-character species** See ²species: characteristic species: regional-character species.

♦ **regional climax** See climax: regional climax.

♦ **regional dialect** See dialect: regional dialect.

♦ **regression coefficient** See coefficient: regression coefficient.

♦ **regression curve** See curve: regression curve.

♦ **regression line** *n.* The line that is the graphic representation of a regression equation, *e.g.*, one involving one dependent variable and one independent variable; $y = a + bx$; where y is the dependent variable, a = the intercept; b = regression coefficient = slope of the line; and x = the independent variable (Lincoln et al. 1985).

cf. curve: regression curve; statistical test: regression

♦ **regression model of evolution** See ⁴model: regression model of evolution.

♦ **regression test, regression** See statistical test: correlation test, regression test.

♦ **regressive, retrogressive** *adj.* Referring to de-differentiation, or reversal, to a simpler state or form (Lincoln et al. 1985).

n. retrogression

♦ **regressive character** See character: regressive character.

♦ **regressive evolution** See ²evolution: regressive evolution.

♦ **regular** See male: regular.

♦ **regular altruism** See altruism (def. 2).

♦ **regular distribution** See distribution: uniform distribution.

♦ **regulation** *n.*

1. The coordination of units to achieve the maintenance of one or more physical, or biological, variables at a constant level; the result of regulation is homeostasis (Wilson 1975, 11).

2. The processes by which an embryo maintains its normal development (Lincoln et al. 1985).

See regulation: population regulation.

biogenic-social regulation See regulation: social regulation: biogenic-social regulation.

population regulation, regulation *n.* Control of population density by density-dependent factors (Lincoln et al. 1985).

cf. hypothesis: population-limiting hypothesis

self-regulation hypothesis See hypothesis: population-limiting hypotheses.

social regulation *n.* The control of behavior in social groups.

♦ **biogenic-social regulation** *n.* In social insects: Social regulation by biological factors such as temperature, humidity, and animals' nutritional needs, combined with their signal mechanisms that convey information about such factors among members of a group [coined by Schneirla (1949 in Immelmann and Beer 1989, 33, who indicate this term is little used now)].

♦ **psychogenic-social regulation** *n.* In more derived vertebrates: Social regulation by psychological factors, such as individual attachment, emotion investment, and dominance-subordinance relationships [coined by Schneirla (1949 in Immelmann and Beer 1989, 238)].

♦ **regulator** *n.* An animal with certain aspects of its bodily condition that tend to be relatively independent of its environmental conditions, *e.g.*, a homeotherm (McFarland 1985, 284).

See communication: nonverbal communication: regulator.

cf. conformer; homeostasis; therm: homeotherm

local regulator *n.* A substance that a transmitting cell secretes that influences other nearby cells (Campbell et al. 1999, 190).

Comments: Local regulators include animal growth factors and neurotransmitters. (Campbell et al. 1999,

- 190). Cells use hormones in communication with more distant cells.
- ♦ **regulator gene** See gene: regulator gene.
- ♦ **regulatory gene** See gene: regulatory gene.
- ♦ **regulon** *n.* A noncontiguous group of genes that is controlled by the same regulator gene (King and Stansfield 1985).
- cf.* gene
- ♦ **reinforcement** *n.*
1. An investigator's use of reinforcement (see below) in an experiment; this involves using partial, positive, or negative reinforcement (Immellmann and Beer 1989, 248–249).
 2. Whatever an investigator has to add to a stimulus-response contiguity to effect their association (Immellmann and Beer 1989, 249).
- cf.* extinction; learning; conditioning
- ♦ **negative reinforcement** *n.*
1. An investigator's withholding something from, or causing aversive stimulation of, an animal (Immellmann and Beer 1989, 248).
 2. An investigator's punishing an animal to suppress its response (Immellmann and Beer 1989, 248).
- ♦ **partial reinforcement** *n.* An investigator's rewarding an animal for only a proportion of its correct responses in a learning experiment (Immellmann and Beer 1989, 216).
- ♦ **positive reinforcement** *n.* An investigator's presenting an animal with a "genuine" reward, *e.g.*, food for a hungry animal, water for a thirsty one, or electrical stimulation in an animal's brain pleasure center (Immellmann and Beer 1989, 248).
- ♦ **secondary reinforcement** *n.* An investigator's presenting an animal with a stimulus that is a sign of a reward, or a means of obtaining a reward; *e.g.*, a monkey's getting tokens that it can use to obtain food from a dispenser (Immellmann and Beer 1989, 248).
- ♦ **reinforcement schedule** *n.* The distribution of reward with respect to when an animal shows its responses in a learning experiment (Immellmann and Beer 1989, 249).
- ♦ **continuous reinforcement schedule** *n.* A reinforcement schedule that rewards an animal for every correct response that it makes (Immellmann and Beer 1989, 249).
- ♦ **fixed-interval reinforcement schedule** *n.* A reinforcement schedule that rewards an animal after it makes a correct response in a set period (Immellmann and Beer 1989, 249).
- ♦ **fixed-ratio reinforcement schedule** *n.* A reinforcement schedule that rewards an animal after it makes a certain set number of correct responses (Immellmann and Beer 1989, 249).
- ♦ **variable-interval reinforcement schedule** *n.* A reinforcement schedule that rewards an animal after it makes a correct response and at time intervals that vary randomly within a certain limit (Immellmann and Beer 1989, 249).
- ♦ **variable-ratio reinforcement schedule** *n.* A reinforcement schedule that gives rewards at random times with respect to how many responses a animal has made (Immellmann and Beer 1989, 249).
- ♦ **reinforcement, reinforcer** *n.* An event (*e.g.*, reward) that is predictably followed by an animal's response and can be shown to increase the future probability of its response (Storz 1973, 236; Hinde 1982, 281).
- cf.* learning; conditioning; negative conditioning
- ♦ **negative reinforcer** *n.* A reinforcer that discourages an animal to approach a stimulus that it associates with this reinforcer (McFarland 1985, 323).
- ♦ **positive reinforcer** *n.* A reinforcer that encourages an animal to approach a stimulus that it associates with this reinforcer (McFarland 1985, 323).
- ♦ **reinforcing selection** See selection: reinforcing selection. See reinforcement schedule.
- ♦ **re-introduction** See introduction: re-introduction.
- ♦ **rejection** See need: rejection.
- ♦ **rejungent species** See ²species: ring species.
- ♦ **¹relationship** *n.*
1. Kinship (Oxford English Dictionary 1972, entries from 1880).
 2. The degree of overall phenotypic similarity between (among) taxa (Lincoln et al. 1985).
 3. The degree of genotypic similarity that is inferred from phenotypic similarity (Lincoln et al. 1985).
 4. "Recency of common ancestry" (Lincoln et al. 1985).
- ♦ **²relationship** *n.* A spatial, social, or both, association between, or among, animals over a sustained period (Immellmann and Beer 1989, 249).
- ♦ **consort relationship** *n.* In *Macaca mulatta* (Rhesus Macaques), *Macaca sylvanus* (Barbary Macaques), *Pan troglodytes* (Chimpanzees), and *Papio* spp. (Baboons): A close relationship of a male and female during her estrus that involves their moving and feeding together, much sexual activity, and frequent mutual grooming (Immellmann and Beer 1989, 58).
- cf.* pair: consort pair
- Comment:* Consort relationships last from a few hours to a few days (Immellmann and Beer 1989, 58).
- ♦ **social relationship** *n.* Two, or more, animals' interacting regularly, or periodically, over some extended period, involving their being able to recognize each other as particular individuals and remembering the results of past encounters (Hinde and Stevenson-Hinde 1976 in Hand 1986, 209).
- ♦ **dominance-subordination relationship** *n.* A social relationship in which "one dyad member accepts (generally follows) the 'rule' that it will defer at points of conflict" (Hand 1986, 209).
- Comment:* Dominance-subordination relationships may be pure or mixed (Hand 1986, 209).
- ♦ **dyadic relationship** *n.* A relationship between two animals.
- ♦ **egalitarian-social relationship** *n.* A social relationship in which neither member of a social dyad is socially dominant (consistently wins) when the pair has social conflicts; their win-loss ratio approaches 50/50 [coined by Hand (1986, 209)].
- ♦ **stimulus-response relationship** *n.* The temporal and quantitative relationship between a specific stimulus' presentation and appearance of an animals' specific behavior (Immellmann and Beer 1989, 294).
- ♦ **relationship, coefficient of** See coefficient: coefficient of relationship.
- ♦ **relative abundance** See abundance: relative abundance.
- ♦ **relative-crowding coefficient** See coefficient: relative-crowding coefficient.
- ♦ **relative density** See density: relative density.
- ♦ **relative dominance** See dominance (ecological): relative dominance.
- ♦ **relative-dominance hierarchy** See hierarchy: dominance hierarchy; relative-dominance hierarchy.
- ♦ **relative frequency** See frequency: relative frequency.

- ♦ **relative sexuality** See sexuality: relative sexuality.
- ♦ **relaxed-open-mouth display** See display: relaxed-open-mouth display.
- ♦ **release call** See animal sounds: call: release call.
- ♦ **releaser** See ²stimulus: releaser.
- ♦ **releaser pheromone** See chemical-releasing stimulus: semiochemical: pheromone: releaser pheromone.
- ♦ **releasing factor** See hormone: releasing hormone.
- ♦ **releasing hormone** See hormone: releasing hormone.
- ♦ **releasing mechanism (RM)** See mechanism: releasing mechanism.
- ♦ **releasing stimulus** See stimulus: releaser.
- ♦ **reliability** *n.*
 1. The consistency of a measurement test (Storz 1972, 237).
 2. Reproducibility of measurements (Lehner 1979, 130).
 3. "An indication of the size of chance errors" (Lincoln et al. 1985).
- ♦ **interobserver reliability** *n.* Reliability of more than one investigator in obtaining very similar data from observing the same behavior (Lehner 1979, 130–132).
- ♦ **intraobserver reliability, self-reliability** *n.* Reliability of the same investigator to obtain very similar data when again observing the same behavior (Lehner 1979, 130).
- ♦ **relic, relict species** See ²species: relict species.
- ♦ **relict (organ)** See organ: relict.
- ♦ **relief ceremony** See ceremony: relief ceremony.
- ♦ **REM sleep** See sleep: stage-1 sleep.
- ♦ **rendezvous pollination** See pollination: rendezvous pollination.
- ♦ **renewability** *n.* "The ability of a resource to become replenished during a specified time interval following depletion" (Wittenberger 1981, 620).
- ♦ **renin** See hormone: renin.
- ♦ **Rensch's laws** See law: Rensch's laws.
- ♦ **repair** *n.* Changing a DNA sequence back to its usual (normal) state (Bernstein et al. 1985, 1278).
- ♦ **recombinational repair** *n.* Repair of DNA damage (*e.g.*, double-strand breaks and cross-links) that can occur only during recombination of homologous chromosomes.
- ♦ **repair enzyme** See enzyme: repair enzyme.
- ♦ **repair hypothesis** See hypothesis: hypotheses of the evolution and maintenance of sex: repair hypothesis.
- ♦ **repeated bites** See bite: repeated bites.
- ♦ **repeated DNA** See DNA: repetitive DNA.
- ♦ **repertoire** *n.* "A stock of dramatic or musical pieces which a company or player is accustomed or prepared to perform; one's stock of parts, tunes, songs, etc." (Oxford English Dictionary 1972, entries from 1947); also, such pieces collectively (Michaelis 1963).
syn. repertoire (Michaelis 1963)
[French *répertorio* < Late Latin *repertorium*, inventory]
- ♦ **repertory** *n.*
 1. "An index, list, catalogue, or calendar;" obsolete definition (Oxford English Dictionary 1972, entries from 1552).
 2. "A storehouse, magazine, or repository, where something may be found" (Oxford English Dictionary 1972, entries from 1552); a collection of these things gathered together (Michaelis 1963).

syn. repertoire, *q.v.* (Oxford English Dictionary 1972)
See -gram: ethogram; repertory: vocal repertory.
[Late Latin *repertorium*, inventory]

- ♦ **behavioral repertory** *n.* "A list of the behavioral acts performed by an individual, caste, or species, sometimes with a specification of relative frequencies of acts" (Hölldobler and Wilson 1990, 636).
- ♦ **vocal repertory** *n.* An inventory of the sounds produced by an individual animal or species (Immelmann and Beer 1989, 325).
cf. -gram: ethogram
Comment: Primates (especially Humans, Chimpanzees, and New-World monkeys), whales, and birds have the more complex vocal repertoires (Immelmann and Beer 1989, 325).
- ♦ **repetition** *n.* The close resemblance of early developmental stages in related animals, with subsequent divergence in later stages by their acquisition of distinctive characters (Lincoln et al. 1985).
cf. law: biogenetic law
- ♦ **repetitious DNA, repetitive DNA** See DNA: repetitive DNA.
- ♦ **repium** See ²community: repium.
- ♦ **replacement queen** See caste: queen: replacement queen.
- ♦ **replete** *adj.* "Fully nourished; well fed" (Lincoln et al. 1985).
See caste: replete.
[< Old French *replet* < Latin *repletus*, past participle of *replere*, to fill again]
- ♦ **replicability** *n.* In statistics, "the idea that replicate experimental units must be extremely similar if not identical at the beginning (premanipulation period) of an experiment" (Hurlbert 1984, 201).
syn. reproducibility (Abbott 1966 in Hurlbert 1984, 201)
- ♦ **replicate** *n.* In statistics, a repeated experiment (Lincoln et al. 1985).
- ♦ **replication** *n.*
 1. In statistics, one's repeating an experiment to obtain more information for estimating experimental error (Lincoln et al. 1985).
 2. "Production of identical copies of information from existing units" (Lincoln et al. 1985).

v.t. replicate
- ♦ **pseudoreplication** *n.* In statistics, one's incorrect "use of inferential statistics to test for treatment effects with data from experiments where either treatments are not replicated (though samples may be) or replicates are not statistically independent" (Hurlbert 1984, 187).
Comments: Hurlbert (1984) describes "implicit pseudoreplication," "sacrificial pseudoreplication," "simple pseudoreplication," and "temporal pseudoreplication." Pseudoreplication is one of "seven deadly sins" in the study of behavior (*q.v.*) (Milinski 1997).
[coined by Hurlbert 1984 in Milinski 1997, 165]
- ♦ **replicator** *n.* "Any entity in the universe of which copies are made" Dawkins (1982, Chapter 5).
Comment: Dawkins (1982) discusses "active replicator," "dead-end replicator," "germ-line replicator," and "passive replicator."
- ♦ **reporter gene** See gene: reporter gene.
- ♦ **representation** *n.* An animal's internal mental image of an object or complex spatial, or social, situations for which it is searching (Kummer 1982 in McFarland 1985, 354).
cf. search image
- ♦ **declarative representation** *n.* A representation of a desired goal or object, *e.g.*, food for a rat (Dickinson 1980 in McFarland 1985, 354).

- procedural representation** *n.* A representation of a set of instructions that lead an animal automatically to a desired object without its envisioning the object, *e.g.*, a maze path for a rat in search of food (Dickinson 1980 in McFarland 1985, 354).
- ♦ **representative sample** See sample: representative sample.
- ♦ **reproducibility** See replicability.
- ♦ **reproduction** *n.*
1. In some animal species: An individual's regrowing a part that has been removed (Oxford English Dictionary 1972, entries from 1727).
Note: This process is now usually now called "regeneration" (Oxford English Dictionary 1972).
 2. In organisms: An individual's producing offspring by some form of generation; the generative production of new individuals by, or from, existing ones; also, an individual's power of reproducing in this way (Oxford English Dictionary 1972, entries from 1785).
 3. An organism's reproductive activities including mate acquisition, gamete production, and parental care (Willson 1983, 5).
- See -genesis.
cf. copulation, fertilization, sexual reproduction
- parthenogenetic reproduction** See parthenogenesis.
- uniparental reproduction** *n.* Reproduction from a single parent, *e.g.*, vegetative reproduction, thelytoky, and self-fertilizing hermaphroditism (Lincoln et al. 1985).
cf. parthenogenesis
- ♦ **reproduction curve** See curve: reproduction curve.
- ♦ **reproductive** *n.* An individual that has offspring.
- primary reproductive** *n.* In Termites: The colony-founding type of a queen or a male derived from a winged adult (Wilson 1975, 592).
- ♦ **reproductive altruism** See altruism: reproductive altruism.
- ♦ **reproductive behavior** See behavior: reproductive behavior.
- ♦ **reproductive community** See ¹population: Mendelian population.
- ♦ **reproductive conflict** See ³conflict: reproductive conflict.
- ♦ **reproductive diapause** See dormancy: diapause: reproductive diapause.
- ♦ **reproductive effort** See effort: reproductive effort.
- ♦ **reproductive-isolating mechanism** See mechanism: isolating mechanism.
- ♦ **reproductive isolation** See isolation: reproductive isolation.
- ♦ **reproductive mimicry** See mimicry: reproductive mimicry.
- ♦ **reproductive-mutualistic mimicry** See mimicry: reproductive-mutualistic mimicry.
- ♦ **reproductive pheromone** See chemical-releasing stimulus: semiochemical: pheromone: reproductive pheromone.
- ♦ **reproductive potential** *n.* The number of offspring produced by one female in a population (Lincoln et al. 1985).
- ♦ **reproductive stage** See stage; reproductive stage.
- ♦ **reproductive success** See success: reproductive success.
- ♦ **reproductive success, principle of** See principle: principle of reproductive success.
- ♦ **reproductive system** See ²system: reproductive system.
- ♦ **reproductive value** See value: reproductive value.
- ♦ **reproductivity effect** See effect: reproductivity effect.
- ♦ **repugnatorial** See -orial: repugnatorial.
- ♦ **research station** *n.* A facility designed for scientific research in a particular geographic area and which may also have an educational program.
Comment: There are hundreds of research stations; I list a few of them below. The Organization of Biological Field Stations (OBFS, <http://www.obfs.org/?q=home>) lists scores of biological field stations found throughout the world.
- Archbold Biological Station (ABS)** *n.* An independent, nonprofit research and educational facility, devoted to long-term ecological research and conservation in Florida (<http://www.archbold-station.org/abs/index.htm>).
- Blandy Experimental Farm (BEF)** *n.* A 700-acre University of Virginia research and educational facility (<http://www.virginia.edu/blandy/>).
Comments: The BEF contains the State Arboretum of Virginia.
- Charles Darwin Research Station (CDRS)** *n.* The operative branch of the Charles Darwin Foundation for the Galápagos Islands, founded in 1959 and which is an international, non-governmental, nonprofit, scientific organization dedicated to the protection of the Galápagos Islands (www.darwin-foundation.org 2000).
cf. place: Galápagos Islands
Comments: Personnel at the Station carry out basic ecological studies of the Galápagos Islands, conduct a program to remove imported pest species that endanger their native species, and run a nursery where they successfully have bred endangered Galápagos Tortoises (Milner 1990, 120). The major physical plant of the Station is on Santa Cruz Island. Fishers angry about quotas on sea-cucumbers and Spiny Lobsters took aggressive actions against workers at the Charles Darwin Research Station and park service personnel in 1995, 1997, and 2000 (Ferber 2000, 15 December, 2001).
- Smithsonian Tropical Research Institute (STRI)** *n.* A part of the Smithsonian Institution's research program with marine terrestrial research stations in Columbia and Panamá and research conducted in many parts of the world (www.si.edu/organization/centers/stri/about.htm).
Comment: STRI became a separate part of the Smithsonian Institution in 1966. STRI's web site provides a wealth of information about it.
- University of Michigan Biological Station (UMBS)** *n.* The University of Michigan's biological research station in Pellston, Michigan, which is dedicated to education and research in field biology and related environmental sciences (<http://lsa.umich.edu/umbs>).
- ♦ **Reserva de la Biosfera Mariposa Monarca** See place: Monarch Butterfly Biosphere Reserve.
- ♦ **reservoir host** See host: reservoir host.
- ♦ **residence time** See time: residence time.
- ♦ **resident** See territory holder.
- ♦ **resident avifauna** See fauna: avifauna: resident avifauna.
- ♦ **residual** See error: prediction error.

- ♦ **residual genotype** See -type, type: genotype: background genotype.
- ♦ **residual-reproductive potential** See potential: residual-reproductive potential.
- ♦ **residual variance** See variance: residual variance.
- ♦ **resistance adaptation** See ³adaptation: 'physiological adaptation, resistance adaptation.'
- ♦ **resource** *n.*
1. In Humans: "A means of supplying some want or deficiency;" a stock, or reserve, upon which one can draw when necessary; now usually plural (Oxford English Dictionary 1972, entries from 1611).
 2. In Organisms: "Any substance, object, or energy source utilized for body maintenance, growth, or reproduction" (Wittenberger 1981, 620).
 3. In Organisms: Something that is consumed, or occupied, during growth, maintenance, or reproduction (Ehrlich and Roughgarden 1986, 630 in Abrams 1992, 282).
Note: This is a broad definition that includes inadvertently ingested nondigestible material as a resource (Abrams 1992, 283).
 4. In Organisms: Something that potentially influences individual fitness (Wiens (1984, 401, in Abrams 1992, 283).
Note: This definition would include (1) a nonpreferred food as a resource in an environment that contains sufficient amounts of preferred foods, and (2) foods in general even when they are superabundant and have no fitness effects (Abrams 1992, 283).
 5. In Organisms: A thing that increases survival, or reproduction, of an individual or population (Abrams 1992, 282).
- syn. Ressource (German)*
Comment: Abrams (1992) discusses some kinds of resources and what distinguishes one resource from another.
- coarse-grained resource** *n.* A resource distributed in a such a way that a consumer encounters it in a proportion different from its actual one; contrasted with fine-grained resource (Lincoln et al. 1985).
- consumable** *n.* A species' eaten resource such as a butterfly's larvae host plant and adult nectar source (Dennis et al. 2006 in New 2009, 84).
cf. utility
- fine-grained resource** *n.* A resource distributed in a such a way that a consumer encounters it in a proportion similar to its actual one; contrasted with coarse-grained resource (Lincoln et al. 1985).
- spatiotemporally clumped resource** *n.* A resource that is clumped in space and whose availability at any given location varies temporally on a short-term basis (Wittenberger 1981, 621).
- utility** *n.* A species' non-eaten resource such as a butterfly's hibernation site, mating site, pupation site, sleeping site, sunning site, and suitable conditions for development such as enemy-free space and microclimate (Dennis et al. 2006 in New 2009, 84).
cf. consumable
- ♦ **resource availability** *n.* "The extent to which a given resource can be obtained or utilized by a given individual or species" (Wittenberger 1981, 620).
- ♦ **resource axes** See bionomic axes.
- ♦ **resource budget** See budget: resource budget.
- ♦ **resource competition** See competition: resource competition.
- ♦ **resource-defense polygyny** See mating system: polygyny: resource-defense polygyny.
- ♦ **resource-holding potential** See potential: resource-holding potential.
- ♦ **respect of possession** See behavior: respectful behavior.
- ♦ **respectful behavior** See behavior: respectful behavior.
- ♦ **respiration** *n.* An organism's taking in oxygen from the air and giving off carbon dioxide and other oxidation products (Michaelis 1963).
Comment: Some definitions of respiration are synonymous with breathing (*q.v.*).
[Latin *respiratio, -onis*]
- aerial respiration** See breathing: air breathing.
- aquatic respiration** See breathing: water breathing.
- aquatic-surface respiration (ASR)** *n.* For example, in many fish species and larvae of some amphibian species: An animal's selectively inspiring a well-oxygenated surface layer of water while being in a body of poorly oxygenated water (Carter and Beadle 1931 in Kramer and Mehegan 1981, 300; Kramer 1987, 84).
syn. surface skimming, surfacing (Lewis 1970 in Kramer and Mehegan 1981, 300), breathing the surface film (Gee et al. 1978 in Kramer and Mehegan 1981, 300)
Comment: A Guppy engaged in ASR usually moves slowly along the water surface with its head contacting the surface and jaws open just beneath the surface. At intervals it may drop below the surface and feed, court, or swim about for a while before darting back and recontacting the surface (Kramer and Mehegan 1981, 301).
[coined by Kramer and Mehegan (1981, 300)]
- ♦ **respondent behavior** See behavior: respondent behavior.
- ♦ **response** *n.* Any change in an organism's behavior, or other attribute, that is caused by a stimulus (Lincoln et al. 1985).
cf. behavior, reflex, taxis
- conditional reflex or response, conditioned reflex or response** See learning: conditioning: Pavlovian conditioning.
- conditioned emotional response** *n.* The interruption, or diminution, of ongoing behavior as a result of an intruding stimulus (Estes and Skinner 1941 in Hinde 1985, 986).
- evolutionary response** See response: genetic response.
- following response** See behavior, following behavior.
- functional response** *n.*
1. An increase in parasite density due to increased host availability or predator density due to increased prey availability [coined by Solomon 1949, 16].
 2. An increase in predation rate in response to an increase in prey density; *e.g.*, in some small-mammal species feeding on sawflies (Holling 1959, 303).
 3. The phenomenon in which "as local populations of the host species increase in numbers, its enemies are able to encounter and to strike individuals at higher frequency" (Holling 1959 in Wilson 1975, 85).
 4. A change in rate of predation by an individual predator in response to change in density of its prey (Lincoln et al. 1985, Ruxton and Gurney 1994, 537).

► **type-1-functional response** *n.* A functional response in which the predation rate is directly proportional to prey density (Holling 1959, 315, illustration, 317).

Comment: In this functional response, the predator is assumed to search at random and have a constant prey-searching rate for all prey densities (Holling 1959, 315).

► **type-2-functional response** *n.* A functional response in which the number of prey attacked per predator increases very rapidly with initial increase in prey density, and thereafter increases more slowly approaching a certain fixed level, with the searching rate becoming progressively less with an increase in prey density (Holling 1959, 316, illustration, 317).

► **type-3-functional response** *n.* A functional response in which searching rate first increases with an increase in prey density and then decreases; *e.g.*, in small mammals that feed on sawflies (Holling 1959, 315, illustration, 317).

genetic response *n.* A population's between-generation genetic change that results from phenotypic selection (*q.v.*) in combination with the organism's genetic system (Fisher 1930a and others in Endler 1992, 222).

syn. evolutionary response (a confusing synonym Endler 1992, 223)

Comment: The process of natural selection is divided into the sequential subprocesses of phenotypic selection and genetic response by quantitative geneticists and animal and plant breeders (Endler 1992, 222).

graded response *n.* A response that varies in proportion to the strength of the stimulus that evokes it (Immelman and Beer 1989, 120).

immobility response *n.* An animal's crouching, freezing, or both due to aversive stimuli (Hinde 1970, 349).

cf. fear, playing dead

indicator response *n.* Movement patterns that occur only in a few species within a family (Seitz 1940–1943 in Heymer 1977, 91).

induced plant response to herbivory *n.* A plant's immune-like response to damage by a herbivore that reduces a herbivore's performance, preference, or both, on that plant (Agrawal 1998, 1201).

Comments: Researchers reported induced plant responses in over 100 herbivore-plant systems (Agrawal 1998, 1201). It seems likely that induced plant response to herbivory evolved in natural communities, but researchers have yet to establish this directly. So far, Agrawal's (1998) clear-cut experiments demonstrate that this response occurs in his experimental site, but not in natural communities. His experimental communities in California were mixtures of alien and native species. The aliens included his two radish species and the butterfly *Pieris rapae* all from Europe, with the butterfly also occurring in Asia. The herbivore-plant responses might be quantitatively different in the natural communities of these organisms.

numerical response *n.*

1. An increase in predator number due to increased prey availability and predator survivorship and reproduction [coined by Solomon 1949, 16].
2. A change in the density of a predator population with a change in prey density (Holling 1959, 303; Lincoln et al. 1985).

operant response *n.* An animal's response that acts on its environment and produces an event that affects the animal's subsequent probability of showing the response (Hinde 1982, 280–281).

cf. reinforcer

optokinetic response See reflex: optomotor reflex.

orientating response, orientating reflex, startle response *n.* An animal's reaction to a novel stimulus that consists of its scrutinizing it attentively, increasing its arousal, and being ready to take flight or defensive action (Immelman and Beer 1989, 209–210).

cf. response: orientation response

Comment: This term derives from the Russian scientist E. N. Sokolov (Immelman and Beer 1989, 209–210).

orientation response *n.* In freely moving animals and phytoflagellates: Movement from one site to another (Heymer 1977, 126).

cf. response: orientating response

pupillary response *n.*

1. A vertebrate animal's expanding and contracting its pupils in response to different light intensities (Heymer 1977, 135).

2. A person's dilating his pupil in response to pictures that interest him, or contracting his pupil in response to an unpleasant stimulus, when no light-intensity change occurs (Heymer 1977, 135).

ritualized response See behavior: ritualized behavior.

skin-conductance response (SCR) *n.* In Humans: Skin perspiring that accompanies emotional changes (Vogel 1997, Science 275, 1269).

startle response See response: orientating response.

unconditional reflex or response, unconditioned reflex or response See learning: conditioning: Pavlovian conditioning.

♦ **response tendency** See potential: specific-action potential(ity).

♦ **response to selection (R)** *n.* The difference in mean phenotype between the progeny generation (μ') and the previous generation (μ), symbolized as $R = \mu' - \mu$ (Hartl 1987, 228).

cf. prediction equation

♦ **response variable** See variable: dependent variable.

♦ **Ressource** See resource.

♦ **restibilic** *adj.* "Perennial" (Lincoln et al. 1985).

♦ **resting-level activity** See activity: spontaneous activity.

♦ **resting potential** See potential: resting potential.

♦ **restocking** *n.* A person's augmenting a species population size by adding more individuals to the population, often as part of a conservation program (New 2009, 168).

cf. introduction, restoration, translocation

♦ **restoration** *n.* Humans' re-introduction of a species or subspecies to a location from which it vanished (New 2009, 168).

cf. introduction, restocking, translocation

syn. butterfly re-introduction

Comment: In the United Kingdom, "butterfly restoration" is largely synonymous with butterfly "re-introduction" (New 2009, 168). People are also restoring natural habitats such as prairies, *q.v.*, in Wisconsin and elsewhere in North America (fig 41).

♦ **restrictase** See enzyme: restriction enzyme.

- ♦ **restriction** *n.* A bacterium's using a restriction enzyme in protection against intruding DNA from other organisms by cutting up this DNA (Campbell et al. 1999, 366).
cf. enzyme: restriction enzyme
- ♦ **restriction endonuclease** See enzyme: restriction enzyme.
- ♦ **restriction enzyme** See enzyme: restriction enzyme.
- ♦ **restriction fragment** *n.* A part of a DNA molecule that a restriction enzyme(s) has cut out of it (Campbell et al. 1999, 366).
- ♦ **restriction-fragment-length-polymorphism marker** See marker: restriction-fragment-length-polymorphism marker.
- ♦ **restriction site** See site: restriction site.
- ♦ **retardation** See ²heterochrony: retardation.
- ♦ **reticular activating system** See ²system: reticular activating system.
- ♦ **reticular formation** See organ: brain: reticular formation.
- ♦ **reticulate evolution** See ²evolution: reticulate evolution.
- ♦ **retinue** See court.
- ♦ **retrieving** *n.*
 1. In some Domestic Dog strains: An individual's finding or rediscovering (game that has been temporarily lost); especially to flush, or set up (partridges) a second time (Oxford English Dictionary 1972, verb entries from 1410).
 2. In some Domestic Dog strains and Humans: An individual's finding and bringing in a bird that has been wounded or killed (Oxford English Dictionary 1972, verb entries from 1856).
 3. In some rodent species: A mother's recovering her young that are outside her nest (Immelmann and Beer 1989, 254).
 4. In some species of ground-nesting birds: An individual's recovering its egg that is outside its nest (Immelmann and Beer 1989, 254).
cf. behavior: egg-rolling behavior
cf. care: behavior care: retrieval
- ♦ **retro-** *prefix* Back; backward (Michaelis 1963). [Latin *retro*, back, backward]
- ♦ **retrofection** *n.* Reinfection of a host by parasite larvae that hatch on its surface and re-enter its body (Lincoln et al. 1985).
- ♦ **retrograde evolution** See ²evolution: retrograde evolution.
- ♦ **retrogressive** See regressive.
- ♦ **retrogressive succession** See ²succession: retrogressive succession.
- ♦ **Retrojecktion** *n.* An animal's using its own body, or parts of it, as a substitute object, e.g., a young mammal's sucking its fingers, paws, or other body parts, when deprived of access to its mother's nipples (Immelmann and Beer 1989, 254). [German which has no precise English equivalent]
- sexual Retrojecktion** *n.* In animals that are kept alone for long periods: An individual's handling its own genitalia that enables it to derive "sexual gratification" (Immelmann and Beer 1989, 254).
cf. masturbation
- ♦ **retrorecognition phenomenon** See phenomenon: retrorecognition phenomenon.
- ♦ **return-benefit altruism** See altruism: return-benefit altruism.
- ♦ **reversal learning** See learning: reversal learning.
- ♦ **reversal problem** See test: reversal test.
- ♦ **reversal test** See test: reversal test.
- ♦ **reverse mutation** See ²mutation: reverse mutation.
- ♦ **reverse-sexual dimorphism** See sex role reversal.
- ♦ **reversion** See atavism.
- ♦ **revertant** *n.* An organism that bears a revertant allele (Lincoln et al. 1985). See allele: revertant.
- ♦ **revivescence** *n.* An organism's emergence from hibernation or some other quiescent state (Lincoln et al. 1985).
- ♦ **revolution** *n.* An instance of great change, or alteration, in affairs or in some particular thing (Oxford English Dictionary 1972, entries from 1450).
- first Darwinian revolution** *n.* Biologists' accepting the theory of common descent (all organisms evolved from a common ancestor); distinguished from second Darwinian revolution (Mayr 1982, 117). *cf.* revolution: second Darwinian revolution
- genetic revolution** *n.* A large amount of genetic change that is generated in a species within a relatively short evolutionary period (Mayr 1982, 885). *syn.* genetic transilience (Templeton 1980 in Mayr 1982, 885). Slatkin (1987, 789) suggests that genetic transilience is a loose synonym of genetic revolution. *Comment:* Stabilization of the genetic change takes a few to thousands of generations (Mayr in Hapgood 1984).
- scientific revolution** *n.*
 1. One of the highly drastic changes in the conceptual framework of a science (Mayr 1972 in 1982, 882).
 2. The occurrence of one paradigm's replacing another; the old paradigm ceases to be a useful and acceptable way of explaining the phenomena to which it applies (Kuhn 1970 in Moore 1984, 478). *Notes:* Mayr (1972 in 1982, 882) points out the so-called "Darwinian revolutions" occurred over 200 yr which is too many years to be considered revolutions. Also, there was no crisis situation in the 1850s, and there was no replacement of one paradigm by another. Further Mayr (1982, 857) says, "I cannot think of a single case in biology where there was a drastic replacement of paradigms between two periods of "normal science." However, in his 1997 book, Mayr uses the term "Scientific Revolution." Kuhn (1962 in Mayr 1982) gives criteria of identifying a scientific revolution. Further, he says that modern science began with the "Scientific Revolution" (Mayr 1997, 26).
 3. A series of changes in the structure of European thought that included systematic doubt about past views of the world, empirical and sensory verification of natural phenomena, "the abstraction of human knowledge into separate sciences, and the view that the world functions like a machine" (Hooker 1996). *Comments:* The main root of the Scientific Revolution is the re-discovery of Aristotle's work by Europeans in the 12th and 13th centuries (Hooker 1996). Important 15th-through 18th-century contributors to the Revolution include Leonardo da Vinci (1452–1519), Nicolaus Copernicus (1473–1543), Francis Bacon (1561–1626), Galileo Galilei (1564–1642), Anthony van Leeuwenhoek (1632–1723), Robert Hooke (1635–1703), Jan Swammerdam (1637–1680), Isaac Newton (1642–1727), Henry Cavendish (1731–1810), and Joseph Priestley (1733–1804).

- second Darwinian revolution** *n.* Biologists' accepting natural selection as the only direction-giving factor in evolution that was completed during the evolutionary synthesis, *ca.* 1936–1947; distinguished from first-Darwinian revolution (Mayr 1982, 117). *cf.* revolution: first Darwinian revolution
- ◆ **reward** *n.* An object (*e.g.*, food, water), or opportunity (*e.g.*, a chance to see outside its cage) that an animal finds favorable in the context of conditioning (*q.v.*) (Immelman and Beer 1989, 248).
- floral reward** *n.* An attractant (*e.g.*, floral oils, food bodies, nectar, or pollen) in a flower that invites and lengthens visits of floral visitors (Buchmann and Nabhan 1996, 246).
- ◆ **r extinction** See ²extinction: r extinction.
- ◆ **RFLP marker** See marker: restriction-fragment-length-polymorphism marker.
- ◆ **RFLPs** See -morphism: polymorphism: restriction-fragment-length polymorphisms.
- ◆ **rheo-** *comb. f.* "Current or flow, as of water or electricity" (Michaelis 1963). [*Greek rheos, a current*]
- ◆ **rheogameon** See ²species: polytypic species.
- ◆ **rheology** See study of: limnology: rheology; study of: theology.
- ◆ **rheophile** See ¹-phile: rheophile.
- ◆ **rheophobe** See -phobe: rheophobe.
- ◆ **rheoplankton** See plankton: rheoplankton.
- ◆ **rheopositive** *adj.* Referring to an organism's showing behavioral, or other responses, to air, or water, currents (Lincoln et al. 1985).
- ◆ **rheoreceptive** *adj.* Referring to an organism's being sensitive to air, or water, currents (Lincoln et al. 1985).
- ◆ **rheotaxis** See taxis: rheotaxis.
- ◆ **rheotrophic** *adj.* Referring to an organism that obtains its nutrients largely from percolating, or running, water (Lincoln et al. 1985).
- ◆ **rheoxene** See -xene: rheoxene.
- ◆ **rhexigenous** See -genous: rhexigenous.
- ◆ **rhicochetal locomotion** See locomotion: rhicochetal locomotion.
- ◆ **rhipium** See ²group: rhipium.
- ◆ **rhithron** *n.* "The upper reaches of a river" (Lincoln et al. 1985). *adj.* rhithrous *cf.* potamous
- ◆ **rhizo-, rhiz-** *comb. f.* Root; referring to a root or roots (Michaelis 1963). [*Greek rbiza, root*]
- ◆ **rhizobenthos** See ²community: benthos: rhizobenthos.
- ◆ **rhizophage, rhizophagy, rhizophagous** See -phage: rhizobenthos.
- ◆ **rhizophile, rhizophagy, rhizophilous** See ¹-phile: rhizophile.
- ◆ **rhizoplane** See -sphere: rhizosphere.
- ◆ **rhizosphere** See -sphere: rhizosphere.
- ◆ **rhoium** See ²community: rhoium.
- ◆ **rhoophile, rhoophilic, rhoophilus, rhoophilous** See ¹-phile: rhoophile.
- ◆ **R horizon** See soil horizon: D horizon.
- ◆ **RHP** See potential: resource-holding potential.
- ◆ **rhyacium** See ²community: rhyacium.
- ◆ **rhyacophile, rhyacophilous, rhyacophilous** See ¹-phile: rhyacophile.
- ◆ **rhypophage, rhypophagy, rhypophagous** See -phage: ryphophage.
- ◆ **rhygium** See ²community: rhygium.
- ◆ **rhythm** *n.* A periodic change in an organism's physical environment, such as diurnal, tidal, and seasonal cycles (Immelman and Beer 1989, 217). See rhythm: biological rhythm. *cf.* dormancy: hibernation
- biological rhythm, biorhythm, biorhythmicity** *n.* A regular periodicity shown by whole organisms, their behaviors, and their physiological activity and underlying physiological regulation (Immelman and Beer 1989, 33). *syn.* biological clock, clock, periodicity, rhythm, rhythmicity *cf.* clock
- circadian rhythm** *n.* In many animal species: A rhythm that recurs about every 1 day (24.1 hr) (Wilson 1975, 580). *syn.* diurnal rhythm (Immelman and Beer 1989, 44) *cf.* time synchronizer [*Latin circa, around + dies, day*]
- circalunadian rhythm** *n.* A usually bimodal rhythm with a persistent periodicity of about 1 lunar day (24.8 hr) (Lincoln et al. 1985).
- circamonthly rhythm** See rhythm: lunar rhythm.
- circannual rhythm** *n.* An organism's endogenous rhythm that is usually slightly less than 1 yr (365.2 solar days) (McFarland 1985, 291). *syn.* annual rhythm, annual periodicity (Immelman and Beer 1989, 15) *Comments:* Circannual rhythms include yearly migration bouts of many bird species, cold-season hibernation of many vertebrate species, and fluctuations in reproduction and other activities of many animal species (Immelman and Beer 1989, 15). Humans and *Marmota monax* (Groundhogs) are among the many mammals that show circannual rhythms (Line 1997, 28 January, C2).
- circasemiannual rhythm** *n.* A rhythm with 2 cycles within about 1 yr (Lincoln et al. 1985).
- diurnal rhythm** See rhythm: circadian rhythm.
- endogenous rhythm** *n.* An internal rhythm that programs an organism's behavior in synchrony with an exogenous temporal period, particularly an approximately 24-hr or 365-day period (McFarland 1985, 291). *cf.* zeitgeber
- infradian rhythm** *n.* A rhythm with a period less than 24.1 hr (Lincoln et al. 1985). *cf.* rhythm: ultradian rhythm
- lunar rhythm** *n.* For example, in *Artibeus jamaicensis* (Jamaican Fruit Bats) and *Palola viridis* (Palolo Worms): A rhythm of about 1 lunar (= synodic) period of 29.5 days (McFarland 1985, 303). *syn.* circamonthly rhythm (Lincoln et al. 1985)
- tidal rhythm** *n.* In many marine animals: A rhythm of about 15 days (half a lunar cycle) (McFarland 1985, 303).
- ultradian rhythm** *n.* A rhythm that slightly exceeds 24 hours (Lincoln et al. 1985). *cf.* rhythm: circadian rhythm, infradian rhythm
- ◆ **rhythmicity** See rhythm.
- ◆ **RI line** See recombinant-inbred line.
- ◆ **ribonucleic acid** See nucleic acid: ribonucleic acid.
- ◆ **ribosome** *n.* In eukaryotes and prokaryotes: An intracellular structure that facilitates the specific coupling of tRNA anticodons with mRNA codons during protein synthesis (Campbell 1996, 308).

Comments: A ribosome is made up of a large subunit and a small subunit (Campbell 1996, 308–309). Each subunit is an aggregate of numerous proteins and rRNA.

- ◆ **richness** See ²group: richness; species richness.
- ◆ **Ricker Mount, Ricker Specimen Mount** *n.* A shallow, glass-covered, or plastic-covered, box that contains cotton, or polyethylene fiber, used to hold biological specimens for display and study [after Clarence B. Ricker a businessman from New Jersey, U.S., who invented this mount to protect his butterfly specimens in about 1900 (Ehler 1999, 10)].
- Comments:* Museums hold biological specimens in many kinds of containers including drawers of the styles of Cornell University and the National Museum of Natural History (e.g., pinned and other arthropods) cabinets, jars of preservative (e.g., arthropods, fishes, or snakes), and open boxes (e.g., fossils, minerals, or rocks).
- ◆ **Ridge-and-Valley Province** See geological province: Ridge-and-Valley Province.
- ◆ **ridiculing** See mocking.
- ◆ **ring angel** See angel: ring angel.
- ◆ **ring species** See ²species: ring species.
- ◆ **riparian** *adj.* Referring to, living, or situated on, river, or stream, banks (Lincoln et al. 1985).
syn. riparial, riparious
- ◆ **riparian ecosystem** See ¹system: ecosystem: riparian ecosystem.
- ◆ **riparious** See riparian.
- ◆ **ripicole, ripicolous** See -cole: ripicole.
- ◆ **risk** *n.*
 1. A cost that involves a context in which a focal organism could suffer bodily harm (Wittenberger 1981, 621). See cost.
 2. Food variance when food rewards are normally distributed (Stephens and Paton 1986, 1659).
cf. cost
- ◆ **risk-averse preference** *n.* A foraging animal's preference for a constant reward rather than a varying one (Stephens and Paton 1986, 1659).
- ◆ **risk-prone** *n.* For example, in *Perisoreus canadensis* (Gray Jays): A foraging individual's preference for a varying reward rather than a constant one (Stephens and Paton 1986, 1659; Ha et al. 1990, 91).
syn. risk-loving, risk-preferring preference
- ◆ **risk-sensitive foraging behavior** See foraging: risk-sensitive foraging behavior.
- ◆ **ritual** *n.*
 1. A person's prescribed form, or method, for performing a religious, or other devotional service (Oxford English Dictionary 1972, entries from 1649).
 2. Human ritual observances; ceremonial acts (Oxford English Dictionary 1972, entries from 1656).
 3. An animal's symbolic behavior that results from ritualization (*q.v.*) (Huxley 1923 and Tinbergen 1952 in McFarland 1985, 392–393).
See behavior: ritualized behavior.
syn. symbolic action (Heymer 1977, 170)
- ◆ **challenge ritual** *n.*
 1. In *Connochaetes taurinus* (Blue Wildebeests): A male's making the rounds to all of his territorial neighbors and making a territorial advertisement display to each (Estes 1969 in Wilson 1975, 491).
 2. In *Damaliscus dorcus* (Bontebok): A territorial maintenance behavior comprised of at least 30 elements (David 1973 in Heymer 1977, 86).
- ◆ **ritualization** *n.*

1. The evolutionary process by which a behavior changes and becomes a display, or signal, used in communication, or at least becomes increasingly effective as a signal (Wilson 1975, 224–230, 594; Immelmann and Beer 1989, 255).

2. A nondisplay behavior's evolutionary transformation into a display behavior, exclusive of the process involved (Immelmann and Beer 1989, 255).

cf. behavior: ritualized behavior, emancipation, ritual, typical intensity

Comment: Many kinds of behaviors have become ritualized including chemical production, excretion, flight, food exchange, predation, respiration, and secretion (Huxley 1914, 1923, 1966 in Heymer 1977, 148; Wilson 1975, 224–230, 594; Immelmann and Beer 1989, 255).

ontogenetic ritualization *n.* Rigidly stereotyped behavior's arising from highly variable behavior of young animals, e.g., a definitive song's arising from subsong (Immelmann and Beer 1989, 256).

◆ **ritualized behavior, ritualized response** See behavior: ritualized behavior.

◆ **ritualized display** See display: ritualized display.

◆ **ritualized fight** See fight: ritualized fight.

◆ **ritualized grooming** See grooming: ritualized grooming.

◆ **riverain** *adj.* Referring to a river bank or the general vicinity of a river (Lincoln et al. 1985).

◆ **riverine** *adj.*

1. Referring to a river (Lincoln et al. 1985).
2. Formed by river action (Lincoln et al. 1985).

◆ **r-K spectrum** *n.* A linear continuum of reproductive and life-history strategies with r-selected species at one extreme and K-selected species at the other (Lincoln et al. 1985).

◆ **r_m , r_{max}** See rate: r_m , r_{max} .

◆ **RNA** See nucleic acid: ribonucleic acid.

◆ **RNAi, RNA interference** See method: RNA interference; post-translational gene silencing.

◆ **RNA world** See world: RNA world.

◆ **RNA-world hypothesis** See hypothesis: RNA-world hypothesis.

◆ **robber** *n.*

1. A person who practices, or commits, robbery; a depredator; plunderer; despoiler (Oxford English Dictionary 1972, entries from *ca.* 1175).

2. In some bee, other insect, and anthophilous-bird species: An individual that makes holes in a flower corolla through which it takes nectar, pollen, or both (Barrows 1976c, 132; Inouye 1980).

syn. flower perforator, thief (Faegri and van der Pijl 1979, 68, 190), nectar robber (Buchmann and Nabhan 1996, 250)

cf. dysteleology, thief

Notes: Barrows (1976c) categorizes robbers as “nectar-foraging robbers,” “nectar-foraging-perforating robbers,” and “pollen-foraging robbers.” Inouye (1980) further clarifies terminology related to “flower robbers.”

3. In some bee species: An individual that takes provisions of another heterospecific, or conspecific, individual (Michener 1974, 230–232; Winston 1987, 115–116).

syn. cleptoparasite, kleptoparasite (Wilson 1975, 580)

4. In *Chroicocephalus ridibundus* (Black-headed Gulls): An individual that takes the food of a heterospecific (e.g., egret, Godwit, or Stilt) individual (Amat 1990, 70).

syn. kleptoparasite, pirate (Amat 1990, 70)

v.i., v.t. rob

cf. egg robbing; parasitism: social parasitism: trophic parasitism: cleptoparasitism

♦ **robustness** *n.* A statistical method's ability to produce a fair result, despite data deviations from the premises upon which the method is based (Lincoln et al. 1985).

♦ **rock** *n.*

1. In geology, the consolidated material that forms the essential part of the Earth's crust, consisting principally of minerals in various states of aggregation and classified according to its mode of formation, as igneous, metamorphic, or sedimentary (Michaelis 1963).

2. A piece of rock (def. 1).

Comment: Igneous rocks include Basalt, Granite, Lava, Obsidian, and Tuff; metamorphic rocks, Gneiss, Marble, Quartzite, and Slate; sedimentary, Conglomerate, Breccia, Limestone, Sandstone, and Shale. There are scores of kinds of rocks, and I define a few of them below.

[Old French *roque, roche*; ultimate origin uncertain]

Acasta Gneiss *n.* Tunalitic Gneiss (from the Northwest Territories, Canada) that is 3.96 Ga old (exhibit, U.S. Museum of Natural History, 2002).

Comment: This Gneiss is the oldest known Earth rock (exhibit, U.S. Museum of Natural History, 2002). There is no geologic record on Earth that is older than this rock.

Gneiss *n.*

1. A coarse-grained, banded metamorphic rock that consists essentially of the same components as granite, but unlike granite has a foliated arrangement of its minerals (Michaelis 1963).

2. Any of a number of highly metamorphosed, banded rocks that contain Feldspar (Michaelis 1963).

[German *gneiss*]

Granite *n.* A hard, coarse-grained, igneous rock composed mostly of Feldspar, Mica, and Quartz (Michaelis 1963).

[Italian, *granito*, originally a past participle of *granire*, to make seeds < Latin *granum*]

Jade *n.* A gemstone that is either the metamorphic rock nephrite or the rarer metamorphic rock jadeite (Michaelis 1963; exhibit, U.S. Museum of Natural History, 2002).

Comments: Jade forms only along faults deep within active subduction zones of drifting continents (exhibit, U.S. Museum of Natural History, 2002). Chromium gives it its brilliant green color and manganese gives it its mauve through lilac colors. White Jade has no elemental impurities.

[French *jade*, variety of *ejade* < Spanish *piedra de ijada*, stone of the side, after the belief that Jade cures pain in a Human's side]

♦ **rock-scissors-paper game** See game (table).

♦ **rocky coast** See habitat: coast: rocky coast.

♦ **rodent run** See display: distraction display.

♦ **rogue** *v.t.* To remove rogues (undesirable weeds, diseased plants, or genetic variants) from a population (Lincoln et al. 1985).

See ²mutation: macromutation.

♦ **role** *n.*

1. For example, in social-mammal species: A pattern of behavior displayed by certain members of a society, consisting of communication, activities that influence other individuals directly, indirectly, or both (Wilson 1975, 298, 594).

Note: The same animal can have more than one role (Wilson 1975, 298, 594).

2. In anthropology, the combination of rights and duties imposed on the incumbents of certain positions within a society (Hinde 1982, 282).

cf. institution

direct role *n.* A society subgroups' behavior, or set of behaviors, that benefits other subgroups and, therefore, its society as a whole (Wilson 1975, 309).

indirect role *n.* A society subgroup's behavior that benefits only it, and is neutral, or even destructive, to other subgroups (Wilson 1975, 310).

♦ **Rolligkeit** See estrus: *Rolligkeit*.

♦ **romantic scientist** See scientist: romantic scientist.

♦ **rookery** See ²group: rookery.

♦ **roost** See ²group: roost.

♦ **root zone** See -sphere: rhizosphere.

♦ **rooted-phylogenetic tree** See -gram: rooted-phylogenetic tree.

♦ **rootless-phylogenetic tree** See -gram: rootless-phylogenetic tree.

♦ **rooting reflex** See reflex: rooting reflex.

♦ **Ropartz effect** See effect: Ropartz effect.

♦ **Rosa's theory of hologenesis** See ²evolution: hologenesis.

♦ **round dance** See dance: bee dance: round dance.

♦ **rout, route** See ²group: rout.

♦ **Roux-Weismann theory** See ²theory: germ-plasm theory.

♦ **royal cell** *n.*

1. In *Apis mellifera* (Western Honey Bees): A large, pitted, waxen cell constructed by the workers that is used for rearing an immature queen (Wilson 1975, 594).

2. In some termite species: A special cell in which a queen lives (Wilson 1975, 594).

♦ **royal jelly** *n.* In *Apis mellifera* (Western Honey Bees): A material, supplied by workers to female larvae in royal cells, that is necessary for the larvae's transformation into queens (Wilson 1975, 594).

Comment: Royal jelly is secreted primarily by a worker's hypopharyngeal gland and consists of a rich mixture of nutrient substances, many with complex chemical structures (Wilson 1975, 594).

♦ **royal substance** See substance: royal substance.

♦ **rose diagram** See graph: rose diagram.

♦ **Rossigkeit** See estrus, *Rossigkeit*.

♦ **ROTAP** See ²species: Rare or Threatened Australian Plant.

♦ **rRNA** See nucleic acid: ribonucleic acid: rRNA.

♦ **rpr** See mutation: reaper.

♦ **r-selected species** See ²species: r-selected species.

♦ **r selection, r selection** See selection: r selection.

♦ **r strategist, R-strategist** See ²species: r strategist.

♦ **r strategy** See strategy: r strategy.

♦ **rubicole** See -cole: rubicole.

♦ **ruderal** *n.*

1. A plant that grows on, or among, stone rubbish; a plant that is characteristic of rubbish heaps (Oxford English Dictionary 1972, entries from 1858).

2. A plant, or other organism, that inhabits an area of rubbish, debris, or disturbance (Lincoln et al. 1985).

See ²species: r-selected species.

cf. 1-phile: chledophile

adj. ruderal

[Latin *rūdēra*, broken stone]

♦ **rudimentary character** See character: rudimentary character.

♦ **ruffling** See behavior: feather ruffling.

♦ **rugophile, rugophily, rugophilic** See 1-phile: rugophile.

♦ **rule** *n.*

1. A principle that regulates a procedure, or method, necessary to be observed in the pursuit, or study, of some art or science (Oxford English Dictionary 1972, entries from 1387).
2. A standard of discrimination or estimation; a criterion, test, canon (Oxford English Dictionary 1972, entries from 1382).
3. A fact (or the statement of one) that is usually true; that is normally the case (Oxford English Dictionary 1972, entries from 1300); a statement that is a biological generality with some exception; contrasted with law (Mayr 1982, 37–45).

syn. concept, generalization, principle (Mayr 1982, 37–45)

cf. axiom, effect, doctrine, dogma, hypothesis, law, principle, theorem, ²theory, truism

[Old French *reule* < Latin *regula*, ruler, rule < *regere*, to lead straight, direct]

Comment: The following entries contain terms with “rule” in them; the same definition of “rule” does not relate to all of them.

Allen's rule *n.*

1. Certain species and other taxa show an “enlargement of peripheral parts under high temperature or toward the Tropics; hence southward in North America;” these parts include mammal ears, feet, horns, and pelage and bird bills, claws, and tails (Allen 1877 in Allen 1906, 382; Scholander 1955, 174).

Note: Allen (1906, 382) indicates that this rule holds only for certain taxa; Scholander (1955, 174) concludes that it is not well supported overall by data. Emlen 1973, 59) states that Allen's rule holds for some mammal groups when Arctic and temperate regions are compared, but not when temperate and tropical regions are compared.

2. Extremities in Arctic mammal species tend to be shorter than mammal species in warmer regions (Emlen 1973, 59).

syn. Allen's law, proportion rule (Lincoln et al. 1985)

cf. rule: Bergmann's rule, ecogeographical rule.

[after J. A. Allen, biologist]

Aschoff's rule *n.* The direction and rate of an organism's drift from a precise 24-hr cycle under experimental conditions is a function of the light intensity and of whether the organism is normally diurnal or nocturnal (Dewsbury 1978, 66).

Comment: This useful rule has exceptions (Dewsbury 1978, 66).

Bergmann's rule *n.*

1. Within a species, or among closely related species, individuals tend to be smaller in warmer environments than in colder ones (Bergmann 1847 in Scholander 1955, 174; Allen 1906, 379; Lindsey 1966, 456).

2. Species of homeothermic vertebrates tend to be smaller in warmer environments than in colder ones (Emlen 1973, 59).

3. Geographically variable species of homeothermic vertebrates are generally represented by larger forms in the colder parts of their ranges than in the warmer parts of their ranges (Lincoln et al. 1985).

syn. Bergmann's law (Emlen 1973, 59); size rule (Lincoln et al. 1985)

cf. law: Allen's law

Comments: Some biologists consider Bergmann's rule to be an empirical generalization without a physiological basis (Lindsey 1966, 456), while others suggest that size increase is due to selection for a smaller surface-to-volume ratio which minimizes heat loss (Emlen 1973, 59). Within some homeotherm species, Bergmann's rule may hold because there appears to be a positive correlation between large size and higher latitude (Lindsey 1966, 463). However, among homeotherm species, Bergmann's rule is not well supported by data (Scholander 1955, 174). In a study of 12,503 poikilotherm species, Lindsey (1966, 464) found that the proportion of species with large adult size tends to increase from the equator towards the poles in Fish and Amphibians. This trend holds for freshwater fish, deep-sea fish, Anurans, Urodeles, and marine neritic fish, arranged roughly in order of decreasing clarity of this trend. In general this rule applies not only within these groups of families but also within families. In Reptiles, this rule holds weakly among Snakes but not among Lizards or non-marine turtles.

[after C. Bergmann]

climatic rule See rule: ecogeographical rule.

decision rule *n.* An animal's response to conspecifics based on their possession of stimuli that identify them as kin or nonkin (Wilson 1987, 10).

Dzierzon's rule, Dzierzon's theory *n.* Drones of *Apis mellifera* (Western Honey Bees) arise from unfertilized eggs and are thus haploid (Dzierzon 1945, 113).

syn. arrhenotoky (Lincoln et al. 1985)

cf. parthenogenesis

Comment: “Dzierzon's rule” probably applies to all Hymenoptera that produce males; some hymenopteran species also sometimes produce diploid males.

[after the beekeeper and Catholic priest Johann Dzierzon who proposed this idea (Mayr 1982, 661)]

ecogeographical rule *n.* Any generalization that describes a trend of geographical variation correlated with environmental conditions (Lincoln et al. 1985).

syn. climatic rule (Lincoln et al. 1985)

cf. law: Glöger's law, Hopkin's bioclimatic law, Rensch's laws; rule: Allen's rule, Bergmann's rule, Hesse's rule

ecological-efficiency rule *n.* Approximately 10% of the biomass of one trophic level is transformed into biomass of organisms in an adjacent trophic level that eat members of the former (Wilson 1975, 267).

Emery's rule *n.* “Species of social parasites are very similar to their host species and therefore presumably closely related to them phylogenetically” (Emery 1909 in Wilson 1975, 372, 583).

energetic-equivalence rule *n.* The rule that large animals have predictably lower population densities than small ones (Mohr 1940 and Damuth 1981 in Cotgreave 1993, 244).

Comment: Recent work shows that this rule is rarely true at the scale of local communities (Cotgreave 1993, 244).

Haldane's rule See law: Haldane's law.

Hamilton's rule *n.*

1. A rule that indicates when an individual should be altruistic to its kin; expressed as $k > 1/r$; k = the benefit in fitness gain to the altruist's genes due to the altruist's helping its relative; $k = b/c$; b = benefit to the relative; c = cost to the helper; $1 = 1.0$; and r = the fraction of genes that an altruist and the rela-

tive it helps have in common due to descent from the same ancestor (Hamilton 1963).

Note: Hamilton's rule is often written as $k(r) > 1$. An extreme hypothetical example of altruism is a person's sacrificing his life to save drowning full siblings only if he can save more than two of them. This is because for full siblings, mean $r = 1/2$; k should be more than two full siblings (Brown 1975, 203).

2. Animals are selected to perform actions for which $rb - c > 0$, where r is the coefficient of relationship between an altruist and beneficiary, b is the benefit to the altruist in indirect fitness, *q.v.*, and c is the cost to the altruist in direct fitness, *q.v.* (Grafen 1984, 69).

Note: Grafen (1984, 70) explains why the above form of the rule is preferable to other forms such as $b/c > 1/r$; Brown (1987) discusses this subject further.

[Grafen (1982) coined this term as "Hamilton's rule."]

heart-weight rule See law: Hesse's rule.

Hebb's rule *n.* Learning and memory are based on modifications of synaptic strength among neurons that are simultaneously active (Hebb 1949 in Tang et al. 1999, 63).

Hesse's rule, "heart-weight rule" *n.* In some mammal species: The ratio of body weight to heart weight is larger in populations found in cold regions compared with those in warmer regions due to individual's maintaining a greater temperature differential between their bodies and environments in colder regions (Lincoln et al. 1985).

pigmentation rule See law: Gloger's rule.

proportion rule See rule: Allen's rule.

size rule See rule: Bergmann's rule.

Watson's rule See principle: principle of mosaic evolution.

wing rule See law: Rensch's rule.

♦ **run-scratching** See scratching: run-scratching.

♦ **runaway hypothesis of female choice** See hypothesis: hypotheses of female choice: runaway hypothesis of female choice.

♦ **runaway-sexual selection** See selection: runaway-sexual selection.

♦ **running on the spot** *n.* In some lizard species: In dominance fighting, a loser's lying flat on the ground and making running movements with its legs without their touching the ground (Kitzler 1942 in Heymer 1977, 177).

syn. treading (Heymer 1977, 177)

♦ **rupestral** *adj.*

1. Referring to walls or rocks (Lincoln et al. 1985).
2. Referring to an organism's living on walls or rocks (Lincoln et al. 1985).

syn. mural, rupestrine (Lincoln et al. 1985)

♦ **rupestrine** See rupestral.

♦ **rupicole** See -cole: rupicole.

♦ **rut** *n.*

1. For example, in Deer, Goats, and Sheep: Annual, or periodic, sexual excitement (Oxford English Dictionary 1972, entries from 1410; Immelmann and Beer 1989, 257).

syn. estrus, heat (Immelmann and Beer 1989, 257)

2. A period during which rut occurs (Michaelis 1963).
3. The roaring, or uproar, made by an animal in rut (Michaelis 1963).

Note: "Rut" is sometimes synonymized with "courtship" in male mammals with the connotation of physiological readiness for mating (Immelmann and Beer 1989, 62).

cf. behavior: rutting behavior, courtship, estrus, foreplay [Middle French < Latin *rugitus*, bellowing < *rugire*, to roar]

♦ **rutting behavior** See behavior: rutting behavior.

♦ **RV** See value: reproductive value.

♦ **r value** See rate: *r* value.

♦ **ryoprophage, ryophage, ryophagy, ryophagous, ryoprophagous** See -phage: ryoprophage.

S

- ♦ **s** See standard deviation.
- ♦ **s** See coefficient: selection coefficient.
- ♦ **S** See prediction equation.
- ♦ **sabulicole** See -cole: sabulicole.
- ♦ **saccharide** See molecule: -saccharide.
- ♦ **sadness** See facial expression: sadness.
- ♦ **safe** See ²group: safe.
- ♦ **salamandrin** See toxin: salamandrin.
- ♦ **saliva spreading** See behavior: saliva spreading.
- ♦ **salsugine** *n.*
 1. An organism that lives in habitats inundated by salt, or brackish, water (Lincoln et al. 1985).
 2. *adj.* Referring to a salsugine or its habitat (Lincoln et al. 1985).

cf. -cole: halicole
- ♦ **“salt hypothesis”** See hypothesis: hypotheses regarding the Permian mass extinction: “salt hypothesis.”
- ♦ **salt marsh** See habitat: marsh: salt marsh.
- ♦ **saltant** *n.* An organism that exhibits a saltation, *q.v.* (Lincoln et al. 1985).
- ♦ **¹saltation** *n.*
 1. A drastic and sudden mutational change (Lincoln et al. 1985).
 2. “An abrupt evolutionary change” (Lincoln et al. 1985).

See speciation: saltatorial speciation.
cf. ²evolution: macroevolution; mutant
- ♦ **²saltation** *n.* An animal’s movement by leaping or bounding (Lincoln et al. 1985).
adj. saltatorial, saltatory
- ♦ **saltatorial** See -orial: saltatorial.
- ♦ **saltatorial evolution** See ²evolution: saltatorial evolution.
- ♦ **saltatorial speciation** See speciation: saltatorial speciation.
- ♦ **saltigrade** See -grade: saltigrade.
- ♦ **samesense mutation** See ²mutation: samesense mutation.
- ♦ **sample** *n.*
 1. A subset of a population (Lincoln et al. 1985).
 2. A representative part of a larger unit used to study the properties of a whole unit (Lincoln et al. 1985).

cf. sample: sample of observations
- ♦ **haphazard sample** *n.* A sample taken on some arbitrary basis, generally convenience (*e.g.*, samples taken before lunch and after supper, or when the study animals are thought to be most active) (Lehner 1979, 111).
cf. sample: random sample

Comment: A haphazard sample is assumed to approximate a random one in certain studies (C. K. Starr, pers. comm.), but it is not a random sample.

observability sample *n.* A census of the number of individuals that are visible to an observer during a regularly scheduled sampling period (Lehner 1979, 114).

random sample *n.*

1. An item drawn from a population in such a way that all possible items each have the same probability of being selected (Lehner 1979, 111).
2. A set of random samples (Lincoln et al. 1985).

cf. sample: haphazard sample

Comments: Random, independent samples are required by many statistical tests. “Random sample” is often mistakenly used to mean “haphazard sample,” *q.v.* (C. K. Starr, pers. comm.). In some studies, researchers report that they analyzed haphazard samples with statistical tests and let the readers assess the importance of the violation from randomness in the analysis (pers. obs.).

representative sample *n.* A subset of a population that is typical of the population as a whole (Lincoln et al. 1985).

sample of observations *n.* “A collection of individual observations selected by a specified procedure” (Sokal and Rohlf 1969, 8).

cf. observation, variable

♦ **sample mean** See mean.

♦ **sample size (N, n, N, n)** *n*

1. The total number of independent, random data used in a statistical test (Siegel 1956, xvi).
2. The number of observations in a data set (Lincoln et al. 1985).

syn. number of replicates (Lincoln et al. 1985)

Comment: “Sample size” is more often used in connection with experiments, and “number of replicates” is more often used in connection with surveys (Chew 1984, 2).

♦ **sample variance** See variance: sample variance.

♦ **sampling** *n.* Taking a sample, *q.v.* (Lincoln et al. 1985).

oversampling *n.* One’s taking a scientific sample(s) of an organism that is large enough to lower its population size and interfere with its future sampling (inferred from Perry 1995, 27).

♦ **sampling error** See error: sampling error.

♦ **sampling technique** *n.* A procedure used to obtain data.

ad libitum sampling *n.* A sampling technique in which one employs no restraints in sampling behavior; in using this technique, one usually records the more easily observed behaviors (Altmann 1974 in Lehner 1979, 113).

all-occurrences sampling *n.* A sampling technique that attempts to record as many acts of a specified type of behavior as possible during a specified sampling period (Lehner 1979, 117).

syn. event-sampling (Hutt and Hutt 1974 in Lehner 1979, 117), complete record (Slater 1978 in Lehner 1979, 117)

Comment: A “sociometric matrix” can be considered to be a type of “all-occurrences sampling” (Lehner 1979, 115).

focal-animal sampling *n.*

1. A sampling technique in which an observer focuses on an individual animal, pair, or small group of animals, during a sampling period; this focal “group” receives the investigator’s highest priority in recording behavior, but behavior of other interacting animals may be recorded as well (Lehner 1979, 116).

2. A sampling technique in which an observer focuses on only one animal in a group and its possible interactions with other group members (Immelmann and Beer 1989, 108).

instantaneous sampling *n.* A special type of one-zero sampling in which an observer scores an animal’s behavior at predetermined points in time (Lehner 1979, 122).

syn. on-the-dot sampling (Slater 1978 in Lehner 1979, 123), point sampling (Dunbar 1976 in Lehner 1979, 123), time-sampling (Hutt and Hutt 1974 in Lehner 1979, 122)

one-zero sampling *n.* A sampling technique in which an observer scores the occurrence of a particular behavior as “1” and its nonoccurrence as a “0” during a short sampling period (Lehner 1979, 121).

syn. time-sampling (Hutt and Hutt 1974 in Lehner 1979, 121), the Hansen system (Fienberg 1972 in Lehner 1979, 121)

scan sampling *n.* A type of instantaneous sampling in which a researcher views several animals at predetermined points in time and scores their behavior states (Lehner 1979, 123).

sequence sampling *n.* A sampling technique that focuses on chains of behavior performed by a single animal or a dyad (Lehner 1979, 118–121).

♦ **sandbathing** *n.* For example, in *Dipodomys spectabilis* (Banner-tailed Kangaroo-rats): An individual’s flexing and extending its body and sliding forward on its sides and ventrum which scent marks its territory (Randall 1987, 426).

♦ **sanguicole** See -cole: sanguicole.

♦ **sanguinivore** See -vore: sanguinivore.

♦ **sansourire** See habitat: mudflat: marisma.

♦ **sapling** *n.* A young tree that arises from a seed or sucker and that is not yet a pole (*i.e.*, a single-trunked tree smaller in girth than a mature tree of its kind) or of useful or timber size (Allaby 1994, 343).

cf. seedling

♦ **saprium** See ²community: saprium.

♦ **sapro-** *comb.f.*

1. “Decomposition or putrefaction” (Michaelis 1963).
2. “Saprophytic” (Michaelis 1963).

[Greek *sapros*, rotten]

♦ **saprobe** *n.*

1. A saprophytic organism (Lincoln et al. 1985).

2. An organism that thrives in water rich in organic matter (Lincoln et al. 1985).

cf. -cole: cadavericole

♦ **saprobiot** See biont: saprobiot.

♦ **saprogenic** See -genic: saprogenic.

♦ **sapromyophile, sapromyophile** See ²-phile: sapromyophile.

♦ **sapromyophile** See ¹-phile: sapromyophile; ²-phile: sapromyophile.

♦ **saprophage** See -biонт: saprobiot.

♦ **saprophile** See ¹-phile: saprophile.

♦ **saprophytophage** See -phage: saprophytophage.

♦ **saproplankton** See plankton: saproplankton.

♦ **saprotoph** See -troph: saprotoph.

♦ **saproxylic** *n.* Referring to an organism that consumes dead wood (xylem) (inferred from New 2009, 33).

♦ **saproxylobios** See -bios: saproxylobios.

♦ **saprozoic, saprozoite** See -zoite: saprozoite.

♦ **sarco-, sarc-** *comb.f.* Flesh; of, or related to, flesh (Michaelis 1963).

[Greek *sarx*, *sarkos*, flesh]

♦ **sarcode** See protoplasm.

♦ **sarcophage, sarcophagous, sarcophagy** See -phage: sarcophage.

♦ **satellite** *n.*

1. A smaller body that accompanies and revolves around a larger one, *e.g.*, a moon (Michaelis 1963).

2. An artificial object made to orbit a celestial body (*e.g.*, the COBE, *q.v.*) (Morris 1982).

Comments: In 2010, many human-made satellites circled the Earth including communication satellites, a space station, and telescopes.

Cosmic Background Explorer (COBE), Explorer 66, 20322 *n.* A satellite launched by the U.S. in 1989 with the mission of taking precise measurements of the diffuse radiation from 1 μm through 1 cm over the whole celestial sphere (<http://nssdc.gsfc.nasa.gov/cgi-bin/database/www-nmc?89-089A>, 2000).

Comments: The COBE measured the spectrum of the 3°K radiation over the range 100 μm through 1 cm, the anisotropy of this radiation from 3 through 10 mm, and the spectrum and angular distribution of diffuse infrared background radiation at wavelengths from 1 through 300 μ (<http://nssdc.gsfc.nasa.gov/cgi-bin/database/www-nmc?89-089A>, 2000). The COBE stopped taking measurements in 1993, and continued to orbit the Earth from 1993 through 2000.

♦ **satellite DNA** See nucleic acid: deoxyribonucleic acid: satellite DNA.

♦ **satellite male** See male: incidental.

♦ **sathrophile, sathrophilous, sathrophily** See ¹-phile: sathrophile.

♦ **satisfice** *v.i.* Humans’ inventing rules of thumb to find solutions that are good enough if not perfect (Simon in Tierney 1983).

♦ **saturation dispersal** See dispersal: saturation dispersal.

♦ **saturation level** See saturation point.

♦ **saturation mutagenesis** See mutagenesis: saturation mutagenesis.

♦ **saturation point** *n.* The maximum wild density of grown individuals attained by a species (Leopold 1933 in Pulliam and Haddad 1994, 141).

syn. saturation level, saturation density (Pulliam and Haddad 1994, 141–142)

cf. carrying capacity

Comment: The saturation point of the Bobwhite Quail is about one bird per acre (Pulliam and Haddad 1994,

- 141). According to Leopold (1933) the saturation point is species specific and does not vary from place to place; however, the species' carrying capacity is habitat dependent.
- ♦ **saturation-presaturation-dispersal hypothesis** See hypothesis: saturation-presaturation-dispersal hypothesis.
- ♦ **saturation screen** *n.* A *Drosophila* genome that has been loaded with mutations by a researcher (Campbell et al. 1999, 399–400).
- ♦ **saurischian pelvis** See pelvis: saurichian pelvis.
- ♦ **saurochore, saurochorous, saurochory** See -chore: saurochore.
- ♦ **saurophile, saurophilous, saurophily** See 1-phile: saurophile.
- ♦ **savanna** See habitat: savanna.
- ♦ **savings** *n.* The amount of material that a subject retains after a rest period after it has mastered a specific task (Storz 1973, 241).
syn. relearning (Storz 1973, 241)
- ♦ **sawt** See ²group: sawt.
- ♦ **saxatile** *adj.* Referring to an organism that lives, or grows, among rocks (Lincoln et al. 1985).
cf. -cole: saxicole
- ♦ **saxicole, saxicoline, saxicolous** See -cole: saxicole.
- ♦ **saxifrage, saxifragous** *n.* An organism that lives in rock crevices (Lincoln et al. 1985).
adj. saxifragous
- ♦ **saxigenous** See -cole: saxicole.
- ♦ **scala naturae** *n.* The continuum from the least perfect atom of matter up through "the most perfect organism — *Homo sapiens*" (Mayr 1982, 201, 242, 305).
syn. chain of being; ladder of nature (Lincoln et al. 1985); phylogenetic scale; The Great Chain of Being (Mayr 1982, 305), scale of nature (Strickberger 2000, 7, illustration)
Comments: Aristotle promoted the *scala naturae*: "Nature passes from inanimate objects through plants to animals in an unbroken sequence." (Mayr 1982, 201, 242, 305; Dawkins 1992, 263). Although Cuvier thoroughly discredited this concept in the beginning of the 19th century, it has remained remarkably persistent, even in much biological writing.
- ♦ **scalar** *adj.* Referring to something completely described by a single number (Lincoln et al. 1985).
- ♦ **scales of measurement** *n.* The various levels of resolution (or precision) of measurement.
- interval scale** *n.* Measurements having attributes of those on an ordinal scale and in addition, known differences between measurements (Lehner 1979, 109–110).
- nominal scale** *n.* Measurement in which observations are classified into predetermined mutually exclusive, qualitatively different categories, *e.g.*, behaviors A, B, and C (Lehner 1979, 109).
- ordinal scale** *n.* Measurement in which observations are classified into predetermined mutually exclusive, qualitatively different categories, *e.g.*, behaviors A, B, and C, and the categories are quantitatively ordered with respect to each other, *e.g.*, behavior A > B > C (Lehner 1979, 109).
- ratio scale** *n.* Measurements having the same characteristics as those on an interval scale, and in addition, a known zero point is known (Lehner 1979, 110).
- ♦ **scamming** See behavior: mashing.
- ♦ **scan sampling** See sampling technique: scan sampling.
- ♦ **scansorial, scandent** See -orial: scansorial.
- ♦ **scarfskin** See cuticle.
- ♦ **scarification** See method: scarification.
- ♦ **scat** *n.* A fecal dropping (Lincoln et al. 1985).
Comment: One g of feces can contain several million host cells (Levy 1999, 5). A researcher can use DNA from these cells to study the host's population biology.
- ♦ **scato-, skato-** *comb. f.* Referring to dung or feces (Brown 1956).
[Greek *skor, skatos*, dung]
- ♦ **scatology** See study of: scatology.
- ♦ **scatophage, scatophagous, scatophagy** See -phage: scatophage.
- ♦ **scatter diagram, scatter plot** See graph: scatter plot.
- ♦ **scatter hoarding** See hoarding: food hoarding: scatter hoarding.
- ♦ **scavenger** *n.* An organism that feeds on carrion or organic refuse (Lincoln et al. 1985).
cf. 1-phile: saprophile, sathrophile
- ♦ **scenopoetic axes** *n. pl.* Axes that relate to resources, such as light, temperature, and humidity, which have upper and lower tolerance values for a species (niche breadth), but do not involve competitive interactions with neighboring species in the context of a multi-dimensional hyperspace (= niche) (Lincoln et al. 1985).
cf. bionomic axes
- ♦ **scent mark, scent post** *n.* For example, in many insect and mammal species, including Ants, some bee species, Canids, Felids, Rodents, and Ungulates: A place where an individual deposited a communicatory odor; *e.g.*, a pheromone, allomone, or acquired smell (Wilson 1975, 187).
v.t. mark, scent mark
cf. behavior: marking behavior; drumming: marking drumming
- ♦ **scent marking** See behavior: marking behavior.
- ♦ **scent post** See scent mark.
- ♦ **Schankler-immigration event** *n.* A sudden replacement of a parent species by its immigrant daughter species as indicated in the fossil record (Bakker 1985, 75).
cf. ²evolution: Lizzie-Borden evolution
[coined by Bakker (1985) after work of D. Schankler]
- ♦ **schizoendemic** See ¹endemic: schizoendemic.
- ♦ **schizogamy** See -gamy: schizogamy.
- ♦ **schizogenesis** See -genesis: schizogenesis.
- ♦ **schizogony, schizont** See parthenogenesis: fission: schizogony.
- ♦ **Scholasticism, scholasticism** *n.*
1. The doctrines of the Schoolmen; the predominant theological and philosophical teaching during A.D. 1000 to 1500 based upon the authority of Christian fathers and Aristotle and his commentators (Oxford English Dictionary 1972, entries from 1756).
 2. A philosophical view that promoted determining the truth by logic, not by observation or experiment; two scholastic schools of thought are realism and nominalism, *q.v.* (Mayr 1982, 92).
- ♦ **school** See ²group: school.
- ♦ **school psychology** See study of: psychology: school psychology.
- ♦ **Schreckstoff, Schreckstoffe** See chemical-releasing stimulus: semiochemical: pheromone: alarm pheromone.

♦ **Schwerdtfeger's law of compensation and moderation** See law: Schwerdtfeger's law of compensation and moderation.

♦ **Schwirrlauf** See dance: bee dance: buzzing run.

♦ **¹science** *n.*

1. "Knowledge acquired by study; acquaintance, mastery, of any department of learning" (Oxford English Dictionary 1972, entries from 1289).
2. The state, or fact, of knowing; knowledge, or cognizance, of something specified or implied; "also with wider, reference, knowledge" (more or less extensive) as a personal attribute (Oxford English Dictionary 1972, entries from *ca.* 1340); systematic knowledge in general (Michaelis 1963).
3. "The kind of knowledge, of intellectual activity, of which the various 'sciences' are examples" (Oxford English Dictionary 1972, entries from 1387).
4. Any department of knowledge in which the results of investigation have been logically arranged and systematized in the form of hypotheses and general laws subject to verification" (Michaelis 1963).
5. "Knowledge of facts, phenomena, laws, and proximate causes, gained and verified by exact observation, organized experiment, and ordered thinking" (Michaelis 1963).

Note: This definition seems appropriate for wide use when one means "science" as it is often used today. For biology, it seems appropriate to substitute "concepts" for "laws" in this definition.

6. An orderly presentation of facts, reasonings, doctrines, and beliefs concerning some subject or group of subjects: the science of theology (Michaelis 1963).
7. "Systematic knowledge in general" (Michaelis 1963).
8. "A self-correcting method of seeking the truth" (Alexander 1987, 201).

See study of: science.

cf. doctrine; law; principle; study of: philosophy: natural philosophy

Comment: Science is predictive when enough is known about a particular subject (Diamond 1987).

[Old French < Latin *scientia* < *sciens*, -entis, present participle of *scrire*, to know]

Big Science *n.* A large expensive scientific project undertaken by a group of scientists and associates; *e.g.*, the Human Genome Project, which cost over \$1 billion U.S. (inferred from Wade 1998, 10 March, C5).

♦ **²science** *n.* "Expertness, skill, or proficiency resulting from knowledge" (Michaelis 1963).

♦ **scientific breakthrough** *n.* A rare scientific discovery that profoundly changes the practice, or interpretation, of science or its implications for society (Bloom 1997, 2029).

♦ **scientific Darwinism** See Darwinism.

♦ **scientific name** See name: nonscientific name.

♦ **scientific revolution** See revolution: scientific revolution.

♦ **scientist** *n.* One who studies one, or more, areas of science (Oxford English Dictionary 1972, entries from 1840).

classic scientist *n.* A scientist who concentrates on the perfection of something that already exists; he tends to work over a subject exhaustively and to defend the status quo; contrasted with romantic scientist (Ostwald 1909 in Mayr 1982, 831).

Comment: Firstborn children who become scientists tend to be classical ones and defend the existing

paradigms during scientific revolutions (Sulloway 1982 in Mayr 1982, 831).

♦ **romantic scientist** *n.* A scientist who bubbles over with ideas that have to be dealt with quickly to make room for the next ones; contrasted with classic scientist (Ostwald 1909 in Mayr 1982, 831).

Comment: Some of a romantic scientist's ideas may be superbly innovative; others are invalid if not silly. The romantic usually does not hesitate to abandon his less successful ideas (Ostwald 1909 in Mayr 1982, 831). Later-borns who become scientists tend to be revolutionaries who propose unorthodox theories (Sulloway 1982 in Mayr 1982, 831).

♦ **scientist-day** See unit of measure: day: scientist-day.

♦ **scientist-hour** See unit of measure: scientist-hour.

♦ **scientist-year** See unit of measure: year: scientist-year.

♦ **scientometrics** See study of: -metry: scientometrics.

♦ **sciophile, sciophilic, sciophilous, sciophily** See ¹-phile: sciophile.

♦ **sciophytium** See ²community: sciophytium.

♦ **scissipary** See -pary: scissipary.

♦ **sclerite** *n.* A portion of an insect's body wall bounded by sutures (Oxford English Dictionary 1972, entries from 1861; Wilson 1975, 594).

♦ **scolite** See fossil: scolite.

♦ **scopa** See organ: scopa.

♦ **Scopes Trial** *n.* The 1925 court trial of John T. Scopes, who was charged with violating Tennessee's new law (the Butler Act) that forbade teaching human evolution, or "Any theory that denies the . . . Divine Creation of man" in public schools (Milner 1990, 397). *syn.* Monkey Trial (Milner 1990, 397)

Comments: Scopes was a part-time substitute teacher whom the American Civil Liberties Union urged to provoke a test case to challenge the Butler Act and notify authorities of his intentions (Milner 1990, 397). The fundamentalist politician William Jennings Bryan won the case by proving that Scopes broke the law. The liberal lawyer Clarence Darrow defended Scopes. The public perceived that Darrow had won by backing Bryan into an intellectual corner. Tennessee repealed the Butler Act in 1967.

♦ **Scopes II** *n.* The court trial concerning the suit against the Arkansas Board of Education by Reverend Bill McLean and the American Civil Liberties Union to enjoin the Board from enforcing Act 590, which required equal time for teaching the theories of creation science and evolution (Milner 1990, 399).

Comments: In 1982, the court ruled that "creation science" did not qualify as an alternative scientific explanation or theory, and that Act 590 was an attempt to establish religion in a state-supported school in violation of the First Amendment of the U.S. Constitution (Milner 1990, 399). In that year Mississippi passed its own similar law by an overwhelming majority.

♦ **scopulus** *adj.* Referring to crags and steep overhanging cliffs (Lincoln et al. 1985).

♦ **score-keeping mutualism** See symbiosis: mutualism: score-keeping mutualism.

♦ **scoto-, scot-** See skoto-.

♦ **scotophile, scotophilic, scotophilous, scotophily** See ¹-phile: scotophile.

♦ **scototaxis** See taxis: scototaxis.

♦ **scout** See caste: scout.

♦ **scout dance** See dance: bee dance: scout dance.

♦ **scouting** *n.*

1. A person's spying, or watching, in order to gain information (Oxford English Dictionary 1972, entries from 1553).
2. A slave-maker ant's emerging from her nest and wandering about in search of a host-species colony (Alloway 1979, 203).
3. A Western Honey Bee workers' searching for a nesting site for her swarm.

v.i. scout

cf. bee: scout

♦ **SCR** See reponse: skin-conductance response.

♦ **scramble competition** See competition: scramble competition.

♦ **scramble-competition polygyny** See mating system: polygyny: scramble-competition polygyny.

♦ **scrapers** See ²group: functional feeding group: scrapers.

♦ **scratching** *n.*

1. In some animal species: An individual's superficially wounding itself, or another, by dragging its claws, or finger nails, over skin; an individual's superficially wounding skin with any hard, pointed object (Oxford English Dictionary 1972, entries from 1474).
2. In some animal species: An individual's using its claws, or nails, as offensive weapons (Oxford English Dictionary 1972, entries from 1589).
cf. behavior: defensive behavior
3. In some animal species: An individual's scraping lightly (a part of its body with its claws, or finger nails, *e.g.*, to relieve itching) (Oxford English Dictionary 1972, entries from 1530).
4. In some animal species: An individual's removing earth, etc., with its claws or nails (Oxford English Dictionary 1972, entries from 1520).

Comment: The Oxford English Dictionary (1972) also defines "scratching out" and "scratching up."

hop-scratching *n.* A bird's springing forward with both legs and simultaneously pulling its claws backwards over a substrate (Wickler 1970 in Heymer 1977, 153).

run-scratching, alternating scratching *n.* A bird's scratching a substrate sequentially with alternate legs (Wickler 1970 in Heymer 1977, 153).
syn. alternating scratching (Heymer 1977, 153)

♦ **scratching over the wing** See grooming: scratching over the wing.

♦ **scream** See animal sounds: scream.

♦ **screech** See animal sounds: screech.

♦ **scrounger** *n.* An organism that obtains resources by parasitizing the behavioral efforts of a producer, thereby reducing its costs of resource gain; contrasted with producer [coined by Barnard and Sibly 1981, 543].
cf. parasitism: brood parasitism, cleptoparasitism, social parasitism

Comment: Examples of scroungers include a kleptoparasitic *Frigata* sp. (frigate bird) and skua (bird) that take a host bird's prey, a *Molothrus ater* (Brown-headed Cowbird) and *Cuculus canorus* (Common Cuckoo) that exploit the nest-building behavior and parental care of another bird species, a dominant female *Crotophaga sulcirostris* (Groove-billed Ani) that exploits communal nest-building and incubation of a subordinant, and a kleptogamist ('sneaky-rutter') male *Cervus elaphus* (Red Deer) that usurps matings from a "harem owner" while he is defending his harem against another competitor (Barnard and Silby 1981, 543).

♦ **scrumping** See behavior: mashing.

♦ **SCUBA, scuba** See apparatus: self-contained underwater breathing apparatus.

♦ **SD** See standard deviation.

♦ **SE** See standard error.

♦ **sea** *n.*

1. The continuous body of salt water that covers most of the Earth's surface, especially this body regarded as a geophysical entity that is distinct from earth and sky (Morris 1982).
2. A tract of water within an ocean (Morris 1982).
3. A relatively large body of salt water that is partly, or completely, landlocked (Morris 1982).
4. The condition of an ocean's surface with regard to its course, flow, swell, or turbulence: a high sea (Morris 1982).

[Middle English see < Old English *sæ*]

eperic sea *n.* A sea that is located on a continental shelf or on a continental interior; distinguished from mediterranean sea (Lapidus 1987, 129).

syn. epeiric sea (Eldredge and Gould 1972, 107), epicontinental sea, inland sea (Lapidus 1987, 129)

mediterranean sea *n.* A sea that is located between two continents, or within a continent; distinguished from eperic sea (Lapidus 1987, 222).

♦ **search engine** *n.* A means of finding information on the World Wide Web, *q.v.* (Lawrence and Giles 1999, 8 July, 107).

Comments: Search engines include Alta Vista, Excite, Google, Hotbot, Infoseek, Lycos, NetScape Navigator, Northern Light, and Yahoo.

♦ **search image, searching image** *n.* An animal's internal image of, or temporary predisposition to search for, a particular prey type or to search for prey in a particular kind of location (von Uexküll 1934 in McFarland 1985, 213; Immelmann and Beer 1989, 259–260).

cf. representation; selection: apostatic selection

♦ **searching automatism** *n.* In Human and other mammal young: An individual's repeatedly moving its head from side to side spontaneously or after receiving a tactile stimulus in its mouth region; the animal's movement stops after it receives a nipple in its mouth and closes its lips around its opening (Heymer 1977, 170).

♦ **season** *n.*

1. The time of the year when a plant flourishes, blooms, fruits, etc. (Oxford English Dictionary 1972, entries from *ca.* 1300).

2. A period of the year, into which it is naturally divided by the Earth's changing its position with regard to the Sun, and marked by daily light-period changes, particular conditions of weather, temperature, etc.; especially spring, summer, winter, and fall in temperate climates and the rainy and dry seasons in tropical climates (Oxford English Dictionary 1972, entries from 1340).

3. The time of the year when an animal is in heat, pairs, breeds, migrates, is killed for food or hunted, etc. (Oxford English Dictionary 1972, entries from *ca.* 1400).

cf. aestival, autumnal, hibernal, serotinal, vernal

autumn *n.* The time on Earth when the Sun "moves" south across the Equator at the autumnal equinox (= fall equinox) on 21 or 22 September with regard to a vantage point on Earth through the arrival of winter (*q.v.*) on 21 or 22 December (Alden et al. 2007, 59).

adj. autumnal

syn. fall

cf. season: spring, summer, winter

Comment: As autumn proceeds, e.g., ambient temperature generally decreases in the Northern Hemisphere and ambient temperature generally increases in many areas of the Southern Hemisphere (Alden et al. 2007, 59).

dormant season *n.* The period from the first autumnal killing frost through the last vernal killing frost; contrasted with growing season.

fall See autumn

growing season *n.*

1. In seasonal climates, the period of rapid plant growth; contrasted with dormant season (Allaby 1994).
2. In Great Britain, the period when the mean temperature exceeds 6°C based on a daily, weekly, or monthly mean of ground, or air, temperature; contrasted with dormant season (Allaby 1994).
3. In the U.S., the period between the last vernal and first autumnal killing frosts; the number of frost-free days; contrasted with dormant season (Allaby 1994).

spring *n.* The time on Earth when the Sun “moves” north across the Equator at the vernal equinox on 21 or 22 March, with regard to a vantage point on Earth, through the arrival of summer (*q.v.*) on 21 or 22 June (Alden et al. 2007, 59).

adj. prevernal (early spring), vernal (late spring)

cf. season: autumn, summer, winter

Comment: As spring proceeds, e.g., ambient temperature generally increases in the Northern Hemisphere, and ambient temperature generally decreases in the Southern Hemisphere (Alden et al. 2007, 59).

summer *n.* The time on Earth when the Sun reaches its peak altitude (angle from Earth’s ground) on the aestival equinox on 21 or 22 June, with regard to a vantage point on Earth, through the arrival of autumn (*q.v.*) on 21 or 22 September (Alden et al. 2007, 59).

adj. aestival (early summer), serotinal (late summer)

cf. season: autumn, spring, winter

Comment: On the average, this is the warmest season of the year in boreal, temperate, and subtropical regions in the Northern Hemisphere and the coldest season of the year in these regions in the Southern Hemisphere.

winter *n.* The time on Earth when the Sun “moves” south across the Equator at the winter solstice on 21 or 22 December, with regard to a vantage point on Earth, through the arrival of spring (*q.v.*) on 21 or 22 March (Alden et al. 2007, 59).

adj. hibernal

cf. season: autumn, spring, summer

Comment: As winter proceeds, e.g., ambient temperature generally decreases in the Northern Hemisphere and ambient temperature generally increases in the Southern Hemisphere (Alden et al. 2007, 59).

♦ **seasonal** *adj.* Referring to an organism that shows periodicity related to season (Lincoln et al. 1985).

♦ **seasonal mimicry** See mimicry: seasonal mimicry.

♦ **Secchi disc, Secchi disk** See apparatus: Secchi disc.

♦ **second Darwinian revolution** See revolution: second Darwinian revolution.

♦ **second instar** See instar: second instar.

♦ **second law of thermodynamics** See law: laws of thermodynamics: second law of thermodynamics.

♦ **second order** See order: second order.

♦ **second-order Markoff chain** See chain: Markoff chain.

♦ **secondary** See helper.

♦ **secondary compound** See compound: secondary compound.

♦ **secondary consumer** See consumer: secondary consumer.

♦ **secondary contact** *n.* Reestablishment of contact between populations after a separation period (Lincoln et al. 1985).

♦ **secondary-defensive behavior** See behavior: defensive behavior: behavior: secondary-defensive behavior.

♦ **secondary discontinuity** See discontinuity: secondary discontinuity.

♦ **secondary drive** See drive: secondary drive.

♦ **secondary host** See ³host: secondary host.

♦ **secondary instinct** See instinct: instinctive behavior: secondary instinct.

♦ **secondary intergradation** See intergradation: secondary intergradation.

♦ **secondary metabolic substance** See compound: secondary compound.

♦ **secondary metabolite** See compound: secondary compound.

♦ **secondary monogyny** See -gyny: monogyny (comments).

♦ **secondary neotenic** See caste: secondary neotenic.

♦ **secondary parasitism** See parasitism: superparasitism.

♦ **“secondary parasitism”** See parasitism: “secondary parasitism.”

♦ **secondary productivity, secondary production** See production: secondary productivity.

♦ **secondary reinforcement** See reinforcement: secondary reinforcement.

♦ **secondary robber** See thief.

♦ **secondary sex ratio** See sex ratio: secondary sex ratio.

♦ **secondary-sexual character, secondary-sexual characteristic** See character: secondary-sexual character.

♦ **secondary-social dominance** See dominance: social dominance: secondary-social dominance.

♦ **secondary speciation** See speciation: secondary speciation.

♦ **secreta** See secretion.

♦ **secretion** *n.*

1. A organism gland’s, or some analogous organ’s, extracting a material from blood, or sap, and transforming it into a particular substance, used for a body function or excreted as waste (Oxford English Dictionary 1972, entries from 1646); an organism’s, or cell’s, producing and releasing a secretion (Lincoln et al. 1985).
2. The product of secretion (Oxford English Dictionary 1972, entries from 1732); any substance, or product, elaborated, and released by a cell, or gland, and that performs a specific function (Lincoln et al. 1985).

syn. secreta (Lincoln et al. 1985)

cf. excretion

neurosecretion *n.*

1. A central-nervous-system cell’s producing a physiologically regulative substance that affects target cells an appreciable distance from its secretion site (Immelmann and Beer 1989, 202, 260).
2. The product of neurosecretion of (def. 1).

- ♦ **sectorial chimera** See chimera: sectorial chimera.
- ♦ **secular** *adj.*
1. Referring to 100-yr periods (Lincoln et al. 1985).
 2. Referring to a process that persists for an indefinitely long time (Lincoln et al. 1985).
- cf.* millennial
- ♦ **sedentary** *adj.* Referring to an organism that is attached to a substrate or not free living (Lincoln et al. 1985).
- cf.* sessile
- ♦ **sedge** See ²group: sedge.
- ♦ **sedge meadow** See habitat: meadow: sedge meadow.
- ♦ **seed** *n.*
1. The fertilized ovule of a phanerogam (seed-bearing plant) (Oxford English Dictionary 1972, entries from *ca.* 1000); the fertilized, ripened ovule of a flowering plant (Lincoln et al. 1985).
 2. Nontechnically, the spore of a cryptogram or a small fruit (Oxford English Dictionary 1972, entries from *ca.* 1000).
 3. Semen (Oxford English Dictionary 1972, entries from *ca.* 1290).
Note: This is now a rare usage.
 4. Offspring, progeny (Oxford English Dictionary 1972, entries from *ca.* 825).
Note: This is now a rare usage.
 5. The ova of a lobster or silkworm moth; oyster spat (Oxford English Dictionary 1972, entries from 1662).
 6. Any propagative plant, or animal, structure (Lincoln et al. 1985).
cf. gamete, propagule
- ♦ **seed bank** *n.* The total buried reserve of all the seeds of different ages from all plant species in a particular area (Buchmann and Nabhan 1996, 253).
- ♦ **seed flower** See organ: flower: seed flower.
- ♦ **seed shadow** *n.* A plant's seed-dispersal area containing seeds that drop from the plant and those come directly from the plant and are dropped by seed-dispersal agents (Buchmann and Nabhan 1996, 253).
- ♦ **seedling** *n.* A young plant that grows from a seed (Morris 1982).
cf. sapling
- ♦ **segment-polarity genes** See gene: segmentation genes (comment).
- ♦ **segmentation genes** See gene: segmentation gene.
- ♦ **segrate** See hybrid: segregate.
- ♦ **segregation** See genetic segregation.
- ♦ **segregation distorter** See gene: segregation distorter.
- ♦ **segregation-distorter allele** See allele: segregation-distorter allele.
- ♦ **segregation distortion** See drive: meiotic drive.
- ♦ **segregation, law of** See law: law of segregation.
- ♦ **segregational load** See genetic load: segregational load.
- ♦ **seismic signal** See signal: seismic signal.
- ♦ **seismotaxis** See taxis: seismotaxis.
- ♦ **select** *v.t.* To favor a gene, mutation, or trait by natural selection: "Certain mutations occur more frequently when they are selected" (Shapiro 1995, 373).
syn. favor, select for: Natural selection *selects for* black coats in young Gorillas.
cf. selection: natural selection
- ♦ **selection** *n.*
1. The process by which one, or more, kinds of things, from a group composed of themselves and similar things, and become more, or less, frequent with

SOME CLASSIFICATIONS OF BIOLOGICAL SELECTION^a

- I. genetic selection (*syn.* genic selection, hard selection)
 - A. artificial selection
 1. individual selection
 2. truncation selection
 - B. natural selection
 1. classification by size of group
 - a. individual selection
 - (1) sexual selection
 - (a) intersexual selection (*syn.* amphiclexis, epigamic selection, sexual selection)
 - (b) intrasexual selection (*syn.* sexual selection)
 - (c) mutual-sexual selection
 - (d) runaway-sexual selection
 - (2) nonsexual selection
 - b. group selection
 - (1) family selection
 - (2) kin selection
 - (a) kin selection (indirect kin selection, alone)
 - (b) kin selection (indirect + direct kin selection)
 - (3) nonkin-group selection
 - (4) demic selection
 - (a) interdemic selection
 - (b) intrademic selection
 - (5) population selection
 - (a) interpopulation selection (*syn.* intergroup selection, *Gruppenauslese*)
 - (b) intrapopulation selection
 - (6) trait-group selection
 - (7) specific selection (*syn.* species selection with one species per "group")
 - (a) interspecific selection (*syn.* species selection)
 - (b) intraspecific selection
 - (8) species-group selection (more than one species per "group")
 - (a) intergroup selection
 - (b) intragroup selection
 2. classification by ecological factor
 - a. b selection
 - b. d selection
 - c. K selection
 - d. r selection
 3. classification by resultant trait distribution
 - a. directional selection (*syn.* dynamic selection)
 - b. disruptive selection (*syn.* centrifugal selection)
 - c. stabilizing selection (*syn.* centripetal selection, normalizing selection)
 4. classification regarding the same gene in different types of organism groups
 5. classification by order
 - a. first-order selection
 - b. second-order selection
 6. classification by time
 - a. acyclical selection
 - b. age-specific selection
 - c. continual selection

- d. cyclical selection
 - e. endocyclic selection
 - 7. classification by location of selective pressure
 - a. external selection (outside an organism)
 - b. internal selection (inside an organism)
 - 8. some other kinds of selection
 - a. a selection
 - b. allaesthetic selection
 - c. alpha selection
 - d. apostatic selection
 - e. automatic selection
 - f. balancing selection
 - g. catastrophic selection (*syn.* catastrophic-mortality selection)
 - h. climatic selection
 - i. competitive selection
 - j. density-dependent selection
 - k. habitat selection
 - l. migrational selection
 - m. organic selection (*syn.* Baldwin effect)
 - n. physiological selection
 - o. purifying selection
 - p. threshold selection
 - q. truncation selection
- II. nongenetic selection (*syn.* cultural selection)

^a Endler (1992) divides natural selection into nonsexual selection and sexual selection, with mortality selection and phenotypic selection as divisions of nonsexual selection.

time [suggested by Strickberger's (1990, 120) discussion of selection of protocells].

Notes: This a very broad definition that is not meant to be synonymous with "natural selection" although "selection" is a synonym for "natural selection." Things that are subjected to selection, in the broad sense, include organic compounds, biochemical pathways, genes and traits programmed by genes, individual organisms, species, higher taxa, cultural traits in some primate species, and perhaps protocells, *q.v.* "Selection" can be defined as to whether it is biological or nonbiological, genetic or nongenetic, related to mate selection, or is from within, or outside, an organism; the size of organism group involved; ecological influences; gene-frequency distributions within a population; order; time; and so forth. Different kinds of selection are defined both as a process and a result of a process. Biological selection may have evolved from chemical selection (Strickberger 1990, 121).

2. The result of this process.

See the table below.

cf. fitness, habitat selection

apostatic selection *n.* Decreased natural selection against a rare-phenotype prey, increased natural selection for a common-phenotype prey, or both, because its predator has a search image for a more common phenotype, *e.g.*, individuals of some species of polymorphic insects and snails may be favored by apostatic selection (Clarke 1962 in Mayr 1982, 593).

Comment: Apostatic selection can help to maintain several morphological forms of the same species of prey (Matthews and Matthews 1978, 330).

artificial selection *n.* Humans' selection and (repeated) breeding of desired phenotypes of a species to obtain individuals with particular characteristics for agricultural, economic, horticultural, scientific, or

other reasons; *e.g.*, particular dog behaviors, particular animal coat colors, increased milk or egg production, increased aggressiveness in Siamese Fighting Fish, or exaggerated behavior such as tumbling in *Columba livia* (Rock Doves) (Lincoln et al. 1985; Immelmann and Beer 1989, 262).

syn. mass selection, recurrent selection, selective breeding (Lincoln et al. 1985)

cf. character: domestication character; ²heterochrony: neoteny

Comment: Humans used a process similar to artificial selection in developing cuter, more baby-like cartoon characters and teddy bears (Morris et al. 1995, 1697).

autoselection *n.* Selection of genes based on their transmission efficiency and without reference to their phenotypic effects (Bell 1982, 503).

catastrophic selection *n.* Natural selection for a particular phenotype during an environmental catastrophe, or emergency, when thousands through millions of other phenotypes of a species succumb (Lewis 1962 in Mayr 1982, 600).

Comment: "Catastrophic selection" is a very important evolutionary process (Lewis 1962 in Mayr 1982, 600).

centrifugal selection See selection: disruptive selection.

counteracting selection *n.*

1. Natural selection that favors a trait during one stage of an organism's life but not at another (Wilson 1975, 71).

2. Selection for genes at some levels (individual, family, and population) but against the same genes at other levels (Wilson 1975, 22, 581).

cf. selection: reinforcing selection

cultural selection *n.* For example, in Humans and Japanese Macaques: Nongenetic selection in which learned information, or concepts, are transmitted that "leads to directional evolutionary change in the social structure of a society" (Wittenberger 1981, 614); contrasted with genetic selection.

syn. nongenetic selection

cf. ³culture; learning; social imitation; tradition

cyclical selection *n.* Natural selection in which a species is subjected to regular alternation of selective pressures that favor one and then the other of two alleles resulting in balanced polymorphism (Wilson 1975, 71).

direct selection *n.*

1. Natural selection that affects gene frequencies as a consequence of individuals' producing direct descendants at different rates (Wittenberger 1981, 614).

2. "Natural selection (including sexual selection) based on direct fitness" (Brown 1987, 299).

cf. selection: indirect selection

directional selection *n.* Natural selection's disproportionate elimination of a group of individuals in one end of a normal (or other kind of population distribution) (Wilson 1975, 67; Mayr 1982, 587–588).

syn. directive selection, dynamic selection, progressive selection (Lincoln et al. 1985)

cf. selection: disruptive selection, stabilizing selection.

Comments: "Directional selection" is a principal process by which "directional evolution" takes place. "Directional evolution" can lead to "speciation" (Wilson 1975, 67; Mayr 1982, 587–588).

directive selection *n.* See selection: directional selection.

disruptive selection *n.* Natural selection that causes a disproportionate elimination of average, or near average individuals, with a consequent increase in population variance (Wilson 1975, 67).

syn. centrifugal selection, diversifying selection (Mayr 1982, 588)

cf. selection: directional selection, stabilizing selection
Comment: “Disruptive selection” is a cause of balanced polymorphism (Wilson 1975, 71). This kind of selection acted (and may still be acting) upon species with mimetic or other forms of polymorphism (Wilson 1975, 582).

double selection *n.* Natural selection involving both male competition and female choice and female competition and male choice (C. R. Darwin in Parker, 1989).

dynamic selection See selection: directional selection.

epigamic selection *n.* The part of sexual selection that involves individuals’ choosing members of the opposite sex as mates; contrasted with intrasexual selection (Wilson 1975, 318, 595; Thornhill and Alcock 1983, 74–75).

syn. amphilexis, intersexual selection, sexual selection (Lincoln et al. 1985); female choice [because most proposed cases of epigamic selection involve females’ choosing among males as mates (Spencer and Masters 1992, 295)]

cf. selection: intrasexual selection, sexual selection (def. 2)

Comments: Epigamic selection can occur before, during, and after copulation (which does not necessarily involve insemination) (Thornhill and Alcock 1983, 74–75). It is difficult to demonstrate in the field (Spencer and Masters 1992, 295). Cronin (1992, 292) describes how “intersexual selection” is a terminological curiosity. It implies that males and females are competing for the privilege of being the sex that mates.

lepigamic, Huxley’s (1938) term for sexual selection, *q.v.* (Wilson 1975, 318)

► **pure epigamic selection, true epigamic selection** *n.* Epigamic selection that is not mixed with another kind(s) of selection, especially intrasexual selection which often occurs with it (Wilson 1975, 318–319).

frequency-dependent selection *n.*

1. Natural selection in which the least frequent of two alleles is selected for, and the two alleles strike a balance at some frequency intermediate to their previous ones, *e.g.*, when a parasite, or predator, repeatedly shifts its preference to attack a disproportionate number of prey individuals belonging to the more common type (Moment 1962 and Owen 1963 in Wilson 1975, 71).

2. Natural selection in which a phenotype’s fitness depends on the frequency of alternative phenotypes in the population (Wittenberger 1981, 615).

cf. selection: frequency-dependent sexual selection

Comment: “Frequency-dependent selection” is typical of “disruptive selection” and “sexual selection” but sometimes characterizes other forms of “natural selection” as well (Wittenberger 1981, 615).

frequency-dependent sexual selection *n.* Selection in which the mating success of an individual male varies with the frequency of his morph in his male population (Partridge and Hill 1984 in Partridge 1988, 525).

gamete selection *n.* Natural selection that results in differential mortality of gametes, or their precursors, during the period between the reductional division of meiosis and zygote formation (Wilson 1975, 64).

cf. drive: meiotic drive

genetic selection, genic selection *n.* Natural selection that causes the genetic composition of a gene pool to change within, or between, generations (Wittenberger 1981, 616).

group selection *n.*

1. Natural selection that acts at the group level, rather than at the individual-organism level (Darwin 1859, 259–262; Wynne-Edwards 1962 in Mayr 1982, 595; Wilson 1983; Brown 1987, 300; Immelmann and Beer 1989, 123).

Notes: Wynne-Edwards (1962) argued that group selection has been of the first importance in the evolution of social behavior, especially behavior that regulates population sizes (Immelmann and Beer 1989, 123). He tended to define groups as discrete populations (= multigenerational demes), isolated from each other except for a trickle of dispersers; these populations persisted indefinitely unless they were driven extinct by selfish genotypes (Wilson 1992, 145). The credibility of this kind of group selection was seriously undermined by William’s (1966) classic book. In the 1960s and 1970s, group selection in any form was rejected by most biologists; but in the 1970s a revised form of group selection (involving trait groups) arose that is accepted by many of today’s evolutionary biologists. The importance of group selection depends largely on the how one defines the group. The problem is aggravated by the fact that many models that are developed as alternatives to group selection (involving multigenerational demes) actually include a component of group selection (involving trait groups) (Wilson 1992, 146). Much of the evidence that Wynne-Edwards offered in support of group selection has been reinterpreted as resulting from kin selection (Immelmann and Beer 1989, 123). Some supporters of group selection claim that certain phenomena can be explained by individual selection, *e.g.*, characters of entire populations including aberrant sex ratios, mutation rates, dispersal distances and other factors that favor inbreeding or outbreeding, and degrees of sexual dimorphism (Mayr 1982, 595).

2. Natural selection that operates on a unit of two, or more, members of a lineage group; in the broad sense, group selection includes both kin and non-kin selection (Wilson 1975, 585).

3. Natural selection in which an individual organism sacrifices its reproductive output (direct fitness) in helping its group (Alcock 1979).

4. Natural selection in which the relative frequencies of genetically different groups (species, populations, or subunits within a population) change through time (Wittenberger 1981, 616).

5. A hypothetical process of natural selection among groups of organisms that is often invoked to explain the evolution of altruism (Dawkins 1982, 288).

syn. kin selection (which is a confusing synonym, Dawkins 1982, 288)

cf. display: epideictic display

Comment: "The study of group selection has a turbulent history that has not yet subsided" (Wilson 1992, 145).

habitat selection *n.* Natural selection exerted by a habitat on the organisms that disperse to it (Bazzaz 1991 in Kramer et al. 1995, 3).

See habitat selection.

heteroselection *n.* Natural selection that favors heterozygotes (Lincoln et al. 1985).

cf. selection: homoselection

homoselection *n.* Natural selection that favors homozygotes (Lincoln et al. 1985).

cf. selection: heteroselection

indirect selection *n.*

1. Natural selection that involves effects of a focal organism (donor) on its nondescendent kin (Brown 1987, 303).

syn. kin selection (Wittenberger 1981, 617; Brown, 1987, 303, discusses problems with this synonym.)

2. Natural selection in which an individual helps its relatives, or other genetically similar individuals, to reproduce (Immelmann and Beer 1989, 106).

See selection: epigamic selection, kin selection.

cf. behavior: altruistic behavior; selection: direct selection, epigamic selection, kin selection

individual selection *n.* Artificial selection (*q.v.*) on individual organisms based solely on their own individual phenotypic values (Hartl 1987, 226, 257–258).

cf. selection: truncation selection

interdeme selection, interdemic selection *n.*

1. Natural selection at the level of entire breeding populations (demes) (Wilson 1975, 587).

2. Demes' differential successes due to their genetic properties (Brown 1987, 304).

cf. selection: intrademic selection

Comment: "Interdeme selection" is one of the extreme forms of "group selection," to be contrasted with "kin selection" (Wilson 1975, 587).

internal selection *n.* Natural selection caused by an organism's internal factors, such as physiology and development (Mayr 1982, 589).

Comment: This is a confusing concept because it is impossible to partition selection into internal and external components (Mayr 1982, 589).

intersexual selection See selection: epigamic selection.

interspecific selection *n.* Natural selection caused by interactions between (among) species (Daly and Wilson 1983).

intrademic selection *n.* Natural selection within a deme (Brown 1987, 304).

cf. selection: interdemic selection

intrasexual selection *n.* The part of sexual selection that involves same sexed individuals' competing among themselves for mates; contrasted with epigamic selection (Wilson 1975, 595; Thornhill and Alcock 1983, 74–75).

syn. male-male competition [because most proposed examples of intrasexual selection involve males (Spencer and Masters 1992, 294)], sexual selection (Lincoln et al. 1985)

K selection *n.* Natural selection that favors a K-selected species, *q.v.* (MacArthur and Wilson 1967; Wilson 1975, 100, 587).

cf. selection: *r* selection

Comments: Traits thought to be favored by "K selection" include large size, long life, and a small number of intensively cared-for offspring that result in a

stable population size. Parry (1981) reviews the definitions of "K selection" and "r selection" that are used by many authors, and he questions the usefulness of these concepts.

kin selection *n.*

1. Natural selection that involves effects of a focal organism (donor) on both its descendant and non-descendant kin (Maynard Smith 1964 in Brown 1987, 303).

[coined by Maynard Smith 1964]

2. Natural selection within a population that increases genes that cause an organism to help its relatives (exclusive of its own offspring according to many authors) to survive, reproduce, or both (Wilson 1975, 587; Dawkins, 1982, 289; Immelmann and Beer 1989, 165).

cf. selection: group selection (in the strict sense), interdemic selection

3. Natural selection for activities that lower an individual's own reproduction but raise a relative's fitness (Alcock 1979, 9).

4. Selection for genes that promote altruistic behavior (McFarland 1985, 140).

5. Natural selection on an actor's genetic trait that affects the genotypic fitness of one, or more, individuals that are genetically related to the actor in a nonrandom way at the loci determining the trait (Michod 1982, 40).

syn. kinship selection (Lincoln et al. 1985); kin-selection theory (Immelmann and Beer 1989, 166)

See selection: indirect selection.

cf. selection: group selection; ³theory: kin-selection theory

Comments: Kin selection occurs in organisms including the plants *Arabidopsis thaliana* and *Cakile edentula* and many social-animal species (Dudley and File 2007, 435; Biedrzycki et al. 2010, 1). Wilson (1975, 587) considers "kin selection" to be one of the extreme forms of "group selection," but McFarland (1985, 128) considers Wilson's classification to be erroneous. "Kin selection" is especially important in that it suggests a biological basis for "altruism," so long as the beneficiary is related to the altruist (Barash 1982, 392). Although many biologists consider "kin selection" to be a reality, Dawkins (1982, 289) considers it to be a hypothetical concept.

mass selection See selection: artificial selection.

meiotic drive See ²drive: meiotic drive.

migrant selection *n.* Natural selection caused by variation in genotypes' tendencies to emigrate (Wilson 1975, 104); e.g., if new populations are founded more consistently by individuals with gene *A* as opposed to those bearing gene *a*, gene *A* is said to be favored by migrant selection (Wilson 1975, 589).

mortality selection *n.* The effects of consistent phenotypic-specific mortality (Fisher 1930, etc. in Endler 1992, 221).

syn. natural selection (a confusing synonym, Endler 1992, 221)

mutual-sexual selection *n.* Sexual selection in which both sexes affect evolution of characters of the opposite sex (Huxley 1914 in Gherardi 1984, 389).

natural selection *n.*

1. The "preservation of favourable variations and the rejection of injurious variations" (Darwin 1859, 80–81).

Notes: Darwin coined this term to signify the analogy between artificial selection and that done by

nature apart from Humans, and he first used the phrase in a manuscript text of 1841 (Hodge 1992, 213, 215). Others objected to this term because they thought it implied conscious choice in organisms that become modified (Darwin 1959, 164–165 in Hodge 1992, 216). Alfred Russell Wallace urged Darwin to use “survival of the fittest” instead of “natural selection” because he felt the former term is free from metaphorical elements that caused people to misunderstand “natural selection” (Hodge 1992, 217).

2. A process that causes a change in the relative frequency of particular genotypes in a population due their phenotypes’ having different numbers of offspring (Wilson 1975, 67).

Notes: Under natural conditions, this differential reproduction can stem from many causes including genotypes’ different abilities in direct competition with other genotypes; differential survival under the onslaught of parasites, predators, and changes in their physical environments; variable reproductive competence; variable ability to penetrate new habitats; and so forth. “Natural selection” is “the agent that molds virtually all of the characteristics of species” (Wilson 1975, 67).

3. A process that results in (1) a difference in trait frequency distribution among age classes, or life-history stages, in a population to an extent beyond that expected from growth and development alone, (2) a difference in trait distribution of all offspring from that of all parents beyond that expected due to phenotypic variation and inheritance alone, or (3) both (Endler 1986 in Endler 1992, 220).

Notes: Based on (Endler 1986), Cooke (1986) defines natural selection as a process that causes a trait’s frequency to differ between parents and offspring not just because the trait is variable and has a genetic basis, but also because it causes an individual with it to have a different fitness than an individual without it (Endler 1986 in Cooke 1986). Cooke (1986) writes that this definition effectively eliminates the charge that “natural selection” is a tautology. Endler (1986) also presents many other definitions of “natural selection.”

4. The result of the process of natural selection from gene-frequency changes through evolution of new taxa.

Note: A result-of-natural-selection definition is differential survival and reproduction of organisms as consequences of the characteristics of their environments (National Academy of Sciences and Institute of Medicine 2008, 5).

See selection: mortality selection, nonsexual selection, phenotypic selection.

syn. evolution (Endler 1992, 220), selection (of many authors), selection theory, survival of the fittest (Hodge 1992, 217)

cf. fitness; selection: artificial selection; survival of the fittest

Comments: The metaphorical terminology “natural selection” is on the borderline of being felicitous and unfortunate because it was strenuously resisted by the majority of Darwin’s contemporaries. “They tended to personify whatever did the selecting and to insist that there was no real difference between selection by Nature and creation by God” Mayr (1982, 842). “Survival of the fittest” is a misleading synonym because, usually, it is a group of *fitter* individuals

within a population that survive and reproduce; it is not often that just *one* individual survives and reproduces. “Many evolutionary biologists are in favor of natural selection regardless of what it actually means” (Cooke 1986). “Natural selection” is used to designate both a process and a result of a process; this increases the likelihood of confusion and circular arguments regarding this term (Immelmann and Beer 1989, 260). Philosophers and scientists debate whether natural selection is a law, principle, force, cause, agent, or a combination of these things (Hodge 1992, 218).

[coined by C. R. Darwin (1859)]

nonsexual selection *n.* Natural selection minus sexual selection, *q.v.* (Endler 1992, 221).

syn. ecological selection (Futuyma 1998, 586), natural selection (a confusing synonym, Endler 1992, 221)

Comment: Darwin made a careful distinction between natural selection and sexual selection; Endler (1992, 221–222) and others include sexual selection as part of natural selection.

normalizing selection See selection: stabilizing selection.

organic selection See effect: Baldwin effect.

orthoselection *n.*

1. Natural selection that causes gradual, unidirectional change in an evolutionary line (Eldredge and Gould 1972, 97).

Note: Some researchers usually view orthoselection as a line’s response to a unidirectional change in one or more features of its physical environment (Eldredge and Gould 1972, 97).

2. Sustained natural selection on the members of a lineage over a long period, causing continued evolution in a given direction (Dawkins 1982, 291).

cf. selection: directional selection

Comment: “Orthoselection can create an appearance of ‘momentum’ or ‘inertia’ in evolutionary trends” (Dawkins 1982, 291).

partial selection *n.* Natural selection whose selection coefficient is between 0 and 1 (Lincoln et al. 1985).

phenotypic selection *n.* The within-generation change in trait distribution among cohorts (or the difference between the actual number of mates and the effective number of mates in sexual selection) (Endler 1992, 222).

syn. natural selection [confusing synonym (Endler 1992, 220)]

pure-epigamic selection See selection: epigamic selection.

r selection *n.*

1. Natural selection that favors an r-selected species (Wilson 1975, 99).

2. Selection that favors rapid rates of population increase, especially prominent in species that specialize in colonizing short-lived environments or undergo large fluctuation in population size (Lincoln et al. 1985).

cf. selection: K selection; ²species: r-selected species

recurrent selection See selection: artificial selection.

reinforcing selection *n.* Natural selection on two, or more, levels of organization, *e.g.*, on the individual, family, or population, in such a way that certain genes are favored at all levels and their spread through the population is accelerated (Lincoln et al. 1985).

runaway-sexual selection *n.* A hypothesized kind of natural selection in which females choose males with particular secondary-sexual characteristics

over generations, causing these characteristics (= male ornaments) to become more and more elaborate over evolutionary time, e.g., magnificent plumage in Birds-of-paradise or Peacocks, huge antlers in the extinct Irish Elk, or long stalked eyes in Diopsidae (flies), *q.v.* (Fisher 1958, 152).

cf. See hypothesis: hypotheses of female choice: runaway hypothesis of female choice

Comments: Ronald A. Fisher (1930) stated this idea verbally, and O'Donald (1962), Lande (1981), and Kirkpatrick (1982) (all in Futuyma 1998, 590) developed mathematical models that supported it (Spencer and Masters 1992, 297). It is a powerful potential cause of speciation (Futuyma 1998, 590). Chimpanzee and human penile sizes might be results of runaway sexual selection (Diamond 1996, 85).

sexual selection *n.*

1. "The process by which an individual gains reproductive advantage by being more attractive to individuals of the other sex" (Darwin 1840, 1859, 1871 in Mayr 1982, 596); selection in which there is "differential ability of individuals of different genetic types to acquire mates," contrasted with nonsexual selection, *q.v.* (Wilson 1975, 318, 595).
 2. The "struggle between males for possession of females" that relates to the males' offspring numbers; this struggle includes physical combat, searching skill, and ability to attract females from a distance (Darwin 1859, 75, in Thornhill and Alcock 1983, 52–53).
- cf.* selection: epigamic selection
3. Natural selection that involves competition among members of the same sex for mates (intrasexual selection, *q.v.*) and selection of mates of one sex by the other sex (intersexual selection = epigamic selection, *q.v.*) (Thornhill and Alcock 1983, 53).

Comments: The third definition is the most thorough of the above three definitions. Darwin (1859) originated the concept of sexual selection and originally described it as different from natural selection; the question being addressed determines whether, or not, sexual selection can be construed as a subclass of natural selection (Spencer and Masters 1992, 294, 296). Leading experts on sexual selection standardly contrast "adaptive sexual selection" (*syn.* good-sense sexual selection, Wallacean sexual selection) with "maladaptive sexual selection" (*syn.* Fisherian sexual selection, good-taste sexual selection) (Cronin 1992, 292). Many field studies that at first seem to be examples of sexual selection, are better described as *nonsexual* selection after further study; thus, sexual selection should be invoked only after adequate study of a mating system (Spencer and Masters 1992, 296, 301).

social selection *n.* Natural selection that is caused by members of a group in competition for food, dominance, reproductive rights, access to mates, and other resources.

Comment: "Social selection" is likely to cause a co-evolutionary spiral in that new mutations can change a social environment which produces new social pressures which favor further new mutations which produce new social pressures and so on (Williams 1966, 184, in Thornhill and Alcock 1983, 53).

species selection See hypothesis: species selection.

stabilizing selection *n.*

1. Natural selection that causes disproportionate elimination of extreme phenotypes in population,

a consequent reduction of population variance, and stabilization of phenotypes around their original trait means (Wilson 1975, 67, 596).

Note: For example, stabilizing selection can cause the proportions of individuals belonging to different age groups to remain constant for generation after generation (Wilson 1975, 595).

2. "A form of natural selection that maintains the same mean and variance among phenotypes each generation" (Wittenberger 1981, 622).

syn. centripetal selection, normalizing selection (Lincoln et al. 1985)

cf. selection: directional selection, disruptive selection

tandem selection *n.* Natural selection for a second trait once the primary one has reached a certain level of refinement (Lincoln et al. 1985).

truncation selection *n.*

1. An episode of natural selection that favors individuals of a single generation that are heterozygous for a certain fraction of their genetic loci (Wallace 1968; Wilson 1975, 72).
2. Natural selection in which a population is divided sharply into two groups, above and below a certain threshold, with those below it removed (Crow 1992, 134).

3. Artificial selection (*q.v.*) in which a person breeds only individuals which have a focal character state only from a tail region of a frequency distribution of this character (Hartl 1987, 226–227, illustration).

Note: Researchers performed truncation selection for seed weight in edible beans (Hartl 1987, 227).

variability selection *n.* Natural selection caused by large degrees of environmental variability (R. Potts 1998 in Selig 1999, 6).

Comment: Three distinctive areas of human evolution each coincides with a different period of increased environmental oscillation: bipedal walking, stone-tool making, and increased brain size (Selig 1999, 6).

♦ **selection coefficient, coefficient of selection**

See coefficient: selection coefficient.

♦ **selection pressure** *n.*

1. "Any feature of the environment that results in natural selection; e.g., food shortage, the activity of a predator, or competition from other members of the same sex for a mate can cause individuals of different genetic types to survive to different average ages, to reproduce at different rates, or both" (Wilson 1975, 594); evolution caused by natural selection (Immelmann and Beer 1989, 261).
2. Natural-selection intensity measured as the alteration of a population's genetic composition from generation to generation (Lincoln et al. 1985).

extrinsic selection pressure *n.* Selection pressure from outside an organisms' population (Immelmann and Beer 1989, 262).

intrinsic selection pressure *n.* Selection pressure from inside an organisms' population (Immelmann and Beer 1989, 262).

♦ **selectionism** *n.* Evolution of organisms through natural selection (*q.v.*).

Comment: Selectionism made vitalism (*q.v.*) superfluous in the realm of adaptation (Mayr 1997, 13).

♦ **selective advantage** *n.* The increased fitness of one genotype relative to another one in its population (Lincoln et al. 1985, Futuyma 1978, 368).

cf. selective disadvantage

♦ **selective attention** See attention: selective attention.

- ♦ **selective breeding** See selection: artificial selection.
- ♦ **selection differential (S)** *n.* The difference in mean phenotype between the selected parents (μ_s) and the entire parental population (μ , designated as $S = \mu_s - \mu$) (Hartl 1987, 228).
- ♦ **selective disadvantage** *n.* The decreased fitness of one genotype relative to another one in its population (Lincoln et al. 1985).
cf. selective advantage.
- ♦ **selective environment** See environment: selective environment.
- ♦ **selective fruit abortion** See abortion: selective fruit abortion.
- ♦ **selective harvesting** *n.* A tree harvesting regime that involves removing a particular percent of trees of a specified size from a forest on prescribed time cycle (e.g., a 15-yr harvest cycle of Coast Redwoods in which 25–30% of trees with a diameter at breast height of greater than 46 cm) (Hoekstra et al. 1995, 247).
- ♦ **selective species** See ²species: selective species.
- ♦ **selective value** See adaptive value: fitness: genetic fitness.
- ♦ **selector gene** See gene: selector gene.
- ♦ **self** *n.*
1. Philosophically, “that which in a person is intrinsically he (in contradistinction to what is adventitious);” a person’s ego (often identified with his soul, or mind, as opposed to his body); a permanent subject of successive and varying states of consciousness (Oxford English Dictionary 1972, entries from *ca.* 1674).
 2. What a person “is at a particular time in a particular aspect or relation;” his “nature, character (or sometimes) physical constitution or appearance; considered as different at different times;” chiefly with a qualifying adjective (his) former, later, self (Oxford English Dictionary 1972, entries from 1697).
 3. An individual person known, or considered, as the subject of his own consciousness (Michaelis 1963).
 4. An individual animal’s characteristics only at the time when it is self-aware or self-conscious (Bunge 1984).
- cf.* awareness: self-awareness
Comment: The presence of self-awareness in nonhuman animals is controversial.
- ♦ **self-abuse** See masturbation.
- ♦ **self-awareness** See awareness: self-awareness.
- ♦ **self-centered DNA** See nucleic acid: deoxyribonucleic acid: selfish DNA.
- ♦ **self-centered-DNA hypothesis** See hypothesis: self-centered DNA hypothesis.
- ♦ **self-concept** *n.* A person’s unique way of perceiving himself (Storz 1973, 247).
- ♦ **self-consciousness** See consciousness: self-consciousness.
- ♦ **self-contained underwater breathing apparatus (SCUBA, scuba)** See apparatus: self-contained underwater breathing apparatus.
- ♦ **self-fertilization** See fertilization: self-fertilization.
- ♦ **self-grooming** See grooming: self-grooming.
- ♦ **self-incompatibility** *n.*
1. In hermaphroditic organisms: An individual’s not being able to produce viable offspring by self-fertilization (Lincoln et al. 1985).
syn. self-sterility
 2. In many hermaphroditic plant species: A genetically controlled mechanism that prevents self-fertilization (Haring et al. 1990, 927).
Comments: Plant species range from being totally self-incompatible (*Lilium philadelphicum*, Barrows 1979a, 570) through partially incompatible (*Asclepias incarnata*, Ivey et al. 2003, 214). Two major types of self-incompatibility are gametophytic self-incompatible and sporophytic self-incompatible (Haring et al. 1990, 927). Secreted glycoproteins that interact with an undescribed pollen component may arrest pollen-tube growth.
- ♦ **self-marking** See behavior: marking behavior; automarking.
- ♦ **self-mimesis** See mimicry: mimesis: cryptic mimesis: self-mimesis.
- ♦ **self-pollination** See pollination: self-pollination.
- ♦ **self-pollution** See masturbation.
- ♦ **self-medicating behavior, self-medication** See pharmacognosy: zoopharmacognosy.
- ♦ **self-regulation hypothesis** See hypothesis: population-limiting hypotheses.
- ♦ **self-reliability** See reliability: intraobserver reliability.
- ♦ **self-sterility** See self-incompatibility.
- ♦ **self-sterility gene** See gene: self-sterility gene.
- ♦ **selfing** See -mixis: automixis.
- ♦ **selfish behavior, selfishness** See behavior: selfish behavior.
- ♦ **selfish gene** See gene: selfish gene.
- ♦ **selfish social behavior** See behavior: social behavior: selfish social behavior.
- ♦ **selfish DNA** See nucleic acid: deoxyribonucleic acid: selfish DNA.
- ♦ **selfish DNA hypothesis** See hypothesis: selfish DNA hypothesis.
- ♦ **selfish-herd hypothesis** See hypothesis: selfish-herd hypothesis.
- ♦ **selfish social behavior** See behavior: social behavior: selfish social behavior.
- ♦ **semantic** *n.*
1. Of, or pertaining to, meaning (Michaelis 1963).
 2. Of, or relating to, semantics (Michaelis 1963).
[iGreek *sēmantikos* < *sēmainein*, to signify]
- ♦ **semantic conception of theory structure** See ⁴model: semantic conception of theory structure.
- ♦ **semantic memory** See memory: fact memory.
- ♦ **semantic view** See ⁴model: semantic conception of theory structure.
- ♦ **semantics** *n. pl.* (construed as singular)
1. In logic, the relations between signs, or symbols, and what they signify or denote (Michaelis 1963).
syn. semasiology, semiotics (Michaelis 1963)
See study of: semantics.
 2. Loosely, verbal trickery (Michaelis 1963).
- ♦ **semantide** See character: semantide.
- ♦ **semantization** *n.* Any evolutionary change that adds to the communicative function of a behavior (Wickler 1967a in Wilson 1975, 224).
- ♦ **sematectonic communication** See communication: sematectonic communication.
- ♦ **semelparity** See -parity: semelparity.
- ♦ **semi- prefix**
1. “Not fully; partially; partly” (Michaelis 1963).
 2. “Exactly half” (Michaelis 1963).
 3. Occurring twice (in a specified period) (Michaelis 1963).
[Latin *semi*]

- ♦ **semi-cryptic polyploidy** See -ploidy: semi-cryptic polyploidy.
- ♦ **semidiurnal** See diurnal: semidiurnal.
- ♦ **semidominance** See dominance: semidominance.
- ♦ **semigamy** See -gamy: semigamy.
- ♦ **semigeographical speciation** See speciation: semigeographical speciation.
- ♦ **semilethal mutation** See ²mutation: semilethal mutation.
- ♦ **seminatural community** See ²community: semi-natural community.
- ♦ **semiochemical** See chemical-releasing stimulus: semiochemical.
- ♦ **semiosystematics** See systematics: semiosystematics.
- ♦ **semiotics, semeiotics** *n.*
1. The doctrine of signs (John Locke, 17th Century, in Sebeok, 1965).
 2. Patterned communications in all modalities (Mead 1964 in Sebeok 1968, 1006).
cf. communication
 3. Semantics; the relation between signs, or symbols, and what they signify or denote (Michaelis 1963).
See study of: semiotics.
syn. semasiology (Michaelis 1963)
See semantics.
adj. semiotic, semiotist, semiotical
[Greek *sēmeiōtikos* < *sēmeion*, diminutive of *sēma*, mark]
- ♦ **semioviparity, semioviparous** See -parity: semioviparity.
- ♦ **semiparasitism** See parasitism: semiparasitism.
- ♦ **semiprecocial** See -cial: precocial: semiprecocial.
- ♦ **semisocial** See social: semisocial.
- ♦ **semispecies** See ²species: allospecies.
- ♦ **sender** *n.* An individual organism that emits a signal (Dewsbury 1978, 99).
cf. signaler, system: communication system
- ♦ **senescence** *n.*
1. An individual organism's growing old; aging process (Oxford English Dictionary 1972, entries from 1695; Lincoln et al. 1985).
 2. An individual organism's post-maturation decline in survivorship and fecundity that accompanies advancing age (Rose and Charlesworth 1980, 141 in Alexander 1987, 43).
 3. An individual organism's phenotypic manifestation of deleterious effects that accumulate in its old age (Willson 1983, 32).
adj. senescent
Comment: Alexander (1987, chap. 1) discusses hypotheses of senescence.
- ♦ **senility** *n.*
1. A person's being senile; old age or the mental and physical infirmity due to old age (Oxford English Dictionary 1972, entries from 1791).
 2. An individual organism's degenerative condition of old age (Lincoln et al. 1985).
syn. post-reproductive (Lincoln et al. 1985)
adj. senile
- ♦ **¹sensation** *n.*
1. Operation, or function, of any of a person's senses; perception by means of a person's senses; now commonly restricted to the subjective element in any operation of a person's senses, a physical feeling that a person considers apart from the resulting perception of an object (Oxford English Dictionary 1972, entries from 1642).
 2. An individual organism's detecting stimulation (Immelmann and Beer 1989, 216); distinguished from perception.
cf. modality, perception
[Latin *sensus*, sense]
- ♦ **²sensation** *n.*
1. A person's psychical affectation or a state of consciousness, due to and related to a particular condition of some portion of his body or a particular impression received by one of his sense organs (Oxford English Dictionary 1972, entries from 1615).
 2. A person's mental feeling; an emotion; now chiefly a characteristic feeling that arises in a particular circumstance (Oxford English Dictionary 1972, entries from 1755).
cf. emotion
- ♦ **³sensation** *n.* A person's excited, or violent, emotion (Oxford English Dictionary 1972, entries from 1808).
- ♦ **⁴sensation** *n.* A stimulus detected by an individual organism's sense organ from which (often in combination with other sensations) it acquires a perception (McFarland 1985, 205).
- ♦ **sense** See modality.
- ♦ **sense organ** See organ: sense organ.
- ♦ **¹sensibility** *n.*
1. A person's tissue's, or organ's, readiness to respond to sensory stimuli; sensitiveness (Oxford English Dictionary 1972, entries from ca. 1400).
 2. A measuring instrument's, or plant's, aptness to be affected by external influences; sensitiveness (Oxford English Dictionary 1972, entries from 1662).
 3. Philosophically, a person's power, or faculty, of feeling; capacity of sensation, as distinguished from cognition and will (Oxford English Dictionary 1972, entries from 1838).
See sensitivity.
- ♦ **²sensibility** *n.*
1. A person's mental perception, awareness of something (Oxford English Dictionary 1972, entries from ca. 1412).
 2. A person's quickness and acuteness of apprehension or feeling; his quality of being easily and strongly affected by emotional influences; sensitiveness (Oxford English Dictionary 1972, entries from 1711).
- ♦ **³sensibility** *n.* A host organism's degree of reaction to a parasite's infection (Lincoln et al. 1985).
- ♦ **sensitive period, sensitive phase** See period: sensitive period.
- ♦ **sensitivity** *n.*
1. An individual animal's (or an individual's part's) having sensation or sensuous perception (Oxford English Dictionary 1972, adjective entries from ca. 1400).
syn. sensitiveness (Michaelis 1963)
 2. An individual organism's having sensation; formerly, often having sense or perception, but not reason (Oxford English Dictionary 1972, adjective entries from 1555).
 3. An individual animal's having an intense perception or sensation (Oxford English Dictionary 1972, adjective entries from 1849).
 4. The degree of acuteness with which an organism's organ discriminates sensations (Michaelis 1963).
 5. An individual organism's ability to perceive and respond to stimuli (Heymer 1977, 144, Lincoln et al. 1985); this involves an organism's reacting to stimuli

- in an adaptive and reversible way (Immelmann and Beer 1989, 159).
- syn.* irritability, sensibility (Lincoln et al. 1985)
- Note:* “Sensitivity” (often called “irritability”) is a fundamental characteristic of life from single cells to multicellular organisms (Immelmann and Beer 1989, 159).
- cf.* sensibility
- adj.* irritable, sensitive
- spectral sensitivity** *n.* An animal’s response threshold to a particular color (light frequency) (Immelmann and Beer 1989, 288).
- ♦ **sensitization** *n.*
1. An individual organism being made more sensitive (to something) (Oxford English Dictionary 1972, entries from 1880).
 2. An individual animal’s lowering its response threshold to key stimuli as it responds to these stimuli (Lorenz 1981, 264); an animal’s generalized alerting reaction that counteracts habituation (Gould 1982, 78).
- cf.* learning: habituation
3. An individual animal’s showing one stimulus-response connection due to repeated activation of another (Immelmann and Beer 1989, 237).
 4. An individual animal’s covert motivation increase due to a threshold change (Immelmann and Beer 1989, 232).
- cf.* learning: conditioning: pseudoconditioning, sensitization; stimulus: priming stimulus
- ♦ **sensitizative phase** See period: sensitive period (comment).
- ♦ **sensorial** See sensory.
- ♦ **sensory** *adj.*
1. Referring to something that is of, or pertaining, to sensation (Oxford English Dictionary 1972, entries from 1749).
 2. Referring to an organ, or system, that conveys, or procures, sense impulses (Oxford English Dictionary 1972, entries from 1799).
 3. Referring to a sensorium, an entire sensory apparatus (Michaelis 1963).
- syn.* sensorial (Michaelis 1963)
- [Late Latin *sensorium*, sensorium < *sensus*, perception < *sentire*, to feel]
- ♦ **sensory adaptation** See ³adaptation: ¹physiological adaptation: sensory adaptation; ²physiological adaptation (comment).
- ♦ **sensory coding** *n.* An individual animal’s transformation of a stimulus effect into a neural-transmission pattern (Immelmann and Beer 1989, 264).
- ♦ **sensory deprivation** *n.* An animal’s naturally, or artificially, being deprived of certain stimuli, which can cause abnormal development under some situations (Storz 1973, 251).
- ♦ **sensory modality** See modality.
- ♦ **sensory physiology** See study of: physiology.
- ♦ **sensory receptor** See receptor: sensory receptor.
- ♦ **sensory system** See ²system: sensory system.
- ♦ **sentience** *n.* A person’s condition, or quality, of being sentient; conscious; susceptible to sensation (Oxford English Dictionary 1971, entries from 1839). See need: sentience.
- ♦ **sentinel behavior** See behavior: sentinel behavior.
- ♦ **separate nesting** See nesting: separate nesting.
- ♦ **separationsyndrome, separation trauma** See syndrome: separation syndrome.
- ♦ **sepicole** See -cole: sepicole.

- ♦ **sequence analysis** See analysis: sequence analysis.
- ♦ **sequence sampling** See sampling technique: sequence sampling.
- ♦ **sequence homology** See homology: sequence homology.
- ♦ **sequential hermaphrodite** See hermaphrodite: sequential hermaphrodite.
- ♦ **sequential patrolling** See patrol.
- ♦ **sequential mutualism** See symbiosis: mutualism: sequential mutualism.
- ♦ **seral** *adj.*
1. Referring to a sere (Lincoln et al. 1985).
 2. Developmental (Lincoln et al. 1985).
- ♦ **serclimax** See ²community: climax: serclimax.
- ♦ **sere** *n.* A stage in community succession (Lincoln et al. 1985).
- cf.* succession: sere
- ♦ **serial-endosymbiosis hypothesis, serial-endosymbiosis theory** See hypothesis: endosymbiosis hypothesis: serial-endosymbiosis hypothesis.
- ♦ **serial homology** See homology: serial homology.
- ♦ **serial monogamy** See mating system: monogamy: serial monogamy.
- ♦ **serial polyandry** See mating system: serial polyandry.
- ♦ **serial polygamy** See mating system: serial polygamy.
- ♦ **serial polygyny** See mating system: polygyny: serial polygyny.
- ♦ **series** *n.* For example, in rats: An individual’s complete group of intromissions that ends with an ejaculation (Dewsbury 1978, 77).
- ♦ **serine kinase** See enzyme: serine kinase.
- ♦ **serotonergic synapse** See synapse: serotonergic synapse.
- ♦ **serodeme** See deme: serodeme.
- ♦ **serological type** See -type, type: serotype.
- ♦ **serology** See study of: serology.
- ♦ **serotaxonomy** See study of: taxonomy: serotaxonomy.
- ♦ **serotonin** See toxin: serotonin.
- ♦ **serotype** See -type, type: serotype.
- ♦ **serpentinophile, serpentinophilous** See ¹-phile: serpentinophile.
- ♦ **serule** See ²succession: microsere.
- ♦ **server** *n.* A “master computer” that supplies information to the World Wide Web or other network of computers (inferred from Lawrence and Giles 1999, 8 July, 107).
- ♦ **sesquiciprocal hybrid** See hybrid: sesquiciprocal hybrid.
- ♦ **sessile** *adj.* In some animal species: Referring to an individual, or species, that is firmly attached, permanently attached, or both to one spot; not ambulatory (Oxford English Dictionary 1972, entries from 1860; Michaelis 1963); e.g., a sponge, mussel, barnacle, or scale insect.
- syn.* nonmotile (Lincoln et al. 1985)
- cf.* sedentary
- Comment:* Some kinds of cells (Oxford English Dictionary 1972) and nonanimal organisms are also described as sessile (Wittenberger 1981, 621). [Latin *sessilis*, sitting down, stunted < *sessus*, past participle of *sedere* to sit]
- ♦ **seven deadly sins in the study of behavior** *n. pl.* Seven important mistakes that occur in the literature of animal behavior and other subjects (Milinski 1997, 159–160): (1) attempting to “prove” a null

hypothesis with small samples, (2) confounding treatments by sequence and time effects, (3) incorrectly increasing sample size due to pseudoreplication (*q.v.*), (4) introducing artifacts into experiments when the research animals are not accustomed to experimental procedures, (5) making unjustified conclusions from observational (*e.g.*, correlational) data, (6) not avoiding observer bias, and (7) using unsuitable controls.

Comments: Milinski (1997) explains these mistakes and urges researchers to improve their work by avoiding them. There are also many other mistakes that occur in the scientific literature that researchers should avoid. Further, regarding sin 1, a researcher should test null hypotheses, not try to “prove” them (*pers. obs.*) [after the title of Milinski’s (1997) paper]

♦ **Sewall-Wright effect** See drift: random drift.

♦ **Sewall-Wright’s theorem** See ³theory: Sewall-Wright’s theorem.

♦ **¹sex** *n.*

1. Either of two divisions of organisms distinguished as males or females; males or females (of a species, etc., especially Humans) viewed collectively (Oxford English Dictionary 1972, entries from 1382).
2. The character of being male or female (Michaelis 1963).
3. One of the two genders of bipolar amphimicts (Bell 1982, 512).

See need: sex.

syn. gender (Bell 1982, 512; a poor *syn.*, D. A. M. Mackay, *pers. comm.*)

adj. sexual

cf. display: advertisement: sex advertisement; gender; hypothesis: hypotheses of the evolution and maintenance of sex; mixis; sexual reproduction

heterogametic sex *n.* The sex that produces gametes that contain unlike sex chromosomes; *e.g.*, female lepidopterans, male flies, female birds, or male mammals; contrasted with homogametic sex (King and Stansfield 1985).

homogametic sex *n.* The sex that produces gametes that contain like sex chromosomes; *e.g.*, male lepidopterans, female flies, male birds, or female mammals; contrasted with heterogametic sex (King and Stansfield 1985).

♦ **²sex** *n.* The sum of all structural, functional, and behavioral characteristics that distinguish males and females (Oxford English Dictionary 1972, entries from 1631).

♦ **³sex** *n.* The activity, or phenomena, of life that is concerned with sexual desire or reproduction (Michaelis 1963).

♦ **trans-kingdom sex** *n.* Transferral of genetic information between individuals of different taxonomic kingdoms (Heinemann and Sprague 1989; Booth et al. 1989). *Comments:* In the laboratory, a bacterium, *Escherichia coli* transfers DNA to yeast (Booth et al. 1989). A crown-gall-tumor bacterium transfers genetic material to injured root cells of certain plants.
cf. transposable element

♦ **viral sex** *n.* Exchange of genetic information between two viruses (Goudsmit in Ryan 1997, 17).
cf. transformation

Comments: Viral sex between HIV-1A and an unknown strain might have given rise to HIV-1E (Goudsmit in Ryan 1997, 17).

♦ **sex, hypotheses of the maintenance of** See hypothesis: hypotheses of evolution and the maintenance of sex.

♦ **sex, hypothesis of the origin of** See hypothesis: Parker-Baker-Smith model of the evolution of sex.

♦ **sex, meaning of** *n.* Sexual reproduction is a way of producing great offspring variation that is characteristic of biological populations; this process creates individual differences from which natural selection produces new species (Weismann 1886 in Mayr 1982, 705).

cf. hypothesis: hypotheses of the evolution and maintenance of sex

Comments: The idea that sex produces great variability goes back to Herder (1784–1791 in Mayr 1982, 706). This is just one of several explanations for the evolution of sex.

♦ **sex attractant** See chemical-releasing stimulus: semiochemical: pheromone: sex pheromone.

♦ **sex change** See hermaphroditism.

♦ **sex chromosome** See chromosome: sex chromosome.

♦ **sex-conditioned gene** See gene: sex-influenced gene.

♦ **sex cycle** *n.* In diploid organisms: “The recurrent series of processes that lead to genetic recombination, such as the alternation of karyogamy and meiosis” (Lincoln et al. 1985).

♦ **sex determination** *n.* The means, or process, by which an individual organism’s sex is determined (Wilson 1975, 594).

syn. sex-determining mechanism (Uzzell 1984)

cf. -gamety

environmental sex determination See sex determination: phenotypic sex determination.

genotypic sex determination *n.* Sex determination primarily by the balance of genetic factors in an individual’s zygote or spore (Lincoln et al. 1985).

haplodiploidy, haplo-diploidy *n.* For example, in some beetle, homopteran, mite, rotifer, thrips, and tick species and in most hymenopteran species: Sex determination in which males are derived from haploid (unfertilized) eggs and females from diploid, usually fertilized eggs (Wilson 1975, 585).

See -ploidy: haplodiploidy, -toky, arrhenotoky.

cf. rule: Dzierzon’s rule

heterogamety *n.* Sex determination based on an individual’s having heterozygous sex chromosomes; *e.g.*, in female lepidopterans, female birds, and male Humans (Lincoln et al. 1985).

cf. ¹sex: heterogametic sex

homogamety *n.* Sex determination based on an individual’s having homozygous sex chromosomes, *e.g.*, in male lepidopterans, male birds, and female Humans (Lincoln et al. 1985).

See -gamety: homogamety.

cf. ¹sex: homogametic sex

maternal sex determination *n.* Sex determination by a mother’s gametic idioype (Lincoln et al. 1985).

metagamic sex determination *n.* Sex determination largely by external environmental influences (Lincoln et al. 1985).

paternal sex determination *n.* Sex determination by a father’s gametic idioype (Lincoln et al. 1985).

phenotypic sex determination, environmental sex determination *n.* Sex determination by external environmental factors, not directly by syngamy or karyogamy (Lincoln et al. 1985).

progamic sex determination *n.* Sex determination in an egg prior to its fertilization (Lincoln et al. 1985).

- syngamic sex determination** *n.* Sex determination as a result of gamete fusion and karyogamy (Lincoln et al. 1985).
- ♦ **sex-determining mechanism** See sex determination.
- ♦ **sex dichromatism** *n.* Sexual dimorphism, *q.v.*, in body color (Immelmann and Beer 1989, 267).
- ♦ **sex differentiation** *n.* The process of diverse development of characters in males and females (Lincoln et al. 1985).
- ♦ **sex digamety** See -gamety: sex digamety.
- ♦ **sex drive** See drive: sex drive.
- ♦ **sex hormone** See hormone: sex hormone.
- ♦ **sex-influenced gene** See gene: sex-influenced gene.
- ♦ **sex-linkage** *n.* A gene's, or character's, being on a sex chromosome (Lincoln et al. 1985).
- ♦ **sex-linked gene** See gene: sex-linked gene.
- ♦ **sex-limited character** See character: sex-limited character.
- ♦ **sex-limited gene** See gene: sex-limited gene.
- ♦ **sex monogamety** See -gamety: sex monogamety.
- ♦ **sex mosaic** See morph: gynandromorph.
- ♦ **sex pheromone** See chemical-releasing stimulus: pheromone: sex pheromone.
- ♦ **sex plurigamety** See -gamety: polygamety.
- ♦ **sex polygamety** See -gamety: sex polygamety.
- ♦ **sex ratio** See ratio: sex ratio.
- ♦ **sex-ratio factor** See factor: sex-ratio factor.
- ♦ **sex reversal** See hermaphroditism: consecutive hermaphroditism.
- ♦ **sex-role reversal** *n.* An animal of one sex's ordinarily showing behavior that is usually shown by members of the opposite sex in its taxonomic group (Wilson 1975, 326, 456); *e.g.*, male *Hippocampus* spp. (Seahorses) take care of fry, male *Jaçanas* take care of chicks, and females of *Scolytus* sp. (bark beetle) select potential male mates (Thornhill and Alcock 1983, 442–443).
See hermaphroditism: consecutive hermaphroditism.
cf. eonism; mimicry: automimicry, female mimicry; transvestism
Comment: Sex role reversal is not considered to be abnormal behavior in these animals.
- ♦ **sexology** See study of: sexology.
- ♦ **sexual, idiosyncratic** *adj.* Referring to sex, sex-related characters, or the process of sexual reproduction (Lincoln et al. 1985).
See idiosyncratic.
- ♦ **-sexual**
- asexual, amictic** *adj.* Referring to reproduction without sex (Bell 1982, 502).
syn. zelotypic
cf. sexual reproduction
- bisexual** *n.*
1. A person with qualities of both sexes (Hinsie and Campbell 1976).
syn. hermaphrodite, intersexual (Lincoln et al. 1985)
See hermaphrodite.
 2. A person's who is erotically attracted to both sexes (Michaelis 1963).
cf. sexual: monosexual
 3. *adj.* Referring to a plant that has both carpels and stamens (Fernald 1950, 1571).
 4. Referring to an organism species that has both males and females (Wilson 1975, 286).
syn. digenic, unisexual (Lincoln et al. 1985)

- cf.* sexual: homosexual
- cosexual** See hermaphrodite.
- eusexual** *adj.* Referring to organisms that display a regular alternation of karyogamy and meiosis (Lincoln et al. 1985).
- cf.* sexual: parosexual, protosexual
- heterosexual** *n.* A person who has a propensity for another person of the opposite sex (Oxford English Dictionary 1971, entries from 1901).
adj. heterosexual
cf. sexual: bisexual, homosexual
- homosexual** *n.* A person who has a propensity for another person of the same sex (Oxford English Dictionary 1971, entries from 1897).
adj. homosexual
cf. behavior: homosexual behavior; sexual: bisexual, heterosexual
Comment: In 1973, the American Psychiatric Association confirmed the importance of the new research by removing the term "homosexuality" from the official manual that lists all mental and emotional disorders. In 1975, the American Psychological Association passed a resolution supporting this action (www.apa.org/pubinfo/orient.html).
- intersexual** See sexual: bisexual.
- monosexual** *n.* A person who has a propensity for only one sex (Oxford English Dictionary 1971).
cf. sexual: bisexual
- parosexual** *adj.* Referring to organisms that achieve genetic recombination by means other than regular alternation of karyogamy and meiosis (Lincoln et al. 1985).
- cf.* sexual: eusexual, protosexual
- protosexual** *adj.* Referring to organisms that achieve genetic recombination by conjugation, lyso-gestation, or transduction (Lincoln et al. 1985).
cf. sexual: eusexual, parasexual
- transsexual** *n.* A person who "changes" his, or her, sex with the use of acting like a person of the opposite sex, dressing in clothes of the opposite sex, electrolysis, hormone treatments, surgery, or a combination of these activities (inferred from Jacobs 1998).
Comments: About 1,500 people in the U.S. surgically alter their genitals each year, and countless others live in various states of gender nonconformity (Jacobs 1998, 50–51). Surgeons can remove a man's penis and testicles and create a vagina at a cost of more than U.S. \$12,000. Surgeons can create an artificial penis from forearm tissue, but the procedure of creating male genitalia for a female using parts of her body is far from perfected. A person's emotional and social aspects of his, or her, gender dysphoria and sex change can be highly complex.
- unisexual** *adj.*
1. Referring to a population, or generation, composed of individuals of one sex only (Lincoln et al. 1985).
 2. Referring to an individual that has either male, or female, reproductive organs and produces gametes of only one sex (Lincoln et al. 1985).
syn. diclinous, dioecious, gonochoristic (Lincoln et al. 1985)
 3. Referring to a species that has only females (Wilson 1975, 286).
 4. Referring to a flower that possesses only male, or female, reproductive organs; contrasted with bisexual (Lincoln et al. 1985).
syn. imperfect (Lincoln et al. 1985)

5. Referring to a species in which the number of females greatly outnumbers males, e.g., the mole salamander (Licht and Bogart 1987).
See sexual: bisexual.
cf. -oecism
- ♦ **sexual aggression** See aggression: sexual aggression.
- ♦ **sexual attraction** *n.* A person's attraction to another person with sexual arousal (inferred from Marano 1997, C1).
cf. behavior: sexual behavior; puberty; sexuality
Comments: Sexual attraction may first occur in Humans at 9 yr of age (Marano 1997, C1). The mean age of first-recalled sexual attraction is 9.6 yr in men and 10.1 yr in women (G. Herdt in Marano 1997, C6). Sexual desire for another person first occurred at the mean age of 11.2 yr for males and 11.9 yr for females, and the first sexual activity occurred at a mean age of 13.1 yr for males and 15.2 yr for females.
- ♦ **"sexual-attraction hypothesis"** See hypothesis: "sexual-attraction hypothesis."
- ♦ **sexual behavior** See behavior: sexual behavior.
- ♦ **sexual bargaining** *n.* A male Chimpanzee's obtaining a copulation undisturbed by other Chimpanzees by first grooming dominant males (Waal 1989, 82).
- ♦ **sexual bonding** See bond: pair bond.
- ♦ **sexual coercion** See copulation: forced copulation.
- ♦ **sexual companion** See companion: sexual companion.
- ♦ **sexual cannibalism** See cannibalism: sexual cannibalism.
- ♦ **sexual characteristic** See character: sexual characteristic.
- ♦ **sexual checking** *n.* A male animal's examining the reproductive receptivity of a female, e.g., in *Macropus parryi* (Whiptailed Wallabies), which involves a male's sniffing at a female's tail and sometimes lifting her tail and pawing and licking her cloaca (Kaufmann 1974a in Wilson 1975, 472).
- ♦ **sexual competition** See competition: sexual competition.
- ♦ **sexual conflict** See ³conflict: reproductive conflict.
- ♦ **sexual dimorphism** See -morphism: dimorphism: horiodimorphism.
- ♦ **sexual imprinting** See learning: imprinting: sexual imprinting.
- ♦ **sexual-isolating mechanism** See mechanism: isolating mechanism: sexual- isolating mechanism.
- ♦ **sexual isolation** See isolation: reproductive isolation.
- ♦ **sexual-meiotic parthenogenesis** See parthenogenesis: sexual-meiotic parthenogenesis.
- ♦ **sexual mounting** See behavior: mounting.
- ♦ **sexual parthenogenesis** See parthenogenesis: sexual parthenogenesis.
- ♦ **sexual reluctance** See coyness.
- ♦ **sexual reproduction** *n.*
1. In most eukaryotic organisms: Reproduction involving meiosis and fertilization (Curtis 1983, 1106) and associated behaviors (Policansky 1987).
Note: This is a common definition of sexual reproduction.
 2. "Any process that unites genes (DNA) in an individual cell or organism from more than a single source" (Margulis et al. 1985, 73).
 3. A process that always involves "at least one autopoietic parent that forms an individual with a genetic

- constitution that differs from both of the parents" (given as "sex" in Margulis et al. 1985, 69).
4. In most eukaryotic organisms: Reproduction in which an individual creates offspring that are genetically different than itself using the process of meiosis (Thornhill and Alcock 1983, 33).
syn. digeny, eusexual reproduction, sex (Lincoln et al. 1985)
cf. gender, mixis, reproduction, sex
Comments: "Sexual reproduction" includes the typical kind of reproduction in which gametes fuse and form zygotes which develop into mature organisms as well as "polyembryony," "hermaphroditism" ("selfing"), and "sexual parthenogenesis" (Thornhill and Alcock 1983, 38). Bell (1982) catalogs many kinds of "sexual reproduction."
- ♦ **eukaryotic sex, meiotic sex** *n.* Sex that leads to the alternation of haploid and diploid cells and requires fertilization and meiosis (Margulis et al. 1985, 69).
- ♦ **prokaryotic sex** *n.*
1. "Any horizontal transmission of DNA" (given as "sex" in Zinder 1985, 8).
 2. Sex that does not lead to the alternation of haploid and diploid cells and requires fertilization and meiosis; prokaryotic sex may involve genetic recombination of autopoietic entities (such as bacterial cells) and non-autopoietic entities (such as plasmids and viruses) (Margulis et al. 1985, 69).
Note: "Prokaryotic" sex probably evolved in the Archean Eon more than 3,000 Ma ago (Margulis et al. 1985, 69).
- ♦ **sexual Retrojecktion** See *Retrojecktion*: sexual *Retrojecktion*.
- ♦ **sexual selection** See selection: sexual selection.
- ♦ **sexual-selection-by-female-choice hypothesis** See hypothesis: hypotheses of divergent evolution of animal genitalia: sexual-selection-by-female-choice hypothesis.
- ♦ **sexual-selection-by-male-conflict hypothesis** See hypothesis: hypotheses of divergent evolution of animal genitalia: sexual-selection-by-male-conflict hypothesis.
- ♦ **sexual skin** *n.* In many species of Old World Monkeys: A female's hairless skin area around her genital orifice that becomes reddened and swollen around her time of estrus (Wilson 1975, 155, 229–231).
Comments: The sexual skin produces sex pheromones in Rhesus Macaques and possibly releases male copulatory behavior. "Males of Hamadryas Baboons and other species possess a permanently colored rump, which they present when greeting and appeasing other males" (Wilson 1975, 155, 229–231).
- ♦ **sexuality** *n.*
1. An individual animal's being sexual or having sexual characters (Oxford English Dictionary 1972, entries from 1800).
Note: This kind of "sexuality" now refers to nonanimal organisms as well.
 2. A person's having sexual powers or capability of sexual feeling (Oxford English Dictionary 1972, entries from 1879).
 3. An individual organism's having an appearance of a particular sex or being distinguished by sex (Oxford English Dictionary 1972, entries from 1908; Michaelis 1963).
 4. A person's sexual activity and feelings, especially after maturation of his, or her, sexual organs (inferred from Marano 1997, C6).

- cf.* puberty, sexual attraction
- hypersexuality** *n.* Excessively frequent sexual behavior; *e.g.*, in some species of domestic animals, wild animals subjected to prolonged social isolation, or some animals with certain brain lesions, *e.g.*, a cat with a damaged amygdala (Immelman and Beer 1989, 137).
- relative sexuality** *n.* A gamete's being able to act as a male or a female when mated to other gametes (Lincoln et al. 1985).
- ♦ **sexuparity** See -parity: sexuparity.
- ♦ **sexy-son hypothesis** See hypothesis: sexy-son hypothesis.
- ♦ **shacking** See behavior: mashing.
- ♦ **shag time** See estrus.
- ♦ **shaking** *n.*
1. A person's trembling his body, limbs, due to physical infirmity or disease; quivering with emotion; shivering with cold; quaking with fear (Oxford English Dictionary 1972, verb entries from *ca.* 1100).
 2. A person's grasping and seizing (a person) roughly to and fro, especially as a punishment or in a struggle (Oxford English Dictionary 1972, verb entries from *ca.* 1300).
 3. An individual animal's vibrating its body (which throws off water, wet snow, dust, etc., or removes stiffness due to repose); figuratively, bestirring itself, arousing itself to activity; also with complement: to shake itself free, loose, awake, sober; and with the construction from (Oxford English Dictionary 1972, verb entries from 1390).
 4. A person's clasping and moving another person's hand to and fro, as a customary salutation, or expression of friendly feeling; shaking hands with (another) (Oxford English Dictionary 1972, verb entries from 1535).
 5. An individual animal's "worrying" (mangling, or killing, by biting, vibrating, or tearing with its teeth) an opponent or prey (Oxford English Dictionary 1972, verb entries from 1565).
 6. A person's moving a person, or thing, up and down, from side to side, or both rapidly (Oxford English Dictionary 1972, verb entries from 1581).
 7. A person's moving his limbs, or body, from side to side, up and down, or both, often resulting from nervous agitation resulting from fear or horror; also a state of this shaking (Oxford English Dictionary 1972, verb entries from 1624).
- n.* the shakes
8. A person's rousing up (an animal) to activity; shaking up a horse (Oxford English Dictionary 1972, entries from 1853).
 9. In many bird and mammal species: A comfort movement that often occurs when an animal leaves water or finishes dust bathing (Heymer 1977, 164).
- ♦ **shaking dance** See dance: bee dance: shaking dance.
- ♦ **shaking to death** *n.* In a hedgehog species; many canid, mustelid, and viverrid species; and *Sarcophilus harrisii* (Tasmanian-devils): An individual's vigorously shaking its head from side to side while holding a prey in its jaws (Immelman and Beer 1989, 268).
- ♦ **shale barren** See habitat: shale barren.
- ♦ **shale-barren opening** See habitat: shale barren: shale-barren opening.
- ♦ **shale-barren woodland** See habitat: shale barren: shale-barren woodland.
- ♦ **sham pecking** See behavior: displacement behavior: sham pecking.
- ♦ **sham preening** See behavior: displacement behavior: sham preening.
- ♦ **shame** See abasement.
- ♦ **Shannon-Weaver formula, Shannon-Weaver function, Shannon-Weiner function** See index: species-diversity index: Shannon-Weaver Function.
- ♦ **shaping** *n.* An investigator's, or animal trainer's, using operant conditioning to cause an animal to perform behavior not originally in its repertory; *e.g.*, bicycle riding by bears, ball balancing by seals, waltzing by Elephants, or ping-pong playing by *Columba livia* (Rock Doves) (Immelman and Beer 1989, 268–269).
- autoshaping** *n.* An animal's undergoing Pavlovian conditioning: behaving toward a stimulus (*e.g.*, light) as if it were another stimulus (*e.g.*, food) because it was exposed to both stimuli simultaneously for a number of pairings (Immelman and Beer 1989, 24). *v.t.* autoshape
- cf.* learning: conditioning: Pavlovian conditioning
- Comment:* For example, when a *Columba livia* (Rock Dove) is simultaneously presented with a lighted key (button) and grain of food, it continually pecks at the key as if it were a grain (McFarland 1985, 324). It does not peck at its key "in order" to obtain an actual grain, as it would if it were showing instrumental conditioning. It just persists in pecking at its key.
- ♦ **Shapiro-Wilk Statistic** See program: Shapiro-Wilk Statistic.
- ♦ **shareable parental investment** See investment: shareable parental investment.
- ♦ **Shejotty meteorite** See meteorite: Shejotty meteorite.
- ♦ **Shelford's law of tolerance** See law: law of tolerance.
- ♦ **shell-searching behavior** See behavior: shell-searching behavior.
- ♦ **shelter-building behavior** See behavior: shelter-building behavior.
- ♦ **shelter-seeking behavior** See behavior: shelter-seeking behavior.
- ♦ **shifting-balance theory** See ²theory: shifting-balance theory.
- ♦ **shivering thermogenesis** See thermogenesis: shivering thermogenesis.
- ♦ **shoal** See ²group: shoal.
- ♦ **shock disease** See disease: shock disease.
- ♦ **short-interspersed nucleotide element** See nucleotide element: short interspersed nucleotide element.
- ♦ **short-term memory** See memory: short-term memory.
- ♦ **short-term optimality** See optimality: short-term optimality.
- ♦ **shoulder enhancement** *n.* The tendency of a person, especially a man, to enlarge his shoulders with hair erection, clothes, and other materials (Leyhausen 1969 in Heymer 1977, 159).
- ♦ **shoulder reaction** See reaction: shoulder reaction.
- ♦ **show** *v.t.* To demonstrate a phenomenon by revealing that it occurs in a statistically significant way (pers. obs.).
- syn.* indicate
- ♦ **showing respect** *n.* In Apes: An individual's making a gesture that communicates respect to an object or recipient, *e.g.*, a Human's making such a gesture toward a guest of high rank or a Chimpanzee's laying a slightly folded hand palm on its head as a greeting to

- a dominant conspecific (Kortlandt 1958, Eibl-Eibesfeldt 1970 in Heymer 1977, 22).
cf. behavior: respectful behavior
- ♦ **showing-the-nest behavior** See behavior: showing-the-nest behavior.
- ♦ **shredder** See group: functional feeding group: “dead-plant shredder,” “live-plant shredder.”
- ♦ **shrewdness** See ²group: shrewdness.
- ♦ **shuffling** See ruffling.
- ♦ **shyness** See learning: conditioning: avoidance conditioning.
- ♦ **sib** See sibling.
- ♦ **sib mating** See mating: sib mating.
- ♦ **sib pollination** See pollination: self-pollination: sib pollination.
- ♦ **sibicide, siblicide** See -cide: sibicide.
- ♦ **sibling** *n.*
1. A brother or sister (Michaelis 1963).
 2. An organism that is genetically closely related to another one, especially one that is a brother or sister (Lincoln et al. 1985).
- syn.* sib (Lincoln et al. 1985)
- ♦ **sibling companion** See companion: sibling companion.
- ♦ **sibling species** See ²species: sibling species.
- ♦ **sibship** *n.* The relationship between (among) siblings (Lincoln et al. 1985).
- ♦ **siccadeserta** *n.* “Dry sand deserts” (Lincoln et al. 1985).
- ♦ **siccocole, siccoile, siccole, siccocolus** See -cole: siccocole.
- ♦ **sickle dance** See dance: bee dance: sickle dance.
- ♦ **siderophile** See 1-phile: siderophile.
- ♦ **sideways building** *n.* A individual swan’s moving only its neck and head while gathering nesting material that it has previously laid by its nest (Petzold 1964 in Heymer 1977, 188).
- ♦ **σ** See variance: population variance.
- ♦ **sigmoid curve** See curve: sigmoid curve.
- ♦ **sigmoid display** See display: sigmoid display.
- ♦ **signal** *n.*
1. A sign, or notice, that one hears or sees, given especially to warn, direct, or convey information (Oxford English Dictionary 1972, entries from 1598).
 2. In communication theory, “the physical embodiment of a message” (Michaelis 1963).
 3. Any organism behavior that conveys information from one individual to another, whether or not it serves other functions as well (Wilson 1975, 594).
 4. The behavior emitted by a sender in a communication system, *q.v.* (Dewsbury 1978, 99).
- See alarm; behavior: appeasement; chemical-releasing stimulus: semiochemical; facial expression: play signal; social signal.
- n.* signaling, signalling
- v.t.* signal
- cf.* animal sounds: call; display; message; melotope; sign vehicle
- Comments:* “A signal specially modified in the course of evolution to convey information is called a display,” *q.v.* (Wilson 1975, 594). Dawkins and Krebs (1978 in Dawkins 1986, 126) claim that some animal signals do not convey information. Researchers disagree regarding the definition of signal (McGregor 1997, 754). A signal can include one, or more, of the following parts: body shape, body size, coloration, electric current, movement, odor, and sound.

aggressive signal *n.* For example, in Humans and *Loxodonta africana* (African Elephants): A sender’s signal that he, or she, will be aggressive if challenged by a receiver (Poole 1989, 140).

Comment: A male *L. africana* announces “his intention to fight” with glandular secretions, urine-marking, and vocalizing (Poole 1989, 140).

alarm signal *n.* An individual’s visual, vocal, or chemical signal that it gives during periods of potential danger and that can alert other individuals to danger (Wittenberger 1981, 612); *e.g.*, *Odocoileus virginianus* (White-tailed Deer) tail flag, snort, stamp the ground with forefeet, and release metatarsal-gland pheromones as parts of their alarm signals (LaGory 1987, 20).

analog signal, analogic signal *n.* A signal that varies in intensity, frequency, or both, as a function of an individual’s underlying motivational state, thereby transmitting quantitative information about such variables as the sender’s mood, distance of the target, and so forth; *e.g.*, the variation in *Poecilia reticulata* (Guppy) body markings that correlates with the fish’s sexual-arousal level (Sebeok 1962 in Wilson 1975, 178, 585; Immelmann and Beer 1989, 121).
syn. graded signal (Wilson 1975, 178)

appeasing signal See behavior: appeasement.

assessment signal *n.* A signal that is necessarily correlated with an animal’s fighting ability, or resource-holding potential, and is therefore “honest”; *e.g.*, the roaring of stags of *Cervus elaphus* (Red Deer) where it appears that stags with a low fighting ability simply cannot roar at a high rate (Clutton-Brock et al. 1979; Maynard Smith and Harper 1988 in Dawkins and Guilford 1991, 866).

chemosignal See chemical-releasing stimulus: semiochemical.

composite signal *n.* A signal made up of two, or more, simpler signals (Wilson 1975, 581).

conventional signal *n.* A signal that indicates a signaler’s membership in a particular category of signalers and is not necessarily a reliable indicator of signaler quality, *e.g.*, the plumage “badges of status” of many bird species (Roper 1986; Maynard Smith and Harper 1988 in Dawkins and Guilford 1991, 865–866).

♦ **counterfeit signal** *n.* A deceptive signal (Wickler 1968, 241).

cf. deception; lie; signal: deceitful signal

deceitful signal *n.* A signal that is incorrectly identified by its receiver, and thus one that may enhance the sender’s fitness and decrease the receiver’s fitness as a result of its misinterpretation (Weldon 1985, pers. comm.), *e.g.*, the signal of a female of a predatory firefly (= “femme fatale”) that lures heterospecific male fireflies to her which she then eats (Alcock 1983, 449) or an animal’s exaggerating its body size that gives it an advantage over a rival (McFarland 1985, 114).

syn. dishonest signal (Dawkins and Guilford 1991, 865)
cf. deception; femme fatale; signal: honest signal

Comment: Dawkins and Guilford (1991, 865) argue “that dishonest signals are likely to be a widespread component of signaling systems concerned with quality advertisement and that previous discussions have neglected a vital evolutionary consideration, the cost to the receiver of eliciting and evaluating honest signals.”

digital signal *n.* A signal that is “turned either on or off, without significant intermediate gradation” (Sebeok 1962 in Wilson 1975, 178; Wilson 1975, 582).
syn. discrete signal (Wilson 1975, 178)

cf. analog or graded signal

Comment: A digital signal is most perfectly represented in the act of simple recognition, particularly during courtship (Sebeok 1962 in Wilson 1975, 178; Wilson 1975, 582).

direct signal See signal: digital signal.

graded signal See signal: analog signal.

honest signal *n.*

1. A signal whose level is related to perfect information regarding what a "receiver wants to know" (Zahavi 1975, 1987 in Dawkins and Guilford 1991, 865, 870).

Note: Some biologists think that this kind of honest signal is unlikely to occur (Dawkins and Guilford 1991, 870).

2. In Elephants, Humans, and probably many ungulate species: A signal that is correctly identified by its receiver, and thus, one that can enhance the receiver's fitness (Weldon 1985, pers. comm.; Poole 1989, 151).

Note: In Humans, facial "beauty" in both sexes, men's muscles, and women's body fat appear be honest signals (Diamond 1996, December, 82).

3. A signal that is uncheatable because it is maintained by receiver cost (Dawkins and Guilford 1991, 870).

Note: Future research is needed to ascertain whether this is a reasonable definition of "honest signal."

4. A signal that is a necessary and perfectly reliable indication of a quality that gives the best estimate of outcome, *e.g.*, resource-holding potential (Dawkins and Guilford 1991, 870).

5. A signal that is a necessary, but not an entirely reliable, indication of a quality that gives the best estimate of outcome (Dawkins and Guilford 1991, 870).

Note: Not all investigators agree with this definition.

6. One of a group of signals in a conventional system that are worth paying attention to on the average (Dawkins and Guilford 1991, 871).

Note: This definition trivializes the concept of "honesty" because it could then be used to describe a system in which cheating and "mimicry" are rife (Dawkins and Guilford 1991, 871).

syn. legitimate signal (Weldon, pers. comm.)

cf. signal: deceitful signal; signaler: deceitful signaller
Comments: Definitions 1, 3, 4, 5, and 6 are based on my perceptions of definitions of "honesty" by Dawkins and Guilford (1991) that I extrapolated to the term "honest signal." Theoretical models indicate that signaling systems can be stable if their average signals are honest (Johnstone and Grafen 1993 and Kokko 1997 in Candolin 1999, 1261). In *Gasterosteus aculeatus* (Three-spined Sticklebacks), males in better physical conditions have higher lipid contents than males in worse conditions. Both males in poor and good conditions tend to have larger reddish areas compared to males in intermediate condition; thus, the size of a male's reddish area is not an honest signal of his lipid content and body condition.

invitation signal *n.* An individual ant's signal that causes a conspecific individual to join in performing an act, such as following an odor trail or cooperating in adult transport (Hölldobler and Wilson 1990, 639).

legitimate signal See signal: honest signal.

odor signal *n.* A signal comprising airborne molecules that a particular animal can perceive (Murlis 1986).

syn. odor plume (Murlis 1986)

cf. chemical-releasing stimulus: pheromone

Comment: Murlis (1986) gives definitions of many factors related to "odor signals."

persuasion signal *n.* A signal employed by individuals with "conflicting interests" that enables them to gain some advantage (Wittenberger 1981, 619).

Comment: "Persuasion signals" are often given during aggressive interactions or "courtship" (Wittenberger 1981, 619).

play signal See facial expression: play signal.

poster signal *n.* In some bird species: A color patch on wings, the tail, or both shown by an individual in flight (Wilson 1975, 213); *e.g.*, the large white wing patches of *Mimus polyglottos* (Northern Mockingbirds).

cf. speculum

Comment: Poster patches may be used as assembling signals (Wilson 1975, 213).

postlinguistic signal *n.* A paralanguage signal that has been in service after the evolutionary origin of true language (human verbal communication) (Wilson 1975, 556).

cf. paralanguage; signal: prelinguistic signal

prelinguistic signal *n.* A paralanguage signal that was in service before the evolutionary origin of true language (human verbal communication) (Wilson 1975, 556).

cf. paralanguage; signal: postlinguistic signal

pursuit-deterrant signal *n.* A prey individual's communicating its alertness and ability to escape predator's attack to the predator (Leal 1999, 521).

Comment: The lizard *Anolis cristatellus* uses a pushup display as a pursuit-deterrant signal (Leal 1999, 521).

seismic signal *n.* In *Litoria infrafrenata* (White-lipped Tree Frogs) and *Spalax* sp. (blind mole rats): An animal produced substrate-borne vibration used in communication (Rado et al. 1987, 1249).

status signal *n.* An animal's trait (morphology, behavior, body-part posture, etc.) that communicates socially relevant information to conspecifics such as social rank or mating experience; *e.g.*, the silver-gray markings of a dominant male Gorilla in a troop, larger song repertoires in older males with more breeding experience of some songbird species, or the wing-patch size of male *Agelaius phoeniceus* (Red-winged Blackbirds) (Schenkel 1947 in Wilson 1975, 280; Immelmann and Beer 1989, 290).

syn. status sign (Wilson 1975, 280)

♦ **signal-detection theory** See ³theory: signal-detection theory.

♦ **signal entropy** *n.* The information in a signal, which is partly or totally transmitted (Wilson 1975, 195).

♦ **signal interceptor** See eavesdropper.

♦ **signal jump** *n.* In many pomacentrid- and some blenniid- and tripterygiid-fish species: An individual's courtship behavior that involves its swimming upward with its rostral end pointing slightly downward, then dropping rapidly downwards and thus inscribing an arc (Heymer 1977, 165).

syn. diving display (Spanier 1970 in Heymer 1977)

♦ **signal receiver** See operator.

♦ **signal stimulus** See stimulus: releaser.

♦ **signal-transduction pathway** See pathway: signal-transduction pathway.

- ♦ **signaler, signaler** *n.* An organism that produces a signal, *q.v.*
cf. signal
- deceitful signaler** *n.* An organism that sends a deceitful signal, *q.v.*
syn. cheater, illegitimate signaler
cf. signal: deceitful signal
- honest signaler** *n.* An organism that sends an honest signal, *q.v.*
syn. legitimate signaler
- ♦ **signaling** *n.*
 1. A person's making signals to inform or notify another person (Michaelis 1963).
 2. A person's communicating by signals (Michaelis 1963).
 3. A cell's communicating with another cell(s) (Campbell and Reece 2005, 203).
[French < Latin *signalis* < *signum*, sign]
- cell signaling** *n.* A cell's communicating with another cell within, between, or among organisms, through chemical means (a chemical messenger) or direct contact (Campbell and Reece 2005, 201–202).
syn. chemical signaling (Campbell 1996, 912); cell-to-cell signaling, signaling (Campbell et al. 1999, 188; Campbell and Reece 2005, 201).
Comments: Cell signaling evolved early in the history of life, the distance between signaling cells ranges from close together through far apart, and the three stages of cell signaling are reception, transduction, and response (Campbell et al. 1999, 188). Cell signaling is a universal mode of regulation in organisms; studies of cell signaling are helping to answer important questions in biology and medicine in areas ranging from embryological development through hormone actions through the development of cancer and other diseases.
- cell-to-cell recognition** *n.* In Animals: Cell signaling in which cells communicate via direct contact between membrane-bound, cell-surface molecules (Campbell and Reece 2005, 203).
- hormonal signaling** *n.* Cell signaling in which an organism's cell releases hormone molecules which travel through air (*e.g.*, ethylene, a plant hormone) or through its body (in animals and plants) to a target cell(s) in another part of the organism's body (Campbell et al. 1999, 190).
syn. endocrine signaling (in animals) (Campbell et al. 1999, 190)
- insulin signaling** *n.* Cell signaling that results from stimulation of an organism's insulin receptor(s) (InR) (Sim and Denlinger 2008, 6777).
Comment: Insulin signaling is essential for normal growth in insects and is a highly important regulator of insect growth and size of cells, organs, and entire bodies in response to nutrient availability by controlling both cell size and number (Sim and Denlinger 2008, 6779). This pathway may be involved in apoptosis, energy metabolism, immune response, and longevity. Suppression of insulin signaling may induce adult diapause in *Culex pipiens* and *Drosophila melanogaster* and the dauer formation in *Caenorhabditis elegans*.
- local signaling** *n.* Cell signaling involving nearby cells, *e.g.*, paracrine signaling, *q.v.* (Campbell and Reece 2005, 203).
cf. signaling; cell signaling; long-distance signaling
- long-distance signaling** *n.* In animals: Cell signaling involving transmission of a signal through a nervous system, involving an electrical signal that

travels the length of a nerve cell and is then reconverted to a chemical signal that crosses a synapse to another nerve cell where it is reconverted to an electrical signal (Campbell and Reece 2005, 203).
cf. signaling; cell signaling; local signaling

paracrine signaling *n.* Cell signaling in which a cell releases a chemical messenger (= a local regulator) into interstitial fluid and, thereby, affects a nearby target cell (Campbell 1996, 913).

Comments: Local regulators include carbon monoxide, growth factors, histamine, interleukins, neurotransmitters, nitric oxide, and prostaglandins. Histamine and interleukins coordinate a person's body defenses (Campbell 1996, 915). Carbon monoxide and nitric oxide can act as both neurotransmitters and paracrine signals.

synaptic signaling *n.* Cell signaling in which a neuron dispatches its transmitter into a synapse, a junction with a target cell (Campbell 1996, 914).

♦ **signaling behavior** See display.

♦ **signature sequence** *n.* A taxon's specific base sequence in ribosomal RNA, or other nucleic acid, that a researcher compared to the specific base sequence of another taxon at a comparable location in its nucleic acid (Campbell 1996, 508).

♦ **significance level** See p: "stipulated-p."

♦ **significance test** See statistical test: significance test.

♦ **significant** See statistically significant.

♦ **Signor-Lipps effect** See effect: Signor-Lipps effect.

♦ **sign stimulus** See *stimulus*: sign stimulus.

♦ **sign vehicle** *n.* The effective part of a signal, *q.v.*; the part that affects a recipient's behavior (Immelmann and Beer 1989, 270).
syn. sign stimulus (in some cases, Immelmann and Beer 1989, 270)

Comment: A "sign vehicle" can include stimuli that act over an extended period and produce a physiological change in an animal [from Morris' (1924) communication theory (Immelmann and Beer 1989, 270)].

♦ **silent allele** See allele: silent allele.

♦ **silent-bared-tooth display** See display: bared-teeth display: silent-bared-tooth display.

♦ **silent DNA** See nucleic acid: deoxyribonucleic acid: silent DNA.

♦ **silicole, silicolous** See -cole: silicole.

♦ **silvicole, silvicolous** See -cole: silvicole.

♦ **silvics** See study of: silvics.

♦ **simple digital organism** See program: simple organism: complex digital organism.

♦ **simplicity** See parsimony.

♦ **Simpson's Index of Diversity** See index: species-diversity index: Simpson's index of diversity.

♦ **simulation** *n.* A model's imitation, or mimicking, of a system's behavior (Lincoln et al. 1985).

♦ **simultaneous choice test** See test: choice test.

♦ **"simultaneous-endosymbiosis hypothesis"** See hypothesis: endosymbiosis hypothesis: "simultaneous-endosymbiosis hypothesis."

♦ **simultaneous hermaphroditism** See hermaphroditism: simultaneous hermaphroditism.

♦ **simultaneous hermaphrodite** See hermaphrodite: simultaneous hermaphrodite.

♦ **simultaneous polyandry** See mating system: simultaneous polyandry.

♦ **simultaneous polygamy** See mating system: simultaneous polygamy.

- ♦ **simultaneous polygyny** See mating system: simultaneous polygyny.
- ♦ **SINE** See nucleotide element: short interspersed nucleotide element.
- ♦ **singing** See animal sounds: song.
- ♦ **single African origin hypothesis** See hypothesis: African-origin hypothesis of human mitochondrial DNA evolution.
- ♦ **single-gene marker** See marker: single-gene marker.
- ♦ **single-impact hypothesis** See hypothesis: single-impact hypothesis.
- ♦ **single-male group** See harem.
- ♦ **single-point analysis** See method: single-point analysis.
- ♦ **single-tail test** See statistical test: one-tailed test.
- ♦ **singular** See ²group: singular.
- ♦ **singular breeding** See breeding: singular breeding.
- ♦ **sink habitat** See habitat: sink habitat.
- ♦ **sire** *n.* In animal breeding, the male parent (Lincoln et al. 1985).
cf. dam
- ♦ **sister** *n.* A female that has one, or both, of the same parents as one, or more, other individuals of either sex (Michaelis 1963).
Comments: Due to terminological problems regarding haplodiploid animals, Page and Laidlaw (1988), classify sisters with a genetic-pairing terminology that includes “super sister,” “full sister,” “super half sister,” “paternal half sister,” and “maternal half sister.” Their classification differs from a commonly used physical-pairing terminology (which I do not include here); their paper gives further clarification.
- ♦ **full sister** *n.* In diploid species: A female that shares the same parents with another female and thus has a pedigree coefficient of relationship, G , of 0.5 with her (Michaelis 1963; Page and Laidlaw 1988, 944).
syn. whole sister (Page and Laidlaw 1988, 944)
Comments: G is 0.5 because sisters share an average of 0.25 of their maternal and paternal genomes for a total average of 0.5. A full sister in a haplodiploid species is called a “super sister,” *q.v.*
- ♦ **half sister** *n.* A female that shares only one parent with another female (Michaelis 1963; Page and Laidlaw 1988, 944).
- ♦ **maternal half sister** *n.* In diploid and haplodiploid species: A female that shares only her mother with another female and thus has a G of 0.25 with her (Page and Laidlaw 1988, 944).
Comment: G is 0.25 because these sisters share an average of 0.25 of their maternal genome and share no paternal genes.
- ♦ **paternal half sister** *n.*
 1. In diploid species: A female that shares only her father with another female, and thus has a G of 0.25 with her (Page and Laidlaw 1988, 944).
Note: G is 0.25 because sisters share an average of 0.25 of their paternal genome and share no maternal genes.
 2. In haplodiploid species: A female that shares only the same paternal grandmother with another female, but has a different father, and thus has a G of 0.25 with her (Page and Laidlaw 1988, 945).
Note: The fathers of these paternal half sisters have different genomes from the same mother, but on the average such fathers have only 0.25 of their genes in common. Therefore, these daughters have 0.25

- of their genes in common via their fathers and no genes in common via their mothers.
cf. sister: half sister: super half sister
- ♦ **super half sister** *n.* In haplodiploid species: A female that has the same father with another female, and thus a G of 0.5 with her sister (Page and Laidlaw 1988, 944).
Comment: This G occurs because their haploid father gives each daughter an essentially identical set of genes.
 - ♦ **super sister** *n.* In haplodiploid species: A female that shares the same mother and same replicated genome from the same father (and thus the same paternal grandmother) with her sister and thus has a pedigree coefficient of relationship, G , of 0.75 with her sister (Page and Laidlaw 1988, 944).
 - ♦ **sister group** See ²group: sister group.
 - ♦ **sister species** See ²species: sister species.
 - ♦ **sister-species group** See ²group: sister group.
 - ♦ **sisyphean genotype** See -type, type: genotype: sisyphean genotype.
 - ♦ **site** *n.* “Place; position; habitat” (Lincoln et al. 1985).
 - ♦ **restriction site** *n.* The place on a DNA molecule where a restriction enzyme cuts the molecule (Campbell et al. 1999, 366).
 - ♦ **site-directed mutagenesis** See method: site-directed mutagenesis.
 - ♦ **Site of Specific Scientific Interest** See place: Site of Specific Scientific Interest.
 - ♦ **site tenacity** See *Ortstreue*.
 - ♦ **sitting** See ²group: sitting.
 - ♦ **situation analysis** See analysis: situation analysis.
 - ♦ **size rule** See rule: Bergmann’s rule.
 - ♦ **size-fitness-correlation hypothesis** See hypothesis: size-fitness-correlation hypothesis.
 - ♦ **skato-** See scato-.
 - ♦ **skatobios** See -bios: skatobios.
 - ♦ **skein** See ²group: skein.
 - ♦ **skewness** *n.* Statistically, the degree of asymmetry, or departure from symmetry, of a frequency distribution (Sokal and Rohlf 1969, 113).
Comment: In a skewed distribution, the mean and median do not coincide (Sokal and Rohlf 1969, 113).
 - ♦ **negative skewness** *n.* A unimodal curve’s having a long thin tail on its left side (Lincoln et al. 1985).
syn. left-skewed curve (Sokal and Rohlf 1969, 113)
 - ♦ **positive skewness** *n.* A unimodal curve’s having a long thin tail on its right side (Lincoln et al. 1985).
syn. right-skewed curve (Sokal and Rohlf 1969, 113)
 - ♦ **skill memory** See memory: skill memory.
 - ♦ **skin-conductance response** See response: skin-conductance response.
 - ♦ **Skinner box** See puzzle box: Skinner box.
 - ♦ **skiophile, skiophilous, sciophilous, skiophilic** See ¹-phile: umbrophile.
 - ♦ **skoto-, skot-, scoto-, scot-** *comb. f.* “Darkness” (Michaelis 1963).
[Greek *skotos*, darkness]
 - ♦ **skotophile, skotophilous, skotophilus, skotophilic, skotophily** See ¹-phile: skotophile.
 - ♦ **skotophilic** *adj.* Referring to the dark phase of a light-dark cycle (Lincoln et al. 1985).
cf. ¹-phile: skotophile
 - ♦ **skotoplankton** See plankton: skotoplankton.
 - ♦ **skototaxis, scototaxis, skototactic** See taxis: skototaxis.
 - ♦ **skulk** See ²group: skulk.
 - ♦ **skull** See ²group: skull.

- ♦ **slack** See habitat: dune slack.
- ♦ **slave-making** See parasitism: social parasitism; slavery.
- ♦ **slavery** See parasitism: social parasitism; symbiosis: slavery.
- ♦ **sleeking** *n.* A bird's depressing its feathers against its skin which reduces heat retention by its feathers (Immelmann and Beer 1989, 101).
cf. feather ruffling
- ♦ **sleep** *n.*
 1. In many animal species: An individual's unconscious state, or condition, that it regularly and naturally assumes, during which its nervous-system activity is almost, or entirely, suspended, and recuperation of its powers occurs; slumber; repose (Oxford English Dictionary 1972, entries from *ca.* 825).
Note: This historical definition is erroneous because an animal's nervous system is very active during sleep.
 2. In many animal species: A period, or occasion, of slumber (Oxford English Dictionary 1972, entries from *ca.* 1200).
 3. In many plant species: An individual's closing its flowers, leaves, or both, especially at night (Oxford English Dictionary 1972, entries from 1757).
cf. movement: rapid-leaf movement, sleep movement
 4. For example, in some amphibian, bird, fish, insect, mammal, mollusc, and reptile species: A period of prolonged inactivity generally associated with organization by a daily, or tidal, rhythm, an elevation of thresholds for various responses, and occurrence in a species-specific (usually safe) site and in a species-specific posture (Dewsbury 1978, 58).
cf. brain waves
 5. A resting animal's active process characterized by a cyclic succession of different psychophysiological phenomena (Kelly 1991, 793).

Comments: Kelly (1991) presents a helpful classification of kinds of sleep, and I include his definitions below, along with more historical ones. The details of sleep vary so much among species "that a comprehensive definition covering all cases remains elusive" (Immelmann and Beer 1989, 271). The hypothalamus mediates sleep in Humans, and probably also in birds and other mammals (Campbell 1996, 1018). Why Humans need sleep remains puzzling (Patricia Churchland in Campbell 1996, 777–778). Sleep might restore basic neurotransmitters because neurons are highly active during sleep. Several centers in a person's cerebrum and brain stem control arousal and sleep (Campbell 1996, 1018).

A CLASSIFICATION OF SLEEP^a

- I. stage-1 sleep (*syn.* active sleep, AS, desynchronized sleep, paradoxical sleep, rapid-eye-movement sleep, REM sleep)
- II. slow-wave sleep
 - A. stage-2 sleep
 - B. stage-3 sleep (*syn.* delta sleep)
 - C. stage-4 sleep (*syn.* delta sleep)

^a After Kelly (1991a).

- active sleep (AS)** See sleep: stage-1 sleep.
deep sleep (DS) *n.* Human sleep in which delta brain waves predominate and periods of a desynchronized EEG reminiscent of wakefulness occur (Campbell 1996, 1018).

- ♦ **delta sleep** See sleep: stage-3 and -4 sleep.
- ♦ **desynchronized sleep** See sleep: stage-1 sleep.
- ♦ **paradoxical sleep** See sleep: stage-1 sleep.
- ♦ **rapid-eye-movement sleep** See sleep: stage-1 sleep.

- ♦ **quiet sleep** *n.* Sleep in which brain waves are relatively long and of high amplitude; contrasted with active sleep (Immelmann and Beer 1989, 272).

- ♦ **REM sleep** See sleep: stage-1 sleep.

- ♦ **slow-wave sleep** See sleep: slow-wave sleep (table).

- ♦ **stage-1 sleep** *n.*

1. Animal sleep in which brain waves are relatively short and of low amplitude; contrasted with quiet sleep (Immelmann and Beer 1989, 272).

2. In Birds and Mammals: An animal's sleep during which its brain waves are desynchronized and have a low-voltage, fast-activity pattern that is similar to that of its waking state (Kelly 1991, 794).

- syn.* active sleep, AS, desynchronized sleep, paradoxical sleep, rapid-eye-movement sleep, REM sleep (Kelly 1991, 794)

Comments: Stage-1 sleep is not definitely known in Amphibians and Reptiles (Kelly 1991, 794–797). In Humans, stage-1 sleep begins *in utero*, and person's stage-1 sleep generally declines with age. This is the deepest sleep stage. A person's brain consumes more oxygen during stage-1 sleep than during intense mental or physical exercise during his waking state. Most human sleepers who awaken from stage-1 sleep recall dreaming; whereas, less than half who awaken from slow-wave sleep recall dreaming. In human males, penile erection frequently occurs during stage-1 sleep and usually bears little relationship to dream content.

[Stage-1 sleep, after the fact that a person goes into this kind of sleep during a sleeping bout after a period of nonsleep. He then goes into stage-2, -3, and -4 sleep (Kelly 1991, 794, fig. 51-2). Desynchronized sleep, after the brain wave forms of an animal in stage-1 sleep. Rapid-eye-movement sleep, after that fact that an animal in stage-1 sleep shows slow, rolling eye movements with bursts of rapid-eye movements.]

- ♦ **stage-2, 3, 4 sleep** See sleep (table).

- ♦ **sleep movement** See movement: sleep movement.

- ♦ **sleep nest** See nest: sleep nest.

- ♦ **sleeping position** *n.* An animal's body position that it adopts during sleep, which varies among species (Immelmann and Beer 1989, 273).
cf. posture.

- ♦ **sleuth** See ²group: sleuth.

- ♦ **sliding** *n.*

1. A person's passing from one place, or point, to another with a smooth and continuous movement, especially through air or water or along a surface (Oxford English Dictionary 1972, verb entries from *ca.* 950).

2. An individual animal's slipping, losing its foothold (Oxford English Dictionary 1972, entries from *ca.* 1225).

3. In many reptile species, etc.: An individual's gliding or crawling, now rarely used (Oxford English Dictionary 1972, entries from *ca.* 1300).

- Note:* The "slider" is a basking turtle that "slides into water at least sign of danger" (Conant 1958, 59).

4. A person's moving, going, or proceeding unperceived, quietly, or stealthily; stealing, slinking, creeping, or slipping away, into, or out of a place,

- etc. (Oxford English Dictionary 1972, entries from 1382).
5. A person's causing (something) to move in a smooth, gliding motion; pushing (something) over a level surface (Oxford English Dictionary 1972, entries from *ca.* 1537).
 6. In some penguin species: An individual's sliding on its ventral side, propelling itself forward with its feet (Heymer 1977, 156).
- syn.* tobogganing (Prevost 1961 in Heymer 1977)
- ♦ **SLiME** See system: subsurface-lithoautotrophic-microbial ecosystem.
- ♦ **"slow ad hoc mimicry"** See mimicry: "ad hoc mimicry: slow ad hoc mimicry."
- ♦ **slow-wave sleep** See sleep: slow-wave sleep (table).
- ♦ **smack** See ²group: smack.
- ♦ **small-eye** See gene: *pax-6* (comments).
- ♦ **small fry** See animal names: small fry.
- ♦ **SMART objectives** *n.* Assessment aims of an organism conservation plan (New 2009, 69). [SMART after specific (unambiguous), measurable, appropriate, realistic (or responsible), time-bound]
- ♦ **smatch** See animal sounds: smatch.
- ♦ **smiling** See facial expression: smiling.
- ♦ **Smithsonian Tropical Research Institute** See research station: Smithsonian Tropical Research Institute.
- ♦ **smog** *n.*
 1. A combination of smoke and fog, especially as seen in highly populated industrial and manufacturing areas (Michaelis 1963).
 2. A lung-searing combination of hydrocarbons, nitrogen oxides, ozone, and other emissions from burning forests or fuels (Revkin 2000, 3 October, D5). [Blend of SM(OKE) and (F)OG]
- ♦ **smoothing** *n.* In statistics, a person's averaging data in time, or space, in order to compensate for random errors, or variations, on a scale smaller than that presumed significant to a given problem (Lincoln et al. 1985).
- ♦ **smuth** See ²group: fluther.
- ♦ **S(n)** See index: species richness.
- ♦ **sneak copulation** See copulation: sneak copulation.
- ♦ **sniff yawning** See yawning: sniff yawning.
- ♦ **snood** *n.* In *Meleagris gallopavo* (Turkey): A pendulous skin over an individual's beak (Zuk 1984, 32). *Comments:* In *M. gallopavo*, females prefer males with longer snoods as mates, and males are less likely to engage in aggression with other males with larger snoods (Richard Buchholz in Anonymous 1996, December, 34, illustration). [possibly from a fillet, band, or ribbon for confining a female person's hair < Old English *snōd*]
- ♦ **snoring** See behavior: snore.
- ♦ **snort** See animal sounds: snort.
- ♦ **snuffling** *n.*
 1. A person's drawing air into his nostrils to smell something; smelling at a thing (Oxford English Dictionary 1972, entries from *ca.* 1600).
 2. In adult *Canis lupus* (Gray Wolves): An individual's probing "its nose and mouth around the lip area of another in an apparent attempt to learn whether it has eaten recently" (Mech 1970 in Wilson 1975, 227). *Comments:* The Oxford English Dictionary (1972) gives many more definitions for human snuffling.
- ♦ **social** *adj.* See sociality.
- ♦ **social attraction** *n.* A mutual attraction between conspecific social animals, or between heterospecific animals, especially in mixed groups, *q.v.* (Immelmann and Beer 1989, 274).
- ♦ **social behavior** See behavior: social behavior.
- ♦ **social bucket** *n.* An individual ant's carrying liquid food between her mandibles and sharing it with her nest mates by mouth-to-mouth contact (Hölldobler and Wilson 1990, 643). *cf.* trophallaxis
- ♦ **social buffering** See buffering: social buffering.
- ♦ **social-cohesion hypothesis** See hypothesis: social-cohesion hypothesis.
- ♦ **social commensalism** See symbiosis: commensalism.
- ♦ **social companion** See companion: social companion.
- ♦ **social conflict** See ¹conflict.
- ♦ **social conventions** *n.* An individual animal's device by which it curtails its own fitness and thereby increases its group survival (Wynne-Edwards 1962 in Wilson 1975, 109). *cf.* display: epideictic display; selection: group selection *Comment:* This is a controversial concept especially as it might relate to nonhuman animals.
- ♦ **social Darwinism** See Darwinism: social Darwinism.
- ♦ **social deprivation** See experiment: isolation experiment.
- ♦ **social distance** See distance: individual distance.
- ♦ **social dominance** See dominance: social dominance.
- ♦ **social donorism** See altruism (def. 2).
- ♦ **social drift** See drift: social drift.
- ♦ **social drive** See drive: bonding drive.
- ♦ **social dynamics** *n.* All of the ways that a species-characteristic social structure is maintained or varied (Immelmann and Beer 1989, 274).
- ♦ **social facilitation** See ²facilitation: social facilitation.
- ♦ **social-facilitation hypothesis** See hypothesis: turtle-homing hypotheses: social-facilitation hypothesis.
- ♦ **social grooming** See grooming: social grooming.
- ♦ **social group** See ²group: social group.
- ♦ **social hierarchy** See dominance hierarchy.
- ♦ **social homeostasis** See homeostasis: social homeostasis.
- ♦ **social hormone** See chemical-releasing stimulus: semiochemical: pheromone.
- ♦ **social-imitative learning, social imitation** See learning: social imitation.
- ♦ **social inhibition** See inhibition: social inhibition.
- ♦ **social mimicry** See mimicry: social mimicry.
- ♦ **social mutualism** See symbiosis: mutualism.
- ♦ **social organization, class A to class E levels** *n.* A classification used for African antelopes and buffaloes (Jarman 1974 in Wilson 1975, 485–486).
- ♦ **social parasitism** See parasitism: social parasitism.
- ♦ **social play** See play: social play.
- ♦ **social psychology** See study of: psychology: social psychology.
- ♦ **social regulation** See regulation: social regulation.
- ♦ **social releaser** See stimulus: releaser: social releaser.
- ♦ **social selection** See selection: social selection.
- ♦ **social stomach** See crop (comment).
- ♦ **social-subordination hypothesis** See hypothesis: population-limiting hypotheses: social-subordination hypothesis.
- ♦ **social system** See ¹system: social system.

- ♦ **social tendency** See drive: bonding drive.
- ♦ **social-tolerance principle** See principle: social-tolerance principle.
- ♦ **social tonus** *n.* In group-living mammals: Mild tension due to continual stimulation of social encounters (Immelmann and Beer 1989, 278).
- ♦ **social tool use** See tool use: social tool use.
- ♦ **social vigilance** See vigilance: social vigilance.
- ♦ **sociality** *n.*
 1. A person's state, or quality, of being social; a person's social intercourse, or companionship, with his fellows, or the enjoyment of this (Oxford English Dictionary 1972, entries from 1649).
 2. In many animal species: An individual's living in an enduring society (Michaelis 1963; Immelmann and Beer 1989, 274).
 3. In some plant species: An individual's growing compactly or in clumps (Michaelis 1963).
 4. In some invertebrate and vertebrate species: Sociobiologically, a species' having one, or more, of the following behaviors that occur in a conspecific group: cooperation in caring for young; reproductive division of labor, with more, or less, sterile individuals working on behalf of individuals engaged in reproduction; and at least two generations of life stages that are capable of contributing to colony labor and that live together (Wilson 1975, 398).
 5. "The combined properties and processes of social existence" (Wilson 1975, 398, 595).
 6. Broadly, behavior with interactions between conspecifics, or between heterospecific symbiotic animals, in which communication is similar to conspecific communication (Dewsberry 1978, 90; Immelmann and Beer 1989, 274); e.g., aggression, courtship, or parental care.

adj. social

cf. social, society, solitary

Comment: Classification of kinds of sociality is in a state of flux (Costa 1997, 152–153).

A CLASSIFICATION OF INSECT SOCIALITY^a

- I. solitary
- II. presocial
 - A. subsocial
 - B. parasocial
 - 1. communal
 - 2. quasi-social
 - 3. semisocial
- III. eusocial

^a Costa (1997, 152).

communal sociality *n.* For example, in some bee and wasp species: sociality in which individuals cooperate in nest construction but rear brood separately (Michener 1974, 372; Wilson 1975, 398).

Comment: Batra (1966, 375) describes this as "colonial" or "communal behavior."

eusociality *n.*

1. Nesting behavior in which a nest-founding female lives long enough to cooperate in division of labor with a group of her mature daughters (used as "eusocial" in Batra 1966, 375).
 2. In a snapping-shrimp species (Alpheidae); some wasp and bee species: sociality with all of these traits: cooperation in young care; reproductive division of labor, with more, or less sterile individuals working on behalf of individuals engaged in reproduction; and overlapping of at least two generations of life stages capable of contributing to colony labor (Wilson 1975, 398; Duffy 1996; Weiss 1996, 6 June, A1).
- syn.* primitive eusociality (Michener 1974, 373)
3. For example, in *Apis mellifera* (Western Honey Bees); possibly *Heterocephalus glaber* (Naked Mole Rats); and some ant, termite, and vespid-wasp species: eusociality (def. 2) with the additional characteristic that queens are externally morphologically distinguishable from female workers (Wilson 1975, 381, 398, 584; Jarvis 1981).

ROUTES TO EUSOCIALITY IN INSECTS^a

DEGREE OF SOCIALITY	COOPERATIVE BROOD CARE	REPRODUCTIVE CASTES	OVERLAP BETWEEN GENERATIONS
Parasocial Route to Eusociality			
solitary (presocial)	–	–	–
communal (presocial)	–	–	–
quasi-social (presocial)	+	–	–
semisocial (presocial)	+	+	–
metasocial (presocial)	+	–	+
eusocial	+	+	+
Subsocial Route to Eusociality			
solitary (presocial)	–	–	–
primitively subsocial (presocial)	–	–	–
intermediate subsocial I (presocial)	–	–	+
intermediate subsocial II (presocial)	+	–	+
eusocial (primitively and truly eusocial)	+	+	+

^a After Wilson (1975, 398). Costa (1997, 152) gives traditional classification of insect sociality which is similar to this classification. A plus (+) indicates the presence of a character; a minus (–), its absence.

syn. high eusociality, hypersociality (Batra 1966, 1977), true eusociality, true sociality

Note: Primitively-eusocial-bee species have no through little food exchange among adults, compared to highly eusocial species which have extensive food exchange among adults (Michener 1974, 372).

[Greek *eu*, good + Latin *socius*, companion; coined as “hypersocial” by Batra (1977, 291)]

hypersociality See sociality: eusociality.

parasociality *n.* For example, in presocial insect species: Sociality in which individuals have one, or two, of the three traits of eusociality (def. 2) (Wilson 1975, 592).

presociality *n.* Sociality in which there is any degree of social behavior beyond sexual behavior yet short of eusociality (Wilson 1975, 398); presociality includes “parasociality” and “subsociality.”

Comment: “Presociality” is a problematic term because it suggests no sociality, that presocial animals are evolving toward eusociality, or both (Costa 1997, 152–153).

primitive eusociality See sociality: eusociality.

quasi-sociality *n.* In some presocial insect species including bees: sociality in which same-generation conspecific individuals use the same composite nests and cooperate in brood care, but do not exhibit caste differentiation or overlap of generations (Michener 1974, 373; Wilson 1975, 398, 593).

semisociality *n.* In some insect species: Sociality in which same-generation, conspecific individuals cooperate in brood care and have a reproductive division of labor, *i.e.*, some individuals are primarily egg layers and some are primarily workers (Michener 1958 in Batra 1966, 375; Michener 1974, 374; Wilson 1975, 398, 594).

subsociality *n.* In some insect species including some passalid, pentatomid, and silphid species: Parental care of young (Batra 1966, 375; Wilson 1975, 346, 398, 428, 596).

Comment: “Subsociality” is a problematic term because it suggests no sociality, that subsocial animals are evolving toward eusociality, or both (Costa 1997, 152–153).

♦**1socialization** *n.*

1. A person’s “development of those patterns of social behavior basic to every normal human being” (Mead 1963 in Wilson 1975, 159).

cf. enculturation

2. A process by which a child learns the different behaviors that are expected from him and accepted by his society (Storz 1973, 261).

3. A person’s acquisition of social traits (Clausen 1968, Williams 1972 in Wilson 1975, 159).

4. An individual animal’s total behavior modification due to its interaction with other members of its society, including its parents; this includes morphogenetic socialization, learning of species-characteristic behavior, and enculturation (Poirier 1972 in Wilson 1975, 159, 595).

5. In some animal species: An individual’s learning behavior that is “strongly influenced by the particularities of its social experience” (Wilson 1975, 12–13, 159; Immelmann and Beer 1989, 276).

Note: This process becomes increasingly prominent as one moves upward phylogenetically into more intelligent species (Wilson 1975, 12–13, 159; Immelmann and Beer 1989, 276).

♦**2socialization** *n.* An individual wild animal’s being tamed so that it forms a primary social relation-

ship with a person, *e.g.*, in dog and wolf pups (Frank and Frank 1982, 95).

♦**socialization phase** See phase: socialization phase.

♦**social stimulation** See ²stimulus: social stimulation.

♦**societies** See ²community: societies.

♦**¹society** *n.* In ecology, a group of organisms living together under the same physiographic conditions and influenced and characterized by a principal species (Michaelis 1963).

♦**²society** *n.*

1. A person’s association with his fellows, especially in a friendly, or intimate, manner; companionship; fellowship (Oxford English Dictionary 1972, entries from 1531).

2. An individual animal’s living in association, in company, or in intercourse with conspecifics; the system, or mode of life, adapted by a conspecific group for the purpose of harmonious coexistence, mutual benefit, defense, etc. (Oxford English Dictionary 1972, entries from 1553 for Humans, 1794 for nonhumans).

3. The system of community life in which people form a continuous and regulatory association for their mutual benefit and protection (Michaelis 1963).

4. The body of people that compose such a community (def. 3); also, all people collectively, regarded as having certain common characteristics and relationships (Michaelis 1963).

5. A cooperating group of conspecific individual organisms (Alverdes 1927, Allee 1931, and Darling 1938 in Wilson, 1975, 8, 595), drawn together, kept together, or both, by social attraction (Immelmann and Beer 1989, 122).

6. An aggregation of socially intercommunicating, conspecific individual organisms that is delimited from other such societies by limited or no communication with them (Altmann, 1965 in Wilson, 1975, 8).

7. A group of conspecific individual organisms organized in a cooperative manner, extending beyond mere sexual activity (Wilson 1975, 7, 595).

8. For example, in some species of colonial invertebrates: A group of physically united zooids that might even be considered a superorganism or an organism (Wilson 1975, 383).

9. For example, in some insect species and *Heterocephalus glaber* (Naked Mole Rats): A eusocial group with reproductive and sterile castes that

SOME CLASSIFICATIONS OF SOCIETIES

I. Classification by effect of demographic variables

- A. casual society (fusion-fission society)
- B. demographic society

II. Classification by acceptance of newcomers

- A. closed society
- B. open society

III. Level of sociality (see sociality)

IV. Classification by attention structure

- A. acentric society
- B. centripetal society

V. Classification with regard to conflict among members

- A. despotic society
- B. egalitarian society

VI. Level of organization

- A. disorganized society
- B. organized society

might even be considered a superorganism (Wilson 1975, 383).

cf. ²group, sociality

[Old French *societe* < Latin *societas*, -*tatis* < *socius*, friend]

acentric society *n.* For example, in *Erythrocebus patas* (Patas Monkeys), Gibbons, and Langurs.; An attention structure (*q.v.*) composed of a society in which the females and young separate from males in times of inter- and intraspecific aggression; contrasted with centripetal society (Wilson 1975, 517).

allelarkean society *n.* An independent, dense, nonnomadic, and civilized human society (Lincoln et al. 1985).

autarkean society *n.* A simple, independent, nomadic, or sparsely distributed human society (Lincoln et al. 1985).

casual society, causal group *n.* In some primate species: A temporary group formed by individuals within a society which is unstable, being open to new members and losing old ones at a high rate, e.g., feeding groups of monkeys within a troop and groups of playing children.

cf. ²society: demographic society (Wilson 1975, 133, 580)

centripetal society *n.* An attention structure (*q.v.*) in which the members of society predominantly watch a dominant male and shift their positions according to his approach or departure, and adjust their aggressive behavior toward others according to his responses (Chance 1967, Chance and Jolly 1970 in Wilson 1975, 517).

closed society *n.*

1. A society that communicates relatively little with nearby societies of the same species and seldom if ever accepts immigrants (Dice 1952, 276; Wilson 1975, 17).
2. In some ant, bee, and termite species, and many rodent species: A society in which members do not tolerate the presence of nonsociety members and thus do not allow interchange of members with other societies (Immelmann and Beer 1989, 122).

syn. closed anonymous group (Heymer 1977, 29)

cf. society: open society

demographic society *n.* "A society that is stable enough through time, usually owing to its being relatively closed to newcomers, for the demographic processes of birth and death to play a significant role in its composition" (Wilson 1975, 133, 582).

cf. ²society: casual society

egalitarian society *n.* A society in which "benefits are divided roughly equally or in proportion to the risk or effort taken" (Vehrencamp 1983, 667, in Hand 1986).

euclonal society *n.* A society composed of genetically identical modular growth units (ramets) that can follow an independent existence if separated from their parent organism (Lincoln et al. 1985).

cf. ²society: paraclonal society, pseudoclonal society

insect society *n.*

1. "In the strict sense, a colony of eusocial insects" (ants, termites, eusocial wasps, or eusocial bees) (Wilson 1971, 465).
2. In the broad sense, any group of presocial, or eusocial, insects (Wilson 1971, 465).

kormogene society *n.* An organism colony in which different individuals are organically connected to one another (Lincoln et al. 1985).

modular society *n.* A society with repeated members or modular units (Lincoln et al. 1985).

► **continuous-modular society** *n.* A society with physically united modular units (Lincoln et al. 1985). *syn.* colony (Lincoln et al. 1985)

► **discontinuous-modular society** *n.* A society with physically separated modular units (Lincoln et al. 1985).

syn. aggregation, population (Lincoln et al. 1985)

multimale society *n.* A society in which more than two males have approximately equal rank (Wilson 1975, 291).

cf. ²society: unimale society

open society *n.* Especially in mammals that migrate in groups for long distances: A society in which members tolerate the presence of conspecifics, or heterospecifics, that were not originally members of their society and, thus, allow interchange, which might be continuous, of members with other societies (Immelmann and Beer 1989, 122).

cf. ²group; ²society: closed society

► **anonymous group** *n.* For example, in some bird and insect species and many rodent species: An open group whose members do not recognize each other as individuals, but are socially attracted to one another (Heymer 1977, 29; Immelmann and Beer 1989, 16, 122).

syn. open-anonymous group (Immelmann and Beer 1989, 16)

cf. aggregation, individualized group

► **individualized group** *n.* In some carnivore and many primate species: An open group whose members recognize each other as individuals (Immelmann and Beer 1989, 15).

cf. ²group: anonymous group.

organized society *n.* A group of conspecific organisms with these five attributes: a complex communication system, division of labor based on specialization, cohesion (members' tendency to stay together in time and space), permanence of group members (little emigration and immigration), and a resistance to immigration of nonsociety members (Eisenberg 1965 in Dewsbury 1978, 91).

paraclonal society *n.* A society comprising genetically identical modular units that cannot regenerate, or follow, an independent existence if separated from their parent organism (Lincoln et al. 1985).

cf. ²society: euclonal society, pseudoclonal society

pseudoclonal society *n.* A society composed of nongenotypically identical modular units that are so closely related and coordinated that they can be regarded as ecologically and functionally equivalent to a clone (Lincoln et al. 1985).

cf. ²society: euclonal society, paraclonal society

synhesma *n.* "A swarming society" (Lincoln et al. 1985).

See synhesma.

unimale society *n.* A society with one highest ranking male; contrasted with multimale society.

cf. harem

♦ **socio-** *comb.f.*

1. "Society; social" (Michaelis 1963).

2. "Sociology; sociological" (Michaelis 1963).

[French < Latin *socius*, companion]

- ♦ **sociobiological-selfish behavior, sociobiological selfishness** See behavior: selfish behavior.
- ♦ **sociobiology** See study of: biology: behavioral ecology, sociology.
- ♦ **sociocline** See cline: sociocline.
- ♦ **sociogenesis** See genesis: sociogenesis.
- ♦ **sociogenetics** See study of: genetics: sociogenetics.
- ♦ **sociogram** See -gram: sociogram.
- ♦ **sociohormone** See chemical-releasing substance: semiochemical: pheromone.
- ♦ **sociology** See study of: sociology.
- ♦ **sociometric matrix** See experimental design, sampling technique.
- ♦ **sociometry** See -metry: sociometry.
- ♦ **sociophobia** See -phobia: sociophobia.
- ♦ **sociotomy** See swarming: budding.
- ♦ **sodefrin** See chemical-releasing stimulus: semiochemical: pheromone: sodefrin.
- ♦ **sodomy** *n.*
 1. Unnatural human sexual intercourse, especially between males, and including Human–nonhuman animal intercourse (bestiality) (Oxford English Dictionary 1972, entries from 1297).
 2. An act of sodomy (def. 1) (Oxford English Dictionary 1972, entries from 1593).
 3. Human male penile insertion into the rectum of another person of either sex (Storz 1973, 263).
cf. copulation: homosexual copulation: pseudocopulation; fellatio
Comment: Laws of a number of U.S. states also include oral–genital acts and bestiality as sodomy (Storz 1973, 263).
[Old French *sodomie* < Late Latin Sodom, to whose people sodomy was imputed]
- ♦ **soft inheritance** See inheritance: soft inheritance.
- ♦ **soft science** See study of: science: soft science.
- ♦ **soft selection** See selection (table).
- ♦ **software** *n.* One or more computer programs (Lincoln et al. 1985).
cf. hardware, program
- ♦ **soil** *n.*
 1. Finely divided rock mixed with organic matter, constituting the portion of Earth's surface in which plants grow (Michaelis 1963).
Note: Soil contains many kinds of organisms including archaeans, bacteria, algae, arthropods, reptiles, salamanders, and small mammals.
 2. In engineering geology, all unconsolidated materials above bedrock; the regolith (Bates and Jackson 1984).
[Old French *soile, sueil* < Latin *solum*, a seat, mistaken for *solum*, the ground]
- ♦ **Typic Haplorthod** *n.* A soil that developed from basal till (nonstratified material deposited directly from glacial ice) (Neilsen et al. 2001, 1724).
- ♦ **soil climax** See ²community: climax: edaphic climax.
- ♦ **soil horizon** *n.* A relatively uniform soil layer, that is more, or less, parallel to the soil surface, and that is distinguishable from layers above and below it with regard to its biological, chemical, or physical characteristic or combination of these characteristics (Allaby 1994, 359).
Comments: Researchers primarily group soil horizons into O, A, B, and C horizons (Allaby 1994, 359). The exact characteristics and numbers of horizons varies among soils. For example, Neilsen et al. (2001) worked with three soil horizons (O_e, O_a, and A) in a northern

gymnospermous forest in New Hampshire. I list the main kinds of horizons below.

A horizon *n.* A soil horizon immediately below the O horizon that contains mixed organo-mineral matter (Allaby 1994, 359).

Comment: Researchers sometimes call the area of an A horizon that lost its mineral matter the A_e horizon (Kimmoms 1996, 258) or E horizon.

[e, E < eluviated (Allaby 1994, 359)]

B horizon *n.* A soil horizon immediately below the A horizon which receives organo-mineral matter from the A horizon (Allaby 1994, 359).

Comment: Not all soils have B horizons (Allaby 1994, 359).

C horizon *n.* A soil horizon immediately below the B horizon that contains soil parent materials, weathered but not otherwise altered by pedogenic processes (Allaby 1994, 359).

D horizon *n.* Unweathered material immediately below the C horizon (Allaby 1994, 359).

syn. R horizon (Allaby 1994, 359)

F horizon *n.* A layer of fermented organic material immediately below the L horizon (Allaby 1994, 359).

H horizon *n.* A layer of humified organic matter below immediately below the F horizon (Allaby 1994, 359).

K horizon *n.* A layer of often cemented mineral crust on a soil (Allaby 1994, 359).

L horizon *n.* The top layer of undecomposed organic litter on soil (Allaby 1994, 359).

[L < litter]

O horizon *n.* A soil horizon comprising organic material at a soil's surface (Allaby 1994, 359).

syn. A_o horizon (Allaby 1994, 359)

[O < organic]

♦ **solar emjoule** See emergy.

♦ **solar mass** *n.* The mass of the Sun; 1.9891×10^{30} kg (Mitton 1993, 421).

♦ **soil erosion** *n.* The process by which soil is carried away from its source over time.

Comment: Natural erosion in forests can be high during and after storms. Human activities increase soil erosion in many places.

♦ **solar transformity** *n.* The solar energy required to make 1 joule of some type of energy; expressed as emjoules per joule (sej/J) (Odum et al. 1988, 28).
cf. emergy

♦ **soldier** See caste: soldier.

♦ **soliciting behavior** See behavior: soliciting behavior.

♦ **soliciting song** See animal sounds: soliciting song.

♦ **solipsism** *n.*

1. In philosophy, a person's belief that his, or her, self is the only thing that exists; therefore, his, or her, reality is subjective (Michaelis 1963).

2. In philosophy, the belief that the only consciousness that a person knows about is his own.

Comment: “Solipsism” is contrasted with “objectivism.” Bateson (1991, 828) states, “Although it is logically defensible, most people would treat hard-line solipsism as an absurd stance. Certainly any committee that made a case for the treatment of animals on this basis would be treated with derision by the media and with contempt by the public at large.”
[Latin *solum*, alone + *ipse*, self]

♦ **solitary** *adj.*

1. Referring to a bee species in which females live alone in their nests and ordinarily do not interact

- with other adults neither their offspring nor others of their own generation (Michener 1974, 38, 374).
2. Referring to a bee species in which females maintain their nests alone, but may still be present in their nests when their progeny mature (Michener 1974, 38).
 3. Referring to an animal “species in which individuals form no enduring groups or pair bonds,” and live most of their lives away from conspecifics; an animal species that is not social (Immelmann and Beer 1989, 281).
cf. social, sociality
Note: Most animal species are solitary.
 4. Referring to a female parasitic wasp that lays only one egg on, or into, a particular host individual.
syn. nonsocial
cf. gregarious
- ◆ **Sollwert** *n.* The predetermined reference value (= efference copy) in an animal's feedback circuit, *q.v.* (Immelmann and Beer 1989, 243).
cf. principle: reaference principles
[German *Sollwert*, should-be value]
- ◆ **soma** *n.* The parts of an individual organism's body that are mortal and that “work for the preservation of genes in the germ-line” (Dawkins 1982, 287).
cf. germ-line
[Greek *sôma*, body]
- ◆ **somatic**
- macrosomatic** *adj.* In many mammal species: Referring to a species that possesses a highly developed sense of smell (Immelmann and Beer 1989, 178).
cf. -somatic: microsomatic
- microsomatic** *adj.* In many mammal species, especially primate species: Referring to a species that possesses a poorly developed sense of smell (Immelmann and Beer 1989, 184).
cf. -somatic: macrosomatic
- ◆ **somatic** *adj.*
 1. Of, or referring to the human body; bodily; corporal; physical (Oxford English Dictionary 1972, entries from 1775).
 2. Referring to the mortal part of an individual organism's body, as opposed to its germ-line (Dawkins 1982, 294).
- ◆ **somatic character** See character: somatic character.
- ◆ **somatic effort** See effort: somatic effort.
- ◆ **somatic-mutation theory** See ³theory: somatic-mutation theory.
- ◆ **somatic nervous system** See ²system: nervous system: somatic nervous system.
- ◆ **somatic parthenogenesis** See parthenogenesis: diploid parthenogenesis.
- ◆ **somatogamy** See -gamy: pseudogamy.
- ◆ **somatogenesis** See -genesis: somatogenesis.
- ◆ **somatogenic variations** *n. pl.* The various reactions of an individual organism's somatic tissues, or of its body as a whole, to external influences and the effects of use or disuse (Lincoln et al. 1985).
- ◆ **somatopsychology** See study of: psychology: somatopsychology.
- ◆ **somatosensory cortex** See organ: brain: somatosensory cortex.
- ◆ **somewhat common** See frequency (table).
- ◆ **-somy**
- monosomy** *n.* An organism's condition of lacking one chromosome of one pair, *e.g.*, an XO condition in *Drosophila* (King and Stansfield 1985).
- polysomy** *n.* An organism's condition of having extra chromosomes of some of its complementary pairs, *e.g.*, an XXX condition in *Drosophila* (King and Stansfield 1985).
- trisomy** *n.* An organism's condition of having one extra chromosome of one pair, *e.g.*, three chromosome-21s in a Human (King and Stansfield 1985).
cf. ploidy: aneuploidy
- ◆ **sonogram** See -gram: sonogram.
- ◆ **Sonagraph** See -graph: Sonograph.
- ◆ **song** See animal sounds: song.
- ◆ **song flight** See flight: courtship flight.
- ◆ **song imprinting** See learning: imprinting: song imprinting.
- ◆ **song print** See template.
- ◆ **sonic, soniferous** *adj.* “Capable of producing sounds” (Lincoln et al. 1985).
- ◆ **sonic hedgehog** See gene: sonic hedgehog.
- ◆ **sonication** See pollination: buzz pollination.
- ◆ **Sorcerer, the** *n.* An Aurignacian cave painting of a black creature that stands upright and has a bison torso and human legs (Thomas, 1995, A30).
Comments: The sorcerer is found in Chauvet Grotto, and similar images are found in Three Brothers Caves in the Pyrenees and Gabilou Caves in Dordogne, France (Thomas, 1995, A30). The Sorcerer might be a mythical being, force, or spirit.
- ◆ **sord** See ²group: sord.
- ◆ **sort** See ²group: sort.
- ◆ **¹sound** *n.*
 1. Any of a class of waves consisting of mechanical disturbances, such as varying pressure or alternating movement, in an elastic system, especially in air (Michaelis 1963); vibration of molecules in air, earth, water, etc. (Gould 1982, 114).
 2. An instance of sound (def. 1) (Michaelis 1963).
 3. Noise; sound lacking pitch and caused by vibrations of different and dissonant frequencies (Michaelis 1963).
- adj.* sonic
cf. animal sounds
- infrasound** *n.* Sound (def. 1 above) less than about 25 cycles per sec (hz) and below human hearing range (Michaelis 1963).
adj. infrasonic, subsonic
Comments: Quine (pers. comm.) indicates that infrasounds are those below 16 hz, although Humans can perceive sounds at 1 hz under certain conditions. McFarland (1985, 254) states that infrasound is that below 10 hz, and that Domestic Pigeons can hear infrasound as low as 0.06 hz.
- pseudosound** *n.* Sound that results from local air pressure changes which animals distinguish from infrasounds when infrasounds are used for long-distance communication (D. B. Quine, pers. comm.).
- ultrasound** *n.* Sound (def. 1) above human hearing threshold, generally considered to be over 20,000 hz, although this upper threshold varies with person and age (Michaelis 1963, D. B. Quine, pers. comm.).
adj. ultrasonic
Comment: Some bat species, shrews, and many rodent species communicate with ultrasounds.
- ◆ **²sound** *n.* Stimulation produced by sound of about 20 through 20,000 hz that is audible to Humans (Michaelis 1963).
- ◆ **³sound** *v.i.*
 1. To produce sound (Michaelis 1963).
 2. “To cause to give forth sound” (Michaelis 1963).
 3. “To utter audibly; pronounce” (Michaelis 1963).

- ♦ **“sound” *v.i.***
 1. To test, or examine, by sound (Michaelis 1963).
 2. In surgery, to search, or examine, with a sound (Michaelis 1963).
- ♦ **“sound” *v.i.*** In harpooned whales: To dive down suddenly and deeply (Michaelis 1963).
- ♦ **sound spectrograph** See -graph: sound spectrograph.
- ♦ **sounder** See ²group: sounder.
- ♦ **source habitat** See habitat: source habitat.
- ♦ **Southern-blot hybridization, Southern-blot technique, Southern blotting, Southern hybridization** See method: Southern blotting.
- ♦ **Southern Hemisphere Annular Mode** See oscillation: Antarctic Oscillation.
- ♦ **Southern Oscillation** See oscillation: Southern Oscillation.
- ♦ **Southern transfer** See method: Southern blotting.
- ♦ **sowse** See ²group: sowse.
- ♦ **Soxhlet method** See method: Soxhlet method.
- ♦ **space psychology** See study of: psychology: space psychology.
- ♦ **spaced training** See training: spaced training.
- ♦ **spacer DNA** See nucleic acid: deoxyribonucleic acid: spacer DNA.
- ♦ **spacing behavior** See behavior: spacing behavior.
- ♦ **span** See ²group: span.
- ♦ **spanandrous sex ratio** See ratio: sex ratio: spanandrous sex ratio.
- ♦ **spatial bonding** See bond: spatial bonding.
- ♦ **spanogyny** See -gyny: spanogyny.
- ♦ **spasmodic dance** See dance: bee dance: spasmodic dance.
- ♦ **spatial distribution** See distribution: spatial distribution.
- ♦ **spatial facilitation** See ¹facilitation: spatial facilitation.
- ♦ **spatial isolation** See isolation: spatial isolation.
- ♦ **spatial niche** See niche: spatial niche.
- ♦ **spatial summation** See ¹facilitation: spatial facilitation.
- ♦ **spatiotemporal structure** *n.* A person’s analysis and testing of an animal’s behavior in relation to its time and place of occurrence (Heymer 1977, 141).
cf. motivational analysis
- ♦ **spatiotemporal territory** See territory: spatiotemporal territory.
- ♦ **spatiotemporally clumped resource** See resource: spatiotemporally clumped resource.
- ♦ **spawn** *n.* A fungal mycelium (Oxford English Dictionary 1972, entries from 1731).
 See animal names: spawn; gamete: egg; group: spawn. *v.i., v.t.* spawn
- ♦ **SPEC** See species of European concern.
- ♦ **special-concern species** See ²species: special concern species.
- ♦ **special creation, Special Creation, creationism, doctrine of special creation** *n.* The belief that all organisms were specially created by God (Lincoln et al. 1985).
cf. creation science, creationist, evolution
- ♦ **specialist species** See ²species: specialist species.
- ♦ **specialization** *n.* An organism’s “evolutionary adaptation to a particular mode of life or habitat” (Lincoln et al. 1985).
cf. stereotypy
Comment: Behavioral stereotypy can be part of a species’ specialization (Klopfer 1969, 35).

- ♦ **specialized** *adj.* Referring to an organism that has a narrow tolerance range for one, or more, ecological conditions (King and Stansfield 1985).
 See ²species: specialized species.
cf. character: specialized character; generalized; ²species: specialist species; topic: stenotopic
- ♦ **specialized character** See character: specialized character.
- ♦ **specialized mimicry** See mimicry: specialized mimicry.
- ♦ **specialized species** See ²species: specialized species.
- ♦ **speciation** *n.*
 1. Genetic diversification of populations and the multiplication of species (Wilson 1975, 595).
 2. One phyletic line’s branching into two separate lines that are reproductively isolated where secondary contacts between them might occur (Brown 1975, 447).
 3. Many coexisting species’ evolving within an evolutionary grouping (Carson 1989, 872).
syn. specification (Darwin 1876 in Fleming 1959, 225)
cf. adaptive radiation; ²evolution: divergent evolution
Comment: “Speciation” is difficult to define due to the difficulty of defining “species,” *q.v.* (Immelmann and Beer 1989, 285).
- ♦ **allochronic speciation** *n.* Speciation that is influenced by divergence of breeding time of individuals within a species (Mayr 1982, 604).
Comment: This is one of three more frequently suggested mechanisms of sympatric speciation, *q.v.* (Mayr 1982, 604).
- ♦ **allopatric speciation** *n.*
 1. A concept of speciation with these tenets: new species arise by lineage splitting and developing rapidly, a small subpopulation of an ancestral form gives rise to a new species, and the new species originates in a very small part of the ancestral species’ geographic range in an isolated area at the periphery of its range (Eldredge and Gould 1972, 96).
syn. allopatric theory of speciation, (Mayr’s theory of) geographic speciation, geographical speciation
cf. speciation: sympatric speciation, geographic speciation; gradualism: phyletic gradualism
2. Speciation in which populations that are isolated by a geographical barrier become new species; contrasted with parapatric speciation and sympatric speciation (Campbell 1990, 465).
Comments: Building up of intrinsic isolating mechanisms occurs in species that may, or may not, have geographical, or other physical, barriers that promote “allopatric speciation” rather than “sympatric speciation.” Although “allopatric speciation” is widely accepted as an important kind of speciation, the relative importances of alternative processes, such as “instantaneous speciation” and “sympatric speciation,” are still controversial (Mayr 1982, 565). For example, pupfish allopatric speciation occurred in Death Valley, U.S., where a great inland lake began to dry up about 10,000 yr ago (Campbell 1990, 466). Now, usually only one pupfish species occurs in each of the small isolated springs that remain.
- ♦ **divergence speciation** *n.* Speciation in which two populations gradually adapt to disparate environments, accumulating differences in genotype and phenotype frequencies; reproductive barriers

between the populations evolve coincidentally; and the populations become different species (Alan Templeton in Campbell 1990, 472).

geographic speciation *n.* The phenomenon that species have similar analogs in different geographical areas (Mayr 1982, 411).

Comment: "Actually, the concept of geographic speciation was by no means entirely novel in 1837 when it occurred to Darwin" (Mayr 1982, 411).

hybrid speciation *n.* Speciation as a direct result of interspecific hybridization (Lincoln et al. 1985).

instantaneous speciation *n.* Speciation that occurs in one generation through drastic mutation such as polyploidy (Mayr 1982, 404; Stebbins 1950 and Grant 1971 in Mayr 1982, 603).

cf. effect; founder effect, ²evolution; instantaneous evolution, genetic drift, ploidy; polyploidy

Comments: Speciation by polyploidy is common in plants, but relatively rare in animals probably because it disrupts sex determination and dosage compensation in those animals with chromosomal sex determination (Miller 1925 and other references in Ptacek et al. 1994, 898). Frogs and Toads (Anura) have more polyploid species than other vertebrate taxa of comparable level. These anurans are in 12 genera and nine families. The tetraploid *Hyla versicolor* (Gray Tree Frog), has at least three separate, independent origins from diploid ancestors. Hugo De Vries discovered instantaneous speciation (sympatric speciation by autoploidy) in the evening primrose *Oenothera lamarckiana* in the 1920s (Mayr 1982, 404, 603).

parapatric speciation *n.*

1. "Speciation in which initial segregation and differentiation of diverging populations takes place in disjunction but complete reproductive isolation is attained after range adjustment so that populations become separate but contiguous" (Lincoln et al. 1985).

2. Theoretical speciation that occurs in two contiguous populations that have slow gene flow that does not overcome the populations' gene-pool divergences (Campbell 1990, 465).

Comment: Researchers have not reported definite cases of parapatric speciation (Campbell 1990, 465).

"peak-shift speciation" *n.* Speciation that results from a peak shift, *q.v.* (Campbell 1990, 473).

peripatric speciation *n.* The concept that evolutionarily more important events that pertain to speciation take place in peripherally isolated populations of a present species (Hapgood 1984).

phytic speciation *n.* One species' gradually evolving into a new one (Mayr 1982, 295).

syn. successional speciation (Lincoln et al. 1985)

cf. ²evolution; phyletic evolution

Comment: Phyletic speciation eventually leads to the replacement of an ancestral species by a derived species (Lincoln et al. 1985).

primary speciation *n.* Speciation by splitting of a single lineage into two, or more, separate evolutionary lineages (Lincoln et al. 1985).

cf. secondary speciation.

quantum speciation See speciation: saltational speciation.

saltational speciation, saltatory speciation, saltation, saltationism *n.*

1. Evolution of new species by macromutations rather than by gradual changes in populations (Mayr 1982, 431, 544).

2. Rapid speciation caused by a combination of natural selection and genetic drift and involving some degree of spatial isolation (Lincoln et al. 1985).

syn. macrogenesis, mutation (in one sense), quantum speciation, saltatory evolution, saltational evolution (Lincoln et al. 1985)

cf. atavism; hypothesis: hypothesis of punctuated equilibrium; mutation; ²evolution: quantum evolution; phyletic gradualism

Comment: There are so many gaps in the fossil record that some geneticists and paleontologists believed that species arose by "saltation" alone as late as the 1940s and by some paleontologists even today (Mayr 1982, 431, 544).

secondary speciation *n.* Interspecific hybridization between distinct evolutionary lineages (Lincoln et al. 1985).

cf. speciation: primary speciation

semigeographical speciation *n.* Speciation along lines of secondary intergradation in zones of marked ecological transition (Lincoln et al. 1985).

stasimorphic speciation *n.* Speciation without morphological differentiation (Lincoln et al. 1985).

stasipatric speciation *n.* A species' (with a wide and essentially continuous range) undergoing fragmentation into a number of descendent races and species (as a result of chromosomal rearrangements) that spread out from their point of origin until their expansion is arrested and the narrow hybridization zone, which has been undergoing a secular movement across the terrain, becomes stabilized (White et al. 1967 in White 1973, 379).

syn. chromosomal speciation (Dietrich 1992, 201)

successional speciation See speciation: phyletic speciation.

sympatric speciation *n.*

1. Speciation that occurs in the same geographic locality; contrasted with allopatric speciation and parapatric speciation (Brown 1975, 447; Immelmann and Beer 1989, 285).

cf. speciation: instantaneous speciation

2. Speciation in which a subpopulation in the midst of its parent population becomes a new species (Campbell 1990, 465).

Comments: Biologists have had vigorous debates regarding whether "sympatric speciation" actually occurs (Brown 1975, 447; Immelmann and Beer 1989, 285). It may have occurred in many plant species and fewer animal species (Campbell 1990, 470). It can occur in a single generation. Hugo De Vries discovered sympatric speciation by autoploidy (a kind of instantaneous speciation) in the evening primrose *Oenothera lamarckiana* in the 1920s. Up to 50% of plant species may have resulted from allopolyploid sympatric speciation, including Cotton, Oats, Potatoes, Tobacco, and Wheat.

◆ **species** *n., pl. species*

1. A class composed of individuals that have some common qualities or characters; frequently a subdivision of a larger class or genus (Oxford English Dictionary 1972, entries from 1630).

2. A distinct class, sort, or kind of something that is specially mentioned or indicated (Oxford English Dictionary 1972, entries from 1561).

[Latin *species*, form, kind; doublet of *spice*]

♦²**species, biological species** *n., pl. species*

1. In Greek philosophy, a division of a genus, regardless of the rank of the genus (Mayr 1982, 255).
2. "What is similar and of a single origin" (Saint Augustine in Mayr 1982, 255).
3. A well-defined unit of nature that is constant and sharply separated from other such units; a unit of creation (Mayr 1982, 255).
Note: This is an herbalist species concept (Mayr 1982, 255).
4. A group of organisms characterized by having the same unchanging essence (*eidos*), being separated from all other species by a sharp discontinuity, being constant through time, and being severely limited to variation within the group (Mayr 1982, 260).
Notes: This is an "essentialist species concept." "Species, thus, were simply defined as groups of *similar* individuals that are different from individuals belonging to other species. Individuals, according to this concept, do not stand in any special relation to each other; they are merely expressions of the same *eidos*." This species concept was used by Christian fundamentalists, and it was accepted almost unanimously in the post-Linnaean period (Mayr 1982, 256, 260).
5. A group of organisms that have "the distinguishing features that perpetuate themselves in propagation from seed" (Ray 1686 in Mayr 1982, 256–257).
Notes: "Thus, no matter what variations occur in the individuals or the species, if they spring from the seed of one and the same plant, they are accidental variations and not such as to distinguish a species. . . . Animals likewise that differ specially preserve their distinct species permanently; one species never springs from the seed of another nor vice versa" (Ray 1686 in Mayr 1982, 256–257). This definition is "as splendid compromise between the practical experience of the naturalist, who can observe in nature what belongs to a species, and the essentialist definition, which demands an underlying shared essence Ray's definition was enthusiastically adopted by generations of naturalists. It had the additional advantage that it fitted so well with the creationist dogma" (Mayr 1982, 257).
6. All the individuals that descend from each other, or from a common parentage, and those that resemble them as much as they do each other (Mayr 1982, 365).
7. "The sum of the individuals that are united by common descent" (von Baer 1828 in Mayr 1982, 257).
Note: "Common descent" means blood relationship here rather than evolutionary heritage (Mayr 1982, 257).
8. A group of organisms that have well-defined and completely constant characters through time (Mayr 1982, 259, 642).
Notes: This is a "typological species concept" that was held by Linnaeus during much of his professional life. Later he proposed that perhaps genera had been created by God and that species were the product of hybridization of these genera. This brought Linnaeus attacks from all sides (Mayr 1982, 259, 642). "Species mongers" who use the typological species concept created thousands of synonymous taxonomic names. One such person named no less than 14 "species" of House Sparrows in one European village (Mayr 1982, 263). Darwin favored this species concept until 1835 (Mayr 1982, 265).

9. "A constant succession of similar individuals that can reproduce together" (Buffon 1749, 385 in Mayr 1982, 262).

Notes: A species is constant and invariable with regard to characters of its members. Further species should be delineated by their "habits, temperaments, and instincts" (Buffon 1749, 385 in Mayr 1982, 262). Buffon's ideas eventually led to the biological-species concept.

10. Essentially an individual organism because only individuals exist, but species, which are comprising more than one individual, and other taxa are human-made constructs (Mayr 1982, 264–265).

Note: Lamarck used this "nominalistic species concept" in his earlier work, and it remained popular among botanists throughout the 19th century. Some biologists have favored this concept in the 20th century as well (Mayr 1982, 264–265).

11. A group of organisms that "remains at large with constant characters, together with other beings of very near structure . . ." (Darwin in Mayr 1982, 266).

Note: Darwin further wrote that species may be true ones yet scarcely differ in any external character. Ideas, from Darwin's notebooks, are similar to those entailed by the modern biological-species concept (Mayr 1982, 266). But later (1856), he wrote that "species" is an undefinable term (Mayr 1982, 267). In *On the Origin of Species . . .* (1859), Darwin gave the impression that he considered species as something purely arbitrary and invented merely for the convenience of taxonomists (Mayr 1982, 268–269).

12. "A group of individuals which reproduce their like within definite limits of variation, and which are not connected with their nearest allied species by insensible variations" (Wallace in Mayr 1982, 270).

Notes: This "morphological species concept," which is similar to the essentialist species concept, raises every isolated geographical race to the rank of a separate species. Nonetheless, this definition was adopted by the majority of taxonomists from the mid-1800s through the early 1900s, as well as many experimental biologists (Mayr 1982, 270). Evolutionary considerations inspired ornithologists to consider species as units separated by discontinuities and subspecies as units with some intermediates (American Ornithologists' Union 1886 in Stevens 1992, 305).

13. A species that is delineated by morphological characters alone, without consideration of other biological factors (Lincoln et al. 1985; Jackson and Cheetham 1990, 579).

syn. morphological species concept, morphospecies (Lincoln et al. 1985).

14. Any discontinuous variant (De Vries in Mayr 1982, 546).

15. A set of genetically related ecotypes (phenotypes resulting from particular habitat conditions) (Turesson 1922 in Mayr 1982, 277).

See ²species: ecospecies.

syn. ecospecies (introduced by Turesson 1922 in Mayr 1982, 277)

Note: Turesson seemed to consider a species to be a "mosaic of ecotypes rather than as a set of variable populations" (Mayr 1982, 277).

16. A species composed of a number of subspecies (Rensch 1922 in Mayr 1982, 290).

See ²species: polytypic species.

cf. ²species: superspecies

Note: This concept was originally called "Rassenkreise" by Rensch (1922) and later called "polytypic species" by Huxley (in Mayr 1982, 290).

17. A group "of actually or potentially interbreeding natural populations which are reproductively isolated from other such groups" (Mayr 1942, 120 in Mayr 1982, 273).

syn. biological species, biospecies (Eldredge and Gould 1972, 92)

Notes: This is "Mayr's original biological-species concept." Jordan (1896, 1905) and Poulton (1903) were the first authors to define the "biological species" (Mayr 1982, 272). The biological-species concept is also a class of species definitions that has also been called "genetical concept of species," "interbreeding-population concept," "reproductive species concept," and "species concepts based on interbreeding" (de Queiroz 1998, 58).

18. A group of actually interbreeding populations reproductively isolated from other such groups (Mayr 1969 in Mayr 1982, 273).

syn. isolation concept (de Queiroz 1998, 58), isolation concept of species (Paterson 1981, 113; 1985, 24)

cf. the recognition concept of species

Notes: This is "Mayr's second biological-species concept." By removing "potentially," he avoided the pragmatic difficulties in evaluating "potential" interbreeding. However this widely used definition does not relate to parthenogenetically reproducing organisms. In fact, such organisms might not even have species according to Ghiselin (1987 in Williams 1992, 319). Starting in the late 1930s, many botanists did not accept the biological-species concept as the unified species concept because plant data indicated that there could be more than one allowable species concept (Stevens 1992, 306).

19. In sexually reproducing organisms: A population, or set of populations, within which the individuals are capable of freely interbreeding under *natural conditions* (Wilson 1975, 595).

20. "A lineage (an ancestral-descendant sequence of populations) evolving separately from others and with its own unitary evolutionary role and tendencies" (Simpson 1961, 153 in Mayr 1982, 294).

Notes: This is the "evolutionary species concept." "The vulnerability of this definition is, of course, that it applies equally to most incipient species, such as geographically isolated subspecies. . . . Also, what exactly is meant by "unitary evolutionary role"? Simpson's definition is that of a phyletic lineage, but not of a species. Furthermore, this definition does not tell us at all how to delimit a sequence of species taxa in time." There are other problems with this definition as well (Mayr 1982, 294).

21. The basic lower unit of classification in biological taxonomy of the Linnaean hierarchy, consisting of a population, or series of populations, of closely related and similar organisms (Wilson 1975, 595).

Note: This is one of the "taxonomic species concepts."

22. A minimum monophyletic group (Eldredge and Cracraft 1980).

Note: This is one of the "taxonomic species concepts."

23. "A lineage . . . which occupies an adaptive zone minimally different from that of any other lineage in its range" (Van Valen 1976, 233, in Mayr 1982, 275).

Notes: This is an "ecological species concept." This definition "reflects the principle of competitive exclusion, but is not very practical as a species definition because it is often exceedingly difficult to discover the "minimal" niche difference between two species, as demonstrated by much ecological research" (Mayr 1982, 275).

24. A diagnosable cluster of individuals within which there is a parental pattern of ancestry and descent, beyond which there is not, and which exhibits a pattern of phylogenetic ancestry and descent among units of like kinds (Eldredge and Cracraft 1980, figure 3.1).

Notes: This definition applies to both sexually and parthenogenetically reproducing organisms. de Queiroz (1998) includes this definition within phylogenetic species concept III (*q.v.*).

25. Two, or more, phenotypes within a population designated as a species (Mayr 1982, 254).

See ²species: polytypic species.

syn. *Rassenkreise* (Mayr 1982, 254)

Note: This is the polytypic species concept.

26. A gene pool whose genes reproduce asexually during DNA replication and generate phenotypes (organisms) that can reproduce sexually producing new combinations of genes (Lincoln et al. 1985).

27. A multi-population system that might have several distinct morphospecies, without phenotypic intermediates, that are replacing each other geographically (Lincoln et al. 1985).

syn. multidimensional species concept, polytypic species concept (Lincoln et al. 1985)

28. One of two, or more, sympatric populations that do not interbreed (Lincoln et al. 1985).

syn. nondimensional species concept (Lincoln et al. 1985)

29. A taxon of the rank of species below the major rank of genus; a basic unit of biological classification; the lowest principle category of zoological classification (Lincoln et al. 1985).

30. A series of populations that is separated from other series of populations by sharp discontinuities in variation pattern (Raven 1986 in Howard 1988).

31. "An irreducible cluster of organisms, within which there is a parental pattern of ancestry and descent, and which is diagnosably distinct from other such clusters" (Cracraft 1987, 341, in Williams 1992, 320).

32. "The most inclusive population of individuals having the potential for phenotypic cohesion through intrinsic cohesion mechanisms" (Templeton 1989, 12, in Williams 1992, 319); a genetically and demographically cohesive populational unit (Templeton in Carson 1989, 872).

Notes: This is called the "cohesion species concept" (Williams 1992, 319). The cohesion mechanisms include isolating mechanisms, common descent, and natural selection.

[Templeton coined "cohesion species concept" in 1989 (de Queiroz 1998, 58)]

33. The "most inclusive population of individual biparental organisms which share a common fertilization system" which includes a specific-mate recognition system (Paterson 1981, 113; 1985, 21, 24).

Notes: This is Paterson's "recognition concept of species," called "recognition-species concept" by Campbell et al. (1999, 450). Paterson (1985) explains why this concept is preferable to the widely used

biological-species concept. The recognition-species concept stresses the fact that sexual selection results in reproductive barriers which are adaptations that enhance reproductive success within a single population, not as safeguards against interbreeding with other populations. Therefore, a population's reproductive isolation from other populations is a spin-off. Researchers contrast the recognition-species concept, in particular, with the biological-species concept which emphasizes reproductive isolation mechanisms.

syn. recognition concept (de Queiroz 1998, 58)
34. A gene pool (= all of the genes in a population) that evolved in isolation from other gene pools as a result of a reproductive isolating mechanism(s) (Alcock 2006, 163).

abbr. sp. (for one species), spp. (for more than one species)

cf. endemic, race

Comments: Scientists have been trying to understand the complicated nature of “species” for centuries. Mayr remarked (1982, 252), “Even today several papers on the species problem are published each year, and they reveal almost as much difference of opinion as existed one hundred years ago.” Carson (1989, 872) wrote that defining “species” is evolutionary biologists’ most knotty problem. Stevens (1992, 303) essentially agrees and discusses species concepts, focusing on those of from 1750 to 1965. According to Dupré (1992, 312), two major theoretical issues regarding the species concept are (1) is a species a natural kind, an individual entity, a set of individual entities, or what? and (2) what criteria should be used for assigning an individual organism to a species: morphology, reproductive characteristics, phylogeny, or what? A natural kind is an entity that exists in nature independently of Humans’ discovering it, naming it, or both. Williams (1992, 318–319) explains that none of the presently proposed “species” definitions is completely satisfactory for reasons including a lack of knowledge about groups “we intuitively recognize as species” and species’ roles in nature and perhaps the main source of difficulty — we have been seeking “a unitary definition for a pluralistic concept.” She also discusses “E-species” (the basic unit of evolution), “T-species” (the basic unit of taxonomy), and their relationships. de Queiroz (1998, 57) further clarifies the definitions of many species concepts and presents evidence that all modern species definitions describe variants of a single general species concept — the general lineage concept of species. Further, he proposes a revised and conceptually unified terminology for the ideas described by contemporary species definitions, discusses “the significance and limitations of different classes of species definitions, and examines an interpretation of species criteria that places alternative criteria in direct conflict and thus contains the key to resolving the species problem.” There are about 1 million named species on Earth. Many species still await discovery, including possible millions in deep-sea communities (Broad 1999, 1 June, D5). Below, are some kinds of species and species concepts that have been designated and defined. Many of these defined kinds of species are not totally discreet from others. Regarding conservation status, in the U.S., species are indicated as endangered species, evidently secure species, extirpated species, extinct species, listed species, and special-concern species at the state and federal levels (Alden et al., 2008, 52).

A CLASSIFICATION OF SPECIES AND SUBSPECIES

FROM A CONSERVATION PERSPECTIVE

(BASED ON IUCN 2001 IN NEW 2009, 9–11)

- I. evaluated for ranking
 - A. applicable for ranking
 - 1. data adequate for ranking
 - a. least concern
 - b. near threatened
 - c. threatened
 - (1) critically endangered
 - (2) endangered
 - (3) vulnerable
 - d. regionally extinct
 - e. extinct in the wild
 - d. extinct
 - 2. data deficient for ranking
 - B. not applicable for ranking
 - II. not evaluated for ranking

active-nuclear species *n.* A bird species in a mixed species flock that seeks out other species and follows them (Wilson 1975, 359).

See ²species: nuclear species, passive-nuclear species.

advanced species *n.* A species that has recently evolved (Wilson 1975, 132).

See Darwin’s admonition.

syn. derived species (Lincoln et al. 1985)

allochronic species *n.* A species that does not occur in the same geological time horizon as another species to which it is compared (Lincoln et al. 1985).

cf. ²species: synchronic species

allospecies *n.*

- 1. One of a group of similar species that comprise a superspecies (Lincoln et al. 1985).
- 2. A population that is intermediate between a race and biological species, and exhibits partial interbreeding and intergradation and weak reproductive isolation (Lincoln et al. 1985).

syn. incipient species, semispecies (Lincoln et al. 1985)

aphanic species See ²species: aphanic species.

association element *n.* A constant species of an (ecological) association (Lincoln et al. 1985).

attendant species *n.* A species of bird that regularly joins a particular type of mixed flock, but is not as attractive to other birds as passive-nuclear species (Wilson 1975, 359).

cf. ²species: nuclear species

Comment: “Attendant species” are less consistent members in a mixed flock than “nuclear species” (Wilson 1975, 359).

biological species, biospecies *n.* “A species defined primarily on biological characters” (Lincoln et al. 1985).

cf. ²species (def. 17, 18), ²species: morphospecies

biological-species concept See ²species (def. 17, 18).

biospecies See ²species: biological species.

buffer species *n.* An organism that acts as an alternative food supply for a predator, thereby buffering its effect on its usual prey (Lincoln et al. 1985).

cenospecies *n.* A group of ecospecies that are capable of limited genetic exchange by forming fertile hybrids (Lincoln et al. 1985).

syn. coenospecies (*Brit.*)

characteristic species *n.*

1. A species that occurs throughout a particular geological stratum and in no other strata (Clark et al. 1904, cliii).

Note: For example, Clark et al. (1904, cliv–clv) list 59 species (one brachiopod and 58 molluscs) as characteristic fossils of the Miocene Epoch. However, some of these species are no longer characteristic ones because of taxonomic revisions.

2. A plant species that almost always occurs in particular community and that a researcher uses to delimit that community (Lincoln et al. 1985).

syn. guide species, index species, indicator species (Lincoln et al. 1985). These are confusing synonyms (pers. obs.).

3. A bird, mammal, or plant species that occurs in a particular community and that a researcher uses to delimit that community (as indicator species in Kritcher and Morrison 1988, 10).

cf. taxon: indicator taxon, ²species: indicator species
syn. dominant species, indicator species (Kritcher and Morrison 1988, 10)

Comments: Communities are defined by different numbers of characteristic species (Kritcher and Morrison 1988, 10–91). Under definition 3, not all species are characteristic species. Some species are characteristic species only when they occur with certain other species.

► **regional-character species** *n.*

1. A characteristic species that is limited to the range of distribution of the community to which it belongs (Lincoln et al. 1985).
2. A species that is a distinguishing feature in the whole range where it occurs together with a particular vegetation unit (Lincoln et al. 1985).

chronospecies, palaeospecies, paleospecies *n.*

1. A species that is represented in more than one geological-time horizon (Lincoln et al. 1985).
2. The successive species that replace others in a phyletic lineage and are given ancestor and descendant status according to the geological-time sequence (Eldredge and Gould 1972, 92; Lincoln et al. 1985).

Note: Each chronospecies is composed of many successional polytypic morphospecies (= holomorphospecies), each of which is in theory the paleontological equivalent of a neontological biospecies (Thomas 1956, 24 in Eldredge and Gould 1972, 93).

climax species *n.* A plant species of a climax community (Lincoln et al. 1985).

Comment: This definition could be extended to any kind of organism as well.

coarse-grained species *n.* One of a group of coexisting related species that are specialized and morphologically dissimilar and, therefore, use different food sources in their habitats (Lincoln et al. 1985).

cf. ²species: fine grained species

cohesion species concept See ²species (def. 32).**collective species** See ²species: superspecies.**common ancestor** See ancestor: common ancestor.**companion species** *n.* A species that is not restricted to any particular vegetation unit (Lincoln et al. 1985).

syn. indifferent species (Lincoln et al. 1985)

competitive species See ²species: c-selected species.

compilospecies *n.* A species, or species complex, that hybridizes with various related species and, in different areas, takes on some of the characteristics of each of these species (Lincoln et al. 1985).

composite species *n.* A species that is represented by a group of specimens obtained from two, or more, localities and not all of the same geological age (Lincoln et al. 1985).

See ²species: polytypic species.

cf. ²species: physiognomic dominant, polytypic species

consociation dominant See ²species: physiognomic species.

constant species *n.*

1. A species that is invariably present in a particular community (Lincoln et al. 1985).
2. A species that occurs in at least 50% of samples taken from a given community (Lincoln et al. 1985).

cryptic species See ²species: sibling species.

C-selected species, C strategist, C-strategist *n.* Within the C-S-R triangle of ecological strategies, a species typically with large body size, rapid growth, relatively long life span, and relatively efficient dispersal, that devotes only a small portion of its metabolic energy to offspring, or propagule, production (Lincoln et al. 1985).

syn. competitive species (Lincoln et al. 1985)

cf. ²species: species, K-selected species, r-selected species, s-selected species

differential species *n.* A plant species that can be used as an indicator of a particular vegetational type because it has relatively high fidelity to this type (Lincoln et al. 1985).

directive species *n.* A species that attracts a predator, of which it is not a usual prey item, to an area rich in the predator's prey species (Lincoln et al. 1985).

derived species See ²species: advanced species.

disjunct species *n.* A species of plant that lives in separate areas that are sufficiently isolated so that a current natural dispersal from one to the other area seems impossible [coined by Candolle in Mayr 1982, 444].

dominant species *n.*

1. A species that exerts considerable influence upon a community due to its size, abundance, or coverage (Lincoln et al. 1985).
2. A species in an ecological community which has a very high biomass compared to other community species, has a very high population size, or both (Campbell and Reece 2005, 1168).

Note: For example, the tree *Acer saccharum* (Sugar Maple) is a dominant species in some forests of Eastern U.S. where it has a major impact on abiotic factors such as shading and soil, which, in turn, affect many other forest species (Campbell and Reece 2005, 1168).

See ²species: characteristic species.

► **subdominant** *n.* A species that may appear to be more abundant at certain times of the year than a true dominant species in a climax (Lincoln et al. 1985).

► **subdominule** *n.* "A subdominant of a microcommunity" (Lincoln et al. 1985).

ecdemic species *n.* A foreign, non-native species (Lincoln et al. 1985).

cf. ²species: endemic species, native species

ecological equivalent *n.* One of a group of species that functions in a similar way in different regions or habitats (Grinnell 1924 and Elton 1927 in Colwell 1992, 242).

Comment: According to the environmental niche concept, ecological equivalents fill the same niche in different places; according to the population niche concept, ecological equivalents have remarkably similar niches (Colwell 1992, 242, who discusses these ideas further).

ecological species concept See ²species (def. 23).

ecospecies, oekospecies *n.* A group of populations, or ecotypes, that has the capacity for free genetic-material exchange without loss of fertility or vigor, but having a lesser capacity for such exchange with members of other ecospecies group (Lincoln et al. 1985).

See ²species (def. 15).

Comment: “Ecospecies” is similar to “biological species” (Lincoln et al. 1985).

ecosystem-engineer species *n.* An organism that causes significant physical changes in its environment by its behavior, large biomass, or both (Campbell and Reece 2005, 1169).

syn. foundation species

Comments: *Castor canadensis* (American Beaver) is an ecosystem-engineer species which fells trees and builds dams across streams that cause flooding (Campbell and Reece 2005, 1169–1170). *Juncus gerardi* (Black Rush) increases species richness in some zones of New England salt marshes by preventing salt buildup in soil. This plant shades soil and prevents evaporation and consequent salt deposition. This plant also stops soil from becoming anoxic because it transports oxygen in its subterranean tissues.

edge species *n.* A species found predominantly, or commonly, in the marginal zone of a community (Lincoln et al. 1985).

endangered species *n.*

1. A species that is faced with possible immediate local, global, or both extinction; contrasted with extirpated species, extinct species, species of special concern (special-concern species) and threatened species (Lincoln et al. 1985).
2. A species that is “in danger of extinction throughout all or a significant proportion of its range” (U.S. Endangered Species Act in New 2009, 29).

cf. rarity; ²species: threatened species

Comment: The U.S. Endangered Species Act recognizes only two species statuses — endangered and threatened (New 2009, 29). In the U.S., endangered species include many bird, fish, invertebrate, and mammal species, including about 20 butterfly species (Claiborne 1997, A4). Hotbeds of endangered species include California, Florida, Hawai‘i, and Madagascar. Conservation efforts are saving the endangered subspecies *Lycaeides melissa samuelis* (Karner Blue Butterfly) in part of its former range in the U.S. (fig. 42).

endemic species *n.* A species that is native to, and restricted to, a particular geographical region (Lincoln et al. 1985).

cf. ¹endemic; ²species: ecologic species, native species

energy maximizer *n.* A species that consumes all available energy regardless of its cost in time (Schoener 1971 in Wilson 1975, 143).

Comment: “Energy maximizer” is on a continuum with “time minimizer,” *e.g.*, most opportunistic species (Schoener 1971 in Wilson 1975, 143).

ergatandrous species *n.* A social-insect species that has worker-like males (Lincoln et al. 1985).

cf. caste

espèces jumelles See ²species: sibling species.

E-species See ²species (comments).

ethospecies *n.* A species that is distinguished from others primarily by behavioral traits (Emerson 1959 in Heymer 1977, 65, Lincoln et al. 1985).

cf. ²species: physiological species; -type: ethotype

evolutionary species concept See ²species, def. 20.

exclusive species, faithful species *n.* A species that is totally, or almost totally, confined to one particular community; a species of high fidelity (Lincoln et al. 1985).

cf. ²species: exclusive species, indifferent species, preferential species, strange species

exploitably vulnerable species *n.* A species (*e.g.*, *Ilex verticillata*, Winterberry) that could become endangered if people continue to harvest it in the wild (Galitzki 1996, 26 December, C9).

extirpated species *n.* A species that is locally eliminated, often by an anthropogenic change(s) in its environment (Alden et al., 2008, 52).

cf. extinct; ²species: endangered species, special-concern species, threatened species

extinct species *n.* A species that no longer lives on Earth (Alden et al., 2008, 52).

cf. extinct; ²species: endangered species, special-concern species, threatened species

facultative-schooling species *n.* In some fish species: A species that occasionally forms schools (Breder 1967 in Partridge 1982, 299).

cf. species: obligate schooling species

faithful species See ²species: exclusive species.

fine-grained species *n.* One of a group of coexisting related species that are morphologically similar and use the same foods, but not in equal quantities or proportions (Lincoln et al. 1985).

cf. ²species: coarse-grained species

flagship species *n.* A species of special interest that a person(s) chooses to represent an environmental cause such as an ecosystem that should be conserved (New 2009, 208).

Comments: A flagship species has characters such as attractiveness, distinctiveness, and vulnerability, and can be an important component of environmental advocacy (New 2009, 208). In some cases the conservation focus is on a subspecies of a flagship species. Examples of flagship species are the African Elephant, Eltham Copper Butterfly, Frigate Island Giant Tenebrionid Beetle, Giant Panda, Karner Blue Butterfly, and Orangutan.

form species, morphospecies *n.* One of a group of species that has similar morphological characters but is not confirmed to have a common ancestry with this group (Lincoln et al. 1985).

See ²species (def. 13).

fugitive species *n.* An extreme case of an r strategist that is consistently wiped out of the places it colonizes, and survives only by its ability to disperse and fill new places at a high rate (Hutchinson 1951 in Wilson 1975, 99).

generalist, generalist species *n.* A species with a broad habitat range or food preference, *e.g.*, the American Black Bear or Human (Lincoln et al. 1985); contrasted with specialist species and specialized species.

Comments: Flessa et al. (1975, 72–73) discuss that “generalized” and “specialized” have meanings precise enough to express their respective concepts only within

certain well circumscribed contexts. Measurements of specialization of fossil species are based on their morphologies. Some paleoecologists consider morphological simplicity to indicate generalization and morphological complexity to indicate specialization.

genospecies *n.* An aggregate of interbreeding populations of mutually interfertile forms that contribute to a common gene pool (Lincoln et al. 1985).

geographic race See ²species: subspecies.

group-living species *n.* A species that normally lives in groups at any time of the year, *e.g.*, communally breeding species or species that breed colonially without helpers (Alexander 1974 in Brown 1987, 300).

cf. breeding: communal breeding

guide species See ²species: characteristic species.

heterogameon *n.* A species comprising distinct populations that produce morphologically stable populations when selfed but different types of viable and fertile offspring when crossed (Lincoln et al. 1985).

heteromesogamic species *n.* A species in which different individuals employ different modes of fertilization (Lincoln et al. 1985).

holomorphospecies *n.* A species based on the collective morphological characters of fossil assemblages from throughout the geographical range of a given stratigraphic level (Lincoln et al. 1985).

homogeneon *n.* A genetically and morphologically homogeneous species (Lincoln et al. 1985).

ichnospecies *n.* "A subordinate taxon in the classification of traces" (Lincoln et al. 1985).

incipient species See ²species: allospecies.

index species, indicator species See ²species: characteristic species.

indicator species *n.* A species that a researcher uses to monitor biodiversity changes in a particular region (inferred from Lawton et al. 1998, 73).

cf. taxon: indicator taxon

indifferent species, companion species *n.* A plant species that shows no obvious affinity for any particular community (Lincoln et al. 1985).

cf. ²species: exclusive species, preferential species, selective species, strange species

indigenous species See ²species: native species.

interspecies *n.* A hybrid of two species (Lincoln et al. 1985).

syn. interspecific hybrid

isolation concept of species See ²species (def. 18).

invasive species *n.* A species that is not native (= alien, exotic) to an ecosystem under consideration whose presence causes, or is likely to cause, economic harm, ecological harm, harm to human health, or a combination of these things (United States Department of Agriculture National Invasive Species Information Center 2010).

Comments: Invasive species include all kinds of organisms, and human actions are a primary means of introductions of such species (U.S. Department of Agriculture National Invasive Species Information Center 2010). These species cause over \$120 billion of damage per year in the U.S. alone. They include *Ampelopsis brevipedunculata* (Porcelainberry, fig. 10), *Aphis nerii* (Oleander Aphid, fig. 6), *Lantana camara* (Lantana, fig. 17), and *Verbascum thapsus* (Common Mullein, fig. 11, 12).

keystone species *n.*

1. A predator that greatly modifies its community's species composition and physical appearance and determines the community's integrity and unaltered persistence through time by its activities and abundance (Paine 1969 in Mills et al. 1992, 219). *syn.* keystone predator (Steiner 2001, 2495)

2. A species whose presence is crucial in maintaining the organization and diversity of its ecological community and has an exceptional importance in its community (Paine 1966, 1967 and other authors in Mills et al. 1992, 219).

Note: Keystone species have strong controls on their communities by their pivotal ecological roles, niches or both, not by having large population sizes (Campbell and Reece 2005, 1168–1169).

3. A species whose removal is expected to result in the disappearance of at least half of a considered species assemblage (Mills et al. 1992, 221).

cf. symbiont: keystone mutualist

Comments: There are two general schools of thought about the concept of "keystone" species and related ideas such as "keystone link," "keystone modifier," "keystone plant," "keystone predator," and "keystone prey" (Mills et al. 1992). The school that advocates keystone concepts, defines a "keystone predator," for example, as a predator that greatly modifies its community's species composition and physical appearance and determines its community's integrity and unaltered persistence through time by its activities and abundance (Paine 1969 in Mills et al. 1992, 219). The school that recommends abandoning "keystone" concepts reports that "keystone species" is broadly applied, poorly defined, and nonspecific in meaning (Mills et al. 1992). Further, that school wrote that "the type of community structure implied by the keystone-species concept is largely undemonstrated in nature." That school advocates the study of community-interaction strengths and subsequent application of the results into species-management plans and policy decisions. Brown et al. (2001, 643) described *Dipodomys spectabilis* (Banner-tailed Kangaroo Rat) as a keystone species that makes large burrow mounds of disturbed, nutrient-enriched soil used by several disturbance-requiring plants, specialized fungi that infest seed stores, and many kinds of arthropods, and reptiles and other vertebrates. Other keystone species include the starfish *Pisaster ochraceous*, a predator of *Mytilus californianus* (a mussel) in rocky, intertidal communities in Western U.S. and *Enhydra lutris* (Sea Otter) which lives on sea urchins in the North Pacific Ocean (Campbell and Reece 2005, 1169). Francis et al. (2002) indicated that some organisms may become keystone species only when their hosts are in stressed environments. For example, *Dioryctria albovittella* (a stem-boring moth) may be a keystone species that stunts *Pinus edulis* (Pinyon Pines) that have low resistance to it and reduces their seed productions in an abiotically stressed environment. Low seed production reduces food availability of birds and mammals, and reduces seed dispersal by some species of these animals which are scatter-hoarders. Birds are less likely to visit *P. edulis* with low seed crops (caused primarily by the moth's feeding); therefore, the seeds are more likely to be dispersed by mammals which do not move seeds as far as the birds. Less resistant trees have fewer ectomycorrhizae and a different species composition of them than more resistant trees. The

scale insect *Matsucoccus acalyptus* may also be a keystone species that feeds on *P. edulis*.
[coined by Paine 1969 (in Mills et al. 1992, 219)]

kinetophile *n.* An opportunistic species (Lincoln et al. 1985).

K-selected species, K strategist, K-strategist

n. A species that is characteristic of a relatively constant, or predictable, environment, typically with slow development, relatively high competitive ability, late reproduction, large body size, and iteroparity (Lincoln et al. 1985).

cf. ²species: C-selected species, r-selected species, s-selected species

Linnaean species, Linnaeon, macrospecies, taxonomic species *n.* A large, polymorphic species (Lincoln et al. 1985).

cf. ²species: taxospecies

local-character species *n.*

1. A species, that is a characteristic species, *q.v.*, over only the part of its total range where a designated vegetation unit and species co-occur (Lincoln et al. 1985).

2. A species that occurs in only part of the range of a single vegetation unit (Lincoln et al. 1985).

local species *n.*

1. An insect species with a relatively large population in a very restricted area (inferred from New 2009, 28).

2. A plant species with a relatively large population in a restricted area, small populations spread over a wide area, or some intermediate combination of these distribution patterns (inferred from Leigh et al. 1984 in New 2009, 28).

macrospecies See ²species: Linnaean species.

marginal species *n.* “A plant species that occurs on the edge of a habitat or community” (Lincoln et al. 1985).

metamps *n.* “Different forms of the same species” (Lincoln et al. 1985).

microspecies, jordanon *n.*

1. A microgeographic group or other infrasubspecific group (Lincoln et al. 1985).

2. A part of a species aggregate (Lincoln et al. 1985).

microsubspecies, microgeographic races *n.*

Small subpopulations that comprise a subspecies (Lincoln et al. 1985).

monestric species, monoestric species *n.* A species in which estrus occurs only once per year per female; contrasted with polyestric species (Heymer 1977, 47).

monotypic species *n.* A species with no subspecies or geographical variants; contrasted with polytypic species (Lincoln et al. 1985).

morphospecies See ²species (def. 13).

mountain-relict species *n.* One of a group of closely related species, *e.g.*, a *Colophon* lucanid beetle in South Africa, that is endemic to its own mountain range or peak, likely because environmental changes restricted its ancestral species to that location, and the ancestor evolved into new species (Cochrane 2009).

multidimensional species concept See ²species (def. 27).

native species, indigenous species *n.* A species that naturally occurs in a particular geographic region (Lincoln et al. 1985).

cf. ¹endemic; ²species: ecdemic species, endemic species

nomenspecies See ²species: typological species.

nondimensional species concept See ²species (def. 28).

nominalistic species concept See ²species (def. 10).

nuclear species *n.* In mixed-species bird flocks: A species that contributes significantly to the formation and cohesion of a particular kind of mixed-species flock (Wilson 1975, 359).

syn. nucleus species (Wittenberger 1981, 619)
See ²species: active-nuclear species, passive-nuclear species.

cf. ²species: attendant species

Comment: A nuclear species may, or may not, actually lead the other birds, but their flock is not likely to exist without the species (Wilson 1975, 359).

nucleus species See ²species: nuclear species.

obligate schooling species *n.* In some fish species: A species that nearly always forms schools (Breder 1967 in Partridge 1982, 299).

cf. ²species: facultative schooling species

occasional species *n.* A species that may be found from time to time in, but is not a permanent member of, a particular habitat or community (Lincoln et al. 1985).

oekospecies See ²species: ecospecies.

open-group species *n.* A social species in which individuals move relatively freely among demes; *e.g.*, some ant species or the Chimpanzee (Wilson 1975, 10).

opportunistic species See ²species: kinetophile, r-selected species.

paleospecies, palaeospecies See ²species: chronospecies.

paralocal species, pararegional species *n.* A local character species that has a geographical range only partly overlapping that of the vegetation unit of which it is a characteristic species (Lincoln et al. 1985).

passive nuclear species *n.* A nuclear species in a mixed bird flock that attracts other bird species (Wilson 1975, 359).

cf. ²species: active nuclear species, nuclear species

phylogenetic relict See ²species: relict species.

phylogenetic-species concept I *n.* The “set of organisms between two speciation events, or between one speciation event and one extinction event, or that are descended from a speciation event” (Ridley 1989, 3 in de Queiroz 1998, 59).

syn. cladistic species concept (Ridley 1989 in de Queiroz 1998, 59), Hennigian-species concept (Nixon and Wheeler 1990 in de Queiroz 1998 59)

phylogenetic-species concept II *n.*

1. A population or group of populations defined by one, or more, apomorphic features (Rosen, 1979, 277 in de Queiroz 1998, 59).

2. Monophyletic organism groups that a researcher recognizes as lineages on the basis of their shared, derived characters and ranks as species because of causal factors that maintain the lineages as the smallest important monophyletic groups recognized in a formal classification (Mishler 1985, 213 in de Queiroz 1998, 59).

syn. Autapomorphic species concept (Nixon and Wheeler 1990 in de Queiroz 1998, 59), monophyletic species concept (Smith 1994 in de Queiroz 1998, 59), species concepts based on monophyly (de Quieroz and Donoghue 1988 in de Queiroz 1998, 59)

phylogenetic-species concept III *n.*

1. The smallest diagnosable cluster of individual organisms within which there is a parental pattern

- of ancestry and descent (Cracraft 1983, 170 in de Queiroz 1998, 59).
2. The smallest aggregation of sexual populations or asexual lineages that are diagnosable by a unique combination of character states in comparable individuals (= semaphoronts) (Nixon and Wheeler 1990, 218 in de Queiroz 1998, 59).
- syn.* diagnostic approach (Baum and Donoghue 1995 in de Queiroz 1998, 59)
- See ²species (def. 24).
- physiognomic dominant** *n.* The dominant species of a consociation that has the life form characteristic of a that formation (Lincoln et al. 1985).
- syn.* consociation dominant (Lincoln et al. 1985).
- physiological species** *n.* A species (e.g., a firefly) that is delineated from a sibling species by its behavior (Barber 1951, 1).
- cf.* ²species: ethospecies
- pioneer, pioneer species** *n.* The first species to colonize, or recolonize, a barren, or disturbed, area, and which thereby starts a new succession (Lincoln et al. 1985).
- cf.* ²community: pioneer
- polyestric species, polyoestric species** *n.* A species in which estrus occurs more than once per year per female (Heymer 1977, 47).
- cf.* ²species: monestric species
- polyestrus species, polyoestrous species** *n.* A species that has a succession of breeding periods in one sexual season (Lincoln et al. 1985).
- polyphasic species** *n.* A species that shows marked morphological variation within a given habitat (Lincoln et al. 1985).
- n.* polyphasy
- polytypic species, composite species, Rassenskreis, rheogameon** *n.* A species consisting of several subspecies or geographic variants (Lincoln et al. 1985).
- See ²species (def. 25); species: composite species.
- cf.* ²species: monotypic species
- polytypic species concept** See ²species (def. 25, 27).
- predominant species** *n.*
1. A species that is of outstanding abundance, or importance, in a community (Lincoln et al. 1985).
 2. "A species that is present in all, or nearly all, of the associations of a formation" (Lincoln et al. 1985).
- preferential species** *n.* A plant species found in a variety of communities, but showing greater abundance in one particular community (Lincoln et al. 1985).
- cf.* ²species: exclusive species, indifferent species, selective species, strange species
- primitive species** *n.* A species that originated a relatively long time ago and has undergone little recent evolution (Wilson 1975, 132).
- cf.* Darwin's admonition, ²species: advanced species
- protospecies** *n.* "An ancestral species" (Lincoln et al. 1985).
- pseudospecies** *n.* A culture, or nation, of Humans that is essentially reproductively isolated and is, thus, similar to a biological species (Erikson 1966 in Heymer 1977, 134).
- pseudovicar** *n.* One of two, or more, unrelated, or distantly related, but ecologically equivalent, species that tend to be mutually exclusive because they occupy different geographical areas (Lincoln et al. 1985).
- Rare or Threatened Australian Plant (ROTAP)** *n.* A designation for a rare or threatened

Australian plant species that indicates that one does not know its correct status due to lack of information about the plant (Leigh et al. 1981 in New 2009, 28).

Rassenskreise See ²species (def. 16, 25), ²species: polytypic species.

recognition concept of species, recognition-species concept See ²species (def. 33).

regional-character species See ²species: characteristic species: regional-character species.

rejungent species See ²species: ring species.

relic See ²species: relict species.

relict species *n.*

1. A species that persists in a given area as a survivor from an earlier period or type (Michaelis 1963).

2. A persistent species of a formerly widespread biota that remains in certain isolated areas or habitats (Lincoln et al. 1985), e.g., *Macrotermes darwiniensis* (Morell 1992, 1861).

syn. relic (Lincoln et al. 1985)

3. An extant "archaic form" in an otherwise extinct taxon (Lincoln et al. 1985).

syn. phylogenetic relict (Lincoln et al. 1985)

rheogameon See ²species: polytypic species.

ring species, rejungent species *n.* A species comprising a graded series of populations along an extensive cline that curves round on itself so that the populations at the extremes overlap but are unable to interbreed successfully (Lincoln et al. 1985).

r-selected species, r strategist, r-strategist *n.*

1. An opportunistic species, *i.e.*, one that can increase its population size rapidly, witnessing little intraspecific competition (MacArthur and Wilson 1967 in Wilson 1975, 99).

2. A species that relies upon a high intrinsic rate of increase (*r*) that makes use of a fluctuating environment and ephemeral resources (MacArthur and Wilson 1967 in Wilson 1975, 99).

syn. opportunistic species, ruderal species (Lincoln et al. 1985)

cf. ²species: C-selected species, K-selected species, kinetophile, s-selected species; strategist: r-strategist

Comment: Characteristics of "r-strategists" often include high fecundity, small size, adaptations for long-distance dispersal, fast maturity, no pair bonding, and no parental care (Immelmann and Beer 1989, 256). "Pure-r-strategists" and "pure-K-strategists" are at the extremes of a continuum, most real cases lying somewhere between. "Ecologists enjoy a curious love/hate relationship with the *r/K* concept, often pretending to disapprove of it while finding it indispensable" (Dawkins 1983, 293).

ruderal species See ²species: r-selected species.

selective species *n.* A plant species usually found in one particular community, but also occasionally in other communities as well (Lincoln et al. 1985).

cf. species: exclusive species, indifferent species, preferential species, strange species

semispecies See ²species: allospesies.

sibling species *n.* "Reproductively isolated but morphologically identical or nearly identical species," (Mayr 1982, 959); *e.g.*, a member of a species complex of *Anopheles* mosquitoes or *Microtus arvalis* and *M. subarvalis* (Mayr 1982, 871).

syn. aphanic species, cryptic species, *espèces jumelles*, twin species (Lincoln et al. 1985)

Comments: McDermott (1912 in Lloyd 1989, 52) suggested the concept of sibling species.

sister species *n.* One of the two species that results from the splitting of a cladistic line (Hennig 1950 in Mayr 1982, 226).

special-concern species *n.* A species that appears likely to become threatened unless its environment changes in a beneficial way(s) (Alden et al., 2008, 52).

cf. ²species: endangered species, extinct species, threatened species

specialist species *n.* A species that has a very narrow habitat range or food preference (Lincoln et al. 1985); contrasted with generalist species and specialized species (*q.v.*).

specialized species *n.* A species that has a relatively low potential for further evolutionary change (King and Stansfield 1985); contrasted with specialist species.

species of European concern (SPEC) *n.* A species of conservation concern in Europe (New 2009, 14).

Comment: There are five SPEC categories (Swaay and Warren 1999 in New 2009, 14).

[SPEC = species of European concern]

s-selected species, s strategist, s-strategist

n. Within the C-S-R triangle of ecological strategies, a species typically with small body size, slow growth, long through very long life span, low dispersal ability, strong physiological tolerance to environmental stress, and devotion of a small proportion of its metabolic energy to offspring, or propagule, production; a stress-tolerant species (Lincoln et al. 1985).

cf. ²species: C-selected species, K-selected species, r-selected species

strange species *n.* A rare, or accidental, plant member of a community, probably a relict of an earlier community (Lincoln et al. 1985).

cf. ²species: exclusive species, indifferent species, preferential species, selective species

subspecies *n.*

1. In organisms: “A geographically defined aggregate of local populations which differ taxonomically from other subdivisions of species” (Mayr 1940, 259, etc., in O’Brien and Mayr 1991, 1188).

Note: Avise and Ball (in press in O’Brien and Mayr 1991, 1188) urge that the evidence for the designation of the “biological-species-concept subspecies” come from the concordant distribution of multiple, independent, genetically based traits. O’Brien and Mayr (1991, 1188) offer guidelines for classifying “subspecies.”

2. In Plants: A baby species, or species of small magnitude, that is distinguished by less obvious, or significant, morphological features than are more obvious species within the same genus (Lawrence 1957, 54).

3. In Plants: A major morphological variation of a species that has a geographic distribution of its own, which is distinct from the area occupied by other subspecies of the same species (Lawrence 1957, 55).

syn. geographical race

4. In Plants: A group of individuals with geographic, ecologic, and morphologic characters that are suspected to be counterparts of the ecotype (a biologically significant element determinable only after analysis by slow and tedious experimental techniques) (Lawrence 1957, 55).

5. In Plants: A group of intraspecific individuals of major morphological distinction with, or

without, disjunctive distribution (Englerian School in Lawrence 1957, 55).

6. In Plants: A horticultural element (Link, Sprengel, et al. in Lawrence 1957, 55).

7. In Plants: Any group of individuals below the rank of species (Weatherby in Lawrence 1957, 55).

8. In Plants: An unproved, but suspected ecotype (Lawrence 1957, 55).

9. In organisms: A portion of a species that is separated from other such groups by distance and geographic barriers that prevent the exchange of individuals, as opposed to the genetically based “intrinsic isolating mechanisms” that hold species apart (Wilson 1975, 10, 596).

See ²group.

syn. geographic race (Wilson 1975, 596)

cf. ²species: microsubspecies

Comments: “Subspecies” show every conceivable degree of differentiation from other subspecies, and they are often given scientific names; *e.g.*, in *Gorilla gorilla beringei*, the last name indicates the subspecies (Wilson 1975, 10, 596). Botanical nomenclatural rules provide for the infraspecific categories of subspecies, *varietas*, *subvarietas*, *forma*, *forma biologica*, *forma specialis*, and *individuum* in the order of increasing division of subspecies (Lawrence 1957, 54).

successful species *n.* A species that is still extant (Garrod and Horwood 1984, 367).

successional species *n. pl.* Successive morphospecies within a distinct evolutionary lineage that represent the nodal points of a phyletic evolutionary trend that are sufficiently distinct from one another to justify giving them species names (Lincoln et al. 1985).

superfluent species *n.* An animal species that is of equal significance to a subdominant plant species in its community (Lincoln et al. 1985).

superspecies *n.*

1. A group of similar species (called allospecies) found in the same geographic region, *e.g.*, the *Rana-pipiens* group of frog species in North America (Mayr 1982, 291).

2. “A cluster of incipient species (semispecies)” (Lincoln et al. 1985).

syn. collective species (Lincoln et al. 1985)

cf. ²group: species swarm, ²species (def. 21, 22), ²species: allospecies, species aggregation, species-group

Comment: Mayr (1982, 291) renamed *Artenkreis* of Rensch (1929) “superspecies,” *Artenkreis* (*pl.* *Artenkreise*).

supertramp *n.* A species that has a wide geographical range and a very efficient means of dispersal, but which tends to be excluded by competition from species-rich faunas (Lincoln et al. 1985).

cf. ²species: tramp species

synchronous species *n.* A species that occurs within the same geological time horizon as another species (Lincoln et al. 1985).

cf. species: allochronic species

taxonomic species See ²species: Linnaean species.

taxospecies *n.* “A species based on overall similarity, determined by numerical taxonomic methods” (Lincoln et al. 1985).

threatened species *n.* A species that is “likely to become an endangered species within the foreseeable future throughout all or a significant part of its range” (U.S. Endangered Species Act in New 2009, 29).

cf. ²species: endangered species, extinct species, special-concern species

- A**
- Comment:** The International Union for the Conservation of Nature (2001 in New 2009, 9) includes “critically endangered,” “endangered,” and “vulnerable” species within the category of “threatened species.”
- time minimizer** *n.* An animal species that minimizes its time required to harvest the available energy and devotes its remaining time to other activities, including defending its food supply and reproducing (Schoener 1971 in Wilson 1975, 143).
- tramp species, tramp** *n.* A species with a wide geographical range and an efficient means of dispersal (Lincoln et al. 1985).
cf. ²species: supertramp
- T-species** See ²species (comments).
- twin species** *n.* A pair of sibling species, *q.v.* (Lincoln et al. 1985).
 See ²species: sibling species.
- type species** *n.* A species within a genus that a researcher designates as the one that rightfully hold(s) an existing generic name when that researcher, or another one, revises the genus’ (or subgenus’) limits (White et al. 2000, 904).
- typological species, nomenspecies** *n.* A species that is defined with regard to the characters of its type specimen (Lincoln et al. 1985).
- umbrella species** *n.* A charismatic species, *e.g.*, *Phengaris arion* (Large Blue Butterfly), whose conservation also conserves a high diversity of other organisms (Spitzer et al. 2009, 1056).
syn. conservation umbrella, umbrella (Spitzer et al. 2009, 1056)
- vicarious species** *n.* A species in a group of closely related, ecologically equivalent species that tend to occupy mutually exclusive areas (Lincoln et al. 1985).
syn. vicar, vicariad
cf. study of geography, biogeography: vicariance biogeography
- ♦ **species-abundance curve** See curve: species-abundance curve.
- ♦ **species-accumulation curve** See curve: species-accumulation curve.
- ♦ **species aggregate, collective group** *n.* A group of morphologically similar species that are difficult to tell apart (Lincoln et al. 1985).
cf. ²species: microspecies, superspecies
- ♦ **species-area curve** See curve: species-area curve.
- ♦ **species category** *n.* The class comprising species taxa (Mayr 1982, 254).
- ♦ **species-characteristic, species typical** *adj.* Referring to a trait that is specific to more than one species (Immellmann and Beer 1989, 287).
cf. character: species-specific character
- ♦ **species concept** See ²species.
- ♦ **species-density map** See map: species-density map.
- ♦ **species diversity** See diversity (def. 2).
- ♦ **species equilibrium** See equilibrium: species equilibrium.
- ♦ **species-flock** *n.* A group of several ecologically diverse and closely related species that have evolved within a single macrohabitat, *e.g.*, a particular lake basin (Lincoln et al. 1985).
Comment: Haplochromine cichlids (fish) formed species-flocks in seven Great Lake basins of tropical Africa (Seehausen et al. 1997, 1808).
- ♦ **species-group** See ²group: species-group.
- ♦ **species imprinting** See learning: imprinting: species imprinting.
- ♦ **speciesism** *n.* A person’s prejudice, or an attitude against, other species [coined by Singer 1975, 7].
cf. biophilia
- ♦ **species odor** See odor: species odor.
- ♦ **species packing** *n.* The number of species that a given hyperspace, or hyperspace axis, can contain in a multidimensional hyperspace (Lincoln et al. 1985).
- ♦ **species pairs** See ²species: vicarious species.
- ♦ **species recognition** See recognition: species recognition.
- ♦ **species richness** See index: species richness.
- ♦ **species-sample curve** *n.* See curve: species-accumulation curve.
- ♦ **species selection** See hypothesis: species selection.
- ♦ **species-specific behavior** See behavior: instinctive behavior.
- ♦ **species-specific character** See character: species-specific character.
- ♦ **species swarm** *n.* A large number of closely related species that occur together in a specific geographical area and are derived from the same ancestral stock (Lincoln et al. 1985).
cf. ²species: superspecies
- ♦ **species typical** See species characteristic.
- ♦ **specific** *adj.* Referring to a particular individual, situation, quality, trait, effect, or species; free from ambiguity (Lincoln et al. 1985).
syn. peculiar, unambiguous (Lincoln et al. 1985)
cf. character: specific character
- ♦ **specific-action potential** See potential: specific-action potential.
- ♦ **specific character** See character.
- ♦ **specific-mate-recognition system** See ¹system: specific-mate recognition system.
- ♦ **specific modifier** See gene: specific modifier.
- ♦ **specific nerve energies, doctrine of** *n.* A particular nerve always produces the same type of sensation regardless of its mode of stimulation (Müller 1827 in McFarland 1985, 166).
- ♦ **specific searching image** See search image.
- ♦ **specification** See speciation.
- ♦ **specification error** See error: specification error.
- ♦ **specificity, host specificity** *n.*
 1. A parasite’s being restricted to a given host species (Lincoln et al. 1985).
 2. An adult parasite’s being restricted to a particular host species (Lincoln et al. 1985).
- ♦ **spectral sensitivity** See sensitivity: spectral sensitivity.
- ♦ **spectrogram** See -gram: sonogram.
- ♦ **spectrum analyzer** See -graph: sound spectrograph.
- ♦ **speculum** *n.* In many bird species, *e.g.*, *Anas discors* (Blue-winged Teal): A lustrous mark on a wing (Oxford English Dictionary 1972, entries from 1804).
cf. signal: poster signal
Comment: “Speculum” now also refers to white, or colored, patches, on body surfaces of other kinds of animals besides birds that contrast with background color, *e.g.*, the white area around and below the tail base of many social-mammal species. German-speaking investigators tend to use “speculum” to refer to mammals; English-speaking investigators, to birds (Immellmann and Beer 1989, 288).
- ♦ **speleology** See study of: speleology.

- ♦ **sperm** See gamete: sperm.
- ♦ **spermalege** *n.* In a bed-bug species (Cimicidae): A highly specialized tissue mass beneath the cuticle of a female that receives sperm (after traumatic insemination, *q.v.*) and directs it to circulatory channels that eventually carry it to ova (Thornhill and Alcock 1983, 327).
- ♦ **spermateleosis** See -genesis: spermiogenesis.
- ♦ **spermatheca, spermathecae** See organ: spermatheca.
- ♦ **spermatism** See ³theory: encasement theory: spermism.
- ♦ **spermatize** See fertilize, impregnate.
- ♦ **spermatocyte** See -cyte: spermatocyte.
- ♦ **spermatogamete** See gamete: sperm.
- ♦ **spermatogenesis** See -genesis: spermatogenesis.
- ♦ **spermatophore** *n.* In Butterflies, Cephalopods, Leeches, Millepedes, Newts, Onychophorans, Springtails, Silverfish (insects); and some katydid and cricket species: A body of sperm and associated materials produced by a male or hermaphrodite (Barnes 1974; 311, 428, 669; Oberhauser 1988, 1384; Immelmann and Beer 1989, 289).
Comment: “Spermatophores” are stalked or unstalked, and placed in an environment by a male and picked up by a female, placed on a female by a male, or directly transferred from one individual to the vagina, *bursa copulatrix*, etc., of another.
- ♦ **spermatosome** See gamete: sperm.
- ♦ **spermatozoon, spermatozoan, spermatozoid, spermatozoid** See gamete: sperm.
- ♦ **sperm competition** See competition: sperm competition.
- ♦ **sperm displacement** *n.* In *Peromyscus maniculatus* (Deer Mice) and *Scathophaga stercoraria* (Dung Fly) and some other insect species: A tactic in sperm competition in which sperm from a female's last mate predominate in fertilizing her eggs (Lefevre and Jonsson 1962 in Parker 1984, 10; Smith 1979; Dewsberry 1985 in Schwagmeyer and Foltz 1990, 156; Immelmann and Beer 1989, 289).
syn. sperm precedence (according to some authors; a confusing synonym)
cf. sperm precedence
Comments: In insects, “sperm displacement” may occur due to how the sperm are positioned in a female's spermatheca or due to a male's exercising sperm removal. In Deer Mice, “sperm displacement” is related to the interval between different male's copulations (Schwagmeyer and Foltz 1990, 156).
- ♦ **sperm effect** See effect: sperm effect.
- ♦ **spermiogenesis** See -genesis: spermiogenesis.
- ♦ **spermism, spermist** See ³theory: encasement theory.
- ♦ **spermium** See gamete: sperm.
- ♦ **spermogenesis** See -genesis: spermatogenesis.
- ♦ **spermology** See study of: spermology.
- ♦ **spermophile, spermophilic, spermophily** See ¹-phile: spermophile.
- ♦ **sperm plug** *n.* In some insect, snake, and spider species; many mammal species; and an acanthocephalan-worm species: A plug that a male leaves in a female's vagina, *bursa copulatrix*, or other sexual organ, after mating as part of sperm competition (Parker 1970 in Parker 1984, 15; Immelmann and Beer 1989, 61).
cf. sphragis, tie
- ♦ **sperm precedence** *n.* For example, in *Peromyscus maniculatus* (Deer Mice), *Spermophilus tridecemlineatus* (Thirteen-lined Ground Squirrels), a spider-mite species, and some rabbit species: Predomination of sperm from a female's first mate in fertilizing her eggs (Immelmann and Beer 1989, 289).
syn. first-male advantage (Schwagmeyer and Foltz 1990, 156), sperm displacement (according to some authors; a confusing synonym)
cf. sperm displacement
Comment: In Deer Mice, *e.g.*, sperm precedence is related to the interval between different male's copulations and time in a diel cycle (Dewsberry 1985 and 1988 in Schwagmeyer and Foltz 1990, 156).
- ♦ **sperm removal** *n.* A tactic in sperm competition in which a male takes sperm from a previous male's copulation out of a female's spermatheca before he copulates with her; *e.g.*, in a damselfly, a male scrapes out sperm with his aedeagus (Waage 1979).
- ♦ **sperm-replenishment polyandry** See mating system: polyandry: sperm-replenishment polyandry.
- ♦ **-spermy comb.*f.*** Referring to sperm.
- ♦ **dispermy** *n.* Penetration of an ovum by two sperm during fertilization (Lincoln et al. 1985).
- ♦ **monospermy** *n.* Penetration of an ovum by one sperm during normal fertilization (Lincoln et al. 1985).
- ♦ **polyspermy** *n.* Penetration of an ovum by more than two sperm during fertilization (Lincoln et al. 1985).
- ♦ **sphagnicole, sphagnicolous** See -cole: sphagnicole.
- ♦ **sphagniherbosa** See ²community: sphagniherbosa.
- ♦ **sphagnophile, sphagnophilous, sphagnophily** See ¹-phile: sphagnophile.
- ♦ **sphecology** See study of: sphecology.
- ♦ **-sphere comb.*f.***
 1. “Denoting an enveloping spherical mass” (Michaelis 1963).
 2. “A sphere-shaped body” (Michaelis 1963).
 3. “Denoting a spherical form” (Michaelis 1963).*cf.* biome, biotope
[Greek *sphaira*, ball, sphere]
- ♦ **biosphere, ecosphere, ecumene** *n.* The part of our Earth that supports life, divided into biocycles, biochores, and biotopes and into the eubiosphere and the parabiosphere (Lincoln et al. 1985).
Comments: Diverse bacterial communities occur as deep as 4.2 km and at a temperature of 110°C (Fyfe 1996, 448).
- **eubiosphere** *n.* The part of the biosphere in which organisms' physiological processes can occur (Lincoln et al. 1985).
syn. biogeosphere, true biosphere (Lincoln et al. 1985)
- ♦ **allobiosphere** *n.* Part of the eubiosphere in which heterotrophic organisms occur but into which organic food must be transported because primary production does not occur in it (Lincoln et al. 1985).
- **hyperallobiosphere** *n.* The upper allobiosphere composed of the highest parts of major mountain ranges, typically at altitudes greater than 5,500 m (Lincoln et al. 1985).
- **hypoallobiosphere** *n.* “The lower allobiosphere, including ocean depths below the euphotic zone and hypogean” habitats (Lincoln et al. 1985).
- ♦ **autobiosphere** *n.* Part of the eubiosphere in which energy is fixed by photosynthesis (Lincoln et al. 1985).

- **noosphere** *n.* The part of the biosphere that is altered, or influenced, by human activities (Lincoln et al. 1985).
- **parabiosphere** *n.* The space surrounding the eu-biosphere in which conditions are too extreme for active metabolism, but in which resistant life-cycle stages may exist (Lincoln et al. 1985).
- **pedosphere** *n.* Part of the biosphere comprising soil and soil organisms (Lincoln et al. 1985).
- ecosphere, ecumene** See -sphere: biosphere.
- hydrosphere** *n.* The Earth's water mass, including atmospheric, surface, and subsurface waters (Lincoln et al. 1985).
- lithosphere** *n.* The Earth's rigid crustal plates (Lincoln et al. 1985).
- mesosphere** *n.* The outer layer of the Earth's atmosphere above the stratosphere where temperature decreases with increasing altitude, typically with efficient vertical convection currents (Lincoln et al. 1985).
- phyllosphere** *n.*
 1. A leaf microhabitat (Lincoln et al. 1985).
 2. The immediate surroundings of plant leaves that are influenced by the presence of leaves (Lincoln et al. 1985).
- cf.* -sphere: rhizosphere
- rhizosphere, root zone** *n.* The soil immediately surrounding plant roots that is influenced structurally, or biologically, by the roots' presence (Lincoln et al. 1985).
- cf.* -sphere: phyllosphere
- **rhizoplane** *n.* "The root-surface component of a rhizosphere" (Lincoln et al. 1985).
- stratosphere** *n.*
 1. The nearly uniform cold-ocean water masses in high latitudes and near-bottom waters of middle and low latitudes; ocean water below the thermocline (Lincoln et al. 1985).
 2. The atmosphere layer above the Earth's troposphere, 15–50 km above its surface, in which temperature ceases to fall with increasing altitude, typically without strong convection currents (Lincoln et al. 1985).
- **ozonosphere** *n.* The lower layer of the Earth's stratosphere (def. 2), about 15–30 km about its surface in which the absorption of ultraviolet solar radiation produces ozone (Lincoln et al. 1985).
- ♦ **spheres of dominance** *n.* The phenomenon in which an individual animal may be dominant in some contexts, but not in others (Hand 1985, 211).
- ♦ **sphingophile, sphingophilous, sphingophily** See ²-phile: sphingophile.
- ♦ **spfragis** *n.* In some water-beetle and butterfly species: An external plug that a male applies to his mate's genital opening and prevents other males from mating with her (Thornhill and Alcock 1983, 340).
- cf.* sperm plug
- ♦ **spiladophile, spiladophilus, spiladophily** See ¹-phile: spiladophile.
- ♦ **spinning** See behavior: spinning.
- ♦ **spinster hypothesis** See hypothesis: spinster hypothesis.
- ♦ **spiracular-flap hypothesis of insect wing origin** See hypothesis: hypotheses of origin of insect wings: spiracular-flap hypothesis of insect wing origin.
- ♦ **spiral swimming** See swimming: spiral swimming.
- ♦ **spite, spiteful behavior** See behavior: spiteful behavior.
- ♦ **spitting** *n.*
1. A person's ejecting saliva (at, or on, a person, or thing) as an expression of hatred or contempt (Oxford English Dictionary 1972, verb entries from 975).
2. For example, in *Panthera leo* (Lions) and *Panthera pardus* (Leopards): An individual's ejecting saliva "when angry" (Oxford English Dictionary 1972, verb entries from 1668).
- water spitting** *n.* In some fish species: An individual's squirting water droplets at prey above the surface of water, e.g., in *Colisa lalia* (Dwarf Gourami) and *Toxotes jaculatrix* (Banded Archerfish), which is a kind of tool use (Lüling 1969, 1973, etc. in Heymer 1977, 43).
- cf.* tool use
- ♦ **spittle nest** See nest: spittle nest.
- ♦ **Spjøtvoll method** See statistical test: multiple-comparisons test: planned-multiple-comparisons procedure: Spjøtvoll method.
- ♦ **splendiferin** See chemical-releasing stimulus: semiochemical: pheromone: splendiferin.
- ♦ **split gene** See gene: split gene.
- ♦ **splitter** *n.* A taxonomist who considers "even relatively minor differences as justifying the recognition of new [species,] genera, families, and higher taxa" (Mayr 1982, 240).
- ant.* lumper
- ♦ **sponge carrying** See behavior: sponge carrying.
- ♦ **spongicole, spongicolous** See -cole: spongicole.
- ♦ **spontaneous** *adj.* Referring to a phenomenon that develops, or occurs, without apparent external stimulus or cause (Lincoln et al. 1985).
- ♦ **spontaneous activity** See activity: spontaneous activity.
- ♦ **spontaneous behavior** See behavior: spontaneous behavior.
- ♦ **spontaneous generation** See -genesis: abiogenesis.
- ♦ **spontaneous ovulator** See ovulator: spontaneous ovulator.
- ♦ **spook reaction** See reaction: spook reaction.
- ♦ **sporadic** See frequency (table).
- cf.* abundant, common, rare
- ♦ **sporivore** See -vore: sporivore.
- ♦ **sporophyte** *n.* In many plant species: The diploid phase of a life cycle (Mayr 1982, 959).
- cf.* -plont: diplont
- ♦ **sport** See ⁴mutation.
- ♦ **spring** See ²group: spring.
- ♦ **squabble** See ¹conflict (def. 2).
- ♦ **square law** See law: Hardy-Weinberg law.
- ♦ **s-selected species** See ²species: s-selected species.
- ♦ **SSSI** See place: Site of Specific Scientific Interest.
- ♦ **s strategist, s-strategist** See strategist: s strategist.
- ♦ **s²** See variance: sample variance.
- ♦ **ST** See index: species richness.
- ♦ **¹stability** *n.*
 1. A thing's "ability to remain in the same relative place, or position, in spite of disturbing influences; capacity for resistance to displacement; condition of being in stable equilibrium, tendency to recover its original position after displacement" (Oxford English Dictionary 1972, entries from 1542).
 2. A population's ability to withstand perturbations without marked changes in its composition (Lincoln et al. 1985).
- ♦ **²stability** *n.* The condition in which an organism does not show variation in a particular trait or group of traits; any condition where there is a lack of plasticity, *q.v.* (Bradshaw 1965, 117).

instability, lack of stability *n.* An organism's variation that is not genetic in origin and has no observed environmental cause (although one might exist) (Mather 1953 in Bradshaw 1965, 116–117).

Comment: Some kinds of instability might be due to developmental errors not connected with any environmental influences (Bradshaw 1965, 117).

♦ **stability-time hypothesis** See hypothesis: stability-time hypothesis.

♦ **stabilizing selection** See selection: stabilizing selection.

♦ **stable equilibrium** See equilibrium: stable equilibrium.

♦ **stable-linkage disequilibrium** *n.* The linkage and strong interaction of polygenes that produce particularly favorable or unfavorable combinations (Franklin and Lewontin 1970 in Wilson 1975, 70).

Comment: When there is tight linkage disequilibrium, entire chromosomes can act as genetic units that underlie a trait (Franklin and Lewontin 1970 in Wilson 1975, 70).

♦ **stadium** *n., pl. stadia*

1. The interval between larval molts (Torre-Bueno 1978).
2. An instar, *q.v.* (Torre-Bueno 1978).
3. Any period in an insect's development (Torre-Bueno 1978).

syn. stage (Torre-Bueno 1978)

♦ **stage, state** *n.* An organism's distinguishable growth, or developmental, phase (Lincoln et al. 1985). See stadium.

cf. instar

ergonomic stage *n.* In Ants: The period of a colony life cycle that follows the founding stage, has relatively rapid colony growth in which only workers are produced, and is succeeded by the reproductive stage (Hölldobler and Wilson 1990, 638).

founding stage *n.* In Ants: The earliest period of a colony's life cycle in which a newly fecundated queen raises her first worker brood and which is succeeded by the ergonomic stage (Hölldobler and Wilson 1990, 638).

reproductive stage *n.* In Ants: The period of a colony life cycle that follows the ergonomic stage and in which males and virgin queens are produced (Hölldobler and Wilson 1990, 642).

♦ **stage-1 sleep, stage-2 sleep, stage-3 sleep, stage-4 sleep** See sleep (table) and definitions.

♦ **stagnicole, stagnicolous** See -cole: stagnicole.

♦ **stagnoplankton** See plankton: stagnoplankton.

♦ **Stairway to Heaven** *n.* A pathway the leads *Bos primigenius* (Domestic Cattle) to a slaughter corridor (Temple Grandin in Raver 1997, C1).

[after Led Zeppelin's song *Stairway to Heaven*]

♦ **stamp collecting** See collecting: stamp collecting.

♦ **stamping ground** *n.*

1. A place where *Equus ferus caballus* (Domestic Horses), or other animals, gather (Michaelis 1963).
2. For example, in *Connochaetes taurinus* (Blue Wildebeest): A place where an individual displays stamping, striking the ground with its feet (Wilson 1975, 491).

♦ **stand** See ²group: stand.

♦ **standard deviation (s, SD)** *n.* In statistics, a measure of quantitative variation within a sample data set that one chooses from an entire larger data set (= population) (Lincoln et al. 1985).

cf. standard error, variance: population variance, sample variance

Comment: A standard deviation of a sample set is calculated from the values of that sample set which one chooses from a larger population. For example, to compute the standard deviation of a sample set, let the set be the values 1, 2, 3, 4, 5, chosen from an entire population of 100 values. Subtract each value from the sample set's mean (= 3), square the differences (getting 4, 1, 0, 1, 4), sum these squares (= 10), divide the sum by N - 1 (the sample size minus 1, getting 2.5), and take the square root of the results of this division (= 1 SD = 1.58).

♦ **standard error (SE)** *n.* In statistics, a standard deviation of two or more means (Lincoln et al. 1985).

cf. standard deviation, variance

Comment: The estimated standard error using data from a single mean is the standard deviation (of the mean's data set) divided by the square root of the set's sample size (Lincoln et al. 1985). One SE of the values given under "standard deviation" (comment) is 1.58/ (square root 5) = 2.24.

♦ **standardize** *v.t.*

1. To make, cause, adjust, or adapt to fit a standard (Morris 1982).
2. To express the magnitude of one variable with regard to another variable.

Note: For example, Galen (1996) standardized the relative fitness of study plants by using number of seeds (= set set) per plant.

♦ **star** *n.* A self-luminous celestial body (exclusive of comets, meteors, and nebulae) (Michaelis 1963).

cf. pulsar, quasar

Comments: In general, stars are luminous due to their nuclear fusion processes (Mitton 1993). Remnants of stars that are no longer luminous are also called stars, *e.g.*, a neutron star (that is a radio-wave-emitting pulsar). Stars are predominantly hydrogen with helium as their other major constituent. The Sun, a typical star in many ways, is 94% hydrogen, 5% helium, and less than 0.1% carbon, oxygen, and other elements.

51 Pegasi *n.* A normal star in the constellation Pegasus with one known planet which Swiss astronomers found in 1995 (Wilford 1999, 16 April, A1).

neutron star *n.* A star with a mass from about 1.5–3.0 solar masses that collapsed under gravity to such an extent that it consists almost entirely of neutrons (Mitton 1993).

Comment: Neutron stars are about 10 km in diameter and have a density of 10^{17} kg/m³ (Mitton 1993). They are probably composed of matter of density second only to black holes (Sawyer 1997, A3).

Sun, sun *n.* The central star of our Solar System (Mitton 1993).

Comments: Generally speaking, the Sun is a medium sized star of medium brightness (Mitton 1993). Specifically, it is a dwarf star of spectral type G2 with a surface temperature of 5,700°K.

Upsilon Andromedae *n.* A Sun-like star, 44 light years from Earth, with three large planets (Wilford 1999, 16 April, A1).

Comments: This star is the first Sun-like one found to have multiple planets (Wilford 1999, 16 April, A1). The large gaseous planets are not likely to harbor life; however, their possible moons are possible sites for life.

- ♦ **starch-gel electrophoresis** See method: electrophoresis: starch-gel electrophoresis.
- ♦ **startle** *n.*
1. A person's start, or shock, of surprise or alarm; a person's being startled (Oxford English Dictionary 1972, entries from 1714).
 2. An individual animal's sudden involuntary movement due to a particular stimulus (surprise, alarm, acute pain, etc.) (Oxford English Dictionary 1972, entries from 1530), e.g., in a fish whose tank is rapped with a hard object or over which a shadow passes (Geiger et al. 1985, 11; R. A. Drummond, pers. comm.).
- v.t.* startle
- narcotized startle** *n.* A startle in which fish appear frightened but move more slowly than usual (e.g., in control fish) (Geiger et al. 1985, 11; R. A. Drummond, pers. comm.).
- Comment:* If the fish are fully narcotized, they do not show startle responses to stimuli which ordinarily release them (Geiger et al. 1985, 11; R. A. Drummond, pers. comm.).
- overreactive startle** *n.* A startle in which fish appear extremely frightened and form a dense school or swim rapidly (Geiger et al. 1985, 11; R. A. Drummond, pers. comm.).
- ♦ **startle reflex** See reflex: startle reflex.
- ♦ **startle response** See response: startle response.
- ♦ **stasogenesis** See ²evolution: stasogenesis.
- ♦ **stasimorph, stasimorphic character** See character: stasimorph.
- ♦ **stasimorphic speciation** See speciation: stasimorphic speciation.
- ♦ **stasipatric speciation** See speciation: stasipatric speciation.
- ♦ **stasis** *n.* "A period during which no evolutionary change takes place" (Dawkins 1982, 294).
cf. gradualism
- typostasis** *n.* A relatively static phase in evolutionary history in which few new forms are produced (Lincoln et al. 1985).
cf. -genesis: typogenesis; typolysis
- ♦ **stadium** See ²community: stadium.
- ♦ **stasophile, stasophilous, stasophily** See ¹-phile: stasophile.
- ♦ **statics** See study of: physics: statics.
- ♦ **statary phase** See phase: statary phase.
- ♦ **state** *n.*
1. A particular expression, or condition, of a character (Lincoln et al. 1985).
 2. A stage in a plant's life cycle (Lincoln et al. 1985). See behavior state.
- central excitatory state** *n.* Changes in nerve excitability that outlast the stimulation of an afferent nerve by a few milliseconds (Sherrington 1906, etc., in Hinde 1970, 268–269).
syn. central-motive state
- Comment:* "Central excitatory state" was later broadened to account for similar effects in more complex responses where time courses are different. This concept becomes less useful in more complicated analyses of neurophysiology (Hinde 1970, 269).
- ♦ **statics** See study of: physics: statics.
- ♦ **station** *n.*
1. The precise location of an organism, or species, in its habitat (Lincoln et al. 1985).
2. "A circumscribed area of uniform environmental conditions and vegetation; the typical habitat of a community" (Lincoln et al. 1985).
- ♦ **stationary-growth phase** See phase: stationary-growth phase.
- ♦ **stationary hypothesis, Stationary model** See hypothesis: stationary hypothesis.
- ♦ **stationary model** See hypothesis: stationary hypothesis.
- ♦ **statistic** *n.* Any function of a sample, often used as an estimate of a corresponding parameter of the population from which the sample is drawn and which is usually denoted with Roman letters (Lincoln et al. 1985).
cf. parameter
- ♦ **statistical difference** *n.* A quantitative difference between two, or more, experimental groups, or a coefficient from a predicted value, based on the results of a statistical test a researcher ran to analyze these groups. *Comment:* As a rule of thumb, when using a conventional statistical test, a biologist says she has found a statistical difference when her "calculated-p" is equal to, or less, than 0.05.
- ♦ **statistical hypothesis** See hypothesis: statistical hypothesis.
- ♦ **statistical inference** *n.* The process of predicting, or estimating, population parameters on the basis of sample data (Lincoln et al. 1985).
syn. inductive statistics (Lincoln et al. 1985)
- ♦ **statistical power** See power.
- ♦ **statistical test** *n.* A method used to draw an inference from data or to attempt to reject a null hypothesis (Lincoln et al. 1985).
cf. seven deadly sins in the study of behavior, statistical design
Comment: Some of the hundreds of statistical tests are defined below.

SOME CLASSIFICATIONS OF STATISTICAL TESTS

- I. Classification by conventionality
 - A. conventional statistical test
 - B. unconventional statistical test
- II. Classification by data distribution
 - A. nonparametric statistical test
 - B. parametric statistical test
- III. Classification by level of measurement
 - A. interval statistical test
 - B. nominal statistical test
 - C. ordinal statistical test
- IV. Classification by data independence
 - A. dependent-data statistical test
 - B. independent-data statistical test
- V. Classification by number of null hypotheses tested
 - A. one-tailed statistical test
 - B. two-tailed statistical test
- VI. Classification by number of samples
 - A. one-sample statistical test
 - B. two-sample statistical test
 - C. k-sample statistical test
- VII. Classification by kind of null hypothesis tested
 - A. statistical test for the null hypothesis that a correlation coefficient = 0.
 - B. statistical test for the null hypothesis that a regression coefficient = 0.
 - C. statistical test for the null hypothesis that 2, or more, centers of distribution are equal.
 - D. statistical test for the null hypothesis that 2, or more, means are equal.

analysis of covariance (ANCOVA) *n.* A statistical method that is used to describe the relationship between a continuous dependent variable and one, or more, nominal independent variables and that controls for the effect of one, or more, continuous independent variables (which are called covariates) (Kleinbaum and Kupper 1978, 11).

analysis of variance (ANOVA) *n.* A statistical technique used to assess how two, or more, nominal independent variables affect a continuous dependent variable; loosely speaking, ANOVA is usually concerned with comparisons between, or among, two, or more, sample means (Kleinbaum and Kupper 1978, 11, 244).

Comments: Kinds of ANOVA include model-1 ANOVA, model-2 ANOVA, nested ANOVA, 1-way ANOVA, 2-way ANOVA, nonparametric ANOVA, parametric ANOVA, and combinations of some of these kinds (Siegel 1956, chapters 7, 8; Sokal and Rohlf 1969; Kleinbaum and Kupper 1978). ANOVA can be regarded as a special case of regression (*q.v.*) (Kleinbaum and Kupper 1978, 245).

► **t test, Student's-t test, t-test** *n.* Analysis of variance (ANOVA) used to detect a possible difference between means of two samples; a one-way analysis of variance with two data sets (Sokal and Rohlf 1969, 220).

Comment: Other “t-tests” are used to look for a possible difference between a single specimen and a sample or the possible difference between groups of paired comparisons (Sokal and Rohlf 1969, 233, 332). [“t test” is named after a complicated mathematical distribution, the distribution also known as the Student’s distribution. “Student” derives from the pseudonym of W. S. Gosset who first described this distribution (Sokal and Rohlf 1969, 144).]

before-after-control-impact-pairs analysis *n.* A statistical test that compares values in a control and test group before and after the time of treatment in the test group (Steart-Oaten et al. 1992 in Perry 1995, 26).

bootstrap *n.* A data-based, computer-based simulation method used for estimating descriptive statistics and hypothesis testing (Efron and Tibshirani 1991, 390; 1993, 221).

Comments: This method uses new data sets drawn from an original one to estimate statistics including multimodality of a population, 95% “confidence intervals,” quantitative differences between two samples, and standard errors (Efron and Tibshirani 1993, 1, 4, 56, 225–227, 247, 390). Efron introduced the bootstrap in 1979, and the power of modern computer power makes its use feasible. “Confidence intervals” of a bootstrap are not formal confidence intervals of other statistical tests and should not be confused with them (White et al. 2000, 881).

[From the phrase “to pull oneself up by one’s bootstrap.” This is widely thought to be based on one of the 18th-century *Adventures of Baron Munchausen* by Rudolph Erich Raspe. In one adventure the Baron fell to the bottom of a deep lake. Just when it looked like all was lost, he picked himself up by his own bootstraps.]

correlation test *n.* A statistical method that determines the possible association between two, or more, variables, *e.g.*, human height and weight (Sokal and Rohlf 1969, 495, 549).

syn. regression (Sokal and Rohlf 1969, 495, indicate that this synonym confounds matters)
cf. statistical test: regression test

Comments: Kinds of correlation tests include: the parametric test the Pearson’s-product-moment-correlation coefficient, and nonparametric tests (contingency coefficient, C; Spearman-rank-correlation coefficient, rho, ρ ; Kendall-partial-rank-correlation coefficient, tau, τ ; and Kendall coefficient of concordance, W) (Siegel 1956, Chapter 9). Galton originated the concept of correlation (Mayr 1982, 697).

► **canonical correlation** *n.* A statistical method that looks for possible relationships between two sets of two, or more, variables for exploring the data, hypothesis testing, or both (Palmer 2008; Softstat, Inc. 2008).

Comment: For example a researcher could use canonical correlation to investigate the possible relationship between three measures of scholastic ability and five measures of success in school or the possible relationship between two measures of spider diversity and five measures of spider-habitat characteristics (Willett 2001, 415; Palmer 2008).

cross-validation *n.* A standard statistical test for estimating a prediction error (Efron and Tibshirani 1991, 237).

discriminate analysis *n.* A statistical method that determines how one, or more, independent variables can be used to discriminate among different categories of nominal dependent variables (Kleinbaum and Kupper 1978, 11).

Comment: For example, Kanwal et al. (1993, 1231) used discriminant analysis to generate quantitative rules used for assigning a syllable, *q.v.*, of a call of a Mustached Bat to a previously-defined group of syllables or to a new group.

factor analysis *n.* A statistical multivariable method that aims to explain relationships among several difficult-to-interpret, correlated variables in terms of a few conceptually meaningful, relatively independent, new composite variables called factors (Kleinbaum and Kupper 1978, 11, 376); *e.g.*, among a number of measures of a capacity such as intelligence or a type of behavior such as courtship (Immelmann and Beer 1989, 99).

Comment: Factor analysis can be regarded as a special case of regression, *q.v.* (Kleinbaum and Kupper 1978, 245).

Fisher's-exact test *n.* A test of statistical independence of two properties each occurring in two different states; *e.g.*, moth color (dark and light) and survivorship (high and low) (Sokal and Rohlf 1969, 586).

syn. Fisher-exact-probability test (Siegel 1956, 96), Fisher test (Vieira and Monteiro-Filho 2003, 503)

Comment: The Fisher's-exact test can also be used to determine whether states of a property occur at a frequency different than by chance alone, *e.g.*, dark and light moths occur at a ratio different than 1:1.

jackknife *n.* A data-based, computer-based simulation method for estimating descriptive statistics (Efron and Tibshirani 1993, 141).

Comments: The jackknife was the original computer-based method for estimating biases and standard errors of estimates (Efron and Tibshirani 1993, 141–145). Maurice Quenouille proposed the jackknife estimate of bias in the mid-1950s. This method uses $n - 1$ samples from an original sample with n observations; each of these samples is the same as the original one

except that it has one different observation removed. For example, in a data set with $i = 1, 2, 3, \dots, n$; the first jackknife sample contains all observations but the first in the series; the second sample, all but the second in the series; etc. The jackknife method is an approximation of the bootstrap method (*q.v.*).

jackknife-after-bootstrap *n.* A jackknife method used to measure the variance of a standard error obtained from a bootstrap, $\text{var}(\hat{\sigma}_B)$ (Efron and Tibshirani 1993, 275).

Kruskal-Wallis test *n.* A nonparametric test that compares population medians (National Institute of Standards and Technology 2005).

Comments: The Kruskal-Wallis test “tests the null hypothesis that k samples from possibly different populations actually originate from similar populations, at least as far as their central tendencies, or medians, are concerned. The test assumes that the variables under consideration have underlying continuous distributions” (National Institute of Standards and Technology 2005). Some references misspell “Kruskal” as “Kruskall.”

multiple-comparisons test *n.* A statistical procedure that looks for possible statistical differences among groups of data; *e.g.*, Scheffé’s test which looks for all possible comparisons among pairs of means, or groups of means (Day and Quinn 1989, 436).

Comment: Day and Quinn (1989) describe many multiple-comparisons tests including the Mann-Whitney-U statistic, Spjøtvoll method, Behrens-Fisher-*t* test, Welch’s test, Studentized-Range statistic (Q), least-significant-difference test (LSD test), Scheffé’s test, Bonferroni method, Tukey’s method, Duncan’s-multiple-range new test, Waller-Duncan-*k*-ratio test, and Dunnett’s test.

► **Dunnett’s test** *n.* A parametric test that compares treatments with a control (Dunnett 1955 in Day and Quinn 1989, 438).

cf. statistical test: multiple-comparisons test: planned-multiple-comparisons test: Steel’s test

► **planned-multiple-comparisons procedure (PMCP)** *n.* Specific comparisons, out of a set of all possible comparisons, that one decides to make the onset of an experiment (Day and Quinn 1989, 435).

cf. statistical test: multiple-comparisons test

Comments: Ideally planned comparisons should be orthogonal, *i.e.*, they should test completely separate hypotheses and thus provide independent pieces of information. Planned-multiple-comparisons procedures include the Behrens-Fisher-*t* test, Cochran’s-approximate-*t* test, Fligner-Policello test, Mann-Whitney-Wilcoxon-*U* statistic, Spjøtvoll method, Steel-Dwass test, Steel-Dwass-Ryan test, and Welch’s test; contrasts; and pairwise comparisons.

Behrens-Fisher-*t* test *n.* A parametric PMCP that is robust to unequal variances (Day and Quinn 1989, 435).

Cochran’s-approximate-*t* test *n.* A parametric PMCP (Day and Quinn 1989, 435).

contrast *n.* A parametric planned comparison method that compares combinations of means with one another; *e.g.*, an average of two means is compared with a third mean (Day and Quinn 1989, 435).

Fligner-Policello test *n.* A robust version of the Mann-Whitney-U test that requires only that the distributions under each treatment are symmetrical (Day and Quinn 1989, 435).

Mann-Whitney-Wilcoxon-*U* statistic *n.* A nonparametric PMCP; perhaps the simplest pairwise test to run (Day and Quinn 1989, 435).

pairwise comparison *n.* A planned comparison of means that compares two means (Day and Quinn 1989, 435).

cf. statistical test: multiple-comparisons test: planned-multiple-comparisons procedure: contrast

Spjøtvoll method *n.* A parametric PMCP that is best for contrasts (Day and Quinn 1989, 435).

Steel-Dwass test *n.* A nonparametric, instantaneous PMCP that uses pairwise rankings (Day and Quinn 1989, 438).

Steel-Dwass-Ryan test *n.* A stepwise, *ad hoc* version of the Steel-Dwass test (Day and Quinn 1989, 438).

Welch’s test *n.* A parametric PMCP (Day and Quinn 1989, 435).

► **Steel’s test** *n.* A nonparametric test that compares treatments with a control (Steel 1959 in Day and Quinn 1989, 438).

cf. statistical test: multiple-comparisons test: planned-multiple-comparisons test: Dunnett’s test

► **unplanned-multiple-comparisons procedure, UMCP** *n.* A procedure that compares all possible groups within an experiment; contrasted with planned-multiple-comparisons test.

Comments: This procedure is used to look for any possible differences between groups. UMCPs can be inappropriate because of (1) an incorrect type of error rate was used, (2) conclusions drawn using these tests are based on inconsistent criteria, (3) means pronounced different at the significance level of 5% by one test may not be significantly different at this level using another test, and (4) commonly used tests are not robust to violations of assumptions. Different methods have been designed for different purposes, and the best method to use for a particular experiment depends on the precise objectives of an experiment (Day and Quinn 1989, 434). Most UMCPs can be simply modified for unequal sample sizes (Day and Quinn 1989, 436). Unplanned-multiple-comparisons procedures include the Bonferroni method, Bryant-Paulson generalization of Dunn-Sidák method, C method, GH method, joint-rank Ryan test, least-significant-difference test, Nemenyi (joint-rank) test, Student-Newman-Keuls method (SNK), T3 method, Tukey’s test, Waller-Duncan-*k*-ratio test, as well as Duncan’s-multiple-range (-new) test, nonparametric UMCPs, Peritz’s test, protected-unplanned multiple-comparisons tests, Ryan’s procedure, Ryan’s-Q test (Ryan’s-F test), Scheffé’s test (Scheffé test), Shaffer’s test, simultaneous tests, stepwise tests, and Welsh’s step-up (GAPA test).

Bonferroni method *n.* A parametric UMCP that adjusts the significance level per comparison, using the Bonferroni inequality, to ensure that the EER is always below the level chosen; and that is designed to compare combinations of means as well as pairwise comparisons provided the number of comparisons to be made (r) is fixed in advance (Day and Quinn 1989, 436).

Comments: This test requires equal sample sizes and variances (Day and Quinn 1989, 436). Under certain conditions, it can be used when data are nonindependent (Day and Quinn 1989, 437).

Dunn-Sidák method *n.* A more powerful Bonferroni method.

Comment: This test requires equal sample sizes and variances (Day and Quinn 1989, 436).

Bryant-Paulson generalization of Tukey's test *n.* A parametric UMCP used for comparing means adjusted in ANCOVA (Bryant and Paulson 1974 in Day and Quinn 1989, 437).

C method *n.* A parametric UMCP that can be used for with heterogeneous variances and equal, or unequal, sample sizes (developed by Dunnett 1980b from Cochran's approximate t test in Day and Quinn 1989, 437).

Duncan's-multiple-range (-new) test *n.* A parametric, stepwise UMCP, commonly used, but not recommended by most statisticians for many years (Duncan 1955 in Day and Quinn 1989, 433).

Comment: This test requires equal sample sizes and variances (Day and Quinn 1989, 436).

GH method *n.* A parametric UMCP that can be used with heterogeneous variances and equal, or unequal, sample sizes (Games and Howell 1976 in Day and Quinn 1989, 437).

joint-rank Ryan test *n.* A nonparametric, stepwise, *ad hoc* UMCP (Day and Quinn 1989, 437).

least-significant-difference test (LSD test) *n.* The simplest parametric UMCP that sets the type-I-error rate at the per-comparison level of alpha, and as a result it is the most powerful tests available (Day and Quinn 1989, 436).

Comments: Fisher (1935 in Day and Quinn 1989, 436), suggested the protected LSD test. This test requires equal sample sizes and variances (Day and Quinn 1989, 436).

Nemenyi (joint-rank) test *n.* A nonparametric, simultaneous, UMCP (Nemenyi 1963 in Day and Quinn 1989, 437).

nonparametric UMCP *n.* A method that is appropriate if population distributions are not fairly close to normal, *e.g.*, if they are multimodal; and that assumes the distributions under each treatment differ only in location (*e.g.*, median) and the shape and variances of distributions are the same in all treatments, either on the original scale of measurement or on some transformed scale (Day and Quinn 1989, 437).

Peritz's test *n.* A parametric, stepwise UMCP that is a mixture of the SNK test and Ryan's test (Einot and Gabriel 1975 in Day and Quinn 1989, 436).

Comment: This test requires equal sample sizes and variances (Day and Quinn 1989, 436).

protected-unplanned multiple-comparisons test *n.* A parametric UMCP that is applied only if an ANOVA F test is significant.

Ryan's procedure *n.* A parametric UMCP that is Ryan's method (Ryan 1960) modified by Ramsey (1978) (Day and Quinn 1989, 436).

Comment: This test requires equal sample sizes and variances (Day and Quinn 1989, 436).

Ryan's Q test, Ryan's F test *n.* A parametric UMCP that is Ryan's method (Ryan 1960) modified by Einot and Gabriel (1975) (Day and Quinn 1989, 436).

Comment: This test requires equal sample sizes and variances (Day and Quinn 1989, 436).

Scheffé's test, Scheffé test *n.* A parametric UMCP that is designed for all possible comparisons

including both pairwise comparisons and contrasts (Scheffé 1953 in Day and Quinn 1989, 436).

Comment: Under certain conditions, this test can be used when data are nonindependent (Day and Quinn 1989, 437).

Shaffer's test *n.* A parametric UMCP that is a modification of stepwise procedures and replaces the comparison of means farthest apart by an ANOVA F test (Shaffer 1979 in Day and Quinn 1989, 436).

Comment: This test requires equal sample sizes and variances (Day and Quinn 1989, 436).

simultaneous test *n.* A parametric UMCP that uses the same critical value for each comparison so that each comparison has the same chance of a type-I error (Tukey 1953 in Day and Quinn 1989, 436).

stepwise test *n.* A parametric UMCP that is designed to compare pairs of means to find where differences occur, or to detect groups of equivalent means (Day and Quinn 1989, 436).

Student-Newman-Keuls (SNK) *n.* A parametric, stepwise UMCP.

Comments: This test is commonly used, but not recommended by most statisticians for many years (Newman 1939 and Keuls 1952 in Day and Quinn 1989, 433, 436). This test requires equal sample sizes and variances.

T3 method *n.* A parametric, UMCP that can be used for with heterogeneous variances and equal, or unequal, sample sizes (Tamhane 1979 and Dunnett 1980b in Day and Quinn 1989, 437).

Tukey's method *n.* A parametric UMCP that compares each pair of means using the same critical value for each comparison so that each comparison has the same chance of a type-I error (Tukey 1953 in Day and Quinn 1989, 436).

syn. honestly-significant-difference test (HSD test), T method, Tukey's A, Tukey's w method

Comment: This test requires equal sample sizes and variances (Day and Quinn 1989, 436).

Waller-Duncan k-ratio test *n.* A parametric UMCP that is an elaborate protected LSD test (Waller and Duncan 1969 in Day and Quinn 1989, 436).

Comment: This test requires equal sample sizes and variances (Day and Quinn 1989, 436).

Welsh's step-up, GAPA test *n.* A parametric UMCP that is Ryan's method (Ryan 1960) modified by Welsh (1977) (Day and Quinn 1989, 436).

Comment: This test requires equal sample sizes and variances (Day and Quinn 1989, 436).

nonparametric test *n.* A test with these assumptions about the data it analyzes: data are independent; the variable under study has an underlying continuity; and depending on the test, data can be measured in a nominal, ordinal, or interval scale (Siegel 1956, 31); contrasted with parametric test.

Comment: Examples of nonparametric tests are the Chi-square test, Fisher-exact-probability test, Mann-Whitney-U test, and Wilcoxon-matched-pairs-signed-ranks test, as well as nonparametric correlation and nonparametric regression (Siegel 1956).

one-tailed test, one-sided test, single-tail test *n.* A test in which the critical region comprises values on only one side of the mean (the left or right tail) (Lincoln et al. 1985).

parametric test *n.* A statistical test with these assumptions about the data it analyzes: data are

independent and drawn from normally distributed populations, these populations have the same variances (or in special cases, a known ratio of variances), variables are measured in at least an interval scale, and in analysis of variance tests, population means are linear combinations of effects due to columns, rows, or both (Siegel 1956, 19); contrasted with nonparametric test.

Comment: Examples of parametric tests are the Pearson's product-moment correlation coefficient, parametric analysis of variance, and parametric regression.

Prais-Winsten Technique *n.* A statistical method used to correct an analysis for effects of autocorrelated data, which are data that are not statistically independent of one another (Cropper and Griffiths 1994, 253).

Comments: For example the regression equation in Cropper and Griffiths (1994, 252) includes both ΔCGDP and $(\text{PCGDP})^2$. These terms are obviously related to one another in their magnitudes; therefore, they are autocorrelated.

Rayleigh test *n.* One of a number of tests used in circular statistics to determine an event's mean direction, or time, and to determine whether it is statistically different from another event's mean (D. B. Quine, pers. comm.).

regression, regression test *n.* In statistics, an estimation of the relationship between one, or more, dependent variables and one, or more, independent variables, by expressing the dependent variable, or variables, as a linear, or more complex, function of the others (Kleinbaum and Kupper 1978, 34; Lincoln et al. 1985).

syn. least-squares regression (Efron and Tibshirani 1991, 392)

See ²evolution: regressive evolution.

cf. curve: regression curve; regression line; statistical test: correlation

Comments: The concept of regression was first developed by Galton in the 19th century (Mayr 1982, 697). Regression dependent variables are continuous, and independent variables can be any combination of measurement scales (nominal, ordinal, or interval) (Kleinbaum and Kupper 1978, 245). Types of regression include curvilinear regression, linear regression, multivariate regression, nonparametric regression, parametric regression, partial regression, polynomial regression, stepwise regression, and univariate techniques. Analysis of variance (ANOVA), analysis of covariance (ANCOVA), and discriminant analysis can be looked upon as special cases of regression (Kleinbaum and Kupper 1978, 245). Loess, generalized additive models, and CART (classification and regression trees) are computer algorithms that expand the scope of regression (Efron and Tibshirani 1991, 394).

► **loess** *n.* A computer-based curve-fitting method that fits a series of local regression curves for different values of compliance, in each case using only data points near the compliance value of interest; this is contrasted to a regression that fits only one line, or one smooth curve, to a data plot (Efron and Tibshirani 1991, 392).

significance test *n.* A test that provides a criterion for deciding whether a difference between expected and observed values is small enough to be attributed reasonably to chance alone (Lincoln et al. 1985).

single-tail test See test: one-tailed test.

Student's-t test See test: analysis of variance: t test.
test of independence *n.* A statistical test that determines whether two, or more, properties (each different states) are unrelated to one another (= independent of one another) in an experiment (Sokal and Rohlf 1969, 585-606).

Comment: Tests of independence include the chi-square test, Fisher's exact test, and G-test.

two-tailed test, two-sided test *n.* A test in which the critical region includes values on both sides of the mean of the sampling distribution (both right and left tails) (Sokal and Rohlf 1969, 80).

cf. statistical test: one-tailed test

♦ **statistically significant, significant** *adj.* Referring to the outcome of a statistical test that has a "calculated-p" < a "stipulated-p", *q.v.* (Sokal and Rohlf 1969, 161).

cf. study of: statistics: Bayesian statistics

Comments: If a test is statistically significant, a null hypothesis is rejected, and a person finds a difference between groups, a difference between a correlation coefficient of 0 and a found correlation coefficient, or other difference. Some statisticians consider rejection of a null hypothesis to be a controversial method. The occurrence of a particular phenomenon might be statistically significant in an experiment, but not be biologically significant to the organism in question (Thomas and Juanes 1996, 856). Also a biologically-significant phenomenon might not show statistical significance in an experiment. Statistical and biological significance can be associated through the use of statistical power analysis. Johnson (1996, 860) reports that researchers' "blind reliance" on the "stipulated-p" of 0.05 (= the 5% level) can prevent one's making biologically relevant considerations of experiments.

♦ **statistics** *n., pl.*

1. "Quantitative data, pertaining to any subject or group, especially when systematically gathered and collated" (Michaelis 1963).
2. Procedures used to organize data, summarize data, draw inferences from data, or a combination of these activities.

See study of: statistics.

cf. statistical inference, statistical test

♦ **statokinesis** See kinesis: statokinesis.

♦ **status** See ¹rank: dominance rank.

♦ **status competition** See competition: status competition.

♦ **status sign, status signal** See signal: status signal.

♦ **staurogamy** See -gamy: staurogamy.

♦ **steady-state hypothesis** See hypothesis: hypotheses of the beginning and evolution of the Universe: steady-state hypothesis.

♦ **Steel-Dwass test** See statistical test: multiple-comparisons test: planned-multiple-comparisons procedure: Steel-Dwass test.

♦ **Steel's test** See statistical test: Steel's test.

♦ **steganochamaephytum** See ²community: steganochamaephytum.

♦ **stellar black hole** See black hole: stellar black hole.

♦ **stem group** See clade: stem group.

♦ **steno-, sten-** *comb. f.* "Tight; narrow; contracted" (Michaelis 1963).

cf. eury-
[Greek *stenos*, narrow]

♦ **stenobaric** *adj.* Referring to an organism that is tolerant of a narrow range of atmospheric, or hydrostatic, pressure (Lincoln et al. 1985).

- cf.* eurybaric
- ♦ **stenobathic** *adj.* Referring to an organism that is tolerant of a narrow range of depth (Lincoln et al. 1985).
cf. eurybathic
- ♦ **stenobenthic** See benthic: stenobenthic.
- ♦ **stenobiont** See biont: stenobiont.
- ♦ **stenochore, stenochoric, stenochorous** See -chore: stenochore.
- ♦ **stenocoenose** *adj.* Referring to an organism with a restricted distribution (Lincoln et al. 1985).
cf. eurycoenose
- ♦ **stenoecism, stenoecy, stenoecic, stenocious, stenoecious, stenoekous** See -oecism: stenoecism.
- ♦ **stenograph** See -graph: stenograph.
- ♦ **stenohaline** See haline: stenohaline.
- ♦ **stenohydric** *adj.* Referring to an organism that is tolerant of a narrow range of moisture levels or humidity (Lincoln et al. 1985).
cf. euryhydric
- ♦ **stenohygrobia** See fauna: stenohygrobia.
- ♦ **stenoionic** *adj.* Referring to an organism that is tolerant of a narrow range of pH (Lincoln et al. 1985).
cf. euryionic
- ♦ **stenolume, stenophobic** *adj.* Referring to an organism that is tolerant of a narrow range of light intensity (Lincoln et al. 1985).
cf. eurylume
- ♦ **stenomorphic** See -morphic: stenomorphic.
- ♦ **stenophage, stenophagous, stenophagy** See -phage: stenophage.
- ♦ **stenophobic** See stenolume.
- ♦ **stenoplastic** *adj.* Referring to an organism that exhibits only a limited developmental response (phenotypic variation) to different environmental conditions (Lincoln et al. 1985).
cf. euryplastic
- ♦ **stenosubstratic** *adj.* Referring to an organism that is tolerant of a narrow range of substrate types (Lincoln et al. 1985).
cf. eurysubstratic
- ♦ **stenotherm, stenothermic, stenothermal, stenothermous** See therm: stenotherm.
- ♦ **stenothermophile, stenothermophilous, stenothermophily** See ¹-phile: stenothenophile.
- ♦ **stenotopic, stenotopy** See -topy: stenotopy.
- ♦ **stenotropism, stenotropic** See -tropism: stenotropism.
- ♦ **stenoxyenous** See -xenous: stenoxyenous.
- ♦ **step difference** See difference: step difference.
- ♦ **step-fathering** *n.* In an anemone fish: Care of eggs in a brooding father's territory by a conspecific male that obtains the territory after removal of the brooding father (Yanagisawa and Ochi 1986, 1769).
- ♦ **steppe** See habitat: steppe.
- ♦ **sterane** See molecule: sterane.
- ♦ **stercoraceous** *adj.* Referring to a meridicole, *q.v.* (Lincoln et al. 1985).
- ♦ **stereopsis** *n.* An animal's seeing things in three dimensions (Storz 1973, 267).
- ♦ **stereotaxis, stereotactic, stereotaxy** See taxis: stereotaxis.
- ♦ **stereotropism, stereotropic** See -tropism: stereotropism.
- ♦ **stereotype, stereotypic behavior, stereotyped motor acts** See stereotypy.
- ♦ **stereotyped-action pattern** See pattern: fixed-action pattern.

♦ **stereotyped osmallaxis** See osmallaxis: stereotyped osmallaxis.

♦ **stereotypy** *n., pl. stereotypies*

1. An animal's frequent repetition of behavior that serves no obvious purpose (Russell 1934 in Oxford English Dictionary 1989).
2. An animal's "normal" uniform repetition of a kind of behavior (Maier and Schneirla 1964, 164; Immelmann and Beer 1989, 291).
cf. pattern: fixed-action pattern
3. An animal's "abnormal" repetition of a kind of behavior (Hediger 1934 in Meyer-Holzapfel 1968, 479; Mason and Green 1962 in Mitchell 1970, 222); e.g., flying back and forth, head turning, pacing back and forth, rocking back and forth, or vocalizing (Holzapfel 1939 and Hediger 1950 in Hinde 1970, 556; Fox 1974, 73; Immelmann and Beer 1989, 291).

syn. behavior stereotype, stereotype (Hinde 1970, 556), stereotyped motor acts (Spinelli and Markowitz, 1985), stereotypic behavior (Line 1987, 856)

cf. behavior: abnormal behavior; captivity degeneration; specialization

Comments: Stereotypies in caged *Serinus canaria* (Canaries) are spot picking (Dawkins 1980, 80); in *Macaca mulatta* (Rhesus Macaques), crouching, thumb and toe sucking, self-clasping, rocking, etc. (Holzapfel 1939 and Hediger 1950 in Hinde 1970, 556; Mason and Green 1962 in Mitchell 1970, 222; Fox 1974, 73; Immelmann and Beer 1989, 291); and in young multihandicapped children, eye gouging, hand flapping, mouthing, rocking, self-stimulation with objects, saliva play, and nonfunctional motor movements (Sisson et al. 1988, 509–510). In captive animals, a stereotypy often consists of early stages of a behavior sequence, which has become fixed and modified (Hinde 1970, 556). A stereotypy can be due an animal's stimulus deprivation or confinement in an impoverished environment (Dawkins 1980, 80; Immelmann and Beer 1989, 291).

♦ **sterility** *n.*

1. An organism's being unable to produce viable propagules or reproduce sexually (Lincoln et al. 1985).
2. Something's being free from contamination by microorganisms (Lincoln et al. 1985).

adj. sterile

♦ **sterility factor** See factor: sterility factor.

♦ **sternal gland** See gland: sternal gland.

♦ **steroid** See molecule: steroid.

♦ **steroid hormone** See hormone: steroid hormone.

♦ **sterrhium** See ²community: sterrhium.

♦ **sterrhophile, sterrhophilus, sterrhophily** See ¹-phile: sterrhophile.

♦ **sterric** *adj.* Referring to a heath community or heathland habitat (Lincoln et al. 1985).

♦ **sticking out one's tongue** See display: sticking out one's tongue.

♦ **stigmergy, stigmeric communication** See communication: sematectonic communication.

♦ **stigmergy theory** See ³theory: stigmergy theory.

♦ **stigmergy stilt-walking** See locomotion: stilt-walking.

♦ **stimulant** See chemical-releasing stimulus: stimulant.

♦ **stimulation** See ²stimulus.

♦ **¹stimulus** *n., pl. stimuli* Any effect of a stimulus (*q.v.*) on an organism (Immelmann and Beer 1989, 291).

TWO CLASSIFICATIONS OF STIMULI

- I. Classification by their importance to a receiver
 - A. irrelevant stimulus
 - B. relevant stimulus
 - 1. minor stimulus
 - 2. major stimulus (*syn.* sign stimulus, releaser)
 - 3. pseudoreleaser
 - 4. supernormal stimulus (*syn.* superoptimal stimulus)
- II. Classification by their adequacy in eliciting a response from a receiver
 - A. adequate
 - B. inadequate

♦ **²stimulus** *n., pl. stimuli*

1. Physiologically, "something that acts as a 'goad' or 'spur' to a languid bodily organ; an agent that stimulates, increases, or quickens organic activity" (Oxford English Dictionary 1971, entries from 1614).
2. Physiologically, "something that excites an organ or tissue to a specific activity or function; a material agency that produces a reaction in an organism" (Oxford English Dictionary 1971, entries from 1793).
3. Anything that rouses a person's mind or spirits; an incentive (Michaelis 1963).
4. Any internal, or external, condition, or change, that produces a reaction, or change, in an organism (Lincoln et al. 1985; Immelmann and Beer 1989, 292).

See ²stimulus: sign stimulus.

syn. stimulation (Immelmann and Beer 1989, 292)

cf. chemical-releasing stimulus, stimulation

Comments: Hinde (1970, 58) indicates that "stimulus" necessarily does not imply an identifiable response on the part of an organism and that he does not use it to refer to "hypothetical events postulated to account for changes in behaviour." Tinbergen (1951, 36) indicates that "stimulus" is a term that is open to criticisms.

[Latin *stimulus*]

adequate stimulus *n.* A stimulus to which a particular receptor is most sensitive (Heymer 1977, 144; Immelmann and Beer 1989, 294).

cf. ²stimulus: inadequate stimulus

► **inadequate stimulus** *n.* A stimulus to which a particular receptor responds at a relatively high threshold in contrast to an adequate stimulus (Heymer 1977, 144).

chemical-releasing stimulus See chemical-releasing stimulus.

conditional stimulus, conditioned stimulus (CS) *n.* In Pavlovian conditioning, a stimulus that elicits a conditional response (CR), *q.v.* (Dewsbury 1978, 322).

cf. learning: conditioning: Pavlovian conditioning; ²stimulus: unconditional stimulus

configurational stimulus *n.* The particular relational structure among stimulus components (Immelmann and Beer 1989, 119).

cf. perception: gestalt perception

directing stimulus *n.* A stimulus that directs an animal's activity in relation to the spatial arrangement of its surroundings (Tinbergen 1951, 82).

cf. ²stimulus: releasing stimulus

external stimulus, external stimulation *n.*

A stimulus from outside an animal's body (Immelmann and Beer 1989, 96).

syn. peripheral stimulation (Immelmann and Beer 1989, 96)

cf. ²stimulus: internal stimulus; ¹receptor: exteroceptor

internal stimulus, internal stimulation *n.* A stimulus from inside an animal's body (Immelmann and Beer 1989, 156).

cf. ²stimulus: external stimulus; ¹receptor: interoceptor

key stimulus See ²stimulus: releaser.

milking stimulus *n.* The sum of stimuli applied to a lactating mammal by suckling (Cowie et al. 1951).

motivating stimulus See ²stimulus: priming stimulus.

perceptual stimulus See ²stimulus: releaser.

peripheral stimulus, peripheral stimulation See ²stimulus: external stimulus.

photostimulation *n.* A stimulus composed of paka-paka (*q.v.*) and flash (a strong light beam).

Comments: Over 700 people (mostly children) in Japan were hospitalized as a result of photostimulation from an animated television show (WuDunn 1997, A3). These people had one or more of these symptoms: dizziness, losing consciousness, seizures, and vomiting blood. Some video games also cause photostimulation. It might be optically stimulated epilepsy in some cases.

priming stimulus *n.* A stimulus that does not have an immediate overt effect on an animal's behavior, but increases the animal's response tendency to subsequent stimuli (Immelmann and Beer 1989, 232).

cf. sensitization

releaser *n.*

1. Characters exhibited by an individual of a given animal species that activate existing releasing mechanisms in conspecifics and elicit certain chains of instinctive behavior patterns (Lorenz 1932, 1935 in McFarland 1985, 364).

2. A single stimulus, or one out of a very few such crucial stimuli, by which an animal distinguishes key objects such as an enemy, potential mate, and a suitable nesting place (Uexküll 1939; Wilson 1975, 595).

3. "A specific stimulus responsible for evoking a particular fixed-action pattern" (Wittenberger 1981, 620).

4. A relatively simple yet specific stimulus that elicits a fixed-action pattern; *e.g.*, the red breast feathers of a European Robin in another male's territory are a sign stimulus that releases the latter's aggression (Dewsbury 1978, 17).

5. "A stimulus that serves to initiate instinctive activity or mood" (Lincoln et al. 1985).

6. "A sign stimulus used in communication" (Lincoln et al. 1985).

syn. key stimulus, perceptual signs (Tinbergen 1951, 36), perceptual stimulus (Russell 1943 in Heymer 1977, 156), releasing stimulus, sign stimulus (in many usages, Immelmann and Beer 1989, 250), signal stimulus (Russell 1943)

cf. ²stimulus: sign stimulus

Comments: A "releaser" can be a structure, movement, sound, or odor of a conspecific animal (Dewsbury 1978, 18). In Humans, "releasers" include uniforms, signs of rank, emotional displays (Heymer 1977, 35). One person's "yawn" can be a "releaser" for a yawn in another person; a "yawn" can be considered to be

a stereotyped-action pattern (Provine and Hamernik 1986). Immelmann and Beer (1989, 270) distinguish between "sign stimulus" and "releaser."

► **interspecific releaser** *n.* A releaser used in communication between species, such as symbionts (Heymer 1977, 35); e.g., alarm calls of songbirds, warning tail beating of a Goby (fish) that causes its symbiotic shrimp to withdraw into its hole, pheromonal mimicry to ant-larval pheromone by inquiline (Immelmann and Beer 1989, 156).

See chemical-releasing stimulus: semiochemical: allelochemical: allomone

► **social releaser** *n.* A releaser that elicits innate behavior from a conspecific [translated from *Auslöser* (releaser) of Lorenz (1935 in by Tinbergen 1948) by Tinbergen (1951)].

► **supernormal stimulus** *n.*

1. A stimulus that has one, or more, exaggerated attributes and tends to elicit a greater response than the more usual stimuli in its category; e.g., *Charadrius hiaticula* (Ringed Plovers) prefer white eggs with black spots to their own eggs with less contrasting spotting, Oystercatchers (birds) prefer five-egg clutches to their usual three-egg clutches, or host birds give young *Cuculus canorus* (Common Cuckoos) which have very large gaping mouths more attention than their own young (Hailman in Wilson 1975, 253).

Note: "Supernormal stimuli" were discovered by Koehler and Zagarus (1937 in Heymer 1977, 183).

2. A releaser that is preferred to a natural "appropriate" stimulus when an animal may choose between a supernormal stimulus and a natural one (Immelmann and Beer 1989, 300).

syn. supernormal-sign stimulus (Tinbergen 1951, 44), superoptimal stimulus (which is little used now because if one considers "optimal" to be the best possible, then "super" is a superfluous prefix; Immelmann and Beer 1989, 300), supernormal releaser, super-releaser

sign stimulus *n.* A stimulus that has not evolved as a signal but is used as a signal by a receiver, e.g., branches of a tree with a color that makes it easier for birds to recognize the tree as a nesting site (Immelmann and Beer 1989, 270).

syn. key stimulus [*Schlüsselreiz*, preferred by German ethologists because it suggests a key that unlocks the "gate" of a relevant releasing mechanism (Immelmann and Beer 1989, 270)]

cf. stimulus; stimulus: releaser

Comment: "Sign stimulus" is sometimes distinguished from "releaser" which is a stimulus that evolved as a signal and has adaptive significance for both a sender and receiver (Immelmann and Beer 1989, 250), e.g., a kairomone.

signal stimulus See ²stimulus: releaser.

social stimulation *n.* A stimulus that affects a focal organism and emanates from a conspecific (Immelmann and Beer 1989, 277, 292).

stress See stress in the Ss.

subliminal stimulus *n.* A stimulus that is below an organism's threshold level, or insufficient to elicit an organism's response (Lincoln et al. 1985).

subthreshold stimulus *n.* A stimulus whose intensity, or other characteristics, is not sufficient to produce a perceptible effect on an animal (Immelmann and Beer 1989, 312).

supernormal stimulus, supernormal releaser, supernormal-sign stimulus, superoptimal stimulus, super-releaser See ²stimulus: releaser: supernormal stimulus.

unconditional stimulus, unconditioned stimulus (UCS) *n.* In Pavlovian conditioning, a stimulus that elicits an unconditional response, UCR (Dewsberry 1978, 322).

cf. learning: conditioning: Pavlovian conditioning; ²stimulus: conditional stimulus

zeitgeber, Zeitgeber *n.* In many animal species:

A periodic environmental stimulus to which an animal's biological rhythm is entrained (Dewsberry 1978, 65), e.g., the light-dark cycle or lengthening of days in spring (Immelmann and Beer 1989, 330).

syn. proximate causation (*q.v.*) proximate factor (*q.v.*) synchronizer, *q.v.* (Lincoln et al. 1985)

cf. factor

Comment: The term "zeitgeber" is usually restricted to include stimuli in an animal's external environment (Immelmann and Beer 1989, 330).

[coined by Aschoff (1960 in McFarland 1985, 291–292) from German *Zeitgeber*, time giver]

♦ **stimulus adaptation** See learning: habituation.

♦ **stimulus filtering** *n.*

1. An organism's selective neural transmission of energy input from its sensory receptors to its brain or from its lower-level brain centers to its higher-level brain centers (Wittenberger 1981, 622).

2. An organism's selectively responding to some stimuli and its ignoring (filtering out) other stimuli that impinge upon it (McFarland 1985, 210).

peripheral stimulus filtering, peripheral filtering *n.* Stimulus filtering (*q.v.*) in an animal's sense organs (Immelmann and Beer 1989, 292).

♦ **stimulus generalization, generalization** *n.*

An animal's first learning to react in a particular way to a particular stimulus, and then reacting in the same way toward a similar stimulus, e.g., a toad's learning that a black-and-yellow bumble bee is noxious when it tries to eat it due to its sting, and then avoiding all similar looking insects, even perfectly edible, nonstinging ones (Immelmann and Beer 1989, 292).

cf. learning: habituation

♦ **stimulus modality** See modality.

♦ **stimulus-response psychology** See study of: psychology: stimulus-response psychology.

♦ **stimulus-response relationship** See relationship: stimulus-response relationship.

♦ **stimulus specificity** *n.* A receptor's, or behavior's, characteristic selective responsiveness to a stimulus; e.g., different vertebrate retinal photoreceptor cells have different spectral sensitivities (Immelmann and Beer 1989, 294).

cf. ²stimulus: adequate stimulus

♦ **stimulus threshold** See threshold: stimulus threshold.

♦ **sting pheromone** See chemical-releasing stimulus: semiochemical: alarm pheromone.

♦ **stink fight** *n.* In males of *Lemur catta* (Ring-tailed Lemurs): An individual's aggressive behavior that is directed toward another and involves use of odors from pheromone glands (Jolly 1966 in Wilson 1975, 531).

♦ **"stipulated-p"** See p: "stipulated-p."

♦ **stirp** See germ plasm.

♦ **stochastic** *adj.*

1. Of, referring to, or characterized by conjecture; conjectural (Michaelis 1963).

- A**
2. Referring to the process of selecting from among a set of theoretically possible alternatives those elements, or factors, whose combinations will most closely approximate a desired result (Michaelis 1963).
3. In mathematics, referring to a model that “takes into account variations in outcome that are due to chance alone” (Wilson 1975, 596).
- syn.* probabilistic
cf. deterministic
 [Greek *stochastikos* < *stochazesthai*, to guess at < *stochos*, mark, aim; *stochazein*, to shoot with a bow at a target, *i.e.*, scatter events in a partially random manner some of which achieve a preferred outcome (Bateson 1979, 245)]
- ♦ **stochastic analysis** See analysis: stochastic analysis.
- ♦ **stochastic-genetic cause of phenotypic variation** *n.* Variation based “on developmental deviations caused by somatic mutations within the lifetimes of particular organisms” (Wilson 1975, 68).
- ♦ **stochastic process** See process: random process.
- ♦ **stochastic model** See ⁴model: stochastic model.
- ♦ **stochastic series of events** *n.* A limited set of events that has a random component and a selective process so that “only certain outcomes of the random are allowed to endure” (Bateson 1979, 245).
cf. random sequence of events
- ♦ **stochastic theory of mass behavior** See ³theory: stochastic theory of mass behavior.
- ♦ **stochastic variability** See ³theory: stochastic theory.
- ♦ **stock** *n.*
 1. A race, stem, or lineage (Lincoln et al. 1985).
 2. An organism population (Lincoln et al. 1985).
cf. population, race
- ♦ **Stoic** *n.*
 1. A member of a school of Greek philosophy founded by Zeno about 308 B.C., holding that wisdom lies in being superior to passion, joy, grief, etc., and in unperturbed submission to the divine will (Michaelis 1963).
 2. One who supports pantheistic ideas and believes in a designed world created for the benefit of Humans; one who believes “the object of philosophy [is] to understand the order of the world” (Mayr 1982, 90).
 [Latin *Stoicus* < Greek *Stoikos* < *Stoa* < *Poikileē*, Painted Porch, the colonnade at Athens where Zeno taught]
- ♦ **stomach-brooding** See brooding: stomach-brooding.
- ♦ **stomodeal food** See food: stomodeal food.
- ♦ **stomodeal trophallaxis** See trophallaxis: stomodeal trophallaxis.
- ♦ **stomping** *n.* An animal’s treading heavily (Michaelis 1963).
cf. grunt
- ♦ **story telling** *n.* A pejorative term for one’s making seemingly unreasonable hypotheses about adaptiveness of organisms’ traits (Thornhill and Alcock 1983, 12).
cf. just-so story
- ♦ **stotting** See display: stotting.
- ♦ **straight run** *n.* In *Apis mellifera* (Western Honey Bees): A middle run made by a worker during her waggle dance and the element that contains most of the symbolical information concerning the location of a target outside her hive; “a dancing bee makes a straight run, then loops back to the left, or right, then makes another straight run, then loops back in the opposite direction, and so on — the three basic movements together form the characteristic figure-eight pattern of a waggle dance” (Wilson 1975, 596).
cf. dance
- ♦ **strain** *n.* An inbred stock of a species produced by artificial selection, *e.g.*, ebony and vestigial winged *Drosophila* (Immelman and Beer 1989, 296).
- ♦ **strange species** See ²species: strange species.
- ♦ **stratagem** See strategy.
- ♦ **strategist** *n.* An organism that uses a particular kind of strategy, *q.v.*
 See ²species: C-selected species, K-selected species, r-selected species, s-selected species.
- ♦ **strategy** *n.*
 1. A commander-in-chief’s science and art (of projecting and directing the larger military movements and operations of a campaign) (Oxford English Dictionary 1972, entries from 1810); distinguished from tactics (Michaelis 1963).
 2. A person’s use of a stratagem (device for obtaining an advantage, a trick), or artifice, as in business or politics (Michaelis 1963).
 3. A person’s plan, or technique, for achieving some end (Michaelis 1963).
 4. A genetically-determined life-history, or behavior program (composed of tactics), that dictates an organism’s action, or course of development, throughout its life (Dawkins 1977; 1983, 294; Gross 1984, 58).
Notes: Strategies evolve through changes in their tactics (Gross 1984, 58). “Strategies” may also be determined by an individual’s experience (Maynard Smith 1982, 10). Examples of strategies are age of first reproduction, growth form, and relative numbers of sons and daughters.
 5. In game theory, a complete specification (set of rules) of what a contestant (animal or theoretical party) will do in every situation in which it might find itself (Dawkins 1982, 294).
 6. An animal’s “behavioural phenotype; *i.e.*, it is a specification of what an individual will do in any situation in which it may find itself” (Maynard Smith 1982, 10).
 7. An organism’s complex of tactics enables it “to reach biological goal,” *e.g.*, growing, maintaining itself, or reproducing (inferred from Wootton 1984, 3).
 8. The plan, method, or structure used by an individual organism, or organism group, to meet a particular set of conditions (Lincoln et al. 1985); roughly, an animal’s “way of life” (Immelman and Beer 1989, 296).
- syn.* behavioral pattern (a confusing synonym, Dawkins 1982, 294), stratagem (Wilson 1975, 346), tactic (a confusing synonym, Lincoln et al. 1985; Wootton 1984, 1). “Strategy is a much abused but . . . a trendy synonym for an animal’s behaviour pattern” (Dawkins 1982, 294). Wootton (1984, 1) distinguishes between “strategy” and “tactic.” Chapleau et al. (1988) suggest “pattern” and “option” for “strategy” which they feel do not imply purposefulness. Dawkins (1986, 113) suggests that “program” or “phenotype” might be a better word to describe the concepts labeled by “strategy.”
cf. game, ¹tactic; tactics; ³theory: game theory
- Comments:* Nonhuman animals are generally not believed to use “strategies” as results of conscious reasoning (Dawkins 1977, 1983, 294; Maynard Smith

1979). Zimmerman and Hicks (1985) also discuss the usefulness of the term “strategy.”

adaptive strategy *n.* The sum total of a species’ adaptations to its environment (Lincoln et al. 1985).

“best-of-a-bad-situation strategy” *n.* An organism’s strategy that does not yield the highest fitness of all alternative strategies in its population, but is the best one that the organism can use in a particular constrained situation; *e.g.*, sneak copulation by males that are too small to use physical aggression to obtain a copulation (inferred from Gross 1984, 58).
syn. best of a bad situation, BSS (Gross 1984, 58)

bonanza strategy *n.* For example, in some dung-beetle species: An individual’s exploiting food sources (*e.g.*, dung) that are very rich, but at the same time scattered and ephemeral (Wilson 1971a, 1975, 49).

C strategy See ²species: C-selected species.

Concorde strategy See effect: Concorde effect.

conditional strategy *n.*

1. In game theory, a theoretical strategy that is composed of more than one tactics that are genetically facultative, provide unequal fitness, and reflect individual competitive ability; contrasted with mixed strategy and pure strategy (Maynard Smith 1982; Gross 1984, 58–59, illustration).

Note: In organisms, it involves a biont’s performing one action if its interactor performs one particular action and performing an alternative action if its interactor performs another particular action; *e.g.*, retaliate if an opponent attacks and do not retaliate if the opponent does not attack (Maynard Smith 1982).

2. A strategy that involves alternative behavior patterns that an animal employs after ascertaining what competitors and other conspecifics are doing (Thornhill and Alcock 1983, 287).

Comments: These alternatives are not always all shown by one particular animal, and they do not necessarily result in equal reproductive gains. All animals of the same sex in a species are likely to have the genetic basis for all “strategies” within a conditional strategy. For example, if there is a suitable space available, a mate-searching male bee would be territorial; if the space were not available, he would engage in non-territorial scramble competition for mates (Thornhill and Alcock 1983, 287).

domestic-bliss strategy *n.* A female’s examining conspecific males and trying to spot signs of fidelity and domesticity in advance (Dawkins 1977).

evolutionary-stable strategy (ESS) *n.* “A strategy such that, if all the members of a population adopt it, then no mutant strategy could invade the population under the influence of natural selection” (Maynard Smith and Price 1973 in Maynard Smith 1982, 2, 10).

syn. unbeatable strategy (Hamilton 1967 in Maynard Smith 1982, 2)

Comments: Depending on the circumstances, a population, rather than individuals within it, may be an ESS (Maynard Smith 1982, 204). For example, an ESS could involve (1) all animals’ of a population always showing behavior A, (2) a certain proportion’s always showing behavior A and a certain proportion’s showing B, (3) all animals’ showing A X % of the time and showing B Y% of the time, or (4) all animals’ showing A under environmental condition 1 and showing B under condition 2, and so forth. The ESS appears

to be an empirical phenomenon, not an hypothesis to be tested.

[coined by Maynard Smith and Price (1973)]

► **mixed-evolutionary-stable strategy (mixed ESS)** *n.*

1. An ESS with a strategy polymorphism in which bionts, or a certain proportion of organisms, use one action in one situation, and another action in another situation, depending on what other organisms of its population are doing (Maynard Smith 1982, 15).

Note: Mixed ESSs may involve conditional strategies (Maynard Smith 1982, 15).

2. An ESS in which an animal has a genetically programmed ability to spend a set proportion of its time in two distinct behaviors with its switch point set genetically and in which both alternative behaviors result in the same reproductive success (Thornhill and Alcock 1983, 291).

cf. strategy: mixed strategy

Comment: This strategy might occur in insect reproduction (Thornhill and Alcock 1983, 291).

► **pure-evolutionary-stable strategy (pure ESS)**

n. An ESS in which all organisms of a population use the same actions in encounters with others (Maynard Smith 1982, 15).

cf. strategy: pure strategy

K strategy See ²species: K-selected species.

mixed strategy *n.* In game theory, a theoretical strategy that is composed of more than one tactic, that are genetically facultative, or stochastic; may, or many not, reflect individual competitive ability; and provide equal fitness; contrasted with conditional strategy and pure strategy (Gross 1984, 58–59, illustration).

Comments: Theoretically, a species can show a mixed strategy at the individual level in which a single individual has more than one strategy or at the population level in which different individuals each show one strategy or more than one possible strategies (Gross 1984, 59, illustration).

pure strategy *n.* In game theory, a theoretical strategy that is composed of one tactic that is genetically fixed; contrasted with conditional strategy and mixed strategy (Gross 1984, 58–59, illustration).

r strategy See ²species: r-selected species.

reproductive strategy *n.* An organism’s complex of reproductive tactics that it employs in attempting to leave, or actually, leaving offspring (inferred from Wootton 1984, 3).

Comment: For example, in a fish, such traits include age of first reproduction, age-specific fecundity, degree of parity, clutch size, gamete nature and size, organization of reproductive behavior, sex change (in some species), and timing of its reproductive season (Wootton 1984, 3).

s strategy See ²species: s-selected species.

truly-separate strategy *n.* In some cricket species, possibly in some fig-wasps species: One of two alternative strategies that is linked causally to genes different from those that cause the other strategy (Hamilton 1979 and Cade 1981 in Thornhill and Alcock 1983, 291).

Comment: Both members of a pair of these alternative strategies confer the same average reproductive success (Hamilton 1979 and Cade 1981 in Thornhill and Alcock 1983, 291).

unbeatable strategy See strategy: evolutionary stable strategy.

wolf-in-sheep's-clothing strategy *n.* In a green lacewing: A larva's disguising itself as an aphid by plucking some of the waxy, wool from aphid bodies and applying this material to its own dorsum which protects the larva from ants that ordinarily shepherd the aphids [coined by Eisner et al. (1978, 790); "wolf" refers to the lacewing larva's being a "wolf," the predator of aphids, also known as ant cows, and "sheep's clothing" refers to the covering of the herded animals, the aphids].

♦ **stratification** *n.*

1. "Organization into horizontal strata" (Lincoln et al. 1985).
2. Vertical structuring of a community, or habitat, into superimposed horizontal layers (Lincoln et al. 1985).
3. The grouping of individuals of a community, or habitat, into height classes (Lincoln et al. 1985).

See method: stratification.

♦ **stratigraphic paleontology** See study of: paleontology: stratigraphic paleontology.

♦ **stratocladistic** See cladistic.

♦ **stratosphere** See -sphere: stratosphere.

♦ **stratospheric ozone** See molecule: ozone.

♦ **stream-gauging station** *n.* A location with instruments used for measuring stream flow and water qualities (pers. obs.).

Comment: In the Fernow Experimental Station, water from a watershed flows into a weir pond and over a V-notch which enables a researcher to measure the amount of water flow. The weirs are 120-degree sharp-crested V-notch weirs (illustration, Adams et al. 1994, 3).

♦ **Streets** See program: Streets.

♦ **¹stress** *n.*

1. Any aversive stimulus (Wood-Gush et al. 1959 in Dawkins 1980, 59).
2. An environmental factor that restricts growth and reproduction of an organism or population (Lincoln et al. 1985).
3. A factor that disturbs a system's equilibrium (Lincoln et al. 1985).

♦ **²stress** *n.*

1. A person's "hardship, straight, adversity, affliction" (a now obsolete definition, Oxford English Dictionary 1972, entries from 1303).
2. An individual organism's being "hard pressed" (a now obsolete definition, Oxford English Dictionary 1972).
3. A person's, or his part's, witnessing strained exertion, strong effort; a now rare definition (Oxford English Dictionary 1972, entries from 1690); strain upon a person's organ or mind (Oxford English Dictionary 1972, entries from 1843); a person's emotional, or intellectual, strain or tension (Michaelis 1963).
4. Lack of entropy; a condition that arises when an organism's external environment, or internal sickness, makes excessive, or contradictory demands on its ability to adjust; thus, "the organism lacks and needs flexibility, having used up its available uncommitted alternatives" (Bateson 1979, 245).
5. A series of physiological changes, such as release of hormones, that goes on within an animal's body when it is subjected to injury, temperature extremes, etc. (Dawkins 1980, 55).
6. The whole general-adaptation syndrome (*q.v.*) or the latter part of it (Dawkins 1980, 60).

cf. animal suffering; general-emergency reaction; pain; syndrome: fight-or-flight syndrome, general-adaptation syndrome

Comment: The definition of "stress" (= "animal stress") is moot, and this controversy has led to some dubious conclusions about what factors cause "stress" (Dawkins 1980, 61).

♦ **light stress** *n.* In *Rattus norvegicus* (Norway Rats):

Reaction to a bright light in the center of a cage that is measured as defecation frequency, displacement grooming, ambulation, etc., and can be inhibited, or facilitated, with different drugs (Ryall 1958 in Heymer 1977, 111).

♦ **thermal stress** *n.* Any change in an organism's thermal relationship with its environment which, if uncompensated by a temperature-regulatory response disturbs the organism's thermal equilibrium (Bligh and Johnson 1973, 957).

♦ **stress avoidance** *n.* An organism's stress resistance (*q.v.*) by avoiding thermodynamic equilibrium with stress either by a physical barrier that insulates its living tissue from the stress, or by a steady-state exclusion of stress; e.g., a chemical, or metabolic, barrier (Lincoln et al. 1985).

cf. stress tolerance

♦ **stress hypothesis** See hypothesis: population-limiting hypotheses: stress hypothesis.

♦ **stress resistance** *n.* An organism's ability to survive exposure to an unfavorable environmental factor, quantifiable as the stress necessary to produce a specific strain (Lincoln et al. 1985).

♦ **stress syndrome** See syndrome: general adaptive syndrome.

♦ **stressor** See stress.

♦ **stretching syndrome** See syndrome: stretching syndrome.

♦ **STRI** See research station: Smithsonian Tropical Research Institute.

♦ **strict endemic** See ¹endemic: strict endemic.

♦ **stridulation** See animal sounds: stridulation.

♦ **string** See ²group: string.

♦ **stringency, principle of** See principle: principle of stringency.

♦ **stripes display** See display: stripes display.

♦ **stromatolite** *n.* A knobby, intertidal structure made of banded sediment (carbonate mud) that has been constructed by motile bacteria and cyanobacterial colonies, as well as these organisms themselves (Campbell 1987, 512–513; Stanley 1989, 94).

cf. fossil: stromatolite fossil

Comments: Stromatolites are made from sediments that stick to the jellylike coats of these microbes. They migrate out of one layer of sediment and form a new one above. As this happens repeatedly, a layered mat becomes thicker (Campbell 1987, 512–513). Stromatolites are almost exclusively found in supratidal and high intertidal settings which are periodically hot and dry and where few grazing marine animals can survive (Stanley 1989, 96). Stromatolites also grow in subtidal channels where tidal currents are very strong and where few animals can live.

[Greek *stroma*, bed; *lithos*, rock]

♦ **strong reciprocity** *n.* See reciprocity: strong reciprocity.

♦ **strophogenesis** See -genesis: strophogenesis.

♦ **strophotaxis, strophism, strophotactic** See taxis: strophotaxis.

- ♦ **structural activities** See activity: structural activities.
- ♦ **structural botany** See study of: botany: structural botany.
- ♦ **structural chemistry** See study of: chemistry: structural chemistry.
- ♦ **structural geology** See study of: geology: structural geology.
- ♦ **structural gene** See gene: structural gene.
- ♦ **structural isomer** See isomer: enantiomer.
- ♦ **structuralism** *n.*
1. A person's tendency to emphasize structure of something rather than its function (Michaelis 1963); the doctrine that structure rather than function is important (Hughes and Lambert 1984).
 2. The policy of concentrating upon structure in different fields including linguistics and biology (Michaelis 1963).
- cf.* study of: botany: structural botany; geology: structural geology; chemistry: structural chemistry
3. The ideas that natural selection results in a kind of structure (form) that is associated with one particular function; a new kind of function might materialize from this structure; evolution of new structures does not follow all possible paths dictated by external forces; and constraints are imposed both by starting points and by rules of transformation specified by the nature of organic materials; structure determines function (Mayr 1982, 463).
- cf.* creationism, functionalism
- Comments:* Structuralism attempts to understand the principles of organization that represent the conceptual basis within which we can properly think about evolution (D. M. Lambert, pers. comm.). According to one structuralist viewpoint, neither the *elements* nor the *whole* should be the focus of attention but the relationship between them. Structuralists include Georges Cuvier and Richard Owen (Gould 1986, 18).
- ♦ **struggle for existence** *n.*
1. Interactions among organisms including competition and symbiosis; "I use the term Struggle for Existence in a large and metaphorical sense, including dependence of one being on another" (Darwin 1859, 62).
 2. Population members' competition for a limited, vital resource that results in natural selection (Lincoln et al. 1985).
- cf.* Darwinism
- ♦ **stubborness** See ²group: stubbornness.
- ♦ **stuck** See ²mutation: stuck.
- ♦ **stud** See ²group: stud.
- ♦ **Student's-*t* test** See statistical test: *t* test.
- ♦ **study of** *cf.* natural history, philosophy, science
- Comments:* "Study of" in the following definitions usually implies the *scientific* study of. There are many ways to classify disciplines and their branches. Here I generally classify them by main words, e.g., biology, ecology, or geography. Many of these terms end with "-logy," a Greek suffix that denotes knowledge of, science, and study of. Algology, humanology, and mammalogy, for example, are hybrid words derived from both Latin and Greek. Brown (1956, 35) advises coinage of purebred words rather than such "mongrelizations" when possible. Bartholomew (1987, 15) writes, "Composing a definition for a field in biology can be a sterilizing effort because definitions delimit, and biology is functionally indivisible." Therefore, he defined

physiological ecology operationally without confining it.

- ♦ **acoustics** *n.* The study of sound and hearing (Oxford English Dictionary 1972, entries from 1683).
- **bioacoustics** *n. pl.* (construed as singular) The study of nonhuman-animal sounds, sound production, and relationships between the characteristics of a nonhuman animal's sounds and its environment (Immelmann and Beer 1989, 32–33).
- **psychoacoustics** *n. pl.* (construed as singular) Acoustics with reference to the physiological basis and effects of sound (Michaelis 1963).
- ♦ **adaptive correlation** *n.* The study of adaptive correlation, *q.v.* (Immelmann and Beer 1989, 5).
- ♦ **aetiology** See study of: etiology.
- ♦ **agrostology** See study of: graminology.
- ♦ **aktology** *n.* The study of shallow inshore ecosystems (Lincoln et al. 1985).
- ♦ **algology** See study of: phycology.
- ♦ **American behaviorism** See study of: psychology: behaviorism.
- ♦ **animal behavior** See study of: behavior.
- ♦ **animal psychology** See study of: psychology: animal psychology.
- ♦ **antheecology, autoecology** See study of: ecology.
- ♦ **anthropology** *n.*
1. The study of "mankind" in the widest sense (Oxford English Dictionary 1972, entries from 1593); embracing human physiology and psychology and their mutual bearing (Oxford English Dictionary 1972, entries from 1706).
 2. The study of "man" from zoological, evolutionary, and historical standpoints (Oxford English Dictionary 1972, entries from 1861).
 3. The study of humankind as a natural and social entity (Immelmann and Beer 1989, 16, 137).
- Comment:* Some areas of anthropology overlap with human ethology (Immelmann and Beer 1989, 16, 137).
- **cultural anthropology** *n.* Anthropology of human institutions, including language, religion, and art (Immelmann and Beer 1989, 16).
- **demography** *n.* The "branch of anthropology that deals with life-conditions of communities of people, as shown by statistics of birth, death, etc." (Oxford English Dictionary 1972, entries from 1880). See study of: demography.
- **physical anthropology** *n.* Anthropology of human racial physique, technology, and accommodation to and exploitation of our natural environment (Immelmann and Beer 1989, 16).
- ♦ **apiculture** *n.* The scientific study of honey bees and their management for beeswax, commercial rental for pollination services, increased honey production, and queen bees (Buchmann and Nabhan 1996, 242).
- ♦ **apidology** See study of: mellitology.
- ♦ **applied physics** See study of: physics: applied physics.
- ♦ **autobiology** See study of: biology: idiobiology.
- ♦ **autoecology** See study of: ecology: autoecology.
- ♦ **bacteriology** *n.* The study of bacteria from medical and biological perspectives (Michaelis 1963).
- ♦ **behavior, animal behavior** *n.* The study of animal behavior, *q.v.*
- cf.* behavior: animal behavior; study of: ethology; biology: behavioral biology, psychobiology, socio-biology; psychology: psychology: animal psychology, behaviorism

Comment: “Modern behavior” includes “behaviorism,” and ethological and physiological approaches (McFarland 1985, 9).

behavioral biology See study of: biology: behavioral biology.

behavioral science *n.* All of the empirically based investigations of behavior, including ethology, comparative psychology, human psychology, human ethology, various divisions of sociology and anthropology, and behavioral physiology (Immelmann and Beer 1989, 31).

behavioral sciences *n. pl.* The sciences that study human and nonhuman-animal behavior by means of naturalistic observation; including behavior, psychology, sociology, and social anthropology (Chaplin 1968).

behaviorism See study of: psychology: behaviorism.

biocenology See study of: biocoenology.

biocenotics See study of: biocoenology.

biochronology *n.* Dating of biological events using biostratigraphic, or paleontological, methods (Lincoln et al. 1985).

bioclimatology See study of: climatology: bioclimatology.

biocoenology, biocenology, biocenotics, biocoenotics, cenobiology, coenobiology *n.*

The qualitative and quantitative study of organism communities (Lincoln et al. 1985).

biocoenotics See study of: biocoenology.

biodiversity studies *n.* “The systematic examination of the full array of different kinds of organisms together with the technology by which the diversity can be maintained and used for the benefit of humanity” (Ehrlich and Wilson 1991, 758).

bioecology See study of: ecology.

biogeny See study of: evolution.

biohydrology *n.* “The study of interactions between organisms and the water cycle” (Lincoln et al. 1985).

cf. hydrobiology

biological statistics See study of: -metry: biometry.

biology *n.*

1. The study of life [independently coined by Lamarck (1802), Burdach (1800), and Treviranus (1802) according to Mayr (1982, 108, 656)].

2. The division of physical science that deals with organism morphology, physiology, origin, and distribution; sometimes in a narrower sense, physiology alone (Oxford English Dictionary 1972, entries from 1819).

syn. life sciences (Mayr 1997, 24)

cf. study of: botany, live sciences, phycology, zoology

Comments: Now, biology includes the study of any aspect of organisms. Alexander (1987, 7) states that the central question of biology is: What is the evolutionary background, or adaptive function, of organism traits?

► **aerobiology** *n.* “The study of airborne organisms” (Lincoln et al. 1985).

► **autobiology** See study of: biology: idiobiology.

► **behavioral biology** *n.* The “study of all aspects of behavior, including neurophysiology, ethology, comparative psychology, sociobiology, and behavioral ecology” (Wilson 1975).

cf. study of: behavior, behavioral sciences, behaviorism

► **cell biology** *n.* An umbrella term for biological phenomena related to cells and that occur both

inside and the immediate environment outside cells; *e.g.*, cellular architecture, embryonic development, or neurobiological and immunobiological events (Hoffman 1992, 34).

► **evolutionary biology** *n.* Biological disciplines that deal with the evolutionary process, the characteristics of organism populations, ecology, behavior, and systematics (Wilson 1975, 584).

cf. study of: behavior, ethology, evolution, psychology

Comment: Evolutionary biology (including sociobiology) looks at behavior in terms of its past evolution and does not address problems of present-day causation (McFarland 1985, 257). Further, evolutionary biology examines how traits originated, the evolutionary history of traits, and the evolutionary relationships among traits and organisms (Alcock 2006, 95–96).

► **evolutionary developmental biology** *n.* The study of regions of genomes under strong developmental constraints and how gene-expression changes can result in major morphological changes, using phylogenetic comparisons of development [coined by Raff and Popdi in Honeycutt 1997, 37].

syn. evo-devo (Arthur 2002, 757)

cf. homeobox

Comments: Evo-devo has its origins in the comparative embryology of the 19th century, in particular in Haeckel’s and von Baer’s work (Arthur 2002, 757). Present-day evo-devo “erupted out of the discovery of the homeobox” in 1982. One of evo-devo’s principal focuses over since 1982, has been the comparative study of the spatiotemporal expression patterns of developmental genes, both homeobox-containing genes (which code of transcription factors) and other genes.

► **exobiology** *n.* The study of the origin, evolution, and distribution of life in our Universe (<http://exobio.ucsd.edu/>, 2000).

cf. organization: NASA Specialized Center of Research and Training in Exobiology (Appendix 2)

► **geobiology** *n.* “The study of the biosphere” (Lincoln et al. 1985).

► **hydrobiology** *n.* The study of organisms in aquatic habitats (Lincoln et al. 1985).

cf. study of: biohydrology

► **idiobiology, autobiography** *n.* The biology of individual organisms (Lincoln et al. 1985).

cf. study of: ecology: idioecology

► **microbiology** *n.* “The study of microorganisms” (Lincoln et al. 1985).

► **molecular biology** *n.*

1. A branch of biology that involves studies such as elucidation of structures of molecules (*e.g.*, DNA) and metabolic pathways (*e.g.*, the citric-acid cycle) (Mayr 1982, 122–124).

2. A “branch of biology concerned with explaining biological phenomena in molecular terms” (King and Stansfield 1985).

Note: “Molecular biologists often use the techniques of physical chemistry to investigate genetic problems” (King and Stansfield 1985).

3. A branch of biology concerned with the structure of DNA, RNA, and proteins and of processes such as regulation of the levels of gene products, replication, transcription, and translation (Futuyma 1998, 625).

► **paleobiology, Brit. palaeobiology** *n.*

1. The application of theoretical ecology to the study of extinct organisms (Gould 1981b, 13).
Note: Paleobiology of today is essentially present-day paleoecology, *q.v.*
2. The study of extinct-organism biology (Lincoln et al. 1985).

cf. study of: paleontology

► **paleoecology, Brit. palaeoecology** *n.*

1. A largely “theoretical subject of the 1940s and 1950s concerned primarily with recording the kinds of rock types that given taxa preferred and seeking correlations between environment and fossil morphology, largely in the interest of taxonomic refinement” (Gould 1981, 296).
Note: Starting in the 1970s, paleoecology transformed by incorporating theoretical ecology (Gould 1981, 296).
2. “The study of fossil communities” (Lincoln et al. 1985).

► **phreatobiology** *n.* “The study of ground-water organisms” (Lincoln et al. 1985).

► **phyllobiology** *n.* “The study of leaves” (Lincoln et al. 1985).

► **phylogenetic biology** *n.* The application of cladistic analysis in the study of evolutionary history and its relations to all aspects of life (Campbell et al. 1999, 485).

Comments: Phylogenetic biology pervades essentially all subfields of life science. For example in behavior, phylogenetic biology can be used to study the evolutionary history of animal social systems; in conservation, the relationships among populations of endangered and threatened species; in physiology, the evolution of body temperature regulation and brain structure; and in plant development, the evolution of genes that regulate flower development (Campbell et al. 1999, 485).

► **phytobiology** See study of: botany.

► **population biology** *n.* The study of temporal and spatial distributions of members of populations and their relationships to all relevant biotic and abiotic factors in their environments (Lincoln et al. 1985; Immelmann and Beer 1989, 227).
Comment: “Population biology” overlaps in particular with “ecology.”

► **psychobiology** *n.*

1. The study of human minds in relation to anatomy, physiology, and nervous systems (Michaelis 1963).
2. The biological study of psychology; biological aspects of psychology (Michaelis 1963; Delbridge 1981).
3. A vast, highly complex, hybrid field that studies the biological foundations of behavior, including analyses of behavior in terms of biochemical and physiological factors (Storz 1973, 214).

syn. biopsychology (Michaelis 1963)
cf. study of: psychology: physiological psychology

► **sociobiology** *n.*

1. The systematic study of the biological basis of all social behavior (Wilson 1975, 3).
2. The “study of the adaptive significance of animal behavior” (Wittenberger 1981, 621).
3. “The comparative, evolutionary study of the biological bases of social behavior, integrating traditional ethological approaches with new advances in population biology, behavioral ecology,

demography, and life history theory” (Hrdy et al. 1996).

cf. study of: biology: evolutionary biology, ecology, behavior ecology, ethology

Comments: McFarland (1985, 357) includes “sociobiology” as part of “evolutionary biology.” Alexander (1987, 5) discusses some of the problems with the term “sociobiology” and points out that this term has become “a target of derogation and ridicule by nonbiologists, and this has almost certainly delayed the acceptance and use of evolutionary principles by human-oriented scholars.” The sociobiological synthesis profoundly transformed the study of animal behavior and large parts of biological anthropology, and more recently it has influenced other fields including art, botany, development, economics, genetics, law, molecular biology, neurobiology, philosophy, political science, psychology, reproduction, and women’s studies (Hrdy et al. 1996).

► **symbiology** *n.* “The study of symbioses” (Lincoln et al. 1985).

► **zoo biology** *n.* The science of phenomena that occur in zoological gardens and — “in the widest sense — are of biological significance” (Hediger 1941 in Immelmann and Beer 1989, 331).

Comment: Zoo biology contains parts of applied ethology, human medicine, pathology, taxonomy, veterinary medicine, and zoological systematics (Immelmann and Beer 1989, 331).

biomechanics *n.*

1. The study of the mechanics of living-organism structures (Lincoln et al. 1985).
2. The mathematical study of the mechanical, or physical, properties of biological materials, *e.g.*, the hydrostatic “water skeletons” of various aquatic animals and the resiliency and stiffness of wood used as cantilever beams (Buchmann and Nabhan 1996, 242).

biometeorology See study of: meteorology: biometeorology.

biometry See study of: -metry: biometry.

biophysics See study of: physics: biophysics.

biopsychology See study of: biology: psychobiology.

biospeleology, biospeology *n.* “The study of subterranean life” (Lincoln et al. 1985).

biostatistics See study of: -metry: biometry.

biostratigraphy See study of: stratigraphic paleontology.

biostratinomy *n.* “The study of the relationship between fossils and their environment” (Lincoln et al. 1985).

biosystematics See study of: systematics.

botany *n.* The study of plants (Oxford English Dictionary 1972, entries from 1696).

syn. phytology (Lincoln et al. 1985)

Comment: Botany includes bryology, dendrology, ethnobotany, geobotany, graminology, lichenology, paleobotany, phytogeology, phytography, pteridology, silvics, and structural botany.
[Greek *botanikos*, of herbs]

► ethnobotany *n.* The study of the use of plants by groups of Humans (Lincoln et al. 1985).

► geobotany, phytogeography, plant biogeography See study of: geography: phytogeography.

- **paleobotany** *n.* “The study of plant life of the geological past” (Lincoln et al. 1985).
syn. palaeobotany (*Brit.*), palaeophytology (*Brit.*), paleophytology, phytopalaeontology (*Brit.*), phytopaleontology
Comments: Paleobotany usually includes formal classification and naming of plant fossils and research on their chemical residues, paleoecology, and phylogeny (Buchmann and Nabhan 1996, 251).
- **photography** *n.* “Descriptive botany” (Lincoln et al. 1985).
- **structural botany** *n.* The study of the structure and organization of plants (Oxford English Dictionary 1972, entries from 1835).
- botrology** *n.* The science of organizing items, or concepts, into groups or clusters (Lincoln et al. 1985).
- bryology, hepaticology, muscology** *n.* The study of mosses and liverworts (Lincoln et al. 1985).
- caliology** *n.* The study of burrows, hives, nests, tubes, and other domiciles made by animals (Lincoln et al. 1985).
- carcinology** *n.* The study of crustaceans (Lincoln et al. 1985).
- cenobiology** See study of: biocoenology.
- cetology** *n.* The study of whales and their kin (Lincoln et al. 1985).
- chemistry** *n.* The study of elements and their combinations and various phenomena that accompany their exposure to diverse physical conditions (Oxford English Dictionary 1972, entries from 1646).
Comment: Chemistry has many divisions including agricultural chemistry, analytical chemistry, applied chemistry (= practical chemistry), biochemistry, biogeochemistry, inorganic chemistry, organic chemistry, and physical chemistry.
- **biochemistry** *n.* A branch of chemistry that deals with processes and physical properties of organisms (Michaelis 1963).
- **biogeochemistry** *n.* The study of mineral cycling and organism-substrate relationships (Lincoln et al. 1985).
- **organic chemistry** *n.* The study of carbon compounds (Campbell et al. 1999, 49).
cf. organic
- **structural chemistry** *n.* The study of the position of atoms in compounds (Oxford English Dictionary 1972, entry from 1907).
- chorology** See study of: biogeography.
- chronistics** *n.* “The study of time relationships of objects or events” (Lincoln et al. 1985).
- chronostratigraphy** *n.* “The study of age relationships of rock strata” (Lincoln et al. 1985).
- climatology** *n.* The study of climate (Lincoln et al. 1985).
cf. meteorology
- **bioclimatology, ecoclimatology** *n.* The study of biota in relation to climate (Lincoln et al. 1985).
- **dendroclimatology** *n.* The study of tree annual growth rings to determine past climatic conditions (Lincoln et al. 1985).
- **paleoclimatology, Brit. palaeoclimatology** *n.* The study of climates of past geological times (Lincoln et al. 1985).
- clinology** *n.* “The study of the decline of organisms or groups after acme” (Lincoln et al. 1985).
- coenobiology** See study of: biocoenology.
- cognitive psychology** See study of: psychology: cognitive psychology.

- comparative psychology** See study of: psychology: comparative psychology.
- computer vision** *n.* A field of study devoted to discovering algorithms, data representations, and computer architectures that embody the principles underlying visual capabilities (Aloimonos and Rosenfeld 1991, 1249).
- conchology** *n.* “The study of shells” (Lincoln et al. 1985).
cf. study of: malacology; study of: -metry: conchometry
- conchometry** See -metry: conchometry.
- coprology** *n.* The study of feces (Lincoln et al. 1985).
- cetotology** *n.* “The study of acquired characters” (Lincoln et al. 1985).
- cybernetics** See study of: mathematics.
- cycleology** *n.* The study of cyclic phenomena in geology and paleontology (Lincoln et al. 1985).
- cytology** *n.* “The study of the structure and function of living cells” (Lincoln et al. 1985).
- demography** *n.* The study of populations, especially their age structures, growth rates, and processes that determine these properties, including emigration, immigration, kinship structure, and migration (Lincoln et al. 1985; Immelmann and Beer 1989, 71).
See study of: anthropology: demography.
- **adaptive demography** *n.* The age distribution of the sexes and castes that occurs in populations of social animals and that is influenced by selection on the reproductive individuals (Wilson 1975, 15).
- dendrochronology** *n.* See method: dendrochronology.
- dendroclimatology** See study of: climatology.
- dendrology** *n.* The study of trees and shrubs (Lincoln et al. 1985).
cf. study of: botany, silvics
- **paleodendrology, Brit. palaeodendrology** *n.* “The study of fossil trees” (Lincoln et al. 1985).
- dermatoglyphics** *n.* The study of fingerprints (Brown 1995, 3 July, A3).
Comments: Francis Galton (1822–1911) is the probable originator of dermatoglyphics (Brown 1995, 3 July, A3). The chance of a match of fingerprints from two people is much rarer than that of DNA fingerprints.
- development** See study of: embryology.
- dynamics** Also, see study of: physics: dynamics.
- **photodynamics** *n.* The study of light effects on living organisms and their metabolic processes (Lincoln et al. 1985).
- **population dynamics** *n.*
 1. The study of changes within populations and the factors that cause, or influence, these changes (Lincoln et al. 1985).
 2. “The study of populations as functioning systems” (Lincoln et al. 1985).
- **psychodynamics** *n. pl.* (construed as singular) “The study of mental processes in action” (Michaelis 1963).
- **syndynamics** *n. pl.* (construed as singular) “The study of successional changes in plant communities” (Lincoln et al. 1985).
- dysteleology** *n.* The study of apparently functionless, rudimentary organs to sustain the doctrine of dysteleology, *q.v.* (Oxford English Dictionary 1972, entries from 1874).
- earth-system science** *n.* The scientific study of interactions between the solid Earth (from its crust to core) with its atmosphere, biosphere, and hydroosphere (Fyfe 1996, 448).

ecoclimatology See study of: climatology: bioclimatology.

ecography See study of: ecology: ecography.

ecological sociology See study of: ecology: syncology.

ecology, Brit. oecology *n.*

1. The study of organisms' interactions with their environments, including both their abiotic (= physical) and biotic components; their habits and modes of life, etc. (Oxford English Dictionary 1972, entries from 1873; Mayr 1982, 121).

syn. bioecology, bionomics, bionomy, mesology, oikology (Lincoln et al. 1985)

Note: Haeckel (1866) proposed "ecology" to label the science dealing with the "household of nature" (Mayr 1982, 121). Ecology also includes organism reactions to factors in their environments.

2. The study of human populations in terms of physical environment, spatial distribution, and cultural characteristics (Michaelis 1963).

3. The study of relationships among organisms and their past, present, and future environments (Ecological Society of America, <http://esa.sdsc.edu>, 1999).

Note: These relationships include interactions among species, organization of biological communities, physiological responses of individuals, processing of energy and matter in ecosystems, structure and dynamics of populations (Ecological Society of America, <http://esa.sdsc.edu>, 1999).

Comments: Behavior ecology can be classified as part of sociobiology. Population biology overlaps with ecology (Immellmann and Beer 1989, 83). "Ecology" has many metaphors including (1) the well-being of bio-habitats existing outside of Humans, (2) cleansing ourselves of all mental pollution, (3) housing, *e.g.*, black housing and white housing, and (4) the circumstances, pressures, and requirements placed on people in their work environments (Wali 1995). Wali (1995) lists many terms that contain ec-, eco-, ecol-ic, ecological, ecology, and environmental; and he discusses some of them.

[Greek *oikos*, home + -OLOGY]

► **anthecology** *n.* The study of pollination and the relationships between insects and flowers (Lincoln et al. 1985).

cf. study of: pollination ecology

► **autecology, idioecology** *n.* The ecology of individual organisms or species (Lincoln et al. 1985).

cf. study of: ecology: syncology

► **paleoautecology, Brit. palaeoautecology** *n.* The study of the ecology of individual fossil species or groups (Lincoln et al. 1985).

cf. paleosynecology

► **behavioral ecology** *n.* The study of how behavior enables animals to adapt to their environments.

cf. study of: psychology: behavioral ecology

► **chemical ecology** *n.* The study of the biochemistry of organism interactions (Harborne 1982, v).

syn. ecological biochemistry, phytochemical ecology

► **community ecology** *n.* Ecology that focuses on parts of ecosystems, namely communities of interacting populations (Taylor 1992, 52).

► **ecosystem ecology, systems ecology** *n.* Ecology that focuses on measurement of nutrient and energy flows in an ecosystem, in contrast to experi-

ments on well controlled parts of the system (Taylor 1992, 56).

► **genecology** *n.* The study of intraspecific variation and genetic composition in relation to the environment (Lincoln et al. 1985).

► **geoecology** See study of: geology: geoecology.

► **ecography** *n.* "Descriptive ecology" (Lincoln et al. 1985).

► **geographical ecology** *n.* The study of geographic variation of adaptations of organisms to their environments (Mayr 1982, 454).

► **oral ecology** *n.* The ecology of some 400 microorganism species (mostly bacterial species but also protozoans and yeast) that ordinarily inhabit human mouths (Stevens 1996, 314).

Comments: These bacteria evolved with Humans, and most species are not harmful (Stevens 1996, 314–315). Many species help to fend off disease-producing bacteria. For example, some beneficial bacteria produce propionic and butyric acids which kill bacteria that cause human intestinal problems. Humans obtain different main communities of mouth microorganism just after they are born, when their baby teeth start appearing, and during puberty. Climax communities occur in adults.

► **paleoecology, Brit. palaeoecology** *n.*

1. A largely atheoretical subject of the 1940s and 1950s concerned primarily with recording the kinds of rock types that given taxa preferred and seeking correlations between environment and fossil morphology, largely in the interest of taxonomic refinement (Gould 1981, 296).

Note: Starting in the 1970s, paleoecology transformed by incorporating theoretical ecology (Gould 1981, 296).

2. "The study of fossil communities" (Lincoln et al. 1985).

► **phytochemical ecology** See study of: ecology: chemical ecology.

► **phytoecology, phytosociology, plant sociology** *n.* Plant ecology (Lincoln et al. 1985).

cf. study of: botany, phytocoenology

► **pollination ecology** *n.* The study of the ecological and evolutionary relationships in pollination (Buchmann and Nabhan 1996, 252).

cf. study of: anthecology

► **population ecology** *n.*

1. The ecology of organism populations, including their genetics and demography (Immellmann and Beer 1989, 83).

2. The branch of ecology that studies the structure and dynamics of populations" (Sharov 2000 at <http://www.ento.vt.edu/~sharov/popechome/people.html>).

Comments: A principal problem in population ecology is to predict population changes in space and time. This field uses mathematical modeling as its main tool.

► **mathematical-population ecology** *n.* The quantitative study of population ecology which started in 1930 with Fisher's *The Genetical Theory of Natural Selection*, Wright's (1931) *Evolution in Mendelian Populations*, and Haldane's (1932) *Causes of Evolution* (Wilson 1975, 63).

► **restoration ecology** *n.* The science and process of using organisms to restore a human-degraded site to its former conditions, *e.g.*, reforestation of

mine tailings or timberland (Buchmann and Nahan 1996, 253).

► **synecology, ecological sociology** *n.* The ecology of communities, organism groups, populations, systems, or a combination of these subjects (Lincoln et al. 1985).

cf. study of: ecology: autecology

paleosynecology, Brit. palaeosynecology *n.* The “study of the ecology of fossil populations or communities” (Lincoln et al. 1985).

cf. study of: ecology: autecology, paleoautecology

► **systems ecology** See study of: ecology: ecosystem ecology.

► **zooecology** *n.* Animal ecology.

ecosystem science *n.* A well-established and rapidly growing multidisciplinary field characterized by issues that cross boundaries: boundaries represented by spatial and temporal scales, domains of traditional ecological disciplines, and viewpoints of basic research and management (<http://link.springer-ny.com/link/service/journals/10021/about.html>, 2000).

Comments: The scope of ecosystem science extends from bounded ecosystems such as watersheds, through spatially complex landscapes and through Earth itself (<http://link.springer-ny.com/link/service/journals/10021/about.html>, 2000). Ecosystem science also crosses temporal scales from seconds through millennia. Ecosystem science has strong links to other disciplines including aquatic ecology, biogeochemistry, conservation biology, ecological economics, global ecology, hydrology, and landscape ecology. Ecosystem studies employ diverse approaches, including theory and modeling, long-term investigations, comparative research, and large experiments and often include Humans. The journal *Ecosystems* deals with studies in ecosystem science.

edaphology, pedology, soil science *n.*

1. The study of soils, particularly with reference to biota and human use of land for plant cultivation (Lincoln et al. 1985).
2. The scientific study of composition, distribution, and formation of natural soils (Allaby 1994, 294).

embryology *n.* The study of multicellular organism development (Lincoln et al. 1985).

► **behavioral embryology** *n.* The study of behavioral development before an animal is born or hatched from its egg (Immelmann and Beer 1989, 29).

► **neuroembryology of behavior** *n.* The study of the joint development of an animal's behavior and its central nervous system made to elucidate this system's control of behavior (Immelmann and Beer 1989, 29).

endocrinology *n.* The study of endocrine glands and their products, *i.e.*, hormones; sometimes considered to be a branch of medicine (Michaelis 1963). [ENDO- + Greek *krinein*, to separate + -LOGY]

► **behavioral endocrinology, ethoendocrinology** *n.* The study of endocrinology of behavior and effects of behavior on hormone secretion (Immelmann and Beer 1989, 29).

syn. psychoneuroendocrinology (Dewsbury 1978, 218)

► **neuroendocrinology** *n.* The study of hormone secretion of central-nervous-system cells and its function in metabolism, growth, and behavioral regulation (Immelmann and Beer 1989, 202).

energetics *n. pl.* (construed as singular) The study of energy (Oxford English Dictionary 1972, entries from 1855).

► **bioenergetics** *n. pl.* (construed as singular).

1. The study of energy relations, exchanges, etc., in living matter (Michaelis 1963).
2. The study of organisms' caloric requirements with regard to their sizes, kinds of metabolism, and activity patterns (Wilson 1975, 142).

entomology *n.*

1. The study of insects, including their physiology, distribution, and classification (Oxford English Dictionary 1972, entries from 1766); the study of insects only (Torre-Bueno 1978).
2. Broadly, the study of insects and their arthropod kin including Chilopods, Diplopods, and nonmarine arachnids and crustaceans.
3. “The study of insects as one of the best ways to revel in the joys of discovery” (Evans 1985, 27).

adj. entomological

[*entomo* < Greek *entoma*, insects (originally *neutral pl.* of *entomos*, cut up, *en-* in + *temnein* to cut; with reference to insects' segmented body structure) + LOGY]

entomotomy *n.* The study of insect anatomy (Lincoln et al. 1985).

epigenetics See study of: genetics: epigenetics.

► **molecular epidemiology** *n.* The science that reconstructs the evolutionary history of microbes (Bull 1995, 1297).

Comment: This science showed that a dentist definitely infected his patients with AIDS (Bull 1995, 1297).

epiontology *n.* “The study of the developmental history of plant distributions” (Lincoln et al. 1985).

epistemology *n.* The study of how organisms, or organism groups, “know, think, and decide” (Bateson 1979, 242).

cf. study of: philosophy: epistemology

ergonomics *n.* The quantitative study of work, performance, and efficiency (Lincoln et al. 1985).

ethnobotany See study of: botany: ethnobotany.

ethnology, ethnography *n.* The study of character, history, and culture of human groups (Lincoln et al. 1985).

ethnozoology See study of: zoology: ethnozoology.

ethography See study of: ethnology.

► **ethology** *n.*

1. A portrayal of character by mimic gestures; mimicry (an obsolete definition, Oxford English Dictionary 1971, entries from 1656).
2. The science of ethics; also a treatise on manners or morals (an obsolete definition, Oxford English Dictionary 1971, entries from 1678).
3. The science of character formation (Oxford English Dictionary 1971, entries from 1340).

► **ethology** *n.*

1. Studies of the relationships among organized beings in families, societies, aggregations, and communities (I. G. Saint-Hilaire 1854 in Gherardi 1984, 377).
2. “The science of the general conditions of existence which pertain to organisms as individuals and at the same time regulate their relations to other organisms and the inorganic environment” (Wheeler 1902 in Gherardi 1984, 386).

syn. ecology (Wheeler 1902 in Gherardi 1984)

Comment: “Ethology mixes physiology, psychology, morphology, and phylogenetics” (Wheeler in Gherardi 1984, 387).

► **ethology** *n.*

1. “The objective study of behavior” (Tinbergen 1951, 1).
2. “The biological study of behaviour” (Tinbergen 1963 in Gherardi 1983, 98).
3. “The evolutionary study of behavior” (Lorenz in Alexander 1987, 6).

Note: “Ethology” became associated with Lorenz’s particular views of physiology, development, and inheritance of behavior and, as a result, eventually became obscure and less frequently used (Alexander 1987, 6).

4. A nebulous term that refers to classical ethology, *q.v.*, modern studies in animal behavior, or a discipline that is some combination of these fields.

Note: “Today, ethology is in a dynamic empirical stage in which it is often not easily distinguished from other branches of the study of animal behavior. . . .” (Dewsbury 1978, 22).

5. “The science of animal behavior” that includes “the scientific investigation of behavior by all means and by all kinds of people” (Barnett 1981, 633).
6. The study of animal behaviors that deals with their causation (including external stimulation, internal physiological mechanisms and states), development (including ontogeny and genetics), ecology (including physiological and learning adaptations), and evolution (including origins and modifications) (Gould 1982, preface; McFarland 1985, 4–5, 357; Immelmann and Beer 1989, 92).

Note: This definition seems appropriate for wide use. The boundaries of ethology and other sciences are ill defined (Immelmann and Beer 1989, 92).

syn. classical ethology (according to some authors)
cf. study of: phylogeny: behavioral phylogeny, classical ethology

Comment: Based on surveys that I undertook at a national meeting of the Animal Behavior Society (1988) and the a meeting of the International Ethological Congress (1989), scientists who study animal behavior vary appreciably in their conceptions of what constitutes “ethology.” The subjects that they included in “ethology” ranged from only those investigated by European ethologists to all aspects of animal behavior.

[Latin *adj. ethologia*, character + -logy < Greek *ethō*, character, coined by I. G. Saint-Hilaire (1854) meaning ecology; used for the study of behavior by Dollo (1895 in Heymer 1977, 64). Gherardi (1984, 377) suggests that Mill (1843) used this term before Saint-Hilaire.]

► **applied ethology** *n.* Ethology of animal species that are of direct practical interest to Humans, emphasizing practical applications of ethology; applied ethology is composed of veterinary ethology and part of zoo biology (Immelmann and Beer 1989, 19).
cf. study of: biology: zoo biology

► **classical ethology** *n.*

1. “The application of orthodox biological methods to the problems of behavior” (Lorenz 1960a in Lehner 1979, 3).
2. “Study of whole patterns of animal behavior under natural conditions, in ways that emphasize(d) the functions and the evolutionary history of the patterns” (Eisner and Wilson 1975, 1, in Lehner 1979, 2).

3. The objective study of animals, including Humans, from a biological standpoint, emphasizing species-typical behavior and its function and evolution; ethology involves a holistic approach to the study of normal behavior, embodying a detailed analysis of all phases of an animal’s behavior (Heymer 1977, 64).

4. The objective study of behavior; the biological study of behavior; the study of instinct; or study of behavior by individuals who like their animals (depending on the author in Dewsbury 1978, 13).

5. A branch of the study of animal behavior that was started in Europe in the 1930s by zoologists, and promoted studying behaviors that are meaningful in an animal’s natural habitat, beginning an analysis with descriptive studies, studying a wide range of species and behaviors, comparing similar behaviors in closely related species (comparative method), and disparaging the exclusive use of domesticated species (Burghardt 1973 in Dewsbury 1978, 13).

syn. ethology, European ethology, European traditionalism, Lorenz-Tinbergen school of behavior

adj. ethological

cf. study of: behavior; psychology: behaviorism, comparative psychology

Comment: The original ethology group placed a strong emphasis on the study of instinct (Immelmann and Beer 1989, 93).

► **cognitive ethology** *n.* The comparative study of animal cognition (Smith 1999, 9 October, A17). [coined by Donald R. Griffin]

► **comparative ethology** *n.* A branch of ethology that places comparisons of evolutionary, ecological, and morphological aspects of species in the foreground; formulated and explained most original ethological concepts; and recognized and demonstrated that fixed-action patterns are species-specific characters useful in phylogenetic analyses (Immelmann and Beer 1989, 52).

cf. study of: psychology: comparative psychology

Comment: “Comparative ethology” is little used today because a comparative perspective is now used in many other branches of biology (Immelmann and Beer 1989, 52).

► **cultural ethology** *n.* A branch of ethology concerned with the intellectual and material products of Humans and their culture in relation to their development, ecological relevance, dependence on innate behavior, and relation to corresponding situations in nonhuman animals (Koenig 1970, 1975 in Heymer 1977, 106).

► **European ethology** See study of: ethology: classical ethology.

► **human ethology** *n.* A branch of ethology that tries to elucidate the phylogenetic bases of human behavior and determine, with the help of a comparative study of cultures, the innate components of complex human behaviors (Eibl-Eibesfeldt and Hass 1966, etc., in Heymer 1977, 89).

Comments: In contrast to psychology, “human ethology” examines human behavior by observation, not questioning persons; concentrates on humanity, rather than individuals; compares Humans with nonhuman primates, but especially compares human cultures; and examines ontogeny of human behavior. “Human ethology” overlaps with some

- areas of “anthropology” (Immelmann and Beer 1989, 137).
- **modern ethology** *n.* The study of the mechanisms and evolution of behavior, using in particular the conceptual tools: motor programs, drives, programmed learning, and releasers based on physiological-feature detectors (Gould 1982, 65).
- **molecular ethology** *n.* The study of biochemical, anatomical, and physiological routes between genes and behavior (Gould’s 1974 term in Dewsbury 1978, 124).
- **neuroethology** *n.* The study of processes in sense organs and central nervous systems that underlie animals’ performances and control of their behaviors (Immelmann and Beer 1989, 202). *Comment:* This is a little-used term (Immelmann and Beer 1989, 213).
- **paleoethology, Brit. palaeoethology** *n.* The study of the behavior of extinct animals (Immelmann and Beer 1989, 213).
- Comment:* This is a little-used term (Immelmann and Beer 1989, 213).
- **quantitative ethology** *n.* The quantitative recording and subsequent analysis of behavior (Immelmann and Beer 1989, 240). *cf.* -metry: sociometry
- **veterinary ethology, zoo biology** See study of: applied ethology.
- etiology, aetiology** *n.* The study of the origins, or causes, of phenomena (Lincoln et al. 1985). See etiology.
- etymology** *n.* The branch of linguistics concerned with the origins of words (Oxford English Dictionary 1972, entries from 1646). See etymology.
- euthenics** *n.* The branch of science that attempts to improve Humans by maintaining, or improving, their environments (Storz 1973, 91). *cf.* eugenics
- evolution** *n.* The study of evolution, *q.v.* *cf.* study of: biology: evolutionary biology
- **biogeny** *n.* The study of evolution including both ontogeny and phylogeny (Lincoln et al. 1985).
- **macroevolution** *n.* “The study of evolutionary changes that take place over a very large time-scale (Dawkins 1982, 289). *cf.* evolution: macroevolution
- **molecular evolution** *n.* The study of the evolution of molecules.
- classical-molecular evolution** *n.* The study of molecular evolution emphasizing biochemical and molecular-biology technology to solve traditional evolutionary problems (Levin 1984, 454). *Comment:* Interest in molecules themselves and molecular biological and biochemical implications of the evolution of molecules are secondary to molecular biological and biochemical processes in this study (Levin 1984, 454).
- neoclassical-molecular evolution** *n.* The study of molecular evolution emphasizing molecular biological and biochemical processes (Levin 1984, 458).
- evolutionary medicine** *n.* Medical practices that are based on an understanding of the evolution of Humans and their diseases; *e.g.*, not lowering fever when it is not too high because it is a person’s natural means of fighting pathogens (Bull 1995, 1296). *syn.* Darwinian medicine (Bull 1995, 1296)
- evolutionary physiology** See study of: physiology: evolutionary physiology.
- exobiology** See study of: biology: exobiology.

- fluviology** *n.* “The study of rivers” (Lincoln et al. 1985).
- functionalism** See study of: psychology: functionalism.
- genealogy, geneology** *n.* The study of ancestral relationships and lineages (Lincoln et al. 1985). See genealogy.
- genecology** See study of: ecology: genecology.
- geneology** See study of: genealogy.
- general physics** See study of: physics: general physics.
- genesiology** *n.* “The study of reproduction” (Lincoln et al. 1985).
- genetics** *n. pl.* (construed as singular) The scientific study of heredity and heredity variation (Mayr 1982, 732; Campbell et al. 1999, 226). See genetics. *Comments:* Bateson (1906 in Mayr 1982, 732) proposed “genetics” to designate studies and theories of inheritance of his time. Genetics, as a science, was born in 1900 (Mayr 1982, 781). “MendelWeb” is an educational resource regarding the origins of classical genetics, introductory data analysis, elementary plant science, and the history and literature of science (<http://netspace.students.brown.edu/MendelWeb/>). MendelWeb includes Gregor Mendel’s original paper, translations of this paper, an illustrated glossary, and many links. [genetics < Greek *genesis*, descent; on analogy with synthetic, antithetic, etc.]
- **bean-bag genetics** *n.* Genetic studies that ignore gene interaction (Mayr 1982, 558). [coined by Mayr (1959d) based on the fact that “genetics textbooks in the 1940s and 1950s suggested laboratory exercises in which genes were represented by beans of several colors, placed in a bag, mixed and reassembled for each generation, according to certain experimental specifications” (Mayr 1982, 558)]
- **behavior genetics, behavioral genetics** *n.* Genetics of inheritance of behaviors and dispositions (Wilson 1975, 349; Immelmann and Beer 1989, 118). *syn.* psychogenetics (Hall 1951 in Fuller and Thompson 1960), genetic psychology, psychological genetics *Comment:* Immelmann and Beer (1989, 238) restrict “psychogenetics,” *q.v.*, to the genetic study of human behavior. [Fuller and Thompson (1960) appear to have coined “behavior genetics.”]
- **classical genetics** See study of: genetics: Mendelian genetics.
- **cytogenetics** *n.* Genetics that integrates morphology and functions of chromosomes with genetic theory (Mayr 1982, 775).
- **developmental genetics, physiological genetics** *n.* Genetics of the translation of genetic programs into phenotypes from zygotes through adults (Mayr 1982, 630).
- **ecological genetics** *n.* The genetics of populations of living organisms investigated in both the field and laboratory (Mayr 1982, 553). [coined by Ford (1964 in Mayr 1982, 553) to distinguish this branch of genetics from mathematical population genetics, *q.v.*]
- **epigenetics** *n.* “The study of the causal mechanisms of development” (Lincoln et al. 1985).

- **evolutionary genetics** *n.* The genetics of sources of genetic variability and changes in gene frequencies in populations (Mayr 1982, 592).
- **Mendelian genetics, classical genetics** *n.* Genetics that uses selective breeding to determine distribution patterns of hereditary characteristics between parent and descendant generations (Immelmann and Beer 1989, 118).
- **molecular genetics** *n.* Genetics of subjects such as the biochemical natures of genes, genetic codes and the means by which its information is brought forth and utilized in cells, chromosomal and gene mutations, and replication mechanisms that take place during mitosis and meiosis (Immelmann and Beer 1989, 118).
cf. study of: biology: molecular biology
- **paleogenetics, palaeogenetics** *n.* Genetics of fossil organisms (Lincoln et al. 1985).
- **phenogenetics** *n.* The study of genotypic expression in the development of a phenotype (Lincoln et al. 1985).
- **physiological genetics** See study of: genetics: developmental genetics.
- **population genetics** *n.* The study of genetic changes and factors that affect them within and among populations (Mayr 1982, 630; Hartl 1987, ix; Immelmann and Beer 1989, 118, 228).
cf. study of: biology: population biology
Comments: Population genetics combines observation with theory in its attempt to study populations (Hartl 1987, ix). It cuts across many diverse disciplines including anthropology, conservation, ecology, evolutionary biology, genetics, mathematics, molecular biology, natural history, organism breeding, sociology, statistics, systematics, and wildlife management. Some of the subjects of population genetics are fitness, gene flow, genetic drift, heritability, hybrids, inbreeding, kinds of evolution, levels of population structure, mating, migration, mutations, nucleic-acid evolution, ploidy, polymorphism, quantitative traits, selection, selection limits, the Hardy-Weinberg principle and neutral theory, transposable genetic elements, and x- and y-linked genes. Population genetics attempts to relate many of its subjects to one another mathematically in predictive models (Mayr 1982, 630; Immelmann and Beer 1989, 118, 228). Hamilton (2009) views population genetics as “a dialog between predictions based on principles of Mendelian inheritance and results obtained from empirical measurement of genotypes and allele frequencies that form the basis of hypothesis tests.”
- classical-population genetics** *n.* Population genetics that emphasizes biochemical and molecular-biology technology to solve traditional evolutionary problems and that emphasizes evolution of molecules alone (Levin 1984, 454).
- mathematical-population genetics** *n.* Population genetics that involves studying hypothetical populations using mathematics (Mayr 1982, 553).
cf. study of: genetics: ecological genetics
- **psychogenetics** *n.* Genetics of human behavior (Immelmann and Beer 1989, 238).
cf. study of: genetics: behavior genetics
Comment: “Psychogenetics” is an infrequently used term in psychopathology literature (Immelmann and Beer 1989).

- **quantitative genetics** *n.* The scientific study of polygenic traits (= quantitative traits), *q.v.* (Hartl 1987, 216; Tanksley 1993, 206).
- **sociogenetics** *n.* Genetics of social behavior and caste systems (Hölldobler and Wilson 1990, 643).
- **transmission genetics** *n.* Genetics of the origin of new genetic programs, originating from mutation and recombination, and their transfer to an organism's next generation (Mayr 1982, 630).
- **zoogenetics** *n.* “Animal genetics” (Lincoln et al. 1985).
- geobiology** See study of: biology: geobiology.
- geobotany** See study of: geography: phytogeography.
- geochronology** *n.* The dating of events and study of time in relation to the Earth's history as revealed by geological data (Lincoln et al. 1985).
syn. geochrony, geological chronology
- **geochronometry** *n.* Quantitative geochronology, usually measuring time in years (Lincoln et al. 1985).
- geocosmology** *n.* Study of the Earth's origin and geological history (Lincoln et al. 1985).
- geoecology** See study of: geology: geoecology.
- geography** *n.* The study of the Earth's surface, treating its form and physical features, natural and political divisions, climate, production, population, etc. (Oxford English Dictionary 1972, entries from 1542).
Comments: Main divisions of “geography” include “biogeography,” “mathematical geography,” “physical geography,” and “political geography.” “Subterranean geography” is “geology,” *q.v.*
- **biogeography, chorology, geomony** *n.* study of the geographical distributions of organisms, their habitats, and the historical and biological factors that produced them (Lincoln et al. 1985).
- ecological biogeography** *n.* Biogeography concerning the distributions and habits of organisms (Lincoln et al. 1985).
- historical biogeography** *n.* Biogeography concerning historical and biological factors that produced organisms (Lincoln et al. 1985).
- necrogeography, thanogeography** *n.* Biogeography of dead organisms (Lincoln et al. 1985).
- neobiogeography** *n.* Biogeography of modern organisms (Lincoln et al. 1985).
cf. study of: geography: paleobiogeography.
- paleobiogeography, palaeobiogeography** *n.* The biogeography of extinct organisms (Lincoln et al. 1985).
- phylogeography** *n.* The study of the principles and processes that govern geographic distributions and genealogical lineages both within and between species (Avise 1994 in Larson 1995, 115).
- phytogeography** *n.* Plant biogeography (Lincoln et al. 1985).
syn. geobotany, plant biogeography
- **paleophytogeography, Brit. palaeophytogeography** *n.* “The study of plant distributions through geological time” (Lincoln et al. 1985).
- subterranean geography** See study of: geology.
- thanogeography** See study of: geography: necrogeography.
- vicariance biogeography** *n.*
1. The study of the geographical distribution of vicarious species (*q.v.*) (Lincoln et al. 1985).
 2. The study of organisms' geographical distribution in the light of Earth's past geomorphological events (Rieppel 2002, 744).

Note: Vicariance biogeography examines the relationship between sister-groups and past geomorphological events (Rieppel 2002, 744).

zoogeography *n.* The study of the distribution of animals and their communities (Lincoln et al. 1985).

■ **ecological zoogeography** *n.* “The study of distributions of animal species with regard to their life conditions and dispersal potential” (Lincoln et al. 1985).

■ **historical zoogeography** *n.* The study of the distribution of animal species and higher taxa with regard to their past history and the palaeogeographical evolution of the region where they occur (Lincoln et al. 1985).

■ **macrozoogeography** *n.* “The study of dispersion of higher taxa over wide areas” (Lincoln et al. 1985).

■ **microzoogeography** *n.* “The study of dispersion of geographical races, species, or genera over small areas” (Lincoln et al. 1985).

► **ecological geography** *n.* The study of the effect of ecological (environmental) factors on organism geographical distribution (Mayr 1982, 454).

cf. study of: geography: biogeography, ecological biogeography

geological chronology See study of: geochronology.

geology *n.*

1. The study of the Earth's crust, including its strata, relationships among strata, and historical changes in strata (Oxford English Dictionary 1972, entries from 1795).
2. The study of the Earth's origin and structure, processes and forces that have shaped it, and physical and organic history, especially as evidenced by rocks and rock formations (Michaelis 1963).

cf. study of: geography

► **geocology** *n.* “Environmental geology” (Lincoln et al. 1985).

► **structural geology** *n.* The study of the formation of rocks of the Earth's crust (Oxford English Dictionary 1972, entry from 1882).

syn. geotectonic geology (Oxford English Dictionary 1972)

genomics *n.* The study of organisms in terms of their entire genomes (Wade 1995, 17 October, C1; Koonin and Glaperin 1997, 757).

cf. machine: high-throughput-DNA sequencer

Comments: Since 1980, nucleic-acid sequencing evolved from complicated laboratory procedures performed by skilled technicians to automated, commonplace techniques available to both biologists and nonbiologists (Lee and Lee 2000, 171). The nature and quantities of genomic information that researchers already gathered has led to a shift toward a holistic approach to the study of biological systems that required the development of a plethora of new analytical tools.

geomony See study of: geography: biogeography.

geratology *n.* “The study of the decline and senescence of populations” (Lincoln et al. 1985).

gerontology *n.* The study of the senescence and the processes and effects of organism aging (Lincoln et al. 1985).

Comment: “Human gerontology” embraces “anthropology,” “geriatrics,” “psychology,” and “sociology” (Chaplin 1968).

Gestalt psychology See study of: psychology: Gestalt psychology.

graminology, agrostology *n.* “The study of grasses” (Lincoln et al. 1985).

► **paleoagrostology, palaeoagrostology** *n.* “The study of fossil grasses” (Lincoln et al. 1985).

hard science See study of: science: hard science.

helminthology *n.* “The study of parasitic flatworms and roundworms” (Lincoln et al. 1985).

hepaticology See study of: bryology.

herpetology *n.* The study of reptiles and amphibians (Lincoln et al. 1985).

histology *n.* The branch of anatomy dealing with tissue structure (Lincoln et al. 1985).

humanology *n.* The “study of human behavior from an evolutionary (biological and cultural) perspective” (Wittenberger 1981, 616).

hydrobiology See study of: biology: hydrobiology.

ichnology *n.* The study of traces of extant and extinct organisms (Lincoln et al. 1985).

► **neoichnology** *n.* The study of burrows, tracks, and other traces of extant organisms (Lincoln et al. 1985).

► **paleoichnology** *n.* “The study of trace fossils” (Lincoln et al. 1985).

syn. palaeoichnology, palichnology

ichthyology *n.* The study of fish (vertebrates) (Michaelis 1963).

ideology *n.*

1. The study of the origin, evolution, and expression of human ideas (Oxford English Dictionary 1972, entries from 1796; Michaelis 1963).
2. The study of how ideas are expressed in language (Oxford English Dictionary 1972, entry from 1886).

idioecology See study of: autecology.

immunology *n.* The study of hypersensitivity, organism immunity to disease, immunochemistry, immunogenetics, immunopathology, and serology (King and Stansfield 1985).

karyology *n.* The study of cell nuclei, especially chromosome structure (Lincoln et al. 1985).

Comment: “Karyology” is divided into “alpha karyology,” “beta karyology,” “gamma karyology,” “delta karyology,” “epsilon karyology,” and “zeta karyology” (Lincoln et al. 1985).

kinesics *n.* The study of human body language, including gesture, movement, posture, and orientation in social interaction (Immelmann and Beer 1989, 204).

kinetics See study of: physics: kinetics.

kybernetics See study of: cybernetics.

kymatology *n.* “The study of waves and wave motion” (Lincoln et al. 1985).

lampyridology *n.* The study of fireflies (Lampyridae) (Lloyd 1970, 52).

leptology *n.* “The study of minute structures or particles” (Lincoln et al. 1985).

lichenology *n.* “The study of lichens” (Lincoln et al. 1985).

life sciences *n.* All of the disciplines devoted to the study of living organisms; contrasted with physical sciences, social sciences, and other sciences (Mayr 1997, 24).

cf. study of: biology

limacology *n.* “The study of slugs” (Lincoln et al. 1985).

limnobiology See study of: limnology.

limnology, limnobiology *n.* “The study of lakes, ponds, and other standing waters, and their associated biota” (Lincoln et al. 1985).

► **paleolimnology, palaeolimnology** *n.* The “study of the geological history and development of inland waters” (Lincoln et al. 1985).

► **rheology** *n.* The part of limnology devoted to running water (Lincoln et al. 1985).

See study of: rheology.

lithology, petrology *n.* The study of rocks and rock-forming processes (Lincoln et al. 1985).

malacology *n.* The study of molluscs (Oxford English Dictionary 1972, entries from 1836).

cf. study of: conchology, limacology

mathematics *n. pl.* (construed as singular)

1. Originally, the collective name for arithmetic, geometry, and certain physical sciences (including astronomy and optics) that involve geometrical reasoning (Oxford English Dictionary 1972, entries from 1581).

2. In modern usage, the abstract science (pure mathematics) that deductively investigates the conclusions implicit in the elementary conceptions of spatial and numerical relations, and includes as its main divisions algebra, arithmetic, and geometry (Oxford English Dictionary 1972).

3. In a wider, modern sense, mathematics including branches of physical, or other research, that consist in the application of abstract mathematics to concrete data (Oxford English Dictionary 1972).

4. “The study of quantity, form, arrangement, and magnitude; especially, the methods and processes for disclosing, by rigorous concepts and self-consistent symbols, the properties and relations of quantities and magnitudes, whether in the abstract, pure mathematics, or in their practical connections, applied mathematics” (Michaelis 1963).

► **cybernetics, kybernetics** *n.*

1. A multidisciplinary research approach to the structure and functions of data- or information-processing systems; cybernetics is divided into the fundamental disciplines of “algorithm and automata theory,” “control theory,” and “information theory” (Storz 1973, 62).

2. In animals and machines: The study of control and communication in systems, including information systems and feedback control systems (Lincoln et al. 1985; Immelmann and Beer 1989, 66).

control theory *n.* A part of cybernetics that deals with automatic regulation of machines and organisms (Immelmann and Beer 1989, 59).

information theory *n.*

1. The statistical and mathematical study of the encoding, decoding, transmission, storage, retrieval, etc., of information and of computers, telecommunication channels, and other information-processing systems (Michaelis 1963).

2. A branch of probability theory, or cybernetics, that deals with the likelihood of transmission of messages, accurate within specified limits, when the units of information comprising the message are subject to probabilities of transmission failure, random disturbance, etc., and with the measurement of information content of systems (Lincoln et al. 1985).

Note: Information theory employs a quantitative measure of information and does not reflect a

message’s qualitative value (= meaning) (Lincoln et al. 1985; Immelmann and Beer 1989, 147).

topology *n.* A branch of mathematics that ignores quantities and deals only with the formal relations between, or among, components, especially those that can be represented geometrically, e.g., body-surface characters that remain unchanged under quantitative distortion (Bateson 1979, 242).

mechanics See study of: physics: mechanics.

mellitology *n.* “The study of bees” (Lincoln et al. 1985).

syn. apidology (not a preferred synonym, C. K. Starr, pers. comm.)

mesology See study of: ecology.

metaphysics See study of: philosophy.

meteorology *n.* The study of motions of Earth’s atmosphere, especially with a view to forecasting weather (Oxford English Dictionary 1972, entries from 1620); “the study of weather or local atmospheric conditions” (Lincoln et al. 1985).

cf. climatology

► **biometeorology** *n.* The study of effects of atmospheric conditions on biota (Lincoln et al. 1985).

-metry See also -metrics, -metry.

► **biometry** *n.* Broadly, “the application of statistical methods to the solution of biological problems” (Sokal and Rohlf 1969, 2).

syn. biological statistics, biostatistics (Sokal and Rohlf 1969, 2), biometrics (Lincoln et al. 1985)

cf. -metry: biometry

[“biometry” coined by Weldon (in Sokal and Rohlf 1969, 4)]

► **chronometry** *n.* “The science of precise time measurement” (Lincoln et al. 1985).

► **conchometry** *n.* The study of mollusc-shell morphometrics (Lincoln et al. 1985).

cf. study of: conchology

► **geochronometry** See study of: geochronology.

► **psychometry, psychometrics** *n.*

1. “The science of the measurement of psychophysical processes, especially of their interrelationships and” durations in time (Michaelis 1963) which attempts to avoid subjective-judgement effects (Collocot and Dobson 1974).

2. The measurement of intelligence (Michaelis 1963; Collocot and Dobson 1974).

cf. -metry: psychometrics: mental chronometry

► **scientometrics** *n.* The field that uses quantitative methods to analyze the process and development of science (Garfield, 1987).

morphology *n.* The scientific study of the form of organisms and the structures, homologies, and metamorphoses that govern, or influence, this form (Oxford English Dictionary 1972, entries from Goethe 1817; Mayr 1982, 455).

► **evolutionary morphology** *n.* Morphology that “views form either as response to environmental needs (Lamarck-type explanations) or as adaptation produced by selection pressures” (Mayr 1982, 455). *cf.* evolutionary-morphology school

► **functional morphology** *n.*

1. The description of structures in terms of their functions (Mayr 1982, 455).

2. Interpretation of the function of an organism, or organ system, by reference to its shape, form, and structure (Lincoln et al. 1985).

► **morphology of growth** *n.* The study of growth, “including all processes of growth and development

that can be formulated mathematically, particularly allometric growth" (Mayr 1982, 455).

► **synmorphology** *n.* The study of a plant community's floristic composition, minimal area, and extent in time and space (Lincoln et al. 1985).

muscology See study of: bryology.

mycology, mycetology *n.* "The study of fungi" (Lincoln et al. 1985).

myrmecology *n.* "The study of ants" (Lincoln et al. 1985).
[*myrmeco* < Greek *myrmēx*, *myrmēkos*, ant + -LOGY]

natural history See natural history.

natural-language processing *n.* "The study of mathematical and computational modeling of various aspects of language and the development of a wide range of systems" (Joshi 1991, 1242).
Comment: These aspects and systems include spoken language systems that integrate speech and natural language; cooperative interfaces to databases and knowledge bases that model aspects of human-human interaction; multilingual interfaces; machine translation; and message-understanding systems, among others" (Joshi 1991, 1242).

natural theology *n.* The "study of nature for the purpose of understanding God's intention" (Mayr 1997, 26).
cf. natural theology (in the n section)
Comment: Many people considered natural theology to be a legitimate branch of science until about the 1850s (Mayr 1997, 26).

neontology *n.* "The study of young and immature organisms" (Lincoln et al. 1985).

necrology *n.* The study of decomposition, fossilization, and other processes that affect organism remains after death (Lincoln et al. 1985).

nematology, nematodology *n.* "The study of nematodes" (Lincoln et al. 1985).

neoichnology *n.* See study of: ichnology: neoichnology.

neontology *n.* The study of extant species (Mayr 1982, 292).
cf. study of: paleontology

neuroembryology of behavior See study of: embryology.

neuroendocrinology See study of: endocrinology.

neurobiology See study of biology: neurobiology.

neustonology *n.* "The study of neuston" (Lincoln et al. 1985).

nosography, nosology See study of: nosology.

numerical taxonomy (NT) See study: systematics: phenetic systematics; taxonomy: numerical taxonomy.

oceanography *n.* The study of oceans (Lincoln et al. 1985).

oology *n.* "The study of eggs" (Lincoln et al. 1985).

ophiology *n.* "The study of snakes" (Lincoln et al. 1985).

ophiotoxicology See study of: toxicology: ophio-toxicology.

organology *n.* "The study of organ systems and structures" (Lincoln et al. 1985).

ornithology *n.* "The study of birds" (Oxford English Dictionary 1972, entries from 1676).
[Greek *ornis*, *ornithos*, bird + -LOGY]

► **palaeornithology, Brit. palaeornithology** *n.* "The study of fossil birds" (Lincoln et al. 1985).

orography *n.* "The study of the physical geography of mountains and mountain ranges" (Morris 1982).

adj. orographic, orographical
[< Greek *oros*, mountain]

osphresiology *n.* "The study of the sense of smell" (Lincoln et al. 1985).

osteology *n.* "The study of the structure and development of bones" (Lincoln et al. 1985).

paleoagrostology, palaeoagrostology See study of: graminology: paleoagrostology.

paleoalgology, palaeoalgology See study of: phycology: paleophycology.

paleoautecolgy, palaeoautecolgy See study of: ecology: autecology: paleoautecolgy.

paleobiogeography, palaeobiogeography See study of: geography: biogeography: paleobiogeography.

paleobiology, palaeobiology See study of: biology: paleobiology.

paleobotany, palaeobotany See study of: botany: paleobotany.

paleoclimatology, palaeoclimatology See study of: climatology: paleoclimatology.

paleodendrology, palaeodendrology See study of: dendrology: paleodendrology.

paleoecology, palaeoecology See study of: ecology: paleoecology.

paleogenetics, palaeogenetics See study of: genetics: paleogenetics.

paleoichnology, palaeoichnology See study of: ichnology: paleoichnology.

paleolimnology, palaeolimnology See study of: limnology: paleolimnology.

paleontology, Brit. palaeontology *n.* The study of extinct organisms; a branch of geology, or biology, that treats of fossil organisms, often extinct animals (paleozoology) (Oxford English Dictionary 1972, entries from 1838).
cf. study of: biology: paleobiology; ichnology

► **micropaleontology** *n.* The study of microscopic fossils (those from a few microns through 2 cm long) that must be studied by light, or electron, microscopy (Lincoln et al. 1985).

► **molecular paleontology** *n.* Paleontology involving analyzing DNA from fossils (Morell 1992a, 1861).

► **stratigraphic paleontology, biostratigraphy** *n.* "The study and classification of rock strata based on their fossil content" (Lincoln et al. 1985).

paleopalynology, palaeopalynology See study of: palynology: paleopalynology.

paleophytogeography, palaeophytogeography See geography: phytogeography: paleophytogeography.

paleophytology, palaeophytology See study of: botany: paleobotany.

paleornithology, palaeornithology See study of: ornithology: paleornithology.

paleosynecology, palaeosynecology See study of: ecology: synecology: paleosynecology.

paleozoology See study of: paleontology.

palynology *n.*

1. The study of pollen and spores of extinct and extant organisms (Lincoln et al. 1985).
2. The study of microscopic, decay-resistant remains of certain plants and animals and that includes archaeological palynology, Quaternary palynology, and stratigraphic palynology (University of Arizona, Department of Geoscience 2000).

Comment: The Website of the University of Arizona, Department of Geoscience contains much information about pollen and many links to other web sites

regarding pollen (<http://geo.arizona.edu/palynology/pid00010.html>, 2000).

► **paleopalynology**, *Brit. palaeopalynology* *n.*
“The study of fossil spores and pollen” (Lincoln et al. 1985).

parasitology *n.* The study of parasites and parasitism, considered to be branches of biology and medicine (Oxford English Dictionary 1972, entries from 1882).

pathology *n.* “The study of diseases” (Lincoln et al. 1985).

syn. nosography, nosology

► **phytopathology** *n.* The study of plant diseases (Lincoln et al. 1985).

► **psychopathology** *n.* The study of human mental problems (Michaelis 1963).

pedology See study of: edaphology.

perceptual psychology See study of: psychology: perceptual psychology.

petrology See study of: lithology.

pharmacology *n.* “The science of the nature, preparation, administration, and effects of drugs” (Michaelis 1963).

► **psychopharmacology** *n.* The branch of pharmacology that deals with drugs that affect human minds (Michaelis 1963).

phenology *n.* The study of periodic biological phenomena in organisms such as migrations, breeding, emergence of insect adults and flowering, in relation to seasonal changes, and climatic and other ecological factors (Michaelis 1963).

See phenology.

syn. phaenology (*Brit.*) (Lincoln et al. 1985)

Comment: Lincoln et al. 1985 synonymize “phenology” and “phenomenology,” but Michaelis (1963) indicates that “phenology” is a contraction of phenomenology, with a restricted meaning. The USA National Phenology Network (USANPN) (2009) gives a definition similar to the one above, but its definition refers only to animals and plants. Further this reference indicates that abiotic systems also exhibit annual or period stages (such as ice in and ice out of a lake) that are coupled with environmental changes which some authors call “phenology”; but the USANPN prefers the term “seasonality” for non-biological events.

► **phytophenology** *n.* “The study of periodic phenomena of plants, such as flowering and leafing” (Lincoln et al. 1985).

See phenology: phytophenology.

phenomenology See study of: phenomenology.

philology *n.*

1. The scientific study of written records, chiefly of literary works, undertaken to set up accurate texts and determine their meaning (Michaelis 1963).
2. “Linguistics, especially comparative and historical” (Michaelis 1963).
3. Literary study, especially classical scholarship (Michaelis 1963; Morris 1982).
4. Loosely, etymology (Michaelis 1963).

[Old French *filosofie, philosophie* < Latin *philosophia* < Greek < *philosophos* < lover of wisdom]

philosophical psychology See study of: psychology: philosophical psychology.

philosophy *n.*

1. “The love, study, or pursuit of wisdom, or of knowledge of things and their causes, whether theoreti-

cal or practical” (Oxford English Dictionary 1972, entries from 1340).

2. The more advanced knowledge, or study, to which in medieval universities, the seven liberal arts were recognized as introductory; it includes the three branches of natural, moral, and metaphysical philosophies, commonly called the three philosophies (Oxford English Dictionary 1972, entries from 1387); sciences as formerly studied in universities (Michaelis 1963).
3. “Sometimes used especially of knowledge obtained by natural reason, in contrast with revealed knowledge” (Oxford English Dictionary 1972, entries from 1388).
4. With *of*: The study of the general principles of some particular branch of knowledge, experience, or activity; also less properly, of those *of* any subject or phenomenon” (Oxford English Dictionary 1972, entries from 1713).
5. A particular system of ideas that relates to the general scheme of the universe; “a philosophical system or theory” (Oxford English Dictionary 1972, entries from 1390); a treatise on a philosophical system (Michaelis 1963).
6. One’s system that one forms for conducting his life; “the mental attitude, or conduct, of a philosopher; serenity under disturbing influences, or circumstances; resignation; calmness of temper” (Oxford English Dictionary 1972, entries from 1771); practical wisdom; fortitude, as in enduring reverses and suffering (Michaelis 1963).
7. Inquiry into the more comprehensive principles of reality in general, or of some limited sector of it such as human knowledge or human values (Michaelis 1963).
8. General laws that furnish the rational explanation of anything (Michaelis 1963).
9. Reasoned science; a scientific system; an archaic definition (Michaelis 1963).

See philosophy: metaphysical, moral, and natural philosophy.

[Old French *filosofie, philosophie* < Latin *philosophia* < Greek < *philosophos* < lover of wisdom]

► **epistemology** *n.*

1. In philosophy, the critical investigation of the nature, grounds, limits, criteria, or validity of human knowledge (Michaelis 1963).
2. In philosophy, the theory of knowledge (Swartz 2001, 400).

Notes: Epistemology is one of the principle branches of philosophy. Epistemology concerns include “the role of sense perception in the acquisition of knowledge, the possibility of attaining objective knowledge, the psychological aspects of knowledge, and — on some accounts — the sociological aspects of knowledge” (Swartz 2001, 400). Epistemology is “the main preoccupation of the philosophy of science today” (Mayr 1997, 47).

adj. epistemic, epistemological

cf. study of: epistemology

[Greek *epistēmē*, knowledge + -logy]

► **metaphysical philosophy** *n.* In philosophy, knowledge, or study, that deals with ultimate reality, or with the most general causes and principles of things (Oxford English Dictionary 1972, entries from 1794).

syn. philosophy (Oxford English Dictionary 1972)

► **metaphysics** *n. pl.* (construed as singular) In philosophy, the investigation of principles of reality transcending those of any particular science, traditionally including cosmology and ontology (Michaelis 1963).

[Medieval Latin *metaphysica* < Medieval Greek < *ta meta ta physika*, the (works) after the physics referring to Aristotle's ontological treatises which came after his *Physics*]

Comment: Mayr (1997, 27) also defines "metaphysics" as magical, superstitious, or both "explanations of phenomena that are not grounded in the physical world."

cosmology *n.* "The general philosophy of the universe considered as a totality of parts and phenomena subject to laws" (Michaelis 1963).

cf. study of: philosophy: teleology

ontology *n.* "Philosophical theory of reality, including a consideration of the universal and necessary characteristics of all existences" (Michaelis 1963).

[New Latin *ontologia* < Greek *ōn*, *ontos*, being + logos]

► **moral philosophy** *n.* In philosophy, the knowledge, or study, of principles of human action or conduct; ethics (Oxford English Dictionary 1972, entries from ca. 1400).

syn. philosophy (Oxford English Dictionary 1972)

► **natural philosophy, Naturphilosophie** *n.* In philosophy, the knowledge, or study, of nature, or of natural objects and phenomena; now usually called science (Oxford English Dictionary 1972, entries from 1297).

syn. philosophy, science (Oxford English Dictionary 1972)

Comments: This branch of philosophy opposed reductionism and the mechanization of Newtonianism (Mayr 1982, 387–388). Some the naturalists, who believed in *Naturphilosophie*, explained nature in terms of creation and design; others stressed quality, development, uniqueness, and usually a finalistic component. All of the best-known representatives of this philosophy were essentialists, unable to develop a theory of common descent. Much of the naturalists' literature is "fantastic if not ludicrous" (Mayr 1982, 387–388).

► **philosophy of the mind** See study of: psychology: philosophical psychology.

► **teleology** *n.*

1. In philosophy, the study of a creative design in the processes of nature (Plato, Aristotle, the Stoics in Mayr 1982, 47).

Note: "Teleological" refers to four concepts: "adapted systems," "cosmic teleology," "teleomatic processes," and "teleonomic activities" (Mayr 1982, 48–50).

2. In philosophy, the doctrine, or study, of ends or final causes, especially related to design or purpose in nature; also transferred to such design exhibited in natural objects or phenomena (Oxford English Dictionary 1972, entries from 1728); "the branch of cosmology that treats of final causes; finalism" (Michaelis 1963).

See teleology.

photodynamics See study of: dynamics: photodynamics.

phyccocoenology *n.* "The study of algal communities" (Lincoln et al. 1985).

phycology, algology *n.* "The study of algae" (Lincoln et al. 1985).

► **paleoalgology, Brit. palaeoalgology** *n.* "The study of fossil algae" (Lincoln et al. 1985).

phylogenetic biology See study of: biology: phylogenetic biology.

phylogenetic systematics See study of: systematics: phylogenetic systematics.

phylogeny *n.* The history, or study of, evolution or genealogical development in phyla, tribes, or species (Oxford English Dictionary 1972, entries from 1875).

► **behavioral phylogeny** *n.* The study of the evolutionary origin and descent of behaviors (Immelman and Beer 1989, 30).

cf. ethology: comparative ethology

physicalism *n.* The notion that species are under the direct control of physical variables and that low-diversity communities reflect extreme values of a controlling variable, *e.g.*, hypersalinity or low temperature (Gould 1981, 297).

physics *n. pl.* (construed as singular)

1. Originally, the study of all nature; natural science in general; especially the Aristotelian system of natural science (Oxford English Dictionary 1972, entries from 1589).

See study of: physiology (def. 1).

2. Currently, the study of the properties of matter and energy, or of the action of different forms of energy on matter in general (excluding chemistry which deals with the different forms of matter and biology which deals with vital energy) (Oxford English Dictionary 1972, entries from 1715).

3. "The science that treats of the laws governing motion, matter, and energy under conditions susceptible to precise observation, generally considered" distinct from chemistry and biological sciences (Michaelis 1963).

Comment: Two main divisions of physics are "general physics" and "applied physics." Many persons now tend to restrict the term "physics" to "general physics." [Old French *fisique* < Latin *physica* < Greek *physis* (*epistēmē*), (the knowledge) of nature < *phyein*, to produce]

► **applied physics** *n. pl.* (construed as singular) Physics dealing with special phenomena, including astronomy, meteorology, terrestrial magnetism, etc. (Oxford English Dictionary 1972).

► **biophysics** *n. pl.* (construed as singular). "The application of physics to the study of living organisms and systems" (Lincoln et al. 1985).

► **dynamics** *n. pl.* (construed as singular)

1. "The branch of physics that treats of the motion of bodies and the effects of forces in producing motion, including kinetics" (Michaelis 1963).

2. "The science that treats of the action of forces, whether producing equilibrium or motion: in this sense including both statics and kinetics" (Michaelis 1963).

cf. study of: physics: kinetics, statics

► **general physics** *n. pl.* (construed as singular) Physics of the general phenomena of inorganic nature (dynamics, molecular physics, physics of ether, etc.) (Oxford English Dictionary 1972).

► **kinetics** *n. pl.* (construed as singular) The branch of physics that deals with the effect of forces in the production, or modification, of motions of bodies (Michaelis 1963).

► **mechanics** *n. pl.* (construed as singular) “The branch of physics that treats of motion and the action of forces on material bodies, including statics, kinetics, and kinematics” (Michaelis 1963).

Comment: Mechanics is the simplist of all science (Mayr 1997, 27).

► **metaphysics** See study of: philosophy: metaphysics.

► **psychophysics** See study of: physiology: psychophysics.

► **statics** *n. pl.* (construed as singular) “The branch of mechanics dealing with bodies at rest and with the interaction of forces in equilibrium” (Michaelis 1963).

physiological psychology See study of: psychology: physiological psychology.

physiology *n.*

1. Originally, the study and description of natural objects; natural science or philosophy (Oxford English Dictionary 1972, entries from 1654). *cfr.* study of: biology, physics (def. 1)

2. The study of the functions of organisms (Oxford English Dictionary 1972, entries from 1597) and of their individual organs, tissues, and cells (Wilson 1975, 591); broadly including metabolism, motor mechanisms, hormonal regulation, and stimulus reception, transmission, and processing (Immelmann and Beer 1989, 221).

Comments: “Physiology” includes types listed below and “cellular physiology” and “endocrinology” (Immelmann and Beer 1989, 221). “In its broadest sense physiology also encompasses most of molecular biology and biochemistry” (Wilson 1975, 591). [French *physiologie* < Latin *physiologia* < Greek, natural philosophy < *physiologos*, speaker on nature < *physis*, nature + *logos*, word]

► **animal physiology, zoodynamics, zonomy** *n.* Physiology of animals (Lincoln et al. 1985).

► **behavioral physiology** *n.* Physiology of behavior which includes behavioral endocrinology and neuroethology (Immelmann and Beer 1989, 31).

► **ecological physiology** *n.* “The study of physiological adaptations that improve an organism’s survival and permit it to exploit extreme environments” (Feder et al. 1987, i).

syn. ecologically relevant physiology, physiological ecology (used interchangeably by Feder et al. 1987, ix); environmental physiology (Bennett 1987, 1)

► **ecophysiology** *n.* The physiology of organisms’ adaptations to their environments (Lincoln et al. 1985).

► **evolutionary physiology** *n.* The scientific study that integrates functional morphology and physiology with mainstream evolutionary biology (Kingsolver et al. 1995, 396).

► **neurophysiology** *n.* The physiology of nervous systems, especially the physiological processes by which they function (Wilson 1975, 590).

[New Latin < Greek *neuron*, sinew + physiology]

► **psychophysics** *n. pl.* (construed as singular)

1. A branch of physiology that is concerned with human judgements of sensation magnitudes versus actual magnitudes (Storz 1973, 227).

2. The study of relationships between stimulus magnitude and stimulus intensity experienced by an animal (Immelmann and Beer 1989, 238).

► **psychophysiology** *n.* Physiology of human minds (Michaelis 1963).

► **sensory physiology** *n.* The physiology of sensory organs and the ways in which they receive

stimuli from an animal’s environment and transmit them to its nervous system (Wilson 1975, 594).

phytobiology See study of: botany.

phytochemistry See study of: systematics.

phytocenology, phytosociology *n.* “The study of plant communities” (Lincoln et al. 1985).

syn. phytocoenology (*Brit.*)

Comment: “Phytosociology” is generally recognized as being an unfortunate term both etymologically and philosophically; “phytocoenology” is replacing it (Küchler 1964, 1).

phytoecology See study of: ecology: phytoecology.

phytogeography See study of: geography: phytogeography.

photography See study of: botany: photography.

phytology See study of: botany.

phytopaleontology, phytopalaeontology See study of: botany: paleobotany.

phytopathology See study of: pathology: phytopathology.

phytophenomenology See study of: phenology: phytophenomenology.

phytosociology See study of: ecology: phytoecology; phytocoenology.

phytoteratology See study of: teratology: phytotratology.

phytotopography *n.* The study of vegetation of a particular region (Lincoln et al. 1985).

plant biogeography See study of: geography: biogeography: phytobiogeography.

plant sociology See study of: ecology: plant ecology.

plant teratology See study of: teratology: plant teratology.

pomology *n.* “The study and practice of fruit cultivation” (Lincoln et al. 1985).

population biology See study of: biology: population biology.

population dynamics See study of: dynamics: population dynamics.

population genetics See study of: genetics: population genetics.

potamology *n.* “The study of rivers” (Lincoln et al. 1985).

primateology *n.* The study of Primates which includes Prosimians, Monkeys, and Apes (including Humans) (Immelmann and Beer 1989, 232).

protistology *n.* “The study of protists” (Lincoln et al. 1985).

protozoology See study of: zoology: protozoology.

proxemics *n.* The systematic study of space as a specialized component of human culture (Hall 1966 in Wilson 1975, 259).

psolidomeiomology *n.* The study of scale-row reduction in snakes (Lincoln et al. 1985).

psychiatry *n.* The branch of medicine that deals with the diagnosis, treatment, and prevention of human mental disorders (Oxford English Dictionary 1972, entries from 1846; Michaelis 1963).

psychoacoustics See study of: acoustics: psychoacoustics.

psychobiology See study of: biology: psychobiology.

psychodynamics See study of: dynamics: psychodynamics.

psychognosis *n.* “The study of mental states” (Michaelis 1963).

psychology *n.*

1. The study of the nature, functions, and phenomena of human minds (formerly also of souls) (Oxford English Dictionary 1989, entries from 1653).
 2. The study of a human mind as an entity and its relationship to a physical body, based on one's observations of a person's behavior and activity aroused by specific stimuli (Oxford English Dictionary 1989, entries from 1895).
 3. The study of an individual, or a selected group of individuals, when he interacts with his environment or in a particular social context (Oxford English Dictionary 1989, entries from 1895).
 4. The study of human minds in any of their aspects, operations, power, or functions (Michaelis 1963; Storz 1973, 216); the study of human nature (Delbridge 1981).
 5. The study of human mental phenomena, especially those associated with consciousness, behavior, and the problems of adjustment to one's environment (Michaelis 1963).
 6. The study of human and nonhuman animal behavior (Chaplin 1968; Delbridge 1981); the study of "the behavior of organisms" (Storz 1973, 216).
 7. The study of the relationships between antecedent events, or conditions, and the behavior of organisms (Marx and Hillix 1973, 440).
- Note:* Marx and Hillix (1973) consider this to be a rough, initial definition of psychology, and they give other definitions of it.
8. The study of human and animal behavior as it may elucidate human behavior (Gould 1982, 6).

See psychology.

cf. study of: animal behavior; biology: psychobiology; ^{2,3}ethology; behaviorism

Comments: An individual animal is the primary unit of study in psychology (Chaplin 1968). Psychology is primarily concerned with proximate cause of behavior and rarely uses rigorous argument based upon evolutionary theory (McFarland 1985, 357). There are many divisions of psychology with great conceptual and methodological differences; this has caused some authorities to write of "the sciences of psychology." Areas of psychology overlap with anthropology, ethology, and sociology (Immelman and Beer 1989, 238–239). Mayr (1997, 39) comments that some people considered psychology to be one of the humanities, but now some people consider it to be a biological science.

► **abnormal psychology** *n.* The description, explanation, and treatment of human neuroses, psychoses, and other mental and behavioral disorders (Immelman and Beer 1989, 238).

► **animal psychology** *n.*

1. A diverse mixture of subdisciplines including comparative learning and learning theory, behavioral development, physiological processes that underlie behavior (hormone effects on behavior, neural correlates of behavior, brain chemistry), psychopharmacology, and behavior genetics (Drickamer and Vessey 1982, 24).
2. Study of some kinds of animal behavior that historically stems from human psychology, especially the old school of associationism (parts of animal cognition and comparative psychology) (Immelman and Beer 1989, 14).
3. Study of animal "personality" characteristics, including individuality, pathological (= abnormal)

behavior, and subjectivity (insofar as this can be ascertained) (Immelman and Beer 1989, 14).

syn. comparative animal psychology, comparative psychology (Storz 1973, 15)

cf. study of: animal behavior, ^{1,2}ethology; psychology: behaviorism, comparative psychology

Comments: "Animal psychology" has been replaced by "ethology" to a large extent. "Animal psychology" is used in a very general and loose way in most popular writing about animal behavior (Immelman and Beer 1989, 15).

classical-animal psychology *n.* A branch of animal psychology that originated within psychology and that deals with the evolution of mind and higher mental processes; contrasted with classical ethology (Dewsbury 1978, 13).

cf. study of: psychology: behaviorism

► **applied psychology** *n.* The practical use of psychological knowledge that includes divisions such as clinical, educational, industrial, and vocational psychology (Storz 1973, 17–18).

cf. study of: psychology: consumer psychology, counseling psychology, engineering psychology, industrial psychology, personnel psychology

► **behavioral ecology** *n.* An area of psychology that focuses on the transaction between an animal's entire ecological environment and its behavior (Storz 1973, 28–29).

cf. study of: ecology: behavioral ecology

► **behaviorism, Behaviorism, Brit. Behaviourism** *n.*

1. Narrowly, the study of learning and related phenomena, often based on white laboratory rats (Verplanck 1957).

2. The study of animal behavior (including human behavior) based on objectively observable and quantifiable behaviors, not on consciousness, emotion, imagery, mind, sensation, will, etc. (Verplanck 1957; Watson 1913 in Chaplin 1968; Storz 1973, 29).

Note: This is a more widely held idea of "behaviorism."

3. The study of how past events affect an animal's behavior, with the basic tenet that behavior consists of an animal's responses (reflexes), reactions, or adjustments to stimuli, or complexes of stimuli, rather than instincts (Drickamer and Vessey 1982, 23).

syn. American behaviorism

cf. behaviorism; study of: psychology: comparative psychology, stimulus-response psychology

Comments: John B. Watson (1913) is credited for formulating "behaviorism" in his paper "Psychology as a behaviorist views it" (Dewsbury 1978, 23). Early behaviorists include I. P. Pavlov, J. B. Watson, B. F. Skinner, E. L. Thorndike (Chaplin 1968). Friedman (1967, 138) notes that "many areas originally declared off limits by certain varieties of behaviorism — thought, dreams, perception, physiology, consciousness — have been reclaimed by simply renaming them thinking behavior, dreaming behavior, perceptual behavior, physiological behavior, and conscious behavior. This takes, perhaps, undue advantage of the elasticity of the term 'behavior' while allowing the users to remain behaviorists in good standing."

► **clinical psychology** *n.* The study and treatment of problems of human mental health (Storz 1973, 47).

► **cognitive psychology** *n.*

1. The study of mental activity that divides it into cognitive (perceiving, thinking, knowing), affective (feelings, emotions), and conative (acting, doing, striving) activity (Storz 1973, 49).
2. The study of processes such as attention, memory, perception, problem-solving, and thinking (Levin 1987).

cf. cognition

► **community psychology** *n.* An area of psychology that deals with human-individual-behavioral adaptation in community settings and the need for change of functioning of components of a community or society (Storz 1973, 53).

► **comparative psychology** *n.*

1. The study of "mind and intelligences as developed in man and animals" (Oxford English Dictionary 1989, entries from 1748); the comparative study of "minds" of animals (Immelman and Beer 1989, 53).
2. Analysis, or dissection, of complex behavioral structures, comparison of all structures analyzed, and classification of analyses (Romanes 1882 in Gherardi 1984, 381).
3. The study of similarities and differences in the behavior of different animal species which includes ethology with studies originally centered in Europe and animal psychology with studies centered in the U.S.; comparative psychology (E. R. Rees in Storz 1973, 53).
4. The attempt to make comparisons across species in order to develop principles regarding animal behavior (Dewsbury in Drickamer and Vessey 1982, 25); the study of "how and why organisms do the things they do" whose paradigm is the synthetic theory of evolution (Demarest 1987, 148).
5. The science that deals mainly with observable behavior and tends to eschew mentalistic terms such as mind, feeling and intention; compared with ethology, comparative psychology tends to emphasize learning and the physiological basis of behavior, and is concerned with aspects of behavior that are relevant to Humans and cannot be experimentally investigated in Humans for ethical and methodological reasons (Dewsbury 1968).

cf. study of: psychology: animal psychology, behaviorism

Comments: Ratner and Denny (1964, 1, in Dewsbury 1968) state: "The field of comparative psychology includes a wide array of facts, theories, and methods that are generally oriented around the general topic of behavior of organisms (general psychology) and the specific topic of comparative analysis." Waters (1960, 2, in Dewsbury 1968) states: "An adequate description of the nature of comparative psychology must include a statement of its subject matter, its methods, its problems and aims, and its relations with other branches of science." According to Immelman and Beer (1989, 53), "comparative psychology" has recently broadened and turned more in the direction of ethological questions and methodology, making it impossible to draw a sharp line between these two branches of science. Finally, there is much recent discussion, *e.g.*, in the Comparative Psychology Newsletter, about the meaning of comparative psychology.

[Flourens (1864) first officially used this term according to Gherardi (1984, 381).]

► **consumer psychology** *n.* "A branch of applied psychology concerned with questions about the optimal means of making goods and services available, providing information about them, developing and testing methods for promoting interest in their acquisition, and investigating how they might be consumed, with maximum satisfaction and benefit to the customer" (Storz 1973, 59).

► **counseling psychology** *n.* An area of applied psychology that deals with providing persons with information and guidance with problems of educational planning, choosing and getting jobs, and adjusting to personal and marital requirements (Storz 1973, 61).

► **developmental psychology** *n.*

1. The study of the growth and changes of an organism's behavior from its conception to death; originally this field concentrated on child development, but its scope now includes an organism's entire life (Storz 1973, 69).
2. The study of how behavioral and cognitive capacities develop in children and young nonhuman animals and how they are affected by aging (Immelman and Beer 1989, 238).

► **differential psychology** *n.* The study of the psychological differences between, or among, individuals and groups (Storz 1973, 71).

► **dynamic psychology** *n.* Psychology involved with "human nature," as well as consciousness (Storz 1973, 77).

► **education psychology** *n.* Psychology of human learners, learning processes, and instructional strategies as interactive aspects of education (Storz 1973, 78).

► **engineering psychology** *n.* "A branch of applied psychology concerned with the discovery and application of information about human behavior to the design of machines, tools, jobs, and environments so they best match human abilities and limitations" (Storz 1973, 86).

► **experimental psychology** *n.*

1. The experimental study of a person's responses to stimuli (Oxford English Dictionary 1989, entry from 1953).
2. "The use of experimental methods in psychological research" (Storz 1973, 94).
3. The study of psychophysics, learning principles, and the nature of motivation that uses laboratory experiments (Immelman and Beer 1989, 238).

► **faculty psychology** See study of: psychology: faculty psychology.

► **forensic psychology** *n.* Psychology concerned with the reliability of legal evidence (Storz 1973, 99).

► **functionalism** *n.*

1. Psychology that emphasizes mental acts, or processes, with regard to Humans' adaptation to their environments; functionalism stresses objective testing of hypotheses as opposed to subjective introspection (Storz 1973, 103).
2. The study of the functions of minds and how they operate, in contrast to their anatomy (Drickamer and Vessey 1982, 23).

syn. functional psychology (Storz 1973, 103–104)

cf. study of: psychology: behaviorism, structuralism

Comment: Functionalists include W. James, J. Dewey, J. R. Angell, and H. Carr (Chaplin 1968).

► **genetic psychology** *n.* Psychology dealing with the role of genetic influences on behavior, whether innate behaviors exist and how they can be identified and studied, the development of intelligence, etc. (Storz 1973, 106).

► **gestalt psychology, Gestalt psychology** *n.*
1. A school of psychology that holds that a person's perceptions, reactions, etc., are *Gestalts*, *q.v.* (Oxford English Dictionary 1989, entries from 1890).

2. A branch of psychology that attributes animal's behavioral responses to recognition of the sum of all elements of a configuration in contrast to simple cues; *e.g.*, Western Honey Bees can be taught to distinguish between more and less segmented stimuli (Köhler 1964 in Heymer 1977, 77; Storz 1973, 107).

Note: "Gestalt psychology" permits some degree of analysis of the phenomenological variety but not at the molecular level because this would destroy the unitary quality that is undergoing analysis; holds that conscious experience cannot be meaningfully resolved into structuralistic elements; holds that behavior cannot be reduced to combinations of reflexes, or conditioned responses, and still retain its uniqueness and meaningfulness; objects to treating an animal's nervous system "as a static, machinelike structure capable only of responding piecemeal to incoming stimuli;" etc. (Chaplin 1968).

3. A branch of psychology that believes animals gain insight into problems through their innate tendencies to perceive situations as a whole (McFarland 1985, 346).

cf. insight

[German *Gestalt*, form]

► **individual psychology** *n.* A school of psychology that holds that important conflicts often occur between an individual person and his environment, rather than within the individual (Storz 1973, 126).

► **industrial psychology** *n.* A branch of applied psychology that studies human work including job analysis, personnel selection and training, morale, management-employee relations, working conditions and efficiency, design of machines and work spaces, etc. (Storz 1973, 127).

► **medical psychology** *n.*

1. Psychiatry; "the branch of medicine concerned with psychic disorders" (Storz 1973, 159).

Note: This term is used in the United Kingdom and some European countries (Storz 1973, 159).

2. "The application of psychology to all phases of medical research, treatment, and prevention" (Storz 1973, 159).

Note: This definition is used in the U.S. (Storz 1973, 159).

► **metapsychology** *n.* A study that "goes beyond empirical psychology to consider philosophical issues such as the nature of human mind and will and the mind-body problem" (Storz 1973, 170).

► **military psychology** *n.* The study of the psychology of armed forces including analyzing activity and performance in military jobs, designing automated human-machine systems, evaluating morale, exploring the social systems of people in organizations, and training programs (Storz 1973, 172).

► **parapsychology** *n.* The study of human extrasensory perception, psychokinesis, and related topics such as survival after bodily death (Storz 1973, 191).

► **perceptual psychology** *n.* The study of human reception of external stimuli, including subjective, compared to physical, measurements of these stimuli (Drickamer and Vessey 1982, 22).

► **personnel psychology** *n.* A branch of applied psychology that specializes in selecting, evaluating, and training personnel and in morale and relations of management to employees (Storz 1973, 200).

► **philosophical psychology, philosophy of the mind** *n.* The branch of psychology concerned with conceptual and speculative problems and that attempts to analyze and clarify fundamental concepts involved in scientific explanation of mental events and processes, "namely mind, consciousness, self, soul, memory, will, cognition, and perception" (Storz 1973, 201).

► **physiological psychology** *n.* The study of physiological mechanism that underlay behavior (Storz 1973, 214).

► **pseudopsychology** *n.* "Subprofessional teaching and counsel, or outright quackery, in some field where psychology operates" (Storz 1973, 211).

► **psychology of personality** *n.* The study of personality-type variations and how they arise, "especially in light of psychogenic theories such as those of psychoanalysis" (Immelman and Beer 1989, 238).

► **school psychology** *n.* The branch of psychology that specializes on development and adjustments of children to their school situations (Storz 1973, 245).

► **social psychology** *n.* The study of a person's behavior and interactions with his social group (Oxford English Dictionary 1989, entries from 1908; Immelman and Beer 1989, 238).

► **somatopsychology** *n.* The study of the psychological impact of physiological disease on human disability (Storz 1973, 263).

► **space psychology** *n.* The psychological study of Humans during space flight (Storz 1973, 263).

► **stimulus-response psychology** *n.* A school of psychological thought that contends that specified responses always occur following stimulation (Storz 1973, 267).

► **structuralism** *n.* Psychology that emphasizes conscious contents of minds as a proper subject for study rather than mental acts and processes as environmental adaptations (Chaplin 1968).

cf. study of: psychology: functionalism

► **topological psychology** *n.* An attempt to represent the structure and dynamics of Humans and their environments by means of mathematical concepts (Storz 1973, 279).

psychometrics, psychometry See study of: -metry: psychometrics.

psychopathology See study of: pathology: psychopathology.

psychopharmacology See study of: pharmacology: psychopharmacology.

psychophysics See study of: physics: psychophysics.

psychophysiology See study of: physiology: psychophysiology.

pteridology *n.* The study of Pterophyta (Ferns) (Lincoln et al. 1985).

rheology *n.* "The study of fluid movement" (Lincoln et al. 1985).

See study of: limnology; rheology.

scatology *n.* "The study of feces" (Lincoln et al. 1985).

science *n.*

1. "A particular branch of knowledge or study; a recognized department of knowledge" (Oxford English Dictionary 1972, entries from *ca.* 1348); any knowledge department whose investigation results have been logically arranged and systematized in the form of hypotheses and general laws subject to verification (Michaelis 1963).
2. A branch of study that is "concerned either with a connected body of demonstrated truths, or with observed facts that are systematically classified and more, or less, colligated by being brought under general laws, and which includes trustworthy methods for the discovery of new truth within its own domain" (Oxford English Dictionary 1972, entries from 1725); "an orderly presentation of facts, reasonings, doctrines, and beliefs concerning some subject or group of subjects: the *science* of theology" (Michaelis 1963).
3. In modern use, a natural, or physical, science, thus restricted to branches of study that relate to material-universe phenomena and their laws, or principles, sometimes with exclusion of pure mathematics (Oxford English Dictionary 1972, entries from 1867).

See study of: philosophy; natural philosophy, science.

Comments: Science is both an activity (what scientists do) and a body of knowledge (what scientists know) (Mayr 1997, 25). Philosophers find it difficult to define "science."

► **hard science, real science** *n.* Science that includes obtaining its facts from controlled repeatable experiments with all independent variables controlled by an investigator, especially in a laboratory, and obtaining precise numerical values when quantitative data are gathered; hard science includes much of chemistry, physics, and molecular biology; contrasted with soft science (Diamond 1987).

Comment: Scientists cannot often control for all independent variables, but they can use statistical methods that can "control for" some independent variables (pers. obs.).

► **physical science** *n.* Any of the sciences (e.g., astronomy, chemistry, geology, physics, etc.) concerned with structure, properties, and energy relations of matter apart from the phenomena of life (Michaelis 1963).

► **provincial science** *n.* A science that deals with "specific and localized objects about which one could not propose universal laws;" contrasted with "universal science" (Mayr 1997, 31).

Comments: Some philosophers have considered biology to be a provincial science because biology is based on life on Earth alone (Mayr 1997, 31). Munson (1975 in Mayr 1997, 31) argued that biology is a universal science because biological principles are valid for the entire known domain of life's existence — Earth. Mayr (1997, 32) designates biology as an autonomous science equivalent to physics or chemistry.

► **natural science** *n. pl.*

1. Sciences, collectively, that deal with the physical universe (Michaelis 1963).
2. *sing.* Biology, chemistry, physics, or a combination of these sciences (Michaelis 1963).

► **soft science** *n.*

1. Pejoratively, a science that is not as rigorous as a hard science (Diamond 1987).

2. A science that deals with phenomena that are more complicated than those dealt with by hard sciences and, therefore, cannot necessarily involve experiments that are as well controlled as those of hard sciences; nonetheless, a soft science can predict a phenomenon's course with a certain probability (Diamond 1987).

Note: Complicated "soft sciences" include "animal behavior," "anthropology," "ecology," "evolution," "economics," "psychology," and "sociology." The so-called "soft sciences" are the harder (= more difficult) ones according to Diamond (1987).

cf. natural history, operationalism

scientometrics See study of: -metry: scientometrics.

semantics *n. pl.* (construed as singular) In linguistics, the study of the meanings of speech forms, especially of the development and changes in meaning of words and word groups (Michaelis 1963).

cf. communication

semiosystematics See systematics: semiosystematics.

semiotics, semeiotics *n. pl.* (construed as singular)

1. The science of language (Carnap 1942 in Sebeok, 1965).
2. The science of signs, whose divisions are pragmatics, semantics, and syntactics, each of which can be applied, descriptive, or pure (Morris 1946, 353).
3. Analysis of communication in the broadest sense (Pierce, Morris, Carnap, and Mead in Wilson 1975, 201).
4. The scientific study of communication (Wilson 1975, 594).

cf. communication

adj. semeiotic, semiotic, semiotical

[Greek *semeiotikos* < *semeion*, diminutive of *sema*, mark]

► **zoosemiotics** *n.*

1. The "discipline within the behavioral sciences, one which has crystallized at the intersection of semiotics, the science of signs, and ethology, the biological study of behavior" (Sebeok 1963, 1965).

2. The scientific study of animal communication, involving an evolutionary emphasis and logical, analytic techniques associated with human-oriented semiotics (Wilson 1975, 201).

[zoo + semiotics, *q.v.*]

serology *n.* "The study of antigens and antibodies" (Lincoln et al. 1985).

sexology *n.* The study of sex and sexual behavior (Lincoln et al. 1985).

silvics *n.* "The study of forest trees" (Lincoln et al. 1985).

adj. silvical

sociobiology See study of: biology: sociobiology.

sociology *n.*

1. The study of origin, history, and constitution of human society; social science (Oxford English Dictionary 1972, entries from 1843), at all levels of complexity (Wilson 1975, 4, 595).

Note: "Sociology" differs from "sociobiology" chiefly due to the former's structural, and nongenetic (nonevolutionary) approach (Wilson 1975, 4, 595).

2. The study of plant communities or of collectively organized organism groups (Lincoln et al. 1985).
- **ecological sociology** See ecology: syncology.
- **phytosociology** See study of: ecology: phytocology; phytocoenology.
- speleology** *n.* "The study of caves" (Lincoln et al. 1985).
syn. speiology, *Brit.* spelaeology
- spermology** *n.* "The study of seeds" (Lincoln et al. 1985).
- sphecology** *n.* The study of Wasps (Lincoln et al. 1985).
- statics** See study of: physics: statics.
- statistics** *n. pl.* (construed as singular)
1. "The science that deals with the collection, tabulations, and systematic classification of quantitative data, especially of occurrence as a basis for inference and induction" (Michaelis 1963); constructing probability models to relate data with underlying phenomena being studied is also typically a crucial component of statistics and testing hypotheses encompasses only about 10% of statistics (J. O. Berger, pers. comm.).
syn. statistic (Michaelis 1963)
 2. "The scientific study of numerical data based on natural phenomena" (Sokal and Rohlf 1969, 2).
 3. A branch of mathematics that deals with generalization, estimation, and precision in situations where uncertainty exists, dealing particularly with populations, variation, and reduction of data (Lincoln et al. 1985).
- cf.* statistics; study of: -metry: biometry
[German *statistik* < Medieval Latin *statisticus*, statesmanlike, ultimately from Latin *status*, condition, state]
- **Bayesian statistics** *n.* Unconventional statistics that indicate the probability of a null hypothesis' being correct; Bayesian statisticians argue that "calculated-ps" yielded by conventional statistics can result in incorrect inferences about data (Berger and Berry 1988).
[after T. Bayes (1763) who proposed basic ideas of "Bayesian statistics" (Berger and Berry 1988, 159)]
- **circular statistics** *n.* Statistics that deals with biological rhythms with regard to a 24-hr clock and animal orientation with regard to 360° (Batschelet 1965; D. B. Quine, pers. comm.).
- **"confidence-interval statistics"** *n.* Unconventional statistics that indicate whether a null hypothesis is false by examining overlapping and nonoverlapping 95% confidence intervals (Jones 1984).
- **"conventional statistics"** *n.* Statistics based on "calculated-ps" and related probabilities (J. O. Berger, pers. comm.); contrasted with unconventional statistics.
cf. unconventional statistics
- Comment:* The majority of biologists use conventional statistics. Bayesian statisticians question whether one may (sensibly) reject null hypotheses with "calculated-ps" (J. O. Berger, pers. comm.).
- **descriptive statistics** *n.* Statistics that help to organize and summarize data; contrasted with inferential statistics (Sokal and Rohlf 1969, 40).
- **inductive statistics** See statistical inference.
- **inferential statistics** *n.* Statistics that helps to test hypotheses and generalize from data; distinguished from descriptive statistics (Siegel 1956, 1).

- **"unconventional statistics"** *n.* Statistics which make inferences from information other than "calculated-ps," e.g., Bayesian statistics; contrasted with conventional statistics.
- stratigraphic paleontology, stratigraphic palaeontology** See study of: paleontology: stratigraphic paleontology.
- study of signals** *n.* The study of signals which has three main branches: pragmatics, semantics, and syntactics.
- **pragmatics** *n.* The study of the significance that communicatory signs have for their communicants (Smith 1969a in Wilson 1975, 219).
- **semantics** *n.* The study of the message content of signs in communication (Cherry 1957, Smith 1969a in Wilson 1975, 218).
- **syntactics** *n.* The study of signals as physical phenomena (Cherry 1957, Smith 1969a in Wilson 1975, 218).
- symbiology** See study of: biology: symbiology.
- synchorology** *n.* The study of the occurrence, distribution, and classification of plant communities into the following regional units: region, province, sector, subsector, district, and subdistrict (Lincoln et al. 1985).
- syndynamics** See study of: dynamics: syndynamics.
- syncology** See study of: ecology: syncology.
- synmorphology** See study of: morphology: synmorphology.
- synpiontology** *n.* "The study of ancient patterns of distribution and migration of plant communities" (Lincoln et al. 1985).
- synsystematics** See study of: systematics: synsystematics.
- systematics** *n.*
1. "The scientific study of the kinds and diversity of organisms and of any and all relationships among them" (Simpson 1961 in Mayr 1982, 145, 245–246).
 2. Classification of organisms into hierarchical series of groups that emphasizes their phylogenetic interrelationships (Lincoln et al. 1985).
- See classification: study of: taxonomy.
- syn.* taxonomy (in some cases and especially in the first half of the 20th century) (Lincoln et al. 1985)
- **biosystematics** *n.*
1. Systematics of genetic and ecological variation in natural populations (Mayr 1982, 277).
 2. "The study of evolution and the classification of living organisms, based on biological information at the population level such as genetic variability, hybridization, breeding strategies, competition and local adaptations" (Lincoln et al. 1985).
- syn.* biosystematy, genonomy (Lincoln et al. 1985), genecology (Turesson 1922 in Mayr 1982, 277)
- **cladistic systematics, cladistics** *n.*
1. Systematics that bases classification exclusively on genealogy (the branching pattern of phylogeny) in which parental species split into two sister (= daughter) species, which must be given the same categorical rank, and the ancestral species, together with all of its descendants, must be included in a single holophyletic taxon (Hennig 1950 in Mayr 1982, 226).
 2. A classificatory method that employs phylogenetic hypotheses as the basis for classification and uses recency of common ancestry alone as the criterion for grouping taxa, rather than data

- on phenetic similarity or divergence (Lincoln et al. 1985; Campbell 1990, 491). See cladistics under “C.”
- syn.* cladism, cladistic method, cladistics (Lincoln et al. 1985)
- cf.* study of: taxonomy: numerical taxonomy
- Comments:* Cladistics tries to eliminate subjectivity and arbitrariness from classifying by developing a virtually automatic method (Mayr 1982, 226). [Greek *clados*, branch]
- **ecosystematics** *n.* The integrated study of the ontology, evolution, and systematics of ecosystems (Lincoln et al. 1985).
- **ethosystematics** *n.* Systematics based on behavioral characters (Whitmann 1899, 1919 and Heinroth 1911 in Heymer 1977, 65).
- cf.* ²species: ethospecies; -type: ethotype
- **evolutionary systematics** *n.* The branch of systematics in which classification is based on “hypothetical reconstructions of evolutionary history incorporating both cladistic data (on the sequence of branching events) and morphological divergence data” (Lincoln et al. 1985).
- syn.* evolutionary method, synthetic method (Lincoln et al. 1985)
- **Hennigian systematics** See study of: systematics: phylogenetic systematics.
- **molecular systematics** *n.*
1. Systematics using biochemical characters and techniques such as electrophoresis, chromatography, serology, and DNA hybridization (Lincoln et al. 1985).
 2. The study of evolutionary relationships using comparative molecular data (Lincoln et al. 1985).
- **omnispective systematics, omnispective method** *n.* The branch of systematics in which classification is “based on intuitive and pragmatic considerations using weighted phenotypic similarity as the criterion of relationship, with evolutionary history taken into consideration, but without full phylogenetic analysis” (Lincoln et al. 1985).
- **phenetic systematics** *n.* The branch of systematics that classifies organisms using the criteria of overall morphological, anatomical, physiological, or biochemical similarity or difference, with all characters equally weighted and without regard to phylogenetic history (Lincoln et al. 1985).
- syn.* neo-Adansonism, phenetic method, phenetics
- cf.* -gram: dendrogram: phenogram, study of: taxonomy: numerical taxonomy
- Comments:* Charles Michener and Robert Sokal developed “numerical taxonomy” in the 1950s, and people later called their approach as “phenetics” (Futuyma 1998, 92). They attempted to produce a taxonomic procedure that would eliminate a researcher’s subjectivity, by using as many equally weighted characters as possible. This method does not attempt to sort homologous characters from analogous ones (Campbell 1990, 491). It arranges species, or other taxa, in “phenograms.” Phenetic systematics has few proponents today, but its emphasis on multiple quantitative comparisons with the help of computers, had an important impact on the development of presently used phylogenetic methods.
- [phenetic from Greek *phainein*, to appear + type]
- **phylogenetic systematics, Hennigian systematics** *n.* The branch of systematics that classifies organisms based on their phylogenetic relationships,

- not considering morphological resemblances between them as a simple measure of phylogenetic relationship, but dividing these resemblances into concepts of convergence, symplesiomorphy, and synapomorphy and using only synapomorphy to establish relationships (Lincoln et al. 1985).
- **population systematics** *n.* The study of classification performed in view of evolutionary thinking, more particularly population thinking (Mayr 1982, 247).
- syn.* “new systematics” (which is a less correct term for this concept, Mayr 1982, 561)
- Comments:* “Population systematics” studies biological properties of organisms rather than the static characters of dead specimens. The greatest number of kinds of characters — behavioral, biochemical, and physiological, as well as morphological ones — are used in classification. Population systematics was first practiced by Rensch (1929, 1933, 1934) (Mayr 1982, 277). [coined by Huxley, 1940]
- **semiosystematics** *n.* A branch of systematics that focuses on animal signals used in courtship and reproductive isolation (Lloyd 1989, 51).
- Comments:* Semiosystematics is attentive to and may even favor mating signals over morphological traits in classifying animals (Lloyd 1989, 52). Frank A. McDermott (1912) may have made the first formal taxonomic decision based on mating signals by taking a firefly species out of synonymy with another species because he believed that its mating signals were different from the latter’s ones (Lloyd 1989, 52). Researchers have used mating signals for classifying crickets and other firefly species. [Greek, *semio*, sign, signal + systematics, coined by Lloyd (1989)]
- **synsystematics** *n.* “The classification of plant communities” (Lincoln et al. 1985).
- **taxonomy** *n.*
1. Classification, especially in relation to its general rules or principles (Oxford English Dictionary 1972, entries from 1813).
 2. The science of classification (Oxford English Dictionary 1972, entries from 1813), especially of organisms (Wilson 1975, 597).
 3. “The theory and practice of delimiting kinds of organisms and classifying them” (Simpson 1961 and Mayr 1969 in Mayr 1982, 146).
- syn.* systematics (in some cases) (Lincoln et al. 1985)
- See classification; study of: systematics.
- cf.* study of: taxonomy: idiosystematics
- Comment:* Some consider taxonomy be something of an art, and taxonomists to use judgement with “intuitive perception” and “instinct” (Stevens 1992, 303). [French *taxonomie* < Greek *taxis*, arrangement + *nomos*, law; coined by Augustin-Pyramus de Candolle (1778–1841), Swiss-French botanist (Margulis 1981, 16)]
- **alpha taxonomy** *n.* Taxonomy involving describing and naming species (Mayr 1982, 145); contrasted with beta taxonomy, gamma taxonomy.
- **beta taxonomy** *n.* Taxonomy involving classifying species into a natural system of lesser and higher categories (Mayr 1982, 145); contrasted with alpha taxonomy, gamma taxonomy, microtaxonomy.
- syn.* macrotaxonomy (Lincoln et al. 1985)

- **chemotaxonomy** *n.* Taxonomy that uses biochemical characters and techniques (Lincoln et al. 1985).
- **cytotaxonomy** *n.* Taxonomy based on cell structure, especially chromosome structure (Lincoln et al. 1985).
- **eclectic taxonomy** See study of: taxonomy: evolutionary taxonomy.
- **empirical taxonomy** *n.* Classification of organisms based on observed phenotypic similarity (Lincoln et al. 1985).
- **evolutionary taxonomy** *n.* Taxonomy in which phylogenograms, showing branching of organism phyletic lines but also subsequent divergence into taxa, are produced (Mayr 1982, 233).
Comment: Because this methodology uses newly developed methods such as certain numerical methods of phenetics and ancestral-derived partitioning of characteristics of cladistics, it is also called “eclectic taxonomy” (Mayr 1982, 233).
- **gamma taxonomy** *n.* Taxonomy that involves evolutionary interpretations (Mayr 1982, 145); contrasted with alpha taxonomy and beta taxonomy.
- **idiotaxonomy** *n.* Taxonomy of individuals, populations, species, and higher taxa; traditional taxonomy (Lincoln et al. 1985).
cf. study of: taxonomy: syntaxonomy
- **microtaxonomy** *n.*
 1. The subfield of taxonomy that deals with the methods and principles by which kinds (“species”) of organisms are recognized and delimited (Mayr 1982, 146).
 2. The scientific study of species (Mayr 1982, 297).
 3. The branch of taxonomy concerned with the classification of species, varieties, and populations (Lincoln et al. 1985).
cf. study of: taxonomy: macrotaxonomy
- **numerical taxonomy (NT)** *n.*
 1. A classification process, originating in the 1960s, that attempts to eliminate human subjective evaluation of taxonomic characters by using quantitative methods and computer analysis (Mayr 1982, 222).
 2. Taxonomy based on the numerical comparison of large numbers of equally-weighted characters, scored consistently for all groups under consideration, and in which individuals are grouped solely on the basis of observable similarities (Lincoln et al. 1985).
syn. numerical phenetics, taximetrics, taxometrics, taxonometrics (Lincoln et al. 1985)
Comments: In early NT, researchers gave characters equal weight; in later NT, researchers gave characters “phyletic weights.” Workers replaced the “species” with the “operational taxonomic unit” as the unit of classification. Because taxonomists have used numerical methods for generations, the “numerical taxonomy” of Sokal and Sneath (1963), is called “numerical phenetics” (Mayr 1982, 222). People later called “numerical taxonomy” “phenetics,” *q.v.*
- **phytochemistry** *n.* “Chemotaxonomy of plants” (Lincoln et al. 1985).
- **polyphasic taxonomy** *n.* Taxonomy of a given set of organisms by a number of different techniques, applied successively or simultaneously (Lincoln et al. 1985).

- **serotaxonomy** *n.* “Taxonomy based on serological characters” (Lincoln et al. 1985).
- **syntaxonomy** *n.* “The classification and nomenclature of plant communities” (Lincoln et al. 1985).
cf. study of: taxonomy: ideotaxonomy
- **zootaxy** *n.* Animal taxonomy (Lincoln et al. 1985).
- teleology** See study of: philosophy: teleology.
- teleonomy** *n.*
 1. The scientific study of “programmed purposiveness (Osche 1973) in living organisms and in certain manmade machines” (Immelmann and Beer 1989, 308).
 2. “The science of adaptation” (Dawkins 1982, 295).
cf. study of: philosophy: teleology; teleology
Comments: “In effect, teleonomy is teleology made respectable by Darwin . . . This book is an essay in teleonomy.” Teleonomy is a new science that will presumably be involved with questions of units of selection and costs and other constraints on perfection” (Dawkins 1982, 295). Leading neo-Darwinians attempted to replace the term “teleology” with “teleonomy” to avoid the twin specters of natural theology and vitalism (Lennox 1992, 331).
- teratology** *n.* “The study of malformations and monstrosities” (Lincoln et al. 1985).
- **phytoteratology, plant teratology** *n.* The study of plant malformations and monstrosities (Lincoln et al. 1985).
- thanatology** *n.* The study of the circumstances surrounding human death (Storz 1973, 275).
- thermodynamics** *n.* The study of energy transformations (Curtis 1983, 157).
- thremmatology** *n.* The study of organism breeding in domestic situations (Lincoln et al. 1985).
- tocology** *n.* The science of parturition (Ryan 1828 in Miller 1984, 119).
- tokology** *n.* The study of the mechanics and fitness maximization of organisms’ reproduction (Miller 1984, 119).
- toxicology** *n.* The study of the origin, nature, properties, etc., of poisons (Michaelis 1963).
- **ophiotoxicology** *n.* The toxicology of snake venoms (Lincoln et al. 1985).
- tree-ring chronology** See study of: method: dendrochronology.
- trophology** *n.* “The study of nutrition” (Lincoln et al. 1985).
- typology** *n.* “The study of types, as in systems of classification” (Michaelis 1963).
- verbal learning** *n.* The study of how human verbal associations are learned and remembered in specific experimental situations, *e.g.*, paired-associate learning, serial learning, and transfer (Storz 1973, 282).
- xenology** *n.* “The study of host-parasite relationships” (Lincoln et al. 1985).
- zoecology** See study of: ecology: zoecology.
- zoodynamics** See study of: physiology: animal physiology.
- zoology (ZO OL eh gee)** *n.* The study of animals (Lincoln et al. 1985).
Zoology includes cetology, cenozoology, cryptozoology, entomology, ethnozoology, helminthology, herpetology, ichthyology, invertebrate zoology, limnacology, malacology, myrmecology, nematodology, ophiology, ornithology, paleozoology, primatology, protozoology, sphecology, and vertebrate zoology.

- **cenozoology** *n.* “The study of extant animals” (Lincoln et al. 1985).
- **cryptozoology** *n.* The study of cryptozoa, small terrestrial animals that inhabit crevices, live under stones, and in soil and litter (Lincoln et al. 1985).
- **ethnozoology** *n.* The study of the use of animals and animal products by groups of Humans (Lincoln et al. 1985).
- **invertebrate zoology** *n.* The study of invertebrate animals which includes all phyla except Chordata (Wilson 1975, 587).
cf. study of: zoology: vertebrate zoology
- **paleozoology, palaeozoology** *n.* The study of animals of the geological past (Lincoln et al. 1985).
- **protozoology** *n.* “The study of Protozoa” (Lincoln et al. 1985).
- **vertebrate zoology** *n.* Zoology of animals with vertebrae in Phylum Chordata.
cf. study of: zoology: invertebrate zoology
- zoosemiotics** See study of: semiotics: zoosemiotics.
- zoonomy** See study of: physiology: animal physiology.
- ♦ **stygobie** See -cole: cavernicole.
- ♦ **stygophile, stygophilic, stygophily** See ¹-phile: stygophile.
- ♦ **stygon** See biotope: stygon.
- ♦ **stygoxenous** See -xene: trogloxene.
- ♦ **stylus hypothesis of insect wing origin** See hypothesis: hypotheses of origin of insect wings: stylus hypothesis of insect wing origin.
- ♦ **sub-** *prefix*
 1. “Under; beneath; below” (Michaelis 1963).
 2. Anatomically, “situated under or beneath, or on the ventral side of” (Michaelis 1963).
 3. Chiefly scientifically, “almost; nearly; slightly; imperfectly” (Michaelis 1963).
 4. “Lower in rank or grade; secondary; subordinate” (Michaelis 1963).
 5. “Forming a subdivision” (Michaelis 1963).

Also suc- before a c; suf- before an f; sug- before a g; sup- before a p; sur- before a r; sus- before a c, p, or t.
cf. super-
[Latin *sub* < *sub*, under]
- ♦ **subadult** See animal names: adult: subadult.
- ♦ **subaerial** *adj.* Referring to something that occurs immediately above the ground’s surface (Lincoln et al. 1985).
- ♦ **subaquatic** *adj.* “Not completely aquatic” (Lincoln et al. 1985).
- ♦ **subclimax** See ²community: climax.
- ♦ **subcloning** See method: subcloning.
- ♦ **subdominant species** See ²species: dominant species: subdominant species.
- ♦ **subdominule** See ²species: dominant: subdominule.
- ♦ **subfossil** See fossil: subfossil.
- ♦ **subgeocole, subgeocolous** See -cole: subgeocole.
- ♦ **subgregarious** See gregarious: subgregarious.
- ♦ **subhydrophile, subhydrophilous, subhydrophily** See ¹-phile: subhydrophile.
- ♦ **subjective self-awareness** See awareness: self-awareness: subjective self-awareness.
- ♦ **sublethal factor** See factor: sublethal factor.
- ♦ **sublethal gene** See ²mutation: subvital mutation.
- ♦ **sublimation** See behavior: displacement behavior: sublimation.
- ♦ **subliminal stimulus** See ²stimulus: subliminal stimulus.

♦ **submission** *n.*

1. A person’s submitting to an authority, or a conquering or ruling power; a person’s yielding to the claims of another, or surrendering to his will or government; a person’s condition of having submitted; an instance of submission (Oxford English Dictionary 1972, entries from 1482).
2. An individual animal’s showing defensive behaviors that tend to prevent further attack of another contestant, e.g., a Domestic Dog’s, or Gray Wolf’s, rolling over on its back and remaining motionless or an ape’s assuming a female copulation stance (Darwin 1872 in Heymer 1977, 51).
3. An individual animal’s “act of yielding or surrendering” that reflects “resignation” and relates to individual “temperament” or “inclination” and which occurs when an animal loses a fight and halts further attack (Hand 1986, 216).

syn. catasematic behavior (Mertens 1946 in Heymer 1977, 51), submissive behavior, submissive display
cf. display: submissive display, dominance, posture: submissive postures, subordination

- ♦ **submissive coloration** See coloration: submissive coloration.

- ♦ **submissive display** See display: submissive display.

- ♦ **submissive posture** See posture: submissive posture.

- ♦ **subordination** *n.* An animal’s consistently losing, or deferring (= changing its apparent priority and doing something other than what is had been doing or had been seeking to do), in conflict encounters in a particular dyadic relationship (Hand 1986, 205).
cf. dominance, submission

Comment. “Subordination” implies nothing about an individual’s “temperament” or “inclination” (J. L. Hand, pers. comm.).

- ♦ **subsere** See ²succession: subsere.

- ♦ **subsocial** See sociality: subsociality.

- ♦ **subsocial route to sociality in insects** *n.* One of two hypothesized evolutionary paths to eusociality in insects (Wilson 1975, 398).
See sociality.

- ♦ **subsong** See animal sounds: song: subsong.

- ♦ **subspecies** See ²species: subspecies.

- ♦ **substance** *n.* A kind of matter of specific chemical composition (Oxford English Dictionary 1972, entries from 1732).
cf. chemical-releasing substance: semiochemical: allelochemical: allomone: propaganda substance

- ♦ **adoption substance** *n.* A secretion that a social parasite presents to its host insect that induces it to accept the parasite as a colony member (Hölldobler and Wilson 1990, 635).

- ♦ **allelopathic substance** See chemical-releasing substance: allelochemical: allomone: allelopathic substance.

- ♦ **appeasement substance** *n.* A secretion that a social parasite presents to its host insect that reduces the host’s aggression and aids the parasite’s acceptance by the host colony (Hölldobler and Wilson 1990, 635).

- ♦ **exocrine substance** See chemical-releasing stimulus: semiochemical: allelochemical: allomone: exocrine substance.

- ♦ **propaganda substance** See chemical-releasing substance: semiochemical: allelochemical: allomone: propaganda substance.

- royal substance, queen substance** See chemical-releasing substance: semiochemical: pheromone: queen pheromone.
- sympathetic substance** *n.* A chemical used by social-insect-colony parasites (e.g., beetles) that influences their host's behavior (Dawkins 1982, 294).
- trail-marking substance** See chemical-releasing stimulus: semiochemical: pheromone: trail-marking pheromone.
- transmitter substance** See neurotransmitter.
- substitute activity** See behavior: displacement behavior.
- ♦ **substitute object** See object: substitute object.
- ♦ **substitutional load** See genetic load: substitutional load.
- ♦ **¹substrate, substratum** *n. pl. substrates, substrata*
 1. "The matter on which a fungus or other plant grows" (Oxford English Dictionary 1972, entries from 1876).
Note: Researchers currently place Fungi in Kingdom Fungi, not Kingdom Plantae (Plants) (Strickberger 1990, 266).
 2. "The sediment, surface, or medium to which an organism is attracted or upon which it grows" (Lincoln et al. 1985).
- ♦ **²substrate, substratum** *n. pl. substrates, substrata* A substance acted upon by an enzyme (Lincoln et al. 1985).
- ♦ **substrate race** See race: substrate race.
- ♦ **substratohyophile, substratohydrophilous, substratohyrophily** See ¹-phile: substratohyophile.
- ♦ **substratum** See substrate.
- ♦ **substratum stridulation** See stridulation: substratum stridulation.
- ♦ **subsurface-lithoautotrophic-microbial ecosystem** See system: subsurface- lithoautotrophic-microbial ecosystem.
- ♦ **subterranean, subterrestria** *n.* Referring to an organism that lives, or occurs, beneath the Earth's surface (Lincoln et al. 1985).
- ♦ **subthreshold stimulus** See stimulus: subthreshold stimulus.
- ♦ **subtle cheater** See cheater: subtle cheater.
- ♦ **subtraction** *n.* "Loss of a heredity factor" (Lincoln et al. 1985).
- ♦ **subtroglophile** See ¹-phile: subtroglophile.
- ♦ **subtrogloxene** See -xene: subtrogloxene.
- ♦ **subtropical** *adj.*
 1. Referring to the regions adjacent to the Earth's Torrid Zone (Michaelis 1963).
 2. Having characteristics intermediate between, or common to, both Torrid and Temperate Zones (Michaelis 1963).
 3. Referring to the zone of the Earth between 23°27' and 34.0° in either hemisphere; contrasted with temperate and tropical (Lincoln et al. 1985).
Comment: For example, in the U.S. the subtropical zone includes the northern islands of Hawai'i, Puerto Rico, and much of the southern part of the conterminous U.S., from southern California through southern North Carolina.
- ♦ **subvital mutation** See ⁴mutation: subvital mutation.
- ♦ **subxerophile** See ¹-phile: subxerophile.
- ♦ **subzone** See zone: def. 4 (notes).
- ♦ **success** *n.*

1. A person's prosperous achievement of something attempted; a person's attaining an object according to his desire, now often with particular reference to attaining wealth or position (Oxford English Dictionary 1972, entries from 1586).
 2. The longevity of a species and all of its descendants through geological time (Wilson 1990 in Ruse 1993, 58).
cf. dominance (ecological)
- reproductive success (RS)** *n.* An individual organism's number of surviving offspring (Wilson 1975, 325).
cf. principle: principle of reproductive success
- ♦ **¹succession** *n.*
 1. A set of persons, or things, that succeed in the places of others (Oxford English Dictionary 1972, entries from 1647).
 2. The continued sequence in a definite order of species, types, etc.; specifically, the decent in uninterrupted series of forms modified by evolution or development (Oxford English Dictionary 1972, entries from Darwin 1834).
- ♦ **²succession** *n.*
 1. The gradual and predictable process of progressive community change and replacement leading toward a stable climax community (Lincoln et al. 1985).
syn. biotic succession, ecological succession, progressive succession, sere (Lincoln et al. 1985)
 2. The continuous colonization and extinction of species populations in a particular location (Lincoln et al. 1985).
syn. sere (with regard to plants) (Lincoln et al. 1985)
 3. "The chronological distribution of organisms within an area" (Lincoln et al. 1985).
 4. The geological, ecological, or seasonal sequence of species within a habitat or community (Lincoln et al. 1985).
- cf.* climax
Comment: Succession can be an important threat to organisms that live in particular seres because succession can cause rareness and extinction of the seres (New 2009, 103).
- adsere** *n.* The stage of succession that precedes its subclimax stage (Lincoln et al. 1985).
- aquatosere** *n.* A succession that starts in a wet habitat and leads to an aquatic climax (Lincoln et al. 1985).
- cannium** *n.* A succession caused by cultivation (Lincoln et al. 1985).
- cisere** *n.* A succession that results from a major climatic change (Lincoln et al. 1985).
- geosere** *n.* A succession that starts on clay (Lincoln et al. 1985).
See ²community: geosere.
- hydrarch succession, hydrosere** *n.* A succession that begins in a habitat with abundant water (Lincoln et al. 1985).
- cf.* ²succession: mesarch succession, xerarch succession
- lithosere** *n.* A succession that originates on an exposed rock surface (Lincoln et al. 1985).
- mesarch succession, mesosere** *n.*
 1. A succession that begins in a habitat with a moderate amount of water (Lincoln et al. 1985).
 2. A succession within a microhabitat that often fails to reach a stable climax (Lincoln et al. 1985).
syn. serule (Lincoln et al. 1985)
cf. ²succession: hydrarch succession, xerarch succession

microsere, serule *n.* A succession within a microhabitat that often fails to reach a stable climax (Lincoln et al. 1985).

plagiosere *n.* A succession that is deflected from its natural course by continuous human interference (Lincoln et al. 1985).

postclisere *n.* A succession that arises in a more mesic condition than is present in its habitat today; contrasted with precisere (Lincoln et al. 1985).

precisere *n.* A succession that arises under more xeric conditions than those present in a particular habitat today; contrasted with postclisere (Lincoln et al. 1985).

progressive succession See ²community: succession (def. 1).

psammosere *n.* A succession that starts in unconsolidated sand (Lincoln et al. 1985).

retrogressive succession *n.* A succession that recedes from a climax as a result of an external influence, or interference, such as human activity (Lincoln et al. 1985).

sere *n.*

1. A stage in community succession (Lincoln et al. 1985).
2. A succession of plant communities in a given habitat leading to a particular climax association (Lincoln et al. 1985).

See succession (def. 2).

Comment: Seres are classified by habitat or major influencing factors.

serule See ²succession: microsere.

subsere *n.*

1. A succession on a denuded area (Lincoln et al. 1985).
2. A succession arrested by edaphic, or biotic factors (Lincoln et al. 1985).

syn. secondary sere (Lincoln et al. 1985)

cf. ²community: subclimax

therium, therion *n.* A plant succession caused by animal activity (Lincoln et al. 1985).

xerosium *n.* “An ecological succession on drained and dried soils” (Lincoln et al. 1985).

xerarch succession, xerosere *n.* A succession that begins in a dry habitat (Lincoln et al. 1985).

cf. ²succession: hydrarch succession, mesarch succession

♦ **successional speciation** See speciation: successional speciation.

♦ **successional species** See ²species: successional species.

♦ **successive choice test** See test: choice test.

♦ **succinate** See fossil: succinate.

♦ **succorance** See need: succorance.

♦ **sucking** See ³suckling.

♦ **¹suckling** *n.*

1. A human infant that is still feeding at its mother's breast or is unweaned (Oxford English Dictionary 1972, entries from *ca.* 1440).
2. A young mammal that is still feeding at its mother's breast, especially a calf (Oxford English Dictionary 1972, entries from 1530).

♦ **²suckling** *n.*

1. A women's nursing a child at her breast (Oxford English Dictionary 1972, entries from 1408).
2. An adult mammal's allowing, or causing, a young to take nourishment from her breast (Michaelis 1963).

syn. nursing (Michaelis 1963)

3. An individual animal's bringing up, or nourishing, another (Michaelis 1963).

See nursing.

[Middle English < *sucklen*, probably back formation < SUCKLING]

allo suckling *n.* For example, in *Dama dama* (Fallow Deer), *Mirounga angustirostris* (Northern Elephant Seals), mollossid (free-tailed bat), and *Panthera leo* (Lions): A mother's giving milk to a young other than her own (Schaller 1972; etc. in Birgersson et al. 1991, 326).

Comment: “Allosuckling” has been interpreted as co-operation between related individuals or as an effect of living under exceptionally crowded conditions (Birgersson et al. 1991, 326).

♦ **³suckling** *n.* A young mammal's attempting to take, or taking, milk from a mammary gland (Cowie et al. 1951).

syn. sucking (with regard to Humans, Oxford English Dictionary 1972)

cf. lactation, milking

v.i., v.t. suckle

Comments: Suckling includes behaviors such as stimulating a mammary gland and sucking milk. To reduce confusion, “nursing” should be used to refer to a lactating female's actions, and “suckling” should refer to the actions of a young that is aiming to obtain milk from a mammary gland. “Nursing” and “suckling” should not be used interchangeably, and “sucking” and “suckling” should not be used interchangeably (Cowie et al. 1951; D. Fraser, pers. comm.).

♦ **suckling stimulus** See ²stimulus: suckling stimulus.

♦ **suicide** See -cide: suicide.

♦ **suitor phenomenon** See mate guarding: precopulatory mate guarding.

♦ **suffering** See animal suffering.

♦ **sulphur hexafluoride** See molecule: sulphur hexafluoride.

♦ **sulfhydryl group** See group: functional group: sulfhydryl group.

♦ **sum of squares** *n.* In statistics, the sum of the squared deviations from a mean in an analysis of variance (Lincoln et al. 1985).

♦ **summer solstice** See solstice: summer solstice.

♦ **Sun** See star: Sun.

♦ **sun-compass orientation** See taxis: menotaxis: sun-compass taxis.

♦ **sun-dapple territory** See territory: sun-dapple territory.

♦ **super-** *prefix*

1. “Above in position; over” (Michaelis 1963).
2. Anatomically and zoologically, “situated above, or on the dorsal side of” (Michaelis 1963).
3. “Above or beyond; more than” (Michaelis 1963).
4. “Excessively” (Michaelis 1963).
5. “Greater than, or superior, to others in its class” (Michaelis 1963).
6. “Extra; additional” (Michaelis 1963).

cf. sub-

[Latin *super-* < *super*, above, beyond]

♦ **super beneficiary** See beneficiary.

♦ **super-donor** See donor: super-donor.

♦ **super half sister** See sister: half sister: super half sister.

♦ **super-releaser** See ²stimulus: releaser: supernormal stimulus.

♦ **super sister** See sister: super sister.

♦ **superbout** See bout: superbout.

- ◆ **supercolony** See colony: supercolony.
- ◆ **superdispersed distribution** See distribution: contiguous distribution.
- ◆ **superdonor** See donor: superdonor.
- ◆ **superfecundation** *n.* Fertilization of separate ova in a single woman by sperm of different males that is followed by plural birth of half siblings (Smith 1984, 616). *Comment:* There are more than a dozen reported cases of superfecundation reported since the early 1800s (Smith 1984, 616).
- ◆ **superfetation** See superfoetation.
- ◆ **superfluent species** See ²species: superfluent species.
- ◆ **superfoetation, superfetation** *n.* A plant ovary's fertilization by two, or more, kinds of pollen (Lincoln et al. 1985). *syn.* hypercytes
- ◆ **supergene** See gene: supergene.
- ◆ **superior colliculus** See organ: brain: superior colliculus.
- ◆ **superlarvation** See ²heterochrony: paedomorphosis.
- ◆ **supernormal stimulus, supernormal releaser, super-releaser** See ²stimulus: releaser: supernormal stimulus.
- ◆ **supernova** *n., pl. supernovae* A catastrophic stellar explosion (Mitton 1993). *Comments:* A supernova occurs when a star of more than 1.8 solar masses contracts after its activity exhausts its nuclear fuel (Mitton 1993). Then it explodes, blowing off much of its mass into outer space. A supernova can release so much energy that it alone can outshine an entire galaxy of billions of stars. Much of its energy goes into kinetic energy that blows material out into space and is carried off by neutrinos. People see about one supernova in the Milky Way per 200 yr. Researchers detect about 50 supernovae in other galaxies each year.
- ◆ **"supernova hypothesis"** See hypothesis: hypotheses regarding the Permian mass extinction: "supernovae hypothesis."
- ◆ **supernumerary** See helper.
- ◆ **supernumerary chromosome** See chromosome: supernumerary chromosome.
- ◆ **superoptimal stimulus** See ²stimulus: releaser: supernormal stimulus.
- ◆ **superorganism** See organism: superorganism (Appendix 1, part 1).
- ◆ **superparasitism** See parasitism: superparasitism.
- ◆ **superpheromone** See chemical-releasing stimulus: semiochemical: pheromone: superpheromone.
- ◆ **superposition** *n.* In some fish species: The change in rhythm of one kind of fin caused by the dominant rhythm of another kind of fin (Tinbergen 1951, 73).
- ◆ **superreleaser** See ²stimulus: releaser: supernormal stimulus.
- ◆ **supersedure queen** See caste: queen: supersEDURE queen.
- ◆ **superstitious behavior** See behavior: superstitious behavior.
- ◆ **superspecies** See ²species: superspecies.
- ◆ **supertramp** See ²species: supertramp.
- ◆ **supination** See display: wing display: supination.
- ◆ **supine test** See test: supine test.
- ◆ **supplementary reproductive** See reproductive: supplementary reproductive.
- ◆ **supporting cell** See cell: glial cell.
- ◆ **suppressor gene** See gene: suppressor gene.

- ◆ **supra-** prefix "Above; beyond" (Michaelis 1963). *cf.* infra- [Latin *supra*-]
- ◆ **suprabenthos, suprabenthic** See ²community: benthos: suprabenthos.
- ◆ **suprachiasmatic nucleus** See organ: brain: suprachiasmatic nucleus.
- ◆ **supraorganism** See organism: superorganism (Appendix 1, part 1).
- ◆ **supraneuston** See neuston: epineuston.
- ◆ **suprapelos** See ²community: suprapelos.
- ◆ **suprapsammon** See ²community: suprapsammon.
- ◆ **supraterraneus** *adj.* Referring to something that occurs at, or above, ground level (Lincoln et al. 1985).
- ◆ **surface pheromone** See chemical-releasing stimulus: semiochemical: pheromone: surface pheromone.
- ◆ **surgical menopause** See menopause: surgical menopause.
- ◆ **surprise** See facial expression: surprise.
- ◆ **surrogate** *n.* A dummy or stimulus model (Immelman and Beer 1989, 300). *cf.* dummy, model, mother: surrogate mother
- ◆ **surrogate mother** See mother: surrogate mother.
- ◆ **survival of the fittest** *n.*
 1. The idea that animal life entails a direct and continuous competitive struggle — "nature red in tooth and claw" (Dewsbury 1978, 90). *Note:* This is a misconception of the phrase held by 19th-century social philosophers (Dewsbury 1978, 90).
 2. Herbert Spencer's epitomization of Darwinian theory (Mayr 1982, 588). *Note:* "Survival" should mean "reproducing." This epitomization sounds deterministic, but in reality natural selection is statistical rather than an all-or-none phenomenon. "Even though philosophers may still refer to 'survival of the fittest,' biologists no longer use such deterministic language" (Mayr 1982, 588). "When, at the urging of his friends, Darwin adopted Spencer's term 'survival of the fittest,' he jumped from the frying pan into the fire, because this new metaphor suggested circular reasoning" (Mayr 1982, 842). Furthermore, it is usually not the fittest (only one) organism in a population that reproduces, but a group of organisms that are *fitter* than others.
 3. The differential and greater success of better adapted genotypes (Lincoln et al. 1985). *See* selection: natural selection. *cf.* fittest, survival of the luckiest
- ◆ **survival of the luckiest** *n.* The concept that selectively neutral, or very nearly neutral, mutants are often fixed in populations due to random genetic drift; contrasted with "survival of the fittest" (Kimura 1985, 29; 1992, 225). *cf.* ³theory: the neutral theory *Comment:* Kimura (1992, 230) earlier proposed this term to emphasize the importance of good fortune versus natural selection for a mutant's success in evolution.
- ◆ **survival of the stable** See principle: survival of the stable.
- ◆ **survival machine** See gene machine.
- ◆ **survival theory** See ³theory: refugium theory.
- ◆ **survival value** See adaptive significance.
- ◆ **survivorship** *n.* The proportion of individuals from a particular cohort that survive at a given time, typically presented as a survivorship curve (Lincoln et al. 1985).

age-specific survivorship *n.* The probability that an individual of age x will be alive, and presumably be able to reproduce, at a later time, $x + 1$ (Willson 1983, 16).

♦ **survivorship curve** See curve: survivorship curve.

♦ **survivorship schedule** *n.* The number of individuals of a population that survive to each particular age (Wilson 1975, 90).

♦ **suscept** *n.* An organism that is susceptible to, or harbors, a disease organism (Lincoln et al. 1985).

♦ **susceptibility** *n.* An organism's being prone to influence by a stimulus, or to infection by parasites or pathogens (Lincoln et al. 1985).

adj. susceptible

♦ **suspended animation** See biosis: anabiosis.

♦ **suspension feeding** See feeding: suspension feeding.

♦ **suspension feeders** See ²group: functional feeding group: filtering collectors.

♦ **Sutton-Boveri-chromosome theory, Sutton-Boveri-chromosome theory of inheritance**

See ³theory: Sutton-Boveri chromosome theory.

♦ **suture zone** See zone: suture zone.

♦ **swale** See habitat: swale.

♦ **swamp** See habitat: swamp.

♦ **swamp fever** See disease: malaria.

♦ **swampland** See habitat: swamp.

♦ **swarm** *v.t.*

1. For example, in *Apis mellifera* (Western Honey Bees): To form a new colony by a queen and a large number of workers that suddenly depart from their parental nest and fly to some exposed site where they cluster while scout workers fly in search of a suitable new nest cavity (Wilson 1975, 596).

2. *v.i.* For example, in Ants and Termites: To make a mass exodus of reproductive forms from nests at the beginning of a nuptial flight (Wilson 1975, 596).

See ²group: swarm.

♦ **SWARM** See program: SWARM.

♦ **swarming** *n.* In social insects: Colony reproduction in which the queen(s) and a number of workers separate and found a new colony (Hölldobler and Wilson 1990, 643).

budding *n.* In some social-insect species, e.g., *Apis mellifera* (Western Honey Bees): Swarming in which the queen, or queens, and workers leave their main parental nest (Hölldobler and Wilson 1990, 643).
syn. hesmosis (in Ants), sociotomy (in Termites) (Wilson 1975, 139, 580)

fission *n.* For example, in Army Ants: Swarming in which major portions of a colony separate, each with one, more queens, and workers (Hölldobler and Wilson 1990, 643).

Comment: Wilson 1975 (581) originally included swarming and budding as divisions of "colony fission."

hesmosis, sociotomy See ¹swarming: budding.

♦ **²swarming** *n.* For example, in Ants and Termites: The mass exodus of reproductive forms from their nest at the beginning of a nuptial flight (Hölldobler and Wilson 1990, 643).

♦ **sweating** *n.* In some mammal species: An individual's exuding, or excreting, moisture from pores of its skin (Michaelis 1963).

syn. perspiring

n. sweatiness

adj. sweaty

adv. sweatily

[Old English *swætan* < *swat*, sweat]

nonthermal sweating *n.* Sweat glands' responding to a nonthermal stimulus, e.g., a frightening experience for a Human (Bligh and Johnson 1973, 954).

thermal sweating *n.* Sweat glands' responding to a thermal stimulus (Bligh and Johnson 1973, 954).

♦ **swimming** *n.* For example, in some bird, insect, and protozoan species; and many amphibian, crustacean, fish, and mammal species: An individual's propelling itself through water with organized bodily movements (Oxford English Dictionary 1972, entries from 1000; Michaelis 1963; Ricci 1990, 1050).

Comment: *Macaca fuscata* (Japanese Macaques, also called Snow Monkeys) frequently swim in hot spring water. In Figure 43, an infant *M. fuscata* holds onto its mother as she swims in and picks up food from the bottom of a hot-water pool in Jigokudani Monkey Park, Japan. In this Park, I saw a mother swim to the bottom of the pool taking her very small infant underwater with her several times. The drenched infant let go of its mother and started swimming to the edge of the pool by itself. Within seconds, its mother caught it, and the infant soon returned to her back. Pictures of this pool from a live camera are at <http://www.jigokudani-yaenkoen.co.jp/frameset.html>.

coquette swimming See swimming: nod swimming.

corkscrew swimming *n.* In some fish species: Swimming in which an individual circles on a horizontal plane in water, revolving or spiraling around an imaginary central point (Geiger et al. 1985, 10; R. A. Drummond, pers. comm.).

interrupted swimming *n.* In some fish species: Swimming in which an individual has bouts of normal swimming, or rest periods, punctuated with bouts of strenuous, hyperactive swimming (Geiger et al. 1985, 10; R. A. Drummond, pers. comm.).

nectism *n.* For example, in *Paramecia* spp.: Swimming by means of cilia (Lincoln et al. 1985).

nod swimming *n.*

1. In several dabbling-duck species: An epigamic behavior (Heymer 1977, 123).

syn. coquette swimming (Heinroth 1910, Lorenz 1941 in Heymer 1977)

2. In some blenniid-fish species: A behavior that shows an individual's conflict between progressing forward or retreating (Wickler 1963 in Heymer 1977, 123).

spiral swimming *n.* In some fish species: Corkscrew swimming in which an individual moves vertically up and down (Geiger et al. 1985, 10; R. A. Drummond, pers. comm.).

tail-down swimming *n.* In some fish species: Swimming in which an individual has its head up, often near the surface of water, and its body axes perpendicular or at a steep angle with regard to water surface (Geiger et al. 1985, 10; R. A. Drummond, pers. comm.).

tail-up swimming *n.* In some fish species: Swimming in which an individual has its head down with its longitudinal body axis perpendicular or at steep angles with regard to a horizontal substrate (Geiger et al. 1985, 10; R. A. Drummond, pers. comm.).

undulation swimming *n.* In some amphibian, reptile, and mammal species: An individual's swimming with its legs held against its body and propelling itself in a snake-like movement (Dubost 1965 in Heymer 1977, 202).

uninterrupted swimming *n.* In some fish species: Swimming in which an individual moves continuously, or hyperactively, for long periods (Geiger et al. 1985, 11; R. A. Drummond, pers. comm.).

♦ **switch gene** See gene: switch gene.

♦ **sycophage, sycophagous, sycophagy** See -phage: sycophage.

♦ **sylvicole, sylvicolous** See -cole: sylvicole,

♦ **symbiogenesis** See -genesis: biogenesis: symbiogenesis.

♦ **symbiology** See study of: biology: symbiology.

♦ **symbiont, symbioite, symbion** *n.* An organism that lives in close association with another species (Oxford English Dictionary 1972, entries from 1887). *cf.* symbiosis

syn. commensal (Oxford English Dictionary 1972)

adj. symbiotic

ectosymbiont, exosymbiont *n.* One of two symbionts that are both external to each other; contrasted with endosymbiont (Lincoln et al. 1985).

endosymbiont, inhabiting symbiont *n.* A symbiont that lives inside another symbiont; contrasted with ectosymbiont (Lincoln et al. 1985).

exhibited symbiont *n.* A symbiont that can be regarded as the host in a symbiosis in which neither symbiont is contained within the other; contrasted with exhibiting symbiont (Lincoln et al. 1985).

exhibiting symbiont *n.* A symbiont that lives upon another symbiont in a symbiosis in which neither symbiont is contained within the other; contrasted with exhibited symbiont (Lincoln et al. 1985).

exosymbiont See symbiont: ectosymbiont.

inhabiting symbiont See symbiont: endosymbiont.

inhabited symbiont *n.* A symbiont in whose body another symbiont lives (Lincoln et al. 1985).

keystone mutualist *n.* An organism that, if removed from its community, can cause significant community changes (e.g., a cascade of linked extinctions) because of its importance to other organisms (Buchmann and Nabhan 1996, 248).

cf. ²species: keystone species

Comment: Keystone mutualists include some ant species which disperse seeds of proteaceous plants in the fynbos (*q.v.*) and some neotropical fig species which provide food (especially fruit) for many animal species (Buchmann and Nabhan 1996, 248; Christian 2001, 635).

macrosymbiont *n.* A symbiont that is the larger of two partners in a symbiosis; contrasted with microsymbiont (Lincoln et al. 1985).

microsymbiont *n.* A symbiont that is the smaller of two partners in a symbiosis; contrasted with macrosymbiont (Lincoln et al. 1985).

symphile *n.* A symbiont, particularly a solitary insect or other kind of arthropod, that is accepted to some extent by an insect colony and “communicates with it amicably” (Wilson 1975, 596).

n. symphily

adj. symphilic

cf. symbiont: synechthran, synoekete

Comment: Most symphiles are licked, fed, or transported to host brood chambers, or receive a combination of these actions (Wilson 1975, 596).

► **pseudosympophile** *n.* A predator, or parasite, of a social insect that obtains nourishment from trophalactic secretions of this insect (Lincoln et al. 1985).

synechthran *n.* A symbiont that is usually a scavenger, parasite, or predator and is treated with hostility by its host colony (Hölldobler and Wilson 1990, 644).

cf. symbiont: symphile, synoekete; symbiosis: synectry

synoekete *n.* A symbiont that is treated with indifference by its host colony (Hölldobler and Wilson 1990, 644).

cf. symbiont: symphile, synechthran

♦ **symbiosis** *n.*

1. Heterospecific individuals, usually of two plant species, sometimes an animal and a plant species, that live attached to each other, or one as the “tenant” of the other, and contribute to each other’s support; distinguished from parasitism (Oxford English Dictionary 1972, entries from 1877).

syn. commensalism, consortium (Oxford English Dictionary 1972)

2. Heterospecific organisms that are closely associated with one another, with either, or both, species’ benefiting, or not benefiting, from their associations; symbiosis includes commensalism, mutualism, and parasitism (de Bary 1879 in Lewin 1982; Committee on Terminology of the American Society of Parasitologists in Goff 1982, 255).

Note: This definition seems appropriate for wide use. People confounded def. 1 and 2 as early as 1893 (Pound in Boucher 1992, 208).

3. Different species’ having presumed, or actual, mutually beneficial, close associations (Herwig 1883 in Lewin 1982).

4. Symbiosis in which the growth and survival of populations of two species “is benefitted and neither can survive under natural conditions without the other” (Odum 1969, 225).

5. Dissimilar organisms’ (or their parts’) living “together in an intimate association (generally implying a physiological interaction)” (Goff, 1982, 255).

syn. mutualism (a confusing synonym, Immelmann and Beer 1989, 301), *Symbiose*

cf. aposymbiotic, -biosis, cooperation, parachoric, parasitism, predation

Comments: Hertig et al. (1937 in Goff 1982, 255) trace the etymology of “symbiosis.” “Predation,” especially when a predator uses only one through a few prey species, is sometimes classified as a kind of “symbiosis;” e.g., some weevil species are “seed predators” that feed on only one through a few plant species. Boucher (1992) discusses some of the confusion involved in definitions of symbiosis and related terms due to reasons including (1) combining definitions within and between terms, and (2) not specifying whether relationships are beneficial to individuals or populations. Some people use “altruism,” “facilitation,” “obligacy,” “proto-cooperation,” and “symbiosis” with partial through total overlap in meaning with “cooperation” and “mutualism;” the battle for clarity of these terms is far from won (Boucher 1992, 208, 211). Rigorous evolutionary studies should denote organism interactions in terms of gene frequency changes within populations (Templeton and Gilbert 1985 in Boucher 1992, 210).

[Greek *symbiosis*, living together; coined by Anton DeBary to designate close association between two species, whether, or not, it is beneficial (1879 in Boucher 1992, 208)]

acarophytism, acarophytium *n.* “Symbiosis between plants and mites” (Lincoln et al. 1985).

A CLASSIFICATION OF SYMBIOSIS

- I. Nonsocial symbiosis
 - A. commensalism
 - B. mutualism
 - C. parasitism (including nectar robbing, nectar thieving, pollen robbing, pollen thieving)
 - 1. Classification by necessity
 - a. facultative symbiosis
 - b. obligate symbiosis (*syn. obligatory symbiosis*)
 - 2. Classification by order of parasitization of the host
 - a. primary parasitism
 - b. secondary parasitism
 - c. tertiary parasitism
 - d. quaternary parasitism, etc.
 - 3. Classification by number of parasitisms per host individual and number of parasite species involved
 - a. single parasitism
 - b. multiple parasitism
 - (1) superparasitism
 - (2) hyperparasitism
 - 4. predation^a
 - II. Social symbiosis
 - A. social commensalism
 - 1. mixed-group commensalism^b
 - 2. nest commensalism
 - 3. plesiobiosis
 - B. social mutualism
 - 1. mixed-group mutualism^b
 - 2. parabiosis
 - 3. trophobiosis
 - C. social parasitism
 - 1. inquilinism
 - 2. slavery (= dulosis, helotism)
 - 3. temporary social parasitism
 - 4. trophic parasitism
 - 5. xenobiosis

^a Predation is sometimes classified as symbiosis when a predator uses only one to a few prey species.

^b Group includes flocks, herds, and schools.

anisosymbiosis *n.* Symbiosis in which one partner (the macrosymbiont) is larger than the other (microsymbiont) (Lincoln et al. 1985).

cf. symbiosis: isosymbiosis

antipathetic symbiosis *n.* Symbiosis that is either advantageous, or obligatory, to one of the symbionts (Lincoln et al. 1985).

beneficence *n.* Mutualism, commensalism, or both, in organism-organism pairs (Hunter and Aarsen 1988, 34).

biotrophic symbiosis *n.* Symbiosis in which one symbiont uses its living partner as a food source (Lincoln et al. 1985).

cf. symbiosis: necrotrophic symbiosis

byproduct mutualism See symbiosis: mutualism: byproduct mutualism.

calobiosis *n.* In some social-insect species: One species' living in the nest of and at the expense of another species (Lincoln et al. 1985).

cf. symbiosis: nest commensalism

cleaning symbiosis *n.* Symbiosis involving a cleaner, *q.v.*, and its host (Immelmann and Beer 1989, 46).

cleptobiosis, kleptobiosis *n.* In some social-insect species: Symbiosis in which one species of social organism steals food from the stores of another social species but does not live, or nest, close to it (Lincoln et al. 1985).

cf. parasitism: cleptoparasitism

commensalism *n.* "Symbiosis in which members of one species are benefitted while those of the other species are neither benefitted nor harmed" (Wilson 1975, 354, 581); *e.g.*, dispersal of seeds on mammals' fur; owls' and chickadees' using woodpecker's holes; or animals' living in social insects' nests (Futuyma 1986, 29).

Comment: The lines between "commensalism," "mutualism," and "parasitism" are often hazy (Immelmann and Beer 1989, 50).

► **ectocommensalism** *n.* Commensalism involving one organism's living on its host's external surface; contrasted with endocommensalism (Lincoln et al. 1985).

n. ectocommensal

► **nest commensalism** *n.* Commensalism in which one species lives in the nests of another, scavenging on refuse or preying on the scavengers, in either case without harming or benefitting the hosts; *e.g.*, in some beetle, millipede, and other arthropod species that live with Army Ants (Wilson 1975, 354).

cf. symbiosis: calobiosis

► **social commensalism** *n.* Commensalism involving a social species and another species which may be social or nonsocial (Wilson 1975, 354–356).

Comment: This includes "mixed-group symbiosis" ("mixed flocking," "mixed herding," and "mixed schooling"), "nest commensalism," and "plesiobiosis" (Wilson 1975, 354–356).

► **synecathy** *n.* "Commensalism in which the participants (synecthrans) display mutual dislike" (Lincoln et al. 1985).

► **synoecy** *n.* A symbiosis between a social-insect colony and a tolerated guest organism (= synoekete) (Lincoln et al. 1985).

See -oecism: synoecy.

consortism *n.* Symbiosis between two partners (consorts of a consortium) (Lincoln et al. 1985).

ecosymbiosis, exosymbiosis *n.* Symbiosis in which neither symbiont lives within the body of the other; contrasted with endosymbiosis (Lincoln et al. 1985).

endosymbiosis *n.* Symbiosis in which an endosymbiont (inhabiting symbiont) lives within the body of another (inhabited symbiont); contrasted with ecosymbiosis (Lincoln et al. 1985).

epibiosis *n.* Symbiosis in which one organism lives upon the outer surface of another (Lincoln et al. 1985).

exosymbiosis See symbiosis: ecosymbiosis.

generational mutualism See symbiosis: mutualism: generational mutualism.

heterosymbiosis, interspecific symbiosis *n.* Symbiosis between two heterospecific organisms; contrasted with homosymbiosis (Wilson 1975, 596).

homosymbiosis, intraspecific symbiosis *n.* Symbiosis between two conspecific organisms; contrasted with heterosymbiosis (Lincoln et al. 1985).

interspecific symbiosis See symbiosis: heterosymbiosis.

intraspecific symbiosis See symbiosis: homosymbiosis.

isosymbiosis *n.* Symbiosis in which both symbionts are of the same size; contrasted with anisosymbiosis (Lincoln et al. 1985).

kleptobiosis See symbiosis: cleptobiosis.

lestobiosis *n.* Symbiosis in which a colony of a social-insect species with small individuals nests in the walls of a social-insect species with larger individuals and enters its chambers where the former preys on the latter's brood or robs its food stores (Wilson 1975, 588).

syn. synclopia (Lincoln et al. 1985)

cf. symbiosis: kleptobiosis

metabiosis, metabios *n.* Symbiosis between two organisms in which one organism inhabits an environment prepared by the other (Lincoln et al. 1985).

mutualism *n.*

1. For example, in anemone fish and anemones, cleaner fish and their hosts, many plant species and their animal pollinators: Temporary, or permanent, symbiosis in which both species benefit (Oxford English Dictionary 1972, entries from 1876; Lincoln et al. 1985).

syn. symbiosis, true symbiosis synergy; interdependent association, synergism, synergy (Lincoln et al. 1985)

cf. ²evolution: coevolution, cooperation, parasitism, symbiosis, symbiosis: nutricism

Note: In view of the general definitions for "symbiosis," "symbiosis," and "true symbiosis" are confusing synonyms for "mutualism."

2. In many organism species: Interactions between two conspecific organisms in which both gain in inclusive fitness; four kinds of cooperation can be distinguished including reciprocal altruism (West Eberhard 1975, 19).

syn. cooperation (West Eberhard 1975, 19)

3. A behavioral interaction from which all participating organisms derive a net benefit (measured in terms of direct fitness) (Wittenberger 1981, 613).

4. Mutualism between two, or more, conspecific individuals, or species, in which both parties benefit in terms of direct fitness (Brown 1987, 305).

syn. cooperation (Brown 1987, 305)

cf. cooperation; ⁴facilitation; parasitism; predation; symbiont: keystone mutualist

Comments: Boucher (1992, 209) indicates how to measure mutualism. Human preservation of mutualisms is likely to be very important in maintaining some natural communities (Christian 2001, 635).

[coined by Pierre Van Beneden, Belgian zoologist (1873 in Boucher 1992, 209)]

► **byproduct mutualism** *n.* Mutualism in which a neighbor's benefit is an incidental byproduct of a donor's action that it took for its own benefit (Brown 1987, 298).

► **generational mutualism** *n.* Mutualism between generations, e.g., between parents and their offspring (Brown 1987, 299).

► **parabiosis** *n.* In some ant species: Species' which are parabionts nesting in close association, defending their nests jointly, foraging together, and possibly even sharing food, but not rearing their offspring together (Wilson 1975, 354, 590).

► **paramutualism** *n.* Facultative symbiosis between two species (Lincoln et al. 1985).

► **sequential mutualism** *n.* The interactions of a group of plants, that grow in the same area and overlap in their blooming periods, and their coadapted

pollinators that pollinate them as the season progresses (Buchmann and Nabhan 1996, 253–254).

► **score-keeping mutualism** *n.* Mutualism in which two participants repeatedly exchange favors while each adjusts its behavior in response to partial, or total, reciprocation by the other (Brown 1987, 306).

Comment: Score-keeping mutualism is found in the games tit-for-tat and judge (Brown 1987, 306).

► **social mutualism** *n.* Mutualism between a social species and another species that may, or may not, be social; e.g., mixed-group symbiosis, parabiosis, and trophobiosis (Wilson 1975, 354, 356).

► **syndiacony** *n.* Mutualism between some ant and plant species (Lincoln et al. 1985).

adj. syndiaconic

► **trophobiosis** *n.* Social mutualism in which an individual of one species (the trophobiont) yields food to a heterospecific individual in exchange for protection from parasites, predators, or inclement weather, e.g., in ants that receive honeydew from trophobionts (aphids and other homopterans or the caterpillars of certain lycaenid and riordinid butterflies) (Wilson 1975, 354, 597; Hölldobler and Wilson 1990, 644).

myrmecoclepsy *n.* Symbiosis between some ant species in which the guest species steals food directly from the host species (Lincoln et al. 1985).

myrmecosymbiosis *n.* Symbiosis between an ant species and its host plant (Lincoln et al. 1985).

necrotrophic symbiosis *n.* Symbiosis between two living organisms in which one continues to use the other as a food even after its complete, or partial, death has occurred (Lincoln et al. 1985).

cf. symbiosis: biotrophic symbiosis

neutralism See symbiosis: parasymbiosis.

nutricism *n.* Symbiosis in which only one member of a partnership benefits (Lincoln et al. 1985).

cf. parasitism, symbiosis: mutualism

parasitism See parasitism in the Ps.

parasymbiosis *n.*

1. Symbiosis without benefit, or detriment, to either partner (Lincoln et al. 1985).

syn. neutralism (Lincoln et al. 1985)

2. Association of an organism (the parasympiont) with an existing symbiont, e.g., a lichenicolous fungus with an alga (Lincoln et al. 1985).

Comment: Figure 14 shows a kind of light green lichen and pinkish lichen in Florida, U.S., which are both symbiotic relationships of an alga and a fungus species.

phoresy, phoresis, phoretic behavior *n.* Symbiosis in which one organism is merely transported on the body of a heterospecific individual, e.g., a pseudoscorpion being carried by an insect (Lincoln et al. 1985) or a carrion-eating nematode being carried under the wings of a carrion beetle (Immelmann and Beer 1989, 132).

syn. hitchhiking (Immelmann and Beer 1989, 132)

cf. host: carrier host

proto-cooperation *n.* Symbiosis in which populations of two species benefit by their association but relations are not obligatory (Odum 1969, 225).

See cooperation.

score-keeping mutualism See symbiosis: mutualism: score-keeping mutualism.

slavery See parasitism: social parasitism: slavery.

- synclerobiosis** *n.* Symbiosis between two species of social insects that usually inhabit separate nesting sites (Lincoln et al. 1985).
- syndiacony** See symbiosis: mutualism: syndiacony.
- synestry** *n.* "Commensalism in which the participants (syecthrans) display mutual dislike" (Lincoln et al. 1985).
- ◆ **symbiotroph, symbiotropy, symbiotrophic** See -troph-: symbiotroph.
- ◆ **symbolic action** See ritual.
- ◆ **symbolic behavior** See behavior: symbolic behavior.
- ◆ **symbolic territory** See territory: symbolic territory.
- ◆ **symmetric game** See game.
- ◆ **sympaedium** See -paedium: sympaedium.
- ◆ **symparasite** See parasite: symparasite.
- ◆ **sympathetic induction** See effect: group effect.
- ◆ **sympathetic nervous system** See ²system: nervous system: sympathetic nervous system.
- ◆ **sympatric** See -patric: sympatric.
- ◆ **sympatric hybridization** See hybridization: sympatric hybridization.
- ◆ **sympatric speciation** See speciation: sympatric speciation.
- ◆ **syophile** See symbiont.
- ◆ **syphylic substance** See substance: syphylic substance.
- ◆ **symplesiomorph** See character: plesiomorph: symplesiomorph.
- ◆ **symplesiotypy** See -typy: symplesiotypy.
- ◆ **syn-** *prefix* "With; together; associated with or accompanying" (Michaelis 1963). Also sy- before sc, sp, st, and z; syl- before l; sym- before b, p, and m; sys- before s. [Latin < Greek *syn*, together]
- ◆ **synanthropic** See anthropic: synanthropic.
- ◆ **synapomorph, synapomorphy** See character: apomorph: synapomorph.
- ◆ **synaposematic coloration** See coloration: synaposematic coloration.
- ◆ **synapotypy** See -typy: synapotypy.
- ◆ **synapse** *n.* A communicating junction between two neurons (Oxford English Dictionary 1972, entries from 1899), between a receptor cell and a neuron, or between a neuron and an effector-organ cell (Immelman and Beer 1989, 302).
- adrenergic synapse** *n.* A synapse whose neurotransmitter is adrenalin (= epinephrin) (Immelman and Beer 1989, 302).
- cholinergic synapse** *n.* A synapse whose neurotransmitter is acetylcholine (Immelman and Beer 1989, 302).
- electronic synapse** *n.* A synapse across which an electrical charge is directly transmitted (Immelman and Beer 1989, 302).
- serotonergic synapse** *n.* A synapse whose neurotransmitter is serotonin (Immelman and Beer 1989, 302).
- ◆ **synapsis** *n.* Homologous chromosomes' pairing during the first division of meiosis (Mayr 1982, 762, 960).
- ◆ **synaptic signaling** See signaling: synaptic signaling.
- ◆ **syncheimadium** See ²group: syncheimadium.
- ◆ **synchorology** See study of: synchorology.
- ◆ **synchronic** See chronic: synchronic.
- ◆ **synchronic species** See ²species: synchronic species.
- ◆ **synchronopaedium** See -paedium: synchronopaedium.
- ◆ **synchronous hermaphrodite** See hermaphrodite: synchronous hermaphrodite.
- ◆ **synclerobiosis** See symbiosis: synclerobiosis.
- ◆ **synclovia** See biosis: lestobiosis.
- ◆ **syncrypsis** See crypsis: syncrypsis.
- ◆ **syndiacony** See symbiosis: syndiacony.
- ◆ **syndrome** *n.*
1. The concurrence of several symptoms in a human disease; "a set of such concurrent symptoms" (Oxford English Dictionary 1972, entries from 1541).
syn. deprivation syndrome (in some cases, Immelman and Beer 1989, 303)
cf. behavior syndrome
 2. An aggregate, or set, of concurrent symptoms that indicate the presence and nature of a disease (Michaelis 1963).
- Comment:* This concept now relates to nonhuman animals as well (Immelman and Beer 1989, 303). [New Latin < Greek *syndrome* < *syn-*, together + *dramein*, to run]
- adrenogenital syndrome** *n.* A hereditary disease in which a female mammal's adrenal gland secretes androgens instead of cortisone (Dewsbury 1978, 231).
cf. hermaphroditism: progestin-induced hermaphroditism, testicular feminization
- behavior syndrome** See behavior syndrome.
- chronic-fatigue syndrome** *n.* In Human: A combination of symptoms including persistent fatigue for at least 6 mo, impaired concentration and short-term memory, trouble sleeping, and muscle and joint pain (Cheng 1995, 18 July, C9).
Comment: This is the most widely accepted definition of chronic-fatigue syndrome (Cheng 1995, 18 July, C9).
- contiguous-gene-deletion syndrome** *n.* A human syndrome that involves a group of contiguous genes in which absence of one of the genes of the group causes a particular symptom, e.g., in Williams syndrome (Blakeslee 1996, 23 July, C3.)
- deprivation syndrome, syndrome** *n.* All of an animal's "deficits and distortions in its behavioral development that can result from its social isolation in early life, including apathy, motor restlessness, stereotypies, and incapacity for normal social interaction" (Immelman and Beer 1989, 73).
Comment: Researchers have found this syndrome in some species of social mammals, including some primate species (Immelman and Beer 1989, 73).
- fight-or-flight syndrome** *n.* In Mammals: An individual's condition that results from its secretion of adrenaline and noradrenalin under a stress condition and that involves its soon showing combat or escape behavior (Wilson 1965, 253; Immelman and Beer 1989, 297).
syn. fight or flight (Wilson 1965, 253)
- fleurs-du-mâle syndrome** *n.* Queller's (1983, 707) suggestion that in the hermaphroditic plant *Asclepias syriaca* (Common Milkweed), flower number, umbelate raceme longevity, and seasonal distribution of flowers are traits selected primarily for their effects on male competition for females.
[coined by Queller (1983) after Charles Baudelaire's book *Fleurs du Mal (Flowers of Evil)*]
- general-adaptation syndrome (GAS)** *n.* In some vertebrate species: The physiological and behavioral changes undergone by an originally normal individual that was subjected to prolonged stress; the GAS involves the stage of alarm (general-emergency

reaction), stage of resistance, and stage of exhaustion (Selye 1956 in Wilson 1975).

[coined by Selye: general (the belief that the pattern of responses is the same whatever the precise nature of danger) + adaptation (the phenomenon that at least during first stages of the syndrome, an animal's body is adapting to a new condition) + syndrome (many different organs being affected) (Dawkins 1980, 57)]

pollination syndrome *n.*

1. A flower's suite of morphological characters and "floral rewards" that may accurately predict its kinds of floral visitors (P. Knuth and H. Müller in Buchmann and Nabhan 1996, 252).
2. A morphologically convergent adaptive trend exhibited by both the floral features of a pollinated plant and the mouthpart structure and other flower-interactive features of its pollinator (Proctor et al. 1996 in Labandeira 1998, 57).

premenstrual syndrome (PMS) *n.* In many

women of reproductive age: A combination of various physical and emotional symptoms that occurs from 7 through 14 days before menstruation (Clayman 1989, 818).

syn. the curse (Helen Gurley Brown in Mansfield 1995, B6)

cf. premenstrual stress dysphoria disorder

Comments: Premenstrual syndrome affects more than 90% of fertile women at some time in their lives, and in some women it is so severe that their work and social relationships are seriously disrupted (Clayman 1989, 818). Symptoms include backache, breast tenderness, depression, fluid retention, headache, irritability, lower abdominal pain, and tension. Doctors prescribe some antidepressant drugs that inhibit the reuptake of serotonin for PMS and premenstrual stress dysphoria disorder (Squires 1995, A1). Katharina Dalton, M.D., treated women with PMS with progesterone, a now controversial procedure (Slater 2004, 34).

[coined by Katharina Dalton (1916–2003) and Raymond Greene in 1953 in Slater (2004)]

premenstrual-stress-dysphoria disorder, PMS-dysphoria disorder *n.* In some women of reproductive age: A more severe derangement of mood that interferes with daily life and requires medical treatment and often psychotherapy (Squires 1995, A1).

cf. premenstrual stress

Comment: Sufferers of this disorder feel extremely "on edge" and experience markedly depressed moods, marked anxiety and decreased interest in activities (American Psychiatric Association's Diagnostic and Statistical Manual IV in Squires 1995, A1).

separation syndrome, separation trauma *n.*

In some primate species: A young individual's traumatic behavior, including apathy, compulsive movements, inability to form social attachments, restlessness, and other deficits in its social responsiveness, caused by removal of its mother to which it is bonded (Immelman and Beer 1989, 73, 265).

stretching syndrome *n.* Stretching and yawning behavior (Tembrock 1964, etc., in Heymer 1977, 100).

cf. behavior: comfort behavior; yawning

Williams syndrome *n.* A human disease syndrome that includes these symptoms: often elfin facial features, extraordinary language skills for a person with his IQ, extreme friendliness, hernias, a hoarse voice, joint abnormalities, usually mental retardation

(with an average IQ of 60 which causes trouble crossing a street, making monetary change, and tying shoes without help), poor visual-construction cognition, premature skin aging, and supravalvular aortic stenosis (a heart defect) (Blakeslee 1996, 23 July, C3, illustration).

Comment: The genes related to Williams syndrome are on chromosome-7. Some people show partial Williams syndrome in that they have only some of the symptoms listed above (Blakeslee 1996, 23 July, C3).

young-male syndrome *n.* Younger human males' tending to be more competitive and taking risks that lead to more violence than older males (Wilson and Daly 1985, 59).

♦ **syndynamics** See study of: dynamics.

♦ **syncology** See study of: ecology.

♦ **synechthran** See symbiont: synechthran.

♦ **synecthry** See symbiosis: synecthry.

♦ **synergism, synergy** *n.*

1. Cooperative action of two, or more, agencies, such that the total is greater than the sum of the component actions (Lincoln et al. 1989), e.g., two hormones' having a joint effect on an animal that neither has alone (Immelman and Beer 1989, 303).

cf. antagonism

2. The cooperative action of two microorganisms that effects a change that would not occur, or would take place at a slower rate, in axenic culture (Lincoln et al. 1989).

See symbiosis: mutualism.

♦ **synethogametism** *n.* "Gametic compatibility;" gametes' abilities to fuse (Lincoln et al. 1989).

synethogametism, aethogametism *n.* "Gametic incompatibility; the inability of two apparently compatible gametes to fuse" (Lincoln et al. 1989).

♦ **syngameon** See ²species: semispecies.

♦ **syngamate** See gamete: syngamate.

♦ **syngamic sex determination** See sex determination.

♦ **syngamodeme** See deme: gamodeme: syngamodeme.

♦ **syngamy** See -gamy: syngamy.

♦ **syngensis** See -genesis: syngensis.

♦ **syngenic** See -genic: syngenic.

♦ **syngogeographs** See geographical equivalents.

♦ **syngony** *n.* Production of both male and female gametes in the same gonad (Lincoln et al. 1989).

adj. syngonic

♦ **synhesma** See ²group: swarm.

♦ **synhospitalic parasite** See parasite: synhospitalic parasite.

♦ **synkaryon** *n.* A zygote nucleus formed from the fusion of gametic nuclei (Lincoln et al. 1989).

♦ **synkaryotoky** See -ploidy: diploidy.

♦ **synmorphology** See study of: synmorphology.

♦ **synoecete, synecete** See symbiont: synoekete.

♦ **synoecius** See -oecious: synoecius.

♦ **synoecy** See: -oecism: synoecy.

♦ **synoekete** See symbiont: synoekete.

♦ **synomone** See chemical-releasing stimulus: semiochemical: allelochemic: synomone.

♦ **synpiontology** See study of: synpiontology.

♦ **synsystematics** See study of: systematics: synsystematics.

♦ **syntaxics** See study of: semiotics (def. 3); study of signals: syntaxics.

♦ **syntax** *n.*

1. Grammar rules that govern how words are combined to form phrases, clauses, and sentences (Oxford English Dictionary 1972, entries from 1613; Immelmann and Beer 1989, 304).

2. An individual animal's combining and ordering its signals, especially where combining particular signals may convey different information, or produce different effects, from those of the signals used in isolation (Immelmann and Beer 1989, 304).

♦ **syntaxonomy** See study of: taxonomy: syntaxonomy.

♦ **syntechny** See ²evolution: convergent evolution.

♦ **synthesia** See -thesis: synthesis.

♦ **synthetic method** See study of: systematics: evolutionary systematics.

♦ **synthetic theory of classification** See study of: systematics: evolutionary systematics.

♦ **synthetic theory of evolution** See ²evolutionary synthesis.

♦ **synthetic lethal** See chromosome: synthetic lethal; gene: synthetic lethal.

♦ **syntroph** See -troph-: syntroph.

♦ **synxenic** See -xenic: synxenic.

♦ **synzoochore, synzoochorous** See -chore: synzoochore.

♦ **syringograde** See -grade: syringograde.

♦ **syrtidium** See ²community: syrtidium.

♦ **syrtidophile, syrtidophilus, syrtidophily** See ⁻¹phile: syrtidophile.

♦ **system** *n.*

1. A set, or assemblage, of things connected, associated, or interdependent, so as to form a complex unity; a whole that is composed of parts in orderly arrangement according to some plan or scheme (Oxford English Dictionary 1972, entries from circa 1638).

2. Scientifically and technically, a group, set, or aggregate of natural, or artificial, things that form a connected, or complex, whole (Oxford English Dictionary 1972, entries from 1830).

adapted system *n.* A kind of teleology that asserts that organism structures were designed by God to perform particular functions (Mayr 1982, 49). *cf.* teleology

alarm-defense system *n.* Defensive behavior that also functions as an alarm-signaling device within a colony, *e.g.*, certain ant species' secreting chemical-defensive compounds that double as alarm pheromones (Regnier and Wilson 1968, 955, 1969, 893; Wilson and Regnier 1971, 279).

alarm-recruitment system *n.* A communication system that rallies others to some particular place to aid in the defense of their society, *e.g.*, the odor trail system of "lower" termites that is used to recruit colony members to the vicinity of intruders and breaks in their nest wall (Wilson 1975, 48).

attachment-behavior system *n.* A control system that presumably integrates attachment behavior (Hinde 1982, 228).

breeding system *n.* The mode, pattern, and extent to which individuals interbreed with others from the same or different taxa (Lincoln et al. 1985). *cf.* mating system

central-place system *n.* For example, in species of nest-using annelids, arthropods, molluscs, and vertebrates: A form of spatial organization in which one, or more, individuals, or other social units, focuses its activities around a single central location such as a

breeding colony, den, nest site, or roosting site (Wittenberger 1981, 613).

communication system *n.* A means of conveying information that involves seven essential components: a channel, code, context, noise, receiver, sender, and signal (Sebeok 1965; Klopfer and Hatch 1968 in Dewsbury 1978, 99).

complex system *n.*

1. A system in which "the whole is more than the sum of the parts, not in an ultimate, metaphysical sense but in the important pragmatic sense that, given the properties of the parts and the laws of their interaction, it is not a trivial matter to infer the properties of the whole" (Simon 1962 in Mayr 1982, 53); *e.g.*, a cell nucleus, a cell, an organ system, an individual organism, a society, an ecosystem, and the Solar System.

2. A system with a multiplicity of interactions (inferred from Lewontin 2000, 112).

dominance system See hierarchy: dominance hierarchy.

ecosystem *n.*

1. An area of nature that includes living organisms and nonliving substances that interact and produce an exchange of materials between its living and nonliving parts (Odum 1969, 10).

2. All of the organisms of a particular habitat plus the physical environment in which they live (Wilson 1975, 583).

3. The entire biological and physical content of a biotope (Lincoln et al. 1985).

syn. ecological system (Odum 1969, 10)

Comments: "Bioinert body" (Vernadsky 1944), "biotic system" (Thienemann 1939), "holocoen" (Friederichs 1930), and "microcosm" (Forbes 1887), are terms that basically express the concept of "ecosystem" (Odum 1969, 10). Ecosystems vary in size and complexity from, *e.g.*, the ecosystem inside a sponge or the ecosystem of the entire Earth. The human-forearm ecosystem has at least 182 bacterial species (Stein 2007, A6).

► **riparian ecosystem** *n.* The ecosystem in a stream channel between the low- and high-water marks and the terrestrial landscape above the high-water mark where vegetation may be influenced by elevated water tables or extreme flooding and by the ability of the soils to hold water (Naiman et al. 1993 in Nilsson and Berggren 2002, 783).

Comment: Riparian ecosystems include floodplain areas with angiospermous trees and shrubs on heterogeneous substrates, deltas with distinct plant zonation, spruce strips with dense moss on periodically frozen ground, and well-developed forests with diverse communities (Nilsson and Berggren 2002, 783).

Free Air CO₂ Enrichment System (FACE System) *n.* A 30-m-diameter, circular plenum that delivers air to an array of 32 vertical pipes, with adjustable ports every 50 cm, to organisms within the circle; contrasted with closed-growth chambers and open-top growth chambers (DeLucia et al. 1999, 1177–1178, illustration).

Comments: For example, the FACE System can deliver ambient air and CO₂-enriched air to a 14-m tall forest of Loblolly Pines (DeLucia et al. 1999, 1177).

genetic system *n.* The organization of a species' genetic material and reproductive strategy (Lincoln et al. 1985).

inheritance-of-acquired-characteristics system (IAC system) *n.* The phenomenon in which all, or a large proportion, of individual organisms, or cell cultures, exhibit new traits that they pass on to succeeding generations after they are briefly exposed to a chemical, or physical, treatment, under conditions that allow little, or no, growth, thereby ruling out selection of mutants (Landman 1991, 2).
cf. Lamarckism

Comments: Landman (1991) describes IAC systems in organisms including bacteria, *Drosophila*, mice, and protozoa. He also describes “extranucleic IAC systems,” “epinucleic IAC systems,” and “nucleic IAC systems.”

global-positioning system (GPS) *n.* A worldwide radio-navigation system that uses 24 satellites and their ground stations to determine one's position (altitude, latitude, and longitude) on Earth (Trimble Navigation Limited 1996–2000, 21 November).

Comment: Early GPS could calculate one's position to a matter of meters; advanced forms of GPS can determine one's position to the nearest centimeter.

Linnaean system (of nomenclature) *n.* An integrated set of principles and rules that govern the naming of taxa and the application of taxon names and that is based on the Linnaean hierarchy (*q.v.*) of taxonomic categories (www.ohiou.edu/phylocode 2000, glossary).

Comments: “Linnaean” here refers not specifically to the categories used by Carolus Linnaeus himself, but to the set of categories derived from the set used by Linnaeus. Most 20th-century taxonomists adopted the derived set and used it (at least in part) as the basis for the International Code of Botanical Nomenclature, the International Code of Zoological Nomenclature (*q.v.*), and the International Code of Nomenclature of Bacteria. The PhyloCode (*q.v.*) abandons the Linnaean system.

syn. traditional system

mating system See mating system.

memory system *n.* For example, in Humans, one of many systems that enables us to remember past experiences and skills, *e.g.*, a memory system for riding a bicycle, one for drawing, and one for typing words (Lemonick 1999, 13 September, 56).

Comment: Memory systems work in concert, enabling us to have our complex behavior.

mimicry system *n.* An ecological relationship that includes two, or more protagonists that perform three roles: being a model, a mimic, or a dupe (Pasteur 1982, 169).

See “mimicry” for kinds of mimics involved in mimicry systems.

Comment: In organismic mimicry systems, there is a model (a living, or material, agent that emits perceptible stimuli or signals), a mimic (an organism that plagiarizes the model), and a dupe (an animal enemy, or victim, of the mimic that senses the model's signals and, is thus, deceived, by the mimic's similar signals) (Pasteur 1982, 169).

bipolar mimicry system *n.* A mimicry system in which two of the protagonists belong to one species and the third protagonist belongs to another species (Vane-Wright 1976 in Pasteur 1982, 178).

conjunct mimicry system *n.* A mimicry system in which all three protagonists belong to the same species (Vane-Wright 1976 in Pasteur 1982, 178).

SOME MIMICRY SYSTEMS^a

- I. camouflage mimicry system (model not of interest to a dupe)
 - A. cryptic mimesis mimicry system
 - B. eucrypsis-mimicry system
 - C. mimesis mimicry system
 - D. phaneric-mimesis mimicry system
- II. homotype mimicry system (model of interest to dupe)
 - A. actual-model mimicry system
 - 1. model-forbidding-to-dupe mimicry system
 - a. arithmetic mimicry system
 - b. Batesian mimicry system
 - c. Browerian mimicry system (automimicry)
 - d. Gilbertian mimicry system
 - e. Müllerian mimicry system
 - f. Wicklerian-Guthrian mimicry system
 - 2. model-agreeable-to-dupe mimicry system
 - a. Aristotelian mimicry system
 - b. Bakerian mimicry system
 - c. Batesian-Pouyannian mimicry system
 - d. Batesian-Wallacian mimicry system
 - e. Dodsonian mimicry system
 - f. Kirbyan mimicry system
 - g. Pouyannian mimicry system
 - h. Wasmannian mimicry system
 - i. Nicolaian mimicry system
 - j. Wicklerian-Barlowian mimicry system
 - k. Wicklerian mimicry system
 - l. Wicklerian-Eisnerian mimicry system
 - m. Vavilovian mimicry system
 - B. virtual-model mimicry system
 - 1. definable-model mimicry system
 - 2. nondefinable-model mimicry system

^a Pasteur (1982).

disjunct mimicry system *n.* A mimicry system in which each protagonist is a different species (Vane-Wright 1976 in Pasteur 1982, 178).

model-mimic-dupe-tripartite system *n.* A system comprising a model, mimic, and dupe (Vane-Wright 1976 in Pasteur 1982, 178).

Comments: In this system the model, mimic, and dupe may all be the same species or one to all of them may be different species; in some cases the model is not an organism, but rather a thing such as a replica of an organism, a rock, or sand.

model-versus-mimic-dupe-bipolar mimicry system *n.* A model-mimic-dupe-tripartite system in which two of the three parts are the same species (Vane-Wright 1976 in Pasteur 1982, 178).

► **“S1/S2R mimicry system”** *n.* A model-mimic-dupe-tripartite system in which the model is one species and the mimic and dupe are a second species (Vane-Wright 1976 in Pasteur 1982, 178).

Comments: In S₁/S₂R, the slash separates the two species involved. S₁ = the first sender (= model); S₂ = second sender (= mimic); R = receiver (= dupe).

► **“S1S2/R mimicry system”** *n.* A model-mimic-dupe-tripartite system in which the model and mimic are one species and the dupe is a second species (Vane-Wright 1976 in Pasteur 1982, 178).

Comment: This system is “automimicry” when the model and mimic are different conspecific individuals and “self-mimicry” when the model and mimic are the same individual.

► **“S1R/S2 mimicry system”** *n.* A model-mimic-dupe-tripartite system in which the model and dupe are the same species and the mimic is a second species (Vane-Wright 1976 in Pasteur 1982, 178).

moral system, morality *n.* A person's system of ethics, or normative conduct; the question of how agreements, or contracts, about right and wrong are generated and maintained within human societies, and why they differ (Alexander 1987, 12).

natural system *n.* The hidden bond of taxonomic connection sought by naturalists and eventually designated “descent” by Darwin (Mayr 1982, 437).

specific-mate-recognition system *n.* “The subset of adaptations, which are involved in signaling between mating partners or their cells” (Paterson 1981, 113, 1985, 24).

Comment: This system relates to the “recognition concept of species,” *q.v.*

social system *n.* In some animal species (*e.g.*, Bottlenose Dolphins, Chimpanzees, Elephants, and Humans): A species' spatial distributions of its individuals and their associations within their groups, including associations between sexes, extrafamilial social relationships, and intragroup relationships (Immelmann and Beer 1989, 277).

subsurface-lithoautotrophic-microbial ecosystem (SLiME) *n.* An ecosystem in the Earth's crust in which autotrophic bacteria (acetogens) live in basalt, use hydrogen gas for energy, derive carbon from inorganic carbon dioxide, and excrete simple organic compounds consumed by other kinds of bacteria (Fredrickson and Onstoot 1996, 72).

cf. -troph-: acetogen

♦ **²system** *n.*

1. An animal's set of organs, or parts, of the same, or similar, structure, or that have the same function (Oxford English Dictionary 1972, entries from 1740); *e.g.*, endocrine system, circulatory system (blood-vascular system), lymphatic system, nervous system, reproductive system, and respiratory system.

syn. physiological system (Immelmann and Beer 1989, 221)

Note: “System” is now commonly extended to sets of behaviors.

2. In the more evolutionarily derived plants: Each of the primary groups of tissues (Oxford English Dictionary 1972, entries from 1875).

action system See pattern: behavior pattern.

active-sensory system *n.* An individual animal's perceptual system that involves its actively emitting energy and perceiving environmental objects on the basis of energy-pattern alterations that return to it, *e.g.*, an echolocation system in bats, oilbirds, or porpoises (Dewsbury 1978, 186).

behavioral system See cycle: functional cycle.

endocrine system *n.* For example, in Arthropods and Vertebrates: A system composed of endocrine glands and hormones that affects an animal's behavior and other biological features (Curtis 1983, 667).

cf. hormone; ²system: neurendocrine system

hypothalamohypophyseal system *n.* In more derived animals: An “interface” system between an individual animal's central nervous system and its endocrine system (Immelmann and Beer 1989, 222).

intentional system *n.* An animal's system “whose behavior can be (at least sometimes) explained and predicted by relying on ascriptions to the system of beliefs and desires (and other intentionally

characterized features) — what I will call intentions here, meaning to include hopes, fears, intentions, perceptions, expectations, etc.” (Dennett 1978 in McFarland 1985, 502).

motivational system *n.* The causal regulation that underlies an individual animal's particular kind of behavior (Immelmann and Beer 1989, 193).

Comment: “Motivational system” supersedes the concept of a “specific drive” for each kind of behavior (Immelmann and Beer 1989, 193).

neurendocrine system, neuroendocrine system *n.* In many animal species: An individual's nervous system plus its endocrine system.

nervous system *n.* In Cnidaria and more derived animal phyla: An organized constellation of nerve cells and associated nonnerve cells (Bullock 1977 in McFarland 1985, 174).

cf. nerve net, ²system: neurendocrine system, receptor

DIVISIONS OF A VERTEBRATE NERVOUS SYSTEM^a

- I. central nervous system
- II. peripheral nervous system
 - A. sensory nervous system
 - B. motor nervous system
 - 1. somatic nervous system
 - 2. autonomic nervous system
 - a. sympathetic nervous system
 - b. parasympathetic nervous system

^a Curtis (1983, 763).

► **autonomic nervous system** *n.* In Vertebrates: An individual's parasympathetic and sympathetic nervous systems; contrasted with somatic nervous system (McFarland 1985, 181).

Comment: These two nervous systems mediate control over an animal's blood vessels, certain glands, and heart (McFarland 1985, 181). Autonomic activity can cause defecation, feather ruffling, hair erection, and urination depending on the taxon (Immelmann and Beer 1989, 23–24).

parasympathetic nervous system *n.* Part of an individual's autonomic nervous system that is anatomically distinct from its sympathetic nervous system (McFarland 1985, 524).

syn. cholinergic nervous system (American Academy of Allergy, Asthma, and Immunology 1998, S-10)

Comments: An animal's parasympathetic nervous system serves a recuperative function after stress by restoring its blood supply to normal, relaxing curbs on its digestion, and counteracting other effects of its sympathetic nervous system (McFarland 1985, 524).

sympathetic nervous system *n.* Part of an autonomic nervous system with nerve pathways that become active under stress, or exertion, and have an emergency function (McFarland 1985, 524).

Comments: The sympathetic nervous system increases blood supply to an animal's brain, heart, lungs, and muscles; increases its heart rate; and reduces blood supply to its intestines and peripheral body parts. In Humans, this system causes emotional arousal which includes increased heart rate, sweating, and changes in peripheral blood

circulation causing a person's face to become pale or flushed (McFarland 1985, 524).

► **central nervous system (CNS)** *n.* In Vertebrates: A brain plus spinal cord; in Platyhelminths: the anterior ganglion and two nerve cords (McFarland 1985, 176); in annelids: ganglia and a ventral nerve cord; in arthropods: a brain, ganglia, and ventral nerve cord (Barnes 1974).

cf. brain, peripheral nervous system

Comment: The CNS coordinates activities of individual organs, processes incoming messages from sense organs, and in accordance with sensory and stored information, regulates an animal's behavior as a whole (Immelmann and Beer 1989, 42).

► **extrapyramidal system** *n.* In Vertebrates: All non-reflex motor pathways not included in an individual's pyramidal system, *q.v.* (McFarland 1985, 242).

► **peripheral nervous system** *n.* In Vertebrates: The part of an individual's nervous system that includes sensory (afferent) and motor (efferent) pathways that carry information to and from its central nervous system (Curtis 1983, 763–767).

► **pyramidal system, corticospinal system** *n.* In Mammals, except Monotremes: An individual's most important pathway involved in its voluntary movement control; it begins in the individual's motor cortex and proceeds through its midbrain and brainstem to its spinal cord (McFarland 1985, 242). *cf.* ²system: nervous system: extrapyramidal system

► **somatic nervous system** *n.* In Vertebrates: The part of an individual's motor nervous system that carries sensory information from its central nervous system and its commands to skeletal muscles that cause bodily movement (McFarland 1985, 180).

physiological system See ²system.

reproductive system *n.* In organisms: A means by which an individual produces offspring, including apomixis, automixis, endomitosis, outcrossing, panmixia, selfing, and vegetative reproduction (Bernstein et al. 1985, 1279).

See parthenogenesis.

reticular-activating system *n.* In more derived animals: A system in a brain-stem whose activity is related to an individual's state of arousal (Hinde 1982, 281).

sensory system *n.* A system of receptors, sense organs, and sensory pathways to an animal's central nervous system and the receiving, or projecting, areas in its central nervous system that serve a particular modality; *e.g.*, the visual system of a vertebrate (Immelmann and Beer 1989, 264).

♦ **system** *n.* An organism's entire body that is taken as a functional whole (Michaelis 1963).

♦ **systematic mutation, systemic mutation** See ³mutation: systemic mutation.

♦ **systematics** See study of: systematics.

♦ **systematization** *n.* Production of a natural classification of organisms based on phylogenetic relationships (Lincoln et al. 1989).

♦ **systemic** *n.* Referring to a compound that is absorbed and translocated throughout an organism (Ware 1983, 287).

adj. systemic

♦ **systemic fitness** See fitness: inclusive fitness.

♦ **systemic mutation** See ³mutation: systemic mutation.

♦ **systems ecology** See study of: ecology: ecosystem ecology.

t

- ♦ **t** See temperature.
- ♦ **ta** See temperature: ambient temperature.
- ♦ **tabula rasa** *n., pl. tabulae rasae*
 1. A tablet whose writing is erased, and thus, ready to be written on again (Oxford English Dictionary 1972, entries from 1535).
syn. clean slate (Michaelis 1963)
 2. A human mind before its being exposed to experience (Oxford English Dictionary 1972, entries from 1662, quote from Aristotle; Michaelis 1963).
See hypothesis: *tabula rasa*.
cf. learning theory
[Latin scraped tablet, an empty or clean tablet, a clean slate]
- ♦ **tachy-** *comb.f.* Speed; swiftness (Michaelis 1963).
[Greek *tachys*, swift]
- ♦ **tachyauxesis** See auxesis: heterauxesis: tachyauxesis.
- ♦ **tachygamy** See mating system: tachygamy.
- ♦ **tachygen** *n.* A trait that appears suddenly in phylogeny (Lincoln et al. 1985).
- ♦ **tachygenesis** See ²evolution: tachygenesis.
- ♦ **tachymetabolism** See metabolism: tachymetabolism.
- ♦ **tachytely** See ²evolution: tachytely.
- ♦ **tactic** *n.*
 1. An organism's "behavior pattern within a species' repertoire that can potentially be employed in a specified context to achieve a particular goal," contrasted with strategy, *q.v.* (Wittenberger 1981, 622).
 2. An organism's set of coadapted traits (Lincoln et al. 1985).
 3. One of an organism's trait, that is part of a suite of traits that compose a strategy, *q.v.* (Wootton 1984, 12; Gross 1984, 58).
syn. strategy (a confusing synonym; Lincoln et al. 1985; Wootton (1984, 1) who, with others, distinguishes between "strategy" and "tactic")
- ♦ **tactic** *adj.* Pertaining to a taxis (Lincoln et al. 1985).
cf. strategy, tactics
- ♦ **tactical deception** See deception: tactical deception.
- ♦ **tactics** *n. pl.* (construed as singular). The art, or science, of deploying military, or naval, forces in battle, and of employing warlike maneuvers (Oxford English Dictionary 1972, entries from 1626).
syn. tactic (sometimes, Oxford English Dictionary 1972)
cf. tactic
- ♦ **tactile eucrypsis** See mimicry: tactile eucrypsis.
- ♦ **tacitism** See taxis.
- ♦ **tagmosis** *n.*
 1. The condition of specialization of the entire set of limbs on an arthropod body (Flessa et al. 1975, 72).
 2. An arthropod's body organization into segment groups of more, or less, united segments that form distinct trunk sections or tagmata (Snodgrass in Torre-Bueno 1978; Nichols 1989).
Comment: Flessa et al. (1975, 72) measure tagmosis in arthropods using the Brillouin Expression.
- ♦ **taphephobia** See -phobia: taphephobia.
- ♦ **tail bite** See bite: tail bite.
- ♦ **tail-down swimming** See swimming: tail-down swimming.
- ♦ **tail flagging** *n.* For example, in *Odocoileus virginianus* (White-tailed Deer): An individual's lifting its tail and exposing its white, erected hairs on its rump and ventral surface of its tail (LaGory 1987, 20).
Comment: This is part of its alarm behavior (LaGory 1987, 20).
cf. behavior: alarm behavior; display; signal: alarm signal
- ♦ **tail mimicry** See mimicry: tail mimicry.
- ♦ **tail posture** See display: tail display.
- ♦ **tail-up swimming** See swimming: tail-up swimming.
- ♦ **t allele** See allele: t allele.
- ♦ **tameness** *n.* A wild animal's showing no fleeing tendency with regard to a Human, and possibly staying in his vicinity, approaching him for food, or both (Immelman and Beer 1989, 305).
- ♦ **taming** *n.*
 1. A person's domesticating another animal individual, variety, or species (Michaelis 1963).
 2. In agriculture, a person's bringing a taxon under cultivation; a person's producing a taxon by cultivation (Michaelis 1963).
 3. A wild animal's losing its tendencies to flee from a Human (Hale 1969, 22, in Dewsbury 1978, 267).
 4. A wild animal's progressively reducing and eliminating its initial fleeing tendencies and negative reactions toward a Human during interactions with him and possibly showing staying in his vicinity, approaching him, or her, for food, or both (Immelman and Beer 1989, 305).
syn. imprinting [in some cases, but this is a confusing synonym (Immelman and Beer 1989, 305)]
cf. domestication, socialization
- adv.* tamely
n. tamer, tameness
v.t. tame
[Old English *tam*]

- ♦ **tandem calling** See calling: tandem calling.
- ♦ **tandem evolution** See ²evolution: tandem evolution.
- ♦ **tandem running** See recruitment: tandem running.
- ♦ **tandem selection** See selection: tandem selection.
- ♦ **tannic acid** See molecule: tannic acid.
- ♦ **taphrium** See ²community: taphrium.
- ♦ **taphrophile** See ⁻¹phile: taphrophile.
- ♦ **target theory of mutation** See ²theory: hit theory.
- ♦ **target organ** See organ: target organ.
- ♦ **tangled-bank hypothesis** See hypothesis: hypotheses of the evolution and maintenance of sex: tangled-bank hypothesis.
- ♦ **tarsal organ** See gland: tarsal organ.
- ♦ **taste aversion** *n.* An animal's learning to avoid eating a food again that causes noxious, or poisonous, effects on it, *e.g.*, a potential predator's learning to avoid arthropod mimicry models (Immelmann and Beer 1989, 306).
- ♦ **tattooing** See animal sounds: drumming.
- ♦ **tautology** *n.*
 1. A statement, with repeated parts, that is necessarily true by virtue of its structure: Either it is raining, or it is not raining (Oxford English Dictionary 1972, entries from 1659; Michaelis 1963).
 2. An aggregate of linked propositions (whose truth is not claimed) in which the validity of the links between them cannot be doubted, *e.g.*, Euclidean geometry (Bateson 1979, 245).

cf. survival of the fittest
 [Late Latin *tautologia* < Greek *tauto*, the same + *logos*, discourse]
- ♦ **tautomorphism** See -morphism: tautomorphism.
- ♦ **taximetrics** See study of: taxonomy: numerical taxonomy.
- ♦ **-taxis, taxy** *comb. f.* Order; disposition; arrangement (Michaelis 1963).
 [Greek *taxis*, arrangement]
- ♦ **xerotaxis** *n.* "The condition of a plant succession that remains unaffected by drought" (Lincoln et al. 1985).
- ♦ **zygotaxis, zygotactism** *n.* "The mutual attraction between male and female gametes" (Lincoln et al. 1985).
cf. tropism: gamotropism
- ♦ **taxis** *n.*
 1. In motile organisms: An individual's reaction to a particular stimulus by moving toward it (Oxford English Dictionary 1971, entries from 1904).
 2. In organisms and some individual cells: An involuntary movement made in response to an external stimulus (Michaelis 1963).
cf. reflex
 3. An organism's maintaining its body position, changing its body position, or both, with regard to stimulus direction (Kühn 1919; Fraenkel and Gunn 1961; Schöne 1973 in Immelmann and Beer 1989, 306).
Note: This definition seems appropriate for wide use.
 4. Broadly, taxis (def. 3) plus kinesis, *q.v.* (Heymer 1977, 125).
 5. Ethologically speaking, an oriented (directed) movement that occurs along with a fixed-action pattern (Dewsbury 1978, 19).

syn. orientation, tactism (Lincoln et al. 1985); tropism (a currently nonfavored *syn.*)

SOME CLASSIFICATIONS OF TAXES^a

- I. Classification based on temporal aspects of stimulus reception
 - A. klinotaxis (*syn.* phobotaxis, scanning orientation, trial-and-error orientation)
 - B. tropotaxis (tropic orientation)
- II. Classification based on kind of stimulus and stimulus reception^a
 - A. aerotaxis (including prosaerotaxis)
 - B. allelothetic orientation
 - C. anemotaxis
 - 1. anemomenotaxis
 - 2. odor-conditioned anemotaxis
 - D. argotaxis
 - E. astrotaxis (*syn.* star orientation)
 - F. barotaxis
 - G. biotaxis
 - H. celestial-body taxis
 - I. chemotaxis (*syn.* chemiotaxis) (including tropochemotaxis)
 - J. clinotaxis (klinotaxis)
 - K. diaphototaxis
 - L. galvanotaxis (*syn.* electrotaxis, topogalvanotaxis)
 - M. geomagnetotaxis (*syn.* magnetic-compass taxis)
 - N. geotaxis
 - O. hydrotaxis (including aphydrotaxis)
 - P. idiothetic orientation
 - Q. local orientation
 - R. menotaxis (*syn.* compass orientation, compass taxis, constant-angle taxis, direction taxis)
 - 1. light-compass taxis (*syn.* light-compass orientation, light-compass orientation, light-compass reaction)
 - 2. star-compass taxis
 - S. navigation (including true navigation)
 - T. object taxis
 - U. oxygenotaxis (*syn.* oxytaxis)
 - V. phobotaxis
 - W. phonotaxis
 - X. phototaxis (*syn.* heliotaxis, phototropotaxis)
 - 1. aphototaxis
 - 2. dorsal-light reaction
 - 3. photohoramotaxis (*syn.* photohorotaxis)
 - 4. photophobotaxis
 - 5. polarized-light taxis
 - 6. ultraviolet-light taxis
 - 7. ventral-light reaction
 - Y. pneumatotaxis (*syn.* pneumotaxis)
 - Z. remote orientation
 - AA. rheotaxis
 - BB. scototaxis (*syn.* skototaxis)
 - CC. seismotaxis (*syn.* vibrotaxis)
 - DD. sonotaxis
 - EE. strophotaxis
 - FF. telotaxis (*syn.* goal orientation, landmark orientation, pharotaxis, pilotage)
 - GG. thermotaxis (including apothermotaxis)
 - HH. thigmotaxis (*syn.* stereotaxis)
 - II. tonotaxis (*syn.* osmotaxis)
 - JJ. topographical orientation (*syn.* mnemotaxis, sometimes)
 - KK. traumotaxis (*syn.* tramatotaxis)
 - LL. trophotaxis
- III. Some other kinds of taxes
 - A. primary orientation
 - B. secondary orientation

^a Positive and negative kinds of taxes are not given in this table, but some are defined below.

cf. *Erbkoordination*, kinesis, modality, orientation, *Taxiskomponente*, tocotropism, tropism

Comments: Many workers now use "taxis" with regard to animals or animal-like organisms and "tropism" with regard to plant or plant-like organisms. Some workers (Heymer 1977, 172) use "taxis" with regard to freely moving organisms and tropism with regard to sessile organisms. A taxis may, or may not, involve an organism's locomotion toward, or away from, a stimulus. If an organism moves toward a particular stimulus, it shows a positive taxis, *e.g.*, prosaerotaxis and positive phototaxis (= prophototaxis). If it moves away from a particular stimulus, it shows a negative taxis, *e.g.*, negative phototaxis.

[Greek *taxis*, arrangement (Tinbergen 1951, 87, who translates *Taxiskomponente* as taxis)]

aerotaxis *n.* Taxis with regard to an air-liquid interface, or a concentration gradient of dissolved oxygen (Lincoln et al. 1985).

► **prosaerotaxis** *n.* Positive aerotaxis (Lincoln et al. 1985).

allelothetic orientation *n.* Taxis with regard to external (environmental) stimuli (Mittelstaedt 1973 in Heymer 1977, 125).

cf. taxis: idiothetic orientation

anemotaxis *n.* Taxis with regard to wind (Lincoln et al. 1985).

► **anemomenotaxis** *n.* Taxis across wind (Heymer 1977, 172).

► **odor-conditioned anemotaxis** *n.* Anemotaxis that is initiated or enhanced by an odor, *e.g.*, in some species of insects that can respond to pheromones or host-plant odors (May and Ahmad 1983, 183).

aphydotaxis See taxis: hydrotaxis: aphydrotaxis.

apothermotaxis *n.* No taxis with regard to temperature change (Lincoln et al. 1985).

cf. taxis: thermotaxis

argotaxis *n.* Passive movement with regard to water surface tension (Lincoln et al. 1985).

astrotaxis, star orientation *n.* Menotaxis + distance taxis.

cf. taxis: menotaxis: star-compass taxis

barotaxis *n.* Taxis with regard to a pressure stimulus (Lincoln et al. 1985).

biotaxis *n.* Taxis with regard to a biological stimulus (Lincoln et al. 1985).

celestial-body taxis *n.* Taxis with regard to the Sun or stars (Lincoln et al. 1985).

cf. taxis: astrotaxis, menotaxis

chemotaxis, chemiotaxis *n.* Taxis with regard to chemicals (Lincoln et al. 1985).

► **proschemotaxis** *n.* Positive chemotaxis (Lincoln et al. 1985).

► **tropochemotaxis** *n.* Tropotaxis with regard to chemicals.

clinotaxis *n.* Taxis with regard to a stimulus gradient (Lincoln et al. 1985).

compass orientation, compass taxis See taxis: menotaxis.

constant-angle taxis See taxis: constant-angle taxis.

diaphototaxis *n.* Taxis at a right angle with regard to incident light direction (Lincoln et al. 1985).

direction taxis See taxis: menotaxis.

dorsal-light reaction *n.* In many aquatic-animal species: Taxis in which an individual keeps its dorsum toward a light source (Tinbergen 1951, 93).

cf. taxis: ventral-light reaction
[possibly coined by Tinbergen 1951]

electrotaxis See taxis: galvanotaxis.

galvanotaxis *n.* Taxis with regard to electrical stimuli (Lincoln et al. 1985).

syn. electrotaxis, topogalvanotaxis (Lincoln et al. 1985)

► **prosgalvanotaxis** *n.* Positive galvanotaxis (Lincoln et al. 1985).

geotaxis *n.* In many kinds of animals, *Volvox* species (algae): Taxis with regard to gravity (Lincoln et al. 1985).

geomagnetotaxis, magnetic-compass taxis *n.*

For example, some termite and bird species, a ladybird beetle, Western Honey Bees, possibly Humans, Monarch Butterflies, and Loggerhead Turtles: Taxis with regard to the Earth's magnetism (Middendorf 1855 in Baker 1987, 691; Schneider 1961, Becker 1971, Merkel and Wiltschko 1965, and Lindauer 1973 in Heymer 1977, 113; Baker 1980, 555, 1987, 691; Seachrist 1994, 661; Zimmer 1996, May, 50).

cf. modality: magnetoreception

heliotaxis See taxis: phototaxis.

hydrotaxis *n.* Taxis with regard to water or moisture (Lincoln et al. 1985).

cf. taxis: hygrotaxis

► **aphototaxis** *n.* No taxis with regard to light (Lincoln et al. 1985).

hygrotaxis *n.* Taxis with regard to moisture (Lincoln et al. 1985).

cf. taxis: hydrotaxis

idiopathic orientation *n.* Taxis with regard to internal stimuli (Mittelstaedt 1973 in Heymer 1977, 125).

cf. taxis: allelothetic orientation

klinotaxis *n.* For example, in *Euglena* and maggots of some fly species: Taxis (of an organism with only one sense organ for a particular kind of stimulus) that involves side-to-side, or spinning, movements used to detect changes in the intensity of the stimulus in time and space (Fraenkel and Gunn 1940, 58).

syn. phototaxis, scanning orientation, trial-and-error orientation (Tinbergen 1951, 89)

cf. taxis: tropotaxis

[phobotaxis coined by Kühn (1919 in Tinbergen 1951, 89)]

landmark orientation See taxis: telotaxis.

light-compass taxis, light-compass orientation, light-compass reaction See taxis: menotaxis.

local orientation *n.* Taxis toward a goal that is continuously within an individual's sight or other perception (Lincoln et al. 1985, 125).

cf. taxis: remote orientation

magnetic-compass taxis See taxis: geomagnetotaxis.

menotaxis *n.* For example, in *Apis mellifera* (Western Honey Bees) and *Sturnus vulgaris* (European Starlings): Taxis with regard to a particular compass direction without use of nearby landmarks (McFarland 1985, 251).

syn. compass orientation (McFarland 1985, 245), compass taxis, direction taxis, constant-angle taxis

► **light-compass taxis** *n.* For example, in some ant species: Menotaxis with regard to light direction (Tinbergen 1951, 95).

syn. light-compass orientation, light-compass reaction (Tinbergen 1951, 95)

- **star-compass taxis** *n.* For example, in *Passerina cyanea* (Indigo Buntings): Menotaxis with regard to stars, other than the Sun (Sauer and Sauer 1955 and Emlen and Emlen 1966 in McFarland 1985, 254).
- **sun-compass taxis** *n.* For example, in *Apis mellifera* (Western Honey Bees) and *Columba livia* (Rock Doves): Menotaxis with regard to the Sun (McFarland 1985, 254).
- mnemotaxis** *n.* Taxis based on an animal's memory of a path to a destination (Immelmann and Beer 1989, 307).
See taxis: topographical orientation.
- navigation** *n.* For example, in *Sturnus vulgaris* (European Starlings): A complex form of spatial orientation involving topographical orientation, compass orientation, and true navigation (McFarland 1985, 251).
cf. homing
- **true navigation** *n.* An animal's ability to orient toward a "goal," such as a home or breeding area, without using landmarks and without regard to the goal's direction from the animal (McFarland 1985, 251).
- object taxis** *n.* Taxis with regard to an object (Lincoln et al. 1985).
- osmotaxis** See taxis: tonotaxis.
- oxygenotaxis, oxytaxis** *n.* Taxis with regard to oxygen (Lincoln et al. 1985).
- pharotaxis** See taxis: telotaxis.
- phobotaxis** *n.* Taxis away from a stimulus (Lincoln et al. 1985).
See kinesis.
- phonotaxis** *n.* In many animal species: Taxis with regard to sound, used for danger, enemy, and mate detection and auditory communication (Bailey et al. 1988, 33).
- photohoramotaxis, photohorotaxis** *n.* Taxis with regard to color or a light-pattern (Lincoln et al. 1985).
- photophobotaxis** *n.* Taxis with regard to a temporal change in light intensity (Lincoln et al. 1985).
- **negative photophobotaxis** *n.* Taxis away from an increase in light intensity (Lincoln et al. 1985).
- **positive photophobotaxis** *n.* Taxis toward a decrease in light intensity (Lincoln et al. 1985).
- phototaxis** *n.* Taxis with regard to light (Lincoln et al. 1985).
cf. taxis: diaphototaxis, dorsal-light reaction, photohoramotaxis, polarized-light taxis, scototaxis, ultraviolet-light taxis, ventral-light reaction
syn. heliotaxis, phototropotaxis
- **phototropotaxis** *n.* For example, in some planarian species: Tropotaxis with regard to light (Immelmann and Beer 1989, 209).
- **prophototaxis, prosphototaxis** *n.* Positive phototaxis (Lincoln et al. 1985).
- phototropotaxis** See taxis: phototaxis.
- pilotage** See taxis: topographical orientation.
- pneumatotaxis, pneumotaxis** *n.* Taxis with regard to dissolved carbon dioxide or other gas (Lincoln et al. 1985).
- polarized-light taxis** *n.* For example, in *Apis mellifera* (Western Honey Bees): Taxis with regard to polarized light (McFarland 1985, 257).
- polytaxis** See polytaxis.
- positive phototaxis** See taxis: phototaxis: positive phototaxis.

- positive rheotaxis** See taxis: rheotaxis: positive rheotaxis.
- primary orientation** *n.* Taxis that controls body posture (Heymer 1977, 125).
cf. taxis: secondary orientation
- photototaxis** See taxis: phototaxis.
- prosaerotaxis** See taxis: aerotaxis: prosaerotaxis.
- proschemotaxis** See taxis: chemotaxis: proschemotaxis.
- prosgalvanotaxis** See taxis: galvanotaxis: prosgalvanotaxis.
- remote orientation** *n.* Taxis toward a goal that is not continuously within an individual's sight or other perception even if the goal is relatively close (Lincoln et al. 1985, 125).
cf. taxis: local orientation
- rheotaxis** *n.* Water-current, or air-current, taxis (Lincoln et al. 1985).
- **negative rheotaxis** *n.* Rheotaxis against a current.
- **positive rheotaxis** *n.* Rheotaxis with a current.
- scototaxis, skototaxis** *n.* Taxis with regard to a dark place; distinguished from negative phototaxis (Lincoln et al. 1985).
cf. negative phototaxis
- secondary orientation** *n.* Taxis that controls an individual's response to an environmental stimulus (Heymer 1977, 125).
cf. taxis: primary orientation
- seismotaxis, vibrotaxis** *n.* Taxis with regard to vibration or physical shock (Lincoln et al. 1985).
- skototaxis** See taxis: scototaxis.
- sonotaxis** *n.* Taxis with regard to sound.
- space orientation** See modality: kinesthesia.
- stereotaxis** See taxis: thigmotaxis.
- strophotaxis, strophism** *n.* An organism's twisting movement in response to an external stimulus (Lincoln et al. 1985).
- sun-compass taxis** See taxis: menotaxis.
- telotaxis** *n.* In many arthropod, cephalopod, and vertebrate species: Taxis with regard to a single stimulus (object) without reference to other sources of stimulation (Lincoln et al. 1985).
syn. landmark orientation, goal orientation, pharotaxis (Tinbergen and Kruyt 1983 in Tinbergen 1951, 95)
Comments: Telotaxis can involve an animal's locomotion toward a "goal stimulus" which can be a learned one, e.g., a wasp's going to her burrow. Animals achieve telotaxis by use of their echolocation, electric-field sensitivity, infrared sensitivity, and vision, depending on the species (Immelmann and Beer 1989, 209).
- thermotaxis** *n.* Taxis with regard to heat or infrared electromagnetic waves (Lincoln et al. 1985).
- thigmotaxis, stereotaxis** *n.* Taxis with regard to continuous contact with a solid surface (Lincoln et al. 1985).
- tonotaxis, osmotaxis** *n.* Taxis with regard to continuous contact with an osmotic pressure or osmotic stimulus (Lincoln et al. 1985).
- tropochemotaxis** See taxis: chemotaxis.
- topogalvanotaxis** See taxis: galvanotaxis.
- topographical orientation** *n.* For example, in some fossorial bee and wasp species and Humans: Taxis with regard to familiar landmarks.
syn. mnemotaxis [presently unpreferred, coined by Kühn (1919 in Tinbergen 1951, 97)], pilotage (McFarland 1985, 251)
cf. taxis: mnemotaxis, navigation

topotaxis *n.* Taxis with regard to spatial differences in stimulus intensity, especially with reference to stimulus source (Lincoln et al. 1985).

traumataxis, traumotaxis *n.* Organism, cell, or organelle movement in response to injury (Lincoln et al. 1985).

trophotaxis *n.* Taxis with regard to food (Lincoln et al. 1985).

tropophototaxis See taxis: phototaxis.

tropotaxis *n.* In many organism species: Taxis in which an individual simultaneously detects a particular kind of stimulus from more than one part of its body and, thus, moves without side-to-side, or spinning, motions with regard to this stimulus, *e.g.*, a cat's directly moving away from light [possibly coined by Kühn (1919 in Tinbergen 1951, 11)].

syn. tropic orientation

cf. taxis: klinotaxis

ultraviolet-light taxis *n.* For example, in *Apis mellifera* (Western Honey Bees) and some *Colias* (butterfly) and hummingbird species: Taxis with regard to ultraviolet light (McFarland 1985, 257).

ventral-light reaction *n.* In many aquatic-animal species: Taxis in which an individual keeps its venter toward a light source (Tinbergen 1951, 93).

cf. taxis: ventral-light reaction

vibrotaxis See taxis: seismotaxis.

♦ **taxis component** *n.* A stimulus-dependent taxis in a behavior (Immelmann and Beer 1989, 308).

♦ **Taxiskomponente** *n.* An organism's sequence of reactions to external stimuli that continuously corrects its movement direction in relation to the spatial properties of the organism's environment (Tinbergen 1951, 87).

cf. *Erbkoordination* (Tinbergen 1951, 87)

Comment: *Taxiskomponente* is one of two main components of an organism's oriented movement (Tinbergen 1951, 87). [possibly coined by Kühn (1919 in Tinbergen 1951, 87). Tinbergen translated this term as taxis.]

♦ **taxocene** *n.* A group of species that belong to a particular supraspecific taxon and occur together in the same association (Lincoln et al. 1985).

♦ **taxometrics** See study of: numerical taxonomy.

♦ **taxon** *n., pl. taxa*

1. A group of organisms sufficiently distinct to be worthy of being named and assigned a definite category within a classification [first proposed by Meyer-Abich (1926, 126–137, in Mayr 1982, 207, 869, 960)].

2. Any classificatory division of organisms (Oxford English Dictionary 1972, entries from 1826); any organism group that represents a particular unit of classification, *e.g.*, all the members of a given subspecies, species, genus, etc. (Wilson 1975, 597).

syn. category (which is used erroneously as such, Mayr 1982), group (Oxford English Dictionary 1972)

cf. ²group

Comments: "Group" is used to designate an assemblage of organisms that are not designated to another taxonomic category: Group Insecta (Borror et al. 1989, 147). H. J. Lam presented the term "taxon" at the Utrecht symposium on nomenclature in 1948 (Lawrence 1957, 53). Participants at the International Botanical Congress in 1950 voted to use "taxon" wherever appropriate.

indicator taxon *n.* A taxon that a researcher uses to determine the biodiversity of a particular region (inferred from Lawton et al. 1998, 72).

See ²species: characteristic species.

cf. ²species: indicator species

Comments: It is necessary to study a wide range of taxa (with very different ecologies and life histories) of a particular habitat to monitor changes in biodiversity (Lawton et al. 1998, 72).

♦ **taxon cycle** See cycle: taxon cycle.

♦ **taxonometrics** See study of: taxonomy: numerical taxonomy.

♦ **taxonomic character** See character: species character.

♦ **taxonomic groups** See ²group: taxonomic groups.

♦ **taxonomic level, taxonomic rank** See ²rank.

♦ **taxonomic species** See ²species: Linnaean species.

♦ **taxonomy** See study of: taxonomy.

♦ **taxospecies** See ²species: taxospecies.

♦ **-taxy** *suffix* Directed response of a motile organism. See taxis.

♦ **teaching** *n.* A person's imparting instruction or knowledge; "the occupation or function of a teacher" (Oxford English Dictionary 1972, entries from *ca.* 1175).

syn. tutoring (Michaelis 1963)

Comment: Teaching is known only in Humans and *Pan troglodytes* (Chimpanzees). In *Pan troglodytes*, a sign-language-trained individual attempted to mold and influence the signing performance of a younger companion in a lab (Fouts et al. 1983 in Boesch 1991, 530), and mothers influence their infants' attempts to crack nuts in nature (Boesch 1991, 530). All functions attributed to human tutoring by Wood et al. (1976 in Boesch 1991) seem to be performed by these mothers. [Old English *tæcan*, teach]

♦ **team** See ²group: team.

♦ **teat order** See dominance: teat order.

technology *n.*

1. "Theoretical knowledge of industry and the industrial arts" (Michaelis 1963).

2. The application of science and technological advances in industry, manufacturing, commerce, the arts, or a combination of these things (Michaelis 1963).

3. "The technical language of an art, science, etc." (Michaelis 1963).

4. "The means by which material things are produced, as in a particular civilization" (Michaelis 1963).

recombinant-DNA technology *n.* Techniques used for uniting two heterologous DNA molecules, usually as a result of *in vitro* ligation of DNAs from different organisms (King and Stansfield 1985).

syn. gene splicing, molecular cloning, plasmid engineering (King and Stansfield 1985)

Comment: Experiments in genetic engineering commonly produce recombinant DNA molecules, as exemplified by inserting a human gene that codes for insulin into a bacterial plasmid for cloning (King and Stansfield 1985).

recombinant-RNA technology *n.* Techniques used for uniting foreign RNA molecules, or splice different RNAs, from the same species (King and Stansfield 1985).

Comment: For example, a researcher can construct a heterologous RNA sequence by ligations of two, or more, different RNA molecules with T4-RNA ligase (King and Stansfield 1985).

zymotechnology *n.* Technology that involves organisms used in baking and brewing (Bugos 1993, 121).

- ♦ **tecnophage** See -phage: tecnophage.
- ♦ **team** See ²group: team.
- ♦ **teeth chattering** *n.* For example, in *Macaca arctoides* (Stump-tailed Macaques): An individual's rapidly opening and closing its mouth with bared teeth (Waal 1989, 154).
cf. animal sounds; display: bared-teeth display
- ♦ **teeth grinding** See behavior: threat behavior: teeth grinding.
- ♦ **tegulicole** See -cole: tegulicole.
- ♦ **telegraphic** *adj.* Referring to attracting a mate from a distance (Lincoln et al. 1985).
- ♦ **telekinesis** See -kinesis: telekinesis.
- ♦ **telencephalon** See organ: brain: telencephalon.
- ♦ **teleology** *n.*
 1. The study of a creative design in the processes of nature (Plato, Aristotle, the Stoics in Mayr 1982, 47).
Note: "Teleological" refers to four concepts: "teleonomic activities," "teleomatic processes," "adapted systems," and "cosmic teleology" (Mayr 1982, 48–50).
 2. The doctrine, or study, of ends or final causes, especially related to design or purpose in nature; also transferred to such design exhibited in natural objects or phenomena (Oxford English Dictionary 1972, entries from 1728).
 3. The doctrine that phenomena of life and development can be fully explained only by the action of design and purpose and not by mechanical causes (Michaelis 1963).
Note: This doctrine has been abandoned by today's biologists.
 4. A person's explaining nature, including nonhuman animals, in terms of their utility or purpose, especially divine purpose (Michaelis 1963).
Notes: Most of today's biologists are not teleological in this way. However, some biologists use "short-hand" statements that sound teleological, and could be better written: A sand wasp uses a pebble to tamp her burrow closed. A syrphid-fly species mimics yellowjackets in order to avoid predation. These sentences without teleological constructions are: A sand wasp tamps her burrow closed with a pebble. A syrphid-fly species that resembles a yellowjacket wasp has reduced predation compared to a species that does not resemble a yellowjacket.

5. A person's assumption that a nonhuman animal "has a conscious purpose underlying its behavior," when in fact it might not have this purpose (Dewsbury 1978, 6).
Note: Most of today's animal behaviorists do not make this assumption in their studies.
See study of: teleology.
cf. behaviorism: purposeful behaviorism; teleonomy
Comments: Lennox (1992) discusses the Aristotelian model of teleology, external teleology, immanent teleology (= internal teleology), and the Platonic model of teleology. Technical scientific communication should avoid anthropomorphism (def. 2), teleological constructions, and zoomorphism. Many biological writers evidently unwittingly use teleological constructions (def. 4). [New Latin *teleologia* < Greek *telos*, *teleos*, end + *logos*, discourse; coined by Christian Wolff (1728) to refer to explanations of final causes, an idea known from ancient Greece (Lennox 1992, 324)]

cosmic teleology *n.* A kind of teleology asserting that the Universe has a purpose (Aristotle in Mayr 1982, 50).

- ♦ **dysteleology** *n.*
 1. Denial of purposelessness or "final causes" in nature; opposed to teleology (Oxford English Dictionary 1972, entries from 1874).
 2. Frustration of function, *e.g.*, a bee's taking floral nectar through a hole that it made rather than through a natural floral orifice that would be conducive to cross-pollination (Lincoln et al. 1985).
cf. robber, thief
See study of: dysteleology.
- ♦ **teleomatic processes** *n.* Processes, particularly ones relating to inanimate objects, in which a definite end is reached strictly as a consequence of physical laws; *e.g.*, a falling rock reaches the ground (Mayr 1982, 49).
- ♦ **teleonomic activities** *n.* The processes of an organism's individual development (ontogeny) and its seemingly goal-directed behaviors that are underlain by a genetic program (Pittendrigh 1958 in Mayr 1982, 48).
- ♦ **teleonomy** See study of: teleonomy.
- ♦ **telmatium** See ²community: telmatium.
- ♦ **telmatophile** See ⁻¹phile: telmatophile.
- ♦ **telmicole** See -cole: telmicole.
- ♦ **telmophage** See -phage: telmophage.
- ♦ **telocentric chromosome** See chromosome: telocentric chromosome.
- ♦ **telotaxis** See taxis: telotaxis.
- ♦ **temperate** *adj.*
 1. Referring to the Temperate Zone of the Earth between 23°7' north and the northern polar circle (= Arctic Circle, 66°3' north) and 23°7' south and the southern polar circle (Antarctic Circle, 66°3' south) (Lincoln et al. 1985).
 2. Referring to a climate with long warm summers and short, cold winters; contrasted with polar, subtropical, tropical (Lincoln et al. 1985).
Comment: Much of the contiguous U.S. and Alaska are in the Temperate Zone.
- ♦ **temperate rain forest** See ²community: rain forest.
- ♦ **temperature (t., temp)** *n.* The degree of heat of an organism (Michaelis 1963).
Comment: Bligh and Johnson (1973) define kinds of temperatures in addition to the ones listed below.
[Latin *temperatura*, due measure < *temperatus*]
ambient temperature, dry-bulb temperature
- ♦ **(t_a)** *n.* The average temperature of a gaseous, or liquid, environment (usually air or water) surrounding the body, as measured outside the thermal and hydrodynamic boundary layers that overlie the body (Bligh and Johnson 1973, 954).
Comment: A researcher measures ambient temperature with a thermometer shielded from infrared light (Bligh and Johnson 1973, 955).
- ♦ **core temperature, deep-body temperature** *n.* The average temperature of an organism's tissues that are below tissues directly affected by a temperature-gradient change through its peripheral tissues (Bligh and Johnson 1973, 955).
Comments: Researchers cannot measure core temperature accurately, and they generally represent it by a specific core temperature, *e.g.*, rectal temperature (Bligh and Johnson 1973, 955).
- ♦ **effective temperature (T_{eff})** *n.* An arbitrary index that combines in a single value the effect of air movement, humidity, and temperature on a person's feeling of warmth or cold (Bligh and Johnson 1973, 955).

mean-body temperature (T_b) *n.* The sum of the products of the heat capacity and temperature of all an organism's body's tissues divided by its total heat capacity (Bligh and Johnson 1973, 955).

Comments: Researchers cannot measure mean-body temperature precisely in a living organism (Bligh and Johnson 1973, 955).

mean-radiant temperature (T_r) *n.* The temperature of an imaginary isothermal "black" enclosure in which a solid body, or occupant, would exchange the same amount of heat by radiation as in the actual nonuniform enclosure (Bligh and Johnson 1973, 955).

preferred-ambient temperature *n.* The ambient-temperature range associated with specified air movement, humidity, and radiation intensity from which an unrestrained animal does not seek to move to a warmer, or colder, environment (Bligh and Johnson 1973, 955).

preferred-body temperature *n.* The core-temperature range within which an ectothermal animal maintains itself by behavioral means (Bligh and Johnson 1973, 955).

♦ **temperature messenger** See caste: worker: temperature messenger.

♦ **temperature regulation** *n.* An organism's maintaining its body temperature within a restricted range under conditions involving variable external, internal, or both, heat loads; contrasted with temperature conformity (Bligh and Johnson 1973, 955).

autonomic temperature regulation *n.* An organism's regulating its body temperature by autonomic (= involuntary) responses to cold and heat which modify its rates of heat loss (e.g., by basal-metabolism variations, shivering, sweating, thermal tachypnea, and vasomotor-tone variations) and heat production (Bligh and Johnson 1973, 955).

behavioral temperature regulation *n.*

1. An organism's regulating its body temperature by changing its behavior (inferred from Bligh and Johnson 1973, 956).
2. An animal's regulating its body temperature by complex behavior controlled by its central nervous system (Bligh and Johnson 1973, 956).

Note: These behaviors include skeletal-muscle responses to temperature that modify rates of heat loss, or production, e.g., adjusting clothing (Humans), change in body position, change in feather positions (birds), change in fur positions (mammals), exercise, selecting an environment that reduces thermal stress, or a combination of these things (Bligh and Johnson 1973, 955).

chemical temperature regulation *n.* An animal's regulating its body temperature by changing its heat production; an obsolete term (Bligh and Johnson 1973, 956).

Comment: An animal can achieve chemical temperature regulation by changing its metabolic rate, involuntary muscle movements (e.g., shivering), nonshivering thermogenesis, and voluntary muscle movements (Bligh and Johnson 1973, 956).

physiological temperature regulation *n.* An organism's regulating its body temperature by autonomic responses, behavioral responses, or both (Bligh and Johnson 1973, 955).

♦ **temperature sensor** See ²receptor: thermoreceptor.

♦ **temperature survival limit** *n.* The environmental temperature above, or below, which an animal cannot maintain its thermal balance for a long period (Bligh and Johnson 1973, 956).

lower-temperature survival limit *n.* The environmental temperature below which an animal cannot maintain its thermal balance for a long period and at which it becomes progressively hyperthermic (Bligh and Johnson 1973, 956).

upper-temperature survival limit *n.* The environmental temperature above which an animal cannot maintain its thermal balance for a long period and at which it becomes progressively hyperthermic (Bligh and Johnson 1973, 956).

♦ **template** *n.*

1. In many songbird species: Information of a male bird's adult species-specific song that he memorizes and uses as a model against which he matches his own song production during his vocal development (Immelmann and Beer 1989, 309).

syn. sound print (Immelman and Beer 1989, 309)

2. In some invertebrate and many vertebrate species: An individual's memory representation of a set of cues by which it recognizes conspecifics as kin or nonkin (Wilson 1987, 12).

cf. ⁴model: gestalt model, individualistic model

♦ **tempos of evolution** *n. pl.* Bradytely, horotely, and tachytely, *q.v.* (Simpson 1944 in Gould 1994, 6766).

cf. modes of evolution

♦ **temporal facilitation** See ¹facilitation: temporal facilitation.

♦ **temporal gland** See gland: temporal gland.

♦ **temporal polyethism** See polyethism: temporal polyethism.

♦ **temporal prediction** See prediction: temporal prediction.

♦ **temporal summation** See ¹facilitation: temporal facilitation.

♦ **temporary altruism** See altruism: temporary altruism.

♦ **temporary parasite** See parasite: temporary parasite.

♦ **temporary social parasite** See parasite, parasitism: temporary social parasite.

♦ **tendency** *n.* An animal's likeliness to behave in a particular way due to one, or more, probable causal factors (Hinde 1970, 360).

See potential: action potential.

Comment: Burton-Jones (1968 in Hinde 1970, 361) suggests that "tendency" be used for observed likelihood of a behavior's occurrence, and "potential tendency" for theoretical likelihood of a behavior's occurrence.

♦ **teneral** See callow.

♦ **teratology** See study of: teratology.

♦ **terminal extinction** See ²extinction: terminal extinction.

♦ **termitarium** See nest: termitarium.

♦ **termiticole** See -cole: termiticole.

♦ **termiteophile** See -ophile: termiteophile.

♦ **terricle** See -cole: terricole.

♦ **terrier** See dog: terrier.

♦ **Teraserver-USA** See program: Teraserver-USA.

♦ **territorial aggression** See aggression: territorial aggression.

♦ **territorial behavior** See territoriality.

♦ **territorial call** See animal sounds: call: territorial call.

- ♦ **territorial-demarkation substance** See chemical-releasing stimulus: semiochemical: pheromone: territory pheromone.
- ♦ **territorial flight** See flight: courtship flight.
- ♦ **territorial hegemony** *n.* In some reptile species: Territoriality in which a defended area is inhabited by a tyrant male, a few subordinate males, females, and offspring (Wilson 1975, 444–445).
[Greek *hēgemonia* < *hēgeesthai*, to lead]
- ♦ **territorial hierarchy** See hierarchy: dominance hierarchy: territorial hierarchy.
- ♦ **territorial marking** See behavior: marking behavior.
- ♦ **territorial patrolling** See patrol.
- ♦ **territorial polygyny** See mating system: territorial polygyny.
- ♦ **territorial song** See animal sounds: song: territorial song.
- ♦ **territoriality** *n.* An animal's having one, or more, territories (*q.v.*).
cf. individual distance, spacing behavior
- polyterritoriality** *n.* In *Ficedula hypoleuca* (Pied Flycatcher): A male's having two nest-site territories (Breiehagen and Slagsvold 1988, 604).
- ♦ **territory** *n.*
 - An area defended by a male bird (Aristotle and Pliny in Wilson 1975, 260).
 - The land, or country, that belongs to a human ruler or state (Oxford English Dictionary 1972, entries from 1494).
 - In *Luscinia megarhynchos* (Nightingales): A "free-hold" (Olina 1622, 1678 in Wilson 1975, 260).
 - In some anemone, coral, crab, spider, insect, salamander, and frog species; many fish, reptile, bird, and mammal species: An area occupied more, or less, exclusively by an individual, or group of individuals, by a territory holder's repulsion of other animals through overt defense or advertisement (Altum 1867, Eliot 1920, Noble 1939, Brown 1964, Wilson 1971b in Wilson 1975, 256, 442, 444, 564, 597; Robertson 1986, 763; Jaeger 1988, 307).
 - "Any defended area" of an animal (Nobel 1939 in Dewsberry 1978, 93).
 - "An area in which the resident [animal] enjoys priority of access to limited resources that he or she does not enjoy in other areas" (Kaufmann 1971 in Dewsberry 1978, 94).
 - A fixed area from which an individual animal excludes rival intruders by some combination of advertisement, threat, and attack (Brown 1975, 61).
cf. dominion, individual distance, range

Comments: Brown (1975, 60–61) discusses problems with some "territory" definitions. "Dominance hierarchies" and "territories" have intergrading characteristics (Dewsberry 1978, 94). An animal may defend a particular area to different degrees depending on time of year. The original territory concept is tending to fall more and more into obsolescence; instead, workers are describing area inhabitants' degrees of exclusiveness in using an area's resources (Immelmann and Beer 1989, 311). "Territoriality" serves many different functions. Some species exclude both conspecific and heterospecific individuals from their territories (Barrows 1976b, 1983; Immelmann and Beer 1989, 310).
[Latin *territorium* < *terra*, earth. Moffat (1903) introduced the English word "territory" into the scientific literature (Wilson 1975, 260).]

SOME CLASSIFICATIONS OF TERRITORIES

- I. Classification with regard to activities^a
 - A. type-A territory (using for shelter, courting, mating, nesting, gathering most food)
 - B. type-B territory (breeding, gathering the minority of food)
 - C. type-C territory (defending small area around nest)
 - D. type-D territory (pairing, mating)
 - E. type-E territory (using for shelter, roosting)
- II. Classification of type-A and -B territories by type of defense
 - A. absolute-defense territory
 - B. spatiotemporal-defense territory
- III. Classification by constancy of a territory's position
 - A. fixed territory
 - B. floating territory
- IV. Classification by species involved
 - A. intraspecific territory
 - B. interspecific territory
- V. Classification with regard to territory size relative to the territory holder
 - A. microterritoriality
 - B. macroterritoriality
- VI. Classification by territory quality
 - A. optimal territory
 - B. suboptimal territory

^a These activities can vary with species.

communal territory See territory: group territory.
defended territory *n.* For example, in some bee species, stickleback fish, and *Kobus kob thomasi* (Uganda Kob): A territory held by overt defense (Alcock et al. 1978; Dewsberry 1978, 95).

Comment: "Defended territory" grades into "unde-fended territory."

display territory *n.* A space used by one, or more, individuals of the same sex (usually males) solely for courtship and mating (Immelmann and Beer 1989, 76).

cf. ²lek; territory: mating territory

exclusive-occupancy territory *n.* A territory that is defended against all conspecifics except during a short mating period (Dewsberry 1978, 95).

Comment: "Exclusive-occupancy territory" grades into nonexclusive-occupancy territory."

feeding territory *n.* For example, in some diurnal insectivorous songbirds: A territory in which an individual, or conspecific group, feeds (Dewsberry 1978, 96); in some species, feeding territories also include breeding sites (Immelmann and Beer 1989, 310).

Comment: "Feeding territory" grades into "nonfeed-ing territory."

fixed territory *n.* A territory that includes the same space throughout its tenure (Dewsberry 1978, 96).

Comment: "Fixed territory" grades into "floating territory."

floating territory *n.* For example, in some bee species and a bitterling (fish) species: A territory that changes position from time to time (Wilson 1975, 265; Alcock et al. 1978; Barrows 1983).

cf. floater

Comments: A bitterling lays eggs into the mantle cavities of certain mussels and defends the area around the mussel even when the mussel moves. "Floating territory" grades into "fixed territory."

group territory *n.* In many animal species: A territory occupied by two, or more, conspecifics (Brown 1987, 300; Dewsberry 1978, 95; Agren et al. 1989, 28). *syn.* communal territory (Immelmann and Beer 1989, 123).

Comments: “Group territory” grades into “individual territory” (Dewsberry 1978, 95). Group territories are usually held all, or most, of a year, and are usually all-purpose territories (Brown 1987, 300). In one-male groups of Pinnipeds, Lion prides, and Humans, a group territory is occupied by a mated pair or more than two conspecifics (Dewsberry 1978, 95). In the Caribbean-striped Parrotfish, a group territory is held by nonkin (Clifton 1989, 90).

individual territory *n.* For example, many animal species, including some bee species and Stickleback Fish: A territory occupied by one male, except during invasions by conspecific contestants or entries of potential mates (Dewsberry 1978, 95).

Comment: This “individual territory” grades into “group territory” (Dewsberry 1978, 95).

interspecific territory *n.* In some frog, salamander, lizard, and mammal species (including rodents and shrews) and many bird species (including some corvid, hummingbird, warbler, and woodpecker species (Goldcrests, Honey-eaters, and Shrikes): A territory that an individual defends against a heterospecific individual that uses the same resources (Immelmann and Beer 1989, 157).

introsexual territory *n.* In Ferrets: A territory defended by an individual against conspecifics of the same sex (Powell 1979 in Clapperton 1989, 436).

mating territory *n.* For example, in lekking species (including some orchid-bee species, Grouse, Ruffs, and the Uganda Kob) and other territorial animals: A territory in which breeding occurs (Dewsberry 1978, 96).

cf. territory: display territory

Comment: “Mating territory” grades into “nonmating territory.”

microterritory *n.* In males of a sweat bee species: A territory that is large enough to contain only one individual — its holder [coined by Barrows (1976, 377)].

nonexclusive-occupancy territory *n.* A territory that is defended against lower ranking individuals, as in some lizards, or against nongroup members, as in the Steller’s Jay and bicolored-ant birds (Dewsberry 1978, 95).

Comment: “Nonexclusive-occupancy territory” grades into “exclusive occupancy territory.”

nonfeeding territory *n.* In most shorebird species, e.g., Gulls and Ibises; and some bee species. A territory that ordinarily does not contain food (Dewsberry 1978, 96).

Comment: “Nonfeeding territory” grades into “feeding territory” (Dewsberry 1978, 96).

nonmating territory *n.* A territory in which certain activities besides mating occur (Dewsberry 1978, 96).

Comment: “Nonmating territory” grades into “mating territory.”

nonrearing territory *n.* A territory, e.g., a lek, in which young are not reared (Dewsberry 1978, 96).

Comment: “Nonrearing territory” grades into “rearing territory.”

pairing territory *n.* For example, in some gull species and lekking species: A site where pair formation occurs that is away from a nesting site and where other reproductive activities occur (Immelmann and Beer 1989, 212).

cf. lek

rearing territory *n.* For example, in colonial shorebirds, sticklebacks: A territory in which young are reared. “Rearing territory” grades into “nonrearing territory” (Dewsberry 1978, 96).

sun-dapple territory *n.* For example, in male Speckled-wood Butterflies: A territory in a forest whose boundaries are the perimeter of a sun dapple (Davies 1978).

symbolic territory *n.* For example, in males of some bee and hangingfly species: A territory that does not contain emerging receptive females or resources that attract nesting, or foraging females (Thornhill and Alcock 1983, 112).

type-A territory *n.* “A large defended area within which sheltering, courtship, mating, nesting, and most food gathering occur” (Mayr 1935, Nice 1941, Armstrong 1947, and Hinde 1956 in Wilson 1975, 265).

cf. ³range

type-B territory *n.* “A large defended area within which all breeding activities occur but which is not the primary source of food” (Wilson 1975, 265).

type-C territory *n.* A small defended area around an animal’s nest (Wilson 1975, 265).

type-D territory *n.* A territory used exclusively for pairing, mating, or both (Wilson 1975, 265).

type-E territory *n.* A territory used for roosting or as a shelter (Wilson 1975, 265).

undefended territory *n.* For example, in a coati species and *Macropus parryi* (Whiptailed Wallabies): A territory held by behavior other than overt defense (Dewsberry 1978, 95).

Comment: “Undefended territory” grades into “defended territory” (Dewsberry 1978, 95).

♦ **territory game** See game (table).

♦ **territory holder** *n.* In many animal species: An individual that is able to obtain and retain a territory compared to a conspecific that cannot do so (Alcock et al. 1978; Barrows 1983; Caro 1989, 54).

syn. regular; resident (Caro 1989, 54)

cf. floater, nonresident, nonterritorial animal

♦ **territory-holding male** See regular.

♦ **territory marking** See behavior: marking behavior: territory marking.

♦ **territory pheromone** See chemical-releasing stimulus: semiochemical: pheromone: territory pheromone.

♦ **tertiary hyperparasitism** See parasitism: hyperparasitism: tertiary hyperparasitism.

♦ **tertiary parasitism** See parasitism: hyperparasitism: tertiary parasitism; “tertiary parasitism.”

♦ **tertiary sex ratio** See sex ratio: tertiary sex ratio.

♦ **test** *n.* A means by which the existence, quality, or genuineness, of anything can be determined; examination, trial, proof (Oxford English Dictionary 1972, entries from 1651).

See statistical test.

cf. experiment, experimental design

choice test *n.* A test used to determine an animal’s social preferences and investigate its learning and discrimination capacities and stimulus directing and releasing effects; a researcher sets up a choice test so that an animal may choose between, or among, two, or more, objects (Immelmann and Beer 1989, 44).

► **multiple-choice test** *n.* A choice test in which an animal chooses among three, or more, objects (Immelmann and Beer 1989, 44).

► **simultaneous-choice test** *n.* A choice test in which choice objects are presented at the same time (Immelman and Beer 1989, 44).

► **successive-choice test** *n.* A choice test in which choice objects are presented one after another (Immelman and Beer 1989, 44).

Corrositex *n.* An *in vitro* test used as a substitute for the traditional-rabbit-skin test (Roush 1996, Science 274, 168).

Comments: The Corrositex gauges corrosivity of a product according to the time required for a chemical sample to break through a skinlike-protein membrane (Roush 1996, Science 274, 168).

discrimination test *n.* A test used for determining the perceptual, or learning, abilities of animals, in which animals are given choices between stimuli and rewarded for correct responses and, sometimes, punished for incorrect responses (Buchholtz 1973 and Rensch 1973 in Heymer 1977, 195).

Draize test *n.* A test of a chemical product that involves putting the chemical in the eye of a laboratory rabbit (Roush 1996, Science 274, 168)

cf. Three R's

Hebb-Williams test *n.* A series of maze-learning problems that is designed to assess rat "intelligence" (Denenberg and Morton 1962 in Dewsbury 1978, 333).

IQ test *n.* A test that measures IQ (intelligence quotient), by assessing a person's memory, arithmetic and reasoning power, language ability, and concept-formation ability (Gould 1982, 579).

cf. intelligence quotient

Comment: The exact meaning of "IQ" is debatable, but IQ scores are relatively stable with a person's age and correlated with a young person's future academic performance (developed by Albert Benet 1905 in Gould 1982, 529).

mental chronometry *n.* A test used to obtain an objective measure of intangible phenomena such as mental representations which uses the time required to solve a spatial problem as an index of processes involved (Posner 1978 in McFarland 1985, 498).

oddity test *n.* A test used in learning experimentation that gives an animal the opportunity to choose an odd symbol from a group of symbols (McFarland 1985, 509).

cf. learning: oddity learning, test: reversal test

open-field test *n.* A standard method used by experimental psychologists to measure an animal's "general emotionality" as indicated, e.g., by its amount of urination or defecation, and to measure the animal's locomotor activity in relation to its previous environmental conditions or experience (Immelman and Beer 1989, 86, 207).

reversal test *n.* A test used in learning experimentation that gives an animal the opportunity to choose a solution to a problem that was previously the wrong solution (McFarland 1985, 509).

cf. learning: reversal learning, test: oddity test

supine test *n.* A behavioral test in which a researcher places a pair of anesthetized stimulus animals (e.g., hamsters) adjacent to each other and on their backs (supine position) in order to examine the preference of an unanesthetized test animal for one of these stimulus animals (Landauer et al. 1978, 615; M. R. Landauer, pers. comm. 1985).

Comment: In this test, the test animal's responses can be evaluated without the influences of reciprocal behavioral interactions from the stimulus animals

[coined by Landauer et al. 1978, 615; M. R. Landauer, pers. comm. 1985]

traditional-rabbit-skin test *n.* A test used to determine the corrosivity of a chemical product by drizzling or painting a sample on the shaved back of a laboratory rabbit (Roush 1996, Science 274, 168; D. A. M. Mackay, pers. comm.).

cf. test: Corrositex

♦ **testcross** See cross: testcross.

♦ **test of independence** See statistical test: test of independence.

♦ **Test-Operate-Test-Exit (TOTE)** *n.* A control unit in a hierarchy conception of how behavior is functionally organized; the unit consists of a feedback cycle in which a mismatch (test) between what an animal's action is aimed at and what it achieves leads to its repeating the action (operate) and another comparison between aim and result (test), which, if it shows a match, leads to the animal's moving on (exit) to the next operation in a sequence (Miller et al. 1960 in Immelman and Beer 1989, 315).

♦ **testis, testes** See gonad.

♦ **testicular feminization** *n.* In some mammal species: A disease in which a genetic male produces functional amounts of androgens, but his target tissues cannot respond to them because he has an enzyme deficit (Dewsbury 1978, 231).

cf. hermaphroditism: progestin-induced hermaphroditism; syndrome: adrenogenital syndrome

♦ **testosterone** See hormone: testosterone.

♦ **tetany** *n.*

1. A Human tetanoid affection that is characterized by intermittent muscular spasms (Oxford English Dictionary 1972, entries from 1890).

2. For example, in poisoned fish: A long period of muscle contraction that may last as long as 24 hr, or intermittent bouts of muscle contraction (Geiger et al. 1985, 12; R. A. Drummond, pers. comm.).

♦ **tetrodotoxin** See toxin: tetrodotoxin.

♦ **tetranucleotide theory of the structure of DNA** See ²theory: tetranucleotide theory of the structure of DNA.

♦ **tetraploidy** See -ploidy: tetraploidy.

♦ **thalamus** See organ: brain: thalamus.

♦ **thalassium** See ²community: thalassium.

♦ **thalasson** See biotope: thalasson.

♦ **thalassophile** See -phile: thalassophile.

♦ **thalassophobia** See -phobia: thalassophobia.

♦ **thamnocoile** See -cole: thamnocoile.

♦ **thamnophile** See -phile: thamnophile.

♦ **thanatophobia** See -phobia: thanatophobia.

♦ **thanatology** See study of: thanatology.

♦ **thanatosis** See behavior: defensive behavior: playing dead.

♦ **thanogeography** See study of: geography: thanogeography.

♦ **Thayer's-countershading hypothesis** See hypothesis: Thayer's-countershading hypothesis.

♦ **theistic evolution** *n.* The idea that God oversaw and guided the millions of years of evolution that culminated with Humans (Rosin 1999, 8 August, A22).

cf. evolution

♦ **thelygeny** See -geny: thelygeny.

♦ **thelygenic** See -genic: thelygenic.

♦ **thelytoky** See parthenogenesis: thelytoky.

♦**theorem** *n.*

1. A universal, or general, proposition, or statement, not self-evident (as apposed to an axiom), but demonstrable by argument (in the strict sense by necessary reasoning); “a demonstrable theoretical judgement” (Oxford English Dictionary 1972, entries from 1551).
2. In mathematics, a proposition that sets forth something to be proved; a proposition that has been proved or assumed to be true; a rule, or statement, of relations formulated in symbols; a proposition deduced from axioms; or in general, any proposition susceptible of proof (Michaelis 1963).

syn. axiom (in some cases)

cf. axiom, doctrine, dogma, law, principle, rule, theory, truism

Comment: In mathematics, a person may be able to prove a theorem; however, in the sciences, a person tests hypotheses that he may provisionally “accept” if he cannot disprove them (pers. obs.).

[Late Latin *theorema* < Greek *theōrēa*, sight, theory < *theōrein*, to look at]

♦**threatened species** See ²species: threatened species.

♦**theory** *n.* A person’s conception, or mental scheme, of something to be done, or the method of doing it; a systematic statement of rules, or principles, to be followed (Oxford English Dictionary 1972, entries from 1597).

[Late Latin *theoria* < Greek *theoria*, view, speculation < *theorein*, to look at]

♦**theory** *n.*

1. A scheme, or system, of ideas, or statements, held as an explanation, or account, of a group of facts or phenomena; a hypothesis that has been confirmed, or established, by observation, or experiment that is propounded, or accepted, as accounting for the known facts; a statement of what one holds to be the general laws, principles, or causes of something known or observed (Oxford English Dictionary 1972, entries from 1638); a closely reasoned set of propositions, derived from and “supported by” established evidence and intended to serve as an explanation for a group of phenomena: the quantum *theory* (Michaelis 1963).

2. Abstractly (without an article), systematic conception, or statement, of the principles of something; abstract knowledge or its formulation: often used to imply more, or less, supported hypotheses; distinguished from, or opposed, to practice: In theory, according to theory, theoretically (opposed to in practice, or in fact) (Oxford English Dictionary 1972).

3. An integrated group of principles that underlie a science or its practical applications: the atomic *theory* (Michaelis 1963).

4. An arrangement of results, or a body of theorems, that presents a systematic view of some subject: the *theory* of functions (Michaelis 1963).

5. “The grandest synthesis of a large and important body of information about some related group of natural phenomena” (Moore 1984, 474): The Modern Synthesis.

6. “A body of knowledge and explanatory concepts that seeks to increase our understanding of (‘explain’) a major phenomenon of nature” (Moore 1984, 474).

Note: This kind of theory is not falsifiable (Moore 1984, 474).

catastrophe theory *n.* Theory that deals with a large (“catastrophic”) change in a system that causes

it to develop along a totally new pathway (Lewontin 2000, 111).

cf. ³theory: chaos theory, complexity theory

Comments: Such a system changes in time according to simple mathematical laws, may change continuously, undergoes a “catastrophic” change in its entire shape at a critical point, and then continues its development along a totally new pathway (Lewontin 2000, 111). The mathematician René Thom developed catastrophe theory in the 1960s. A wave that breaks and an embryo with a complex shape change are examples of catastrophe systems. Catastrophe theory, chaos theory, and complexity theory “are attempts to show that extremely simple relationships in dynamical systems will lead to what, at first sight, seem unpredictable changes and extraordinary diversity of outcome” (Lewontin 2000, 111).

cf. ¹system: catastrophe system, chaos system, complex system; ²theory: chaos theory, complexity theory

chaos theory *n.* Theory that deals with a very simple dynamic system that may go to equilibrium or undergo regular oscillations in one range of parameters, but in other ranges passes from one state to another in what appears to be a totally random fashion (which can be perfectly predicted from simple equations of the system’s motion) (Lewontin 2000, 112).

cf. ¹system: catastrophe system, chaos system, complex system; ²theory: catastrophe theory, complexity theory

Comments: Meteorology researchers developed chaos theory in the 1980s (Lewontin 2000, 112). Ecologists built simple population-growth models that exhibit chaotic behavior in time as a way to explain the seemingly random changes that occur in the abundances of species. Some researchers consider Gypsy Moth population growth to be an example of a chaotic system.

complexity theory *n.* Theory that deals with putative special “laws” of complex systems that originate in the multiplicity of interactions among many parts (Lewontin 2000, 112).

cf. ¹system: catastrophe system, chaos system, complex system; ²theory: catastrophe theory, chaos theory

Comments: The “laws” arise from the sheer number of elementary interacting parts of a complex system (Lewontin 2000, 112). Complexity theory may eventually elucidate how many genes affect the development on an organism’s feature.

shifting-balance theory *n.* The concept that many species comprise small, partially isolated populations; genetic drift in one, or more, of these populations can fix genes, or gene combinations, that carry it to a higher adaptive peak; and then gene flow can spread those genes to other conspecific populations (Sewall Wright 1931 in Slatkin 1987, 788).

Comment: This concept can be stated in the form of an hypothesis: “Progressive adaptive evolution is most likely in widespread species made up of many local populations among which there is a low level of gene flow” (Wright 1977 in Futuyma 1986, 174, 403).

♦**3theory** *n.*

1. Loosely or generally, a hypothesis proposed as an explanation; hence, a mere hypothesis, speculation, conjecture; an idea, or set of ideas, about something; a person’s individual view or notion (Oxford English Dictionary 1972, entries from 1792); pejoratively, a dubious notion (Moore 1984, 474).

syn. doctrine, hypothesis (in some cases) (Michaelis 1963)

cf. darwinize

2. Scientifically and strictly, a hypothesis that is elevated to a theory because it has not been falsified after many attempts with different kinds of experiments and observations, e.g., one of the hypotheses tested in Darwin's theory of evolution (meaning a body of interconnected statements about natural selection and other processes that are thought to cause evolution) (Curtis 1983, 1108; Futuyma 1986, 15).

cf. axiom; doctrine; dogma; hypothesis; law; model; principle; rule; Dzierzon's rule; theorem; truism

Comments: "Theory" and "hypothesis" are confusing terms because some people make conceptual distinctions between them, and other people use them as equivalent terms. Further, practicing scientists sometimes use the following terms interchangeably in formulation of scientific explanations: algorithm, conjecture, hypothesis, model, and theory. In this book, I often make the distinction between "hypothesis" and "theory" using def. 2 above. In addition, some concepts that were once hypotheses became theories. Testing of some theories revealed that they should be replaced by facts. For example, the hypothesis that organisms descended with modifications from common ancestors became a theory that was replaced by a fact (Futuyma 1986, 15) as have other hypotheses (Mayr 1997, 61). I list terms below because the words "theory" or "theorem" are in their names, in their definitions, or both. The same definition of "theory" does not relate to all of the following terms. The theories listed below vary in how well researchers have tested them.

approach-withdrawal theory *n.* When animals begin their lives, they are capable of only forced movements; intense stimulation causes their withdrawal, and mild stimulation causes their approach (Immelmann and Beer 1989, 19–20).

syn. theory of biphasic processes (Immelmann and Beer 1989, 20)

Comment: By interacting with its environment, an animal builds on its behavioral base "qualitatively distinct levels of behavioral capacity, such as discrimination, motivation control, and hypothesis formation, which can be distinguished in comparisons of different kinds of animals as well as in stages of individual behavioral development" (Immelmann and Beer 1989, 19–20). Schneirla (1965) formulated this theory (Immelmann and Beer 1989).

Aristotle's theory of inheritance See eidos.

autogenetic theory *n.* The hypothesis that organic evolution has a "built-in capacity for or drive toward increasing perfection" (Mayr 1982, 360–361). *syn.* Lamarckian evolution (in part), Lamarckism (in part) (Mayr 1982, 360–361)

Comment: This is one of the six major parts of Lamarckism in the broad sense. "Autogenetic theory" includes "orthogenesis" (Eimer), "aristogenesis" (Osborn), and the "omega principle" (Teilhard de Chardin) (Mayr 1982, 360–361).

balance theories *n. pl.* "Theories concerned with the relation between the attitudes and perceptions of one person towards another person and an object" (Hinde 1982, 277).

biological theory of evolution See evolutionary synthesis.

blood theory of inheritance See blending inheritance.

breakage-fusion theory *n.* The hypothesis proposed by Janssens and Morgan that sister chromatids can break and refuse during meiosis, that is, cross over (Mayr 1982, 767–768).

Comment: Researchers provisionally accepted this hypothesis after they rejected competing hypotheses (Mayr 1982, 767–768).

Castle's theory *n.* The hypothesis that "contamination" of one genetic factor, e.g., white color of an albino *Cavia porcellus* (Guinea-pig) parent, by another, e.g., black color of a Guinea-pig parent, occurs during meiosis (Mayr 1982, 785–786).

syn. contamination theory (Mayr 1982, 767–768)

Comment: This was the last hypothesis of "soft inheritance" proposed by a respectable geneticist, and Castle later abandoned it (Mayr 1982, 767–768).

cell theory, cell theory of multicellularity *n.*

1. A theory that interprets the developmental relationship of cells to organisms and has the principal tenets: (1) all living substance is concentrated in cells, (2) the cells in a organism's body are all individuals of the same morphological rank, (3) tissue cells are morphologically and physiologically elementary individuals, units of structure and function, (4) an organism's body is an aggregate of cells which are its "building stones," and (5) a body's action is the sum of the many special actions performed by many kinds of collaborating cells (Schleiden 1938, Schwann 1939, Heidenhain 1907, and Sharp 1926 in Kaplan and Hagemann 1991, 693–694).
2. The true hypothesis that all living eukaryotic organisms consist of cells and cell products (Mayr 1982, 653).

cf. ³theory: organismal theory

central dogma of evolutionary theory *n.*

The idea that natural selection has a pervasive role in shaping all classes of characters (Wilson 1975, 22).

Comment: Some characters might not be shaped by natural selection.

chain reaction See ³theory: chain-reflex theory.

chain-reflex theory *n.* The hypothesis that all behavior can be explained as a sequence of conditioned and unconditioned reflexes and that complex behavioral responses are simply chain reactions of behavior (Bechterew 1913 and Pavlov 1927 in Heymer 1977, 97).

syn. chain reaction, reflex theory (Heymer 1977, 97); Pavlov's-reflex theory (Tinbergen 1951; 101)

cf. cyclic-reflex hypothesis

Comment: This hypothesis appears to be a "grotesque simplification" (Tinbergen 1951, 101).

chromosome theory See ³theory: Sutton-Boveri chromosome theory.

classical-gene-chromosome theory *n.* Theory that prevailed up to about 1960 and includes these ideas: (1) A chromosome is a somewhat like a string of beads, each bead representing a different gene; (2) each gene is a discrete corpuscle, completely constant from generation to generation (except for very rare mutations), being independent of neighboring genes, and having no effect on them (except for rare position effects); (3) each gene controls, or affects, a character, mutates independently of other genes, and can be separated from its nearest neighbor on a chromosome by crossing over; (4) mutation is a slight modification of a gene molecule, resulting in a new allele; and (5) crossing over is a purely mechanical

breaking of the “string of beads,” followed by a new fusion with the corresponding “piece of string” of a homologous chromosome (Mayr 1982, 795–796).

conflict theory of display *n.* An investigatory approach that recognizes that behavior involves conflict and analyzes behavior in terms of underlying incompatible tendencies (Tinbergen 1959, 1962 and Baerends 1975 in McFarland 1985, 401).

contamination theory See ³theory: Castles' theory.

control theory See study of: cybernetics.

cytoplasmic inheritance theory *n.* A hypothesis from the late 19th and early 20th centuries that a special “species substance” in an organism's cytoplasm causes continuous variation in organisms (Mayr 1982, 786–790).

cf. factor: kappa factor, sex-ratio factor, sterility factor
Comment: This hypothesis is incorrect because most of an organism's characters are programmed by its nuclear DNA (Mayr 1982, 786–790).

Darwin's theory of gemmules, Darwin's theory of pangenesis See ³theory: theory of pangenesis.

de Vries' genetic theory, de Vries' theory of pangens *n.* Hugo de Vries' (1889) concepts of genetics that concerned pangens as the basis of heredity; some of his ideas were similar to modern genetic knowledge; other ideas have been shown to be erroneous (Mayr 1982, 708–709).

de-Vries' mutation theory See mutationism.

displacement theory See ³theory: continental drift.

encasement theory *n.*

1. A now refuted hypothesis that an embryo, or “germ” (gamete), is a development, or an expansion, of a preexisting form that contains all of the rudiments of the parts of a future organism; it is not brought into existence by fecundation alone (Bonnet 1762 in Oxford English Dictionary 1972).
2. A now discarded doctrine that an organism's bodily complexity is totally mapped out in its egg (ovism, believed by an ovist preformationist) or sperm (spermism, spermist preformationist) (Mayr 1982, 12, 106).

Note: This idea was later “resurrected as the genetic program” (Mayr 1982, 12, 106). Encasement theory is opposed to epigenesis.

3. The theory that an organism is fully formed in its gamete and that its development is the growth and solidification of its miniature being (Lewontin 2000, 5).

Notes: Lewontin (2000, 6) explains that “the complete blueprint of the organism and all of the information necessary to specify it is contained” in its fertilized egg. This is a kind of “encasement” of an entire organism in one cell, and supports a hypothesis which he calls a “preformationist theory of development” and the “epigenetic theory of development.” However, the “blueprint” is a plan for an organism's phenotype, and its environment can affect its embryogenesis and its final phenotype through epigenesis (*q.v.*).

syn. incasement theory, preformation (theory) (Lincoln et al. 1985); preformationism (Mayr 1982, 959); theory of evolution (now obsolete synonym, Oxford English Dictionary 1972); theory of preformation

cf. corpuscularian; -genesis: epigenesis; ¹evolution; physicism; ³theory: classical-gene chromosome theory

epeirophoresis theory See hypothesis: continental drift.

exchange-and-interdependence theories *n.*

pl. Theories of interpersonal behavior that involve the view that this behavior depends on the rewards, or expectations of rewards, that can result from this behavior (Hinde 1982, 278–279).

Comment: These theories stress the effects of each individual of a dyadic relationship on each other (Hinde 1982, 278–279).

Fisher's-fundamental theorem *n.* The rate of increase in fitness of any organism at any time is equal to its genetic variance in fitness at that time (McFarland 1985, 112).

[after Ronald Aylmer Fisher, 1890–1962, geneticist and statistician]

Fisher's theory of 1:1 sex ratios *n.*

1. Under outbreeding conditions and assuming that the cost of producing a son or daughter is equal, the optimal sex ratio of a population is 1:1 (Fisher 1930 in Wilson 1975, 317).

2. Assume that in an outbreeding population of diploid, bisexual organisms, both sexes are, on the average, of equal value for the genetic perpetuation of a parent; also, assume that sons and daughters are equally costly for a parent to make; then, if the sex ratio were male biased, one would expect selection for individual females that produced more daughters; if the sex ratio were female biased, one would expect the opposite, until the equilibrium of a 1:1 sex ratio occurs (Fisher 1930, 158–159).

syn. Fisher effect, Fisher's principle (Wilson 1975, 317); Fisherian-sexual selection, Fisher's law, Fisher's rule, Fisher's-sex-ratio theory

cf. principle: handicap principle; selection: sexual selection

Comment: Sex ratios of close to 1:1 predominate in most animal species. Trivers and Hare (1976) discuss sex ratios related to unequal costs of producing sons and daughters.

[after Ronald Aylmer Fisher]

flying-squirrel theory See hypothesis: paranormal hypothesis of insect wing origin.

free-cell-formation theory *n.* Schleiden's (1838, 1842) hypothesis about cell formation that includes the ideas that (1) a cell's nucleus forms by crystallization from granular material within a cell's contents, and (2) the nucleus grows and eventually forms a new cell around itself with the outer nuclear membrane becoming the new cell wall (Mayr 1982, 656).

Comment: By the 1860s, this theory was refuted (Mayr 1982, 656).

game theory *n.*

1. A means of analyzing human economic and military behavior that assumes human players who use the same, or different, strategies behave rationally and according to some criterion of self-interest (von Neumann and Morgenstern 1953 in Maynard Smith 1982, 1–2; Dawkins 1982, 287).

2. A means of analyzing organism behavior that (1) considers strategies (*q.v.*) that individuals use, (2) assumes that organisms behave in ways that promote their fitnesses, and (3) considers environmental constraints on organisms and possibly arising population dynamics and equilibria (Lewontin 1961 and Slobodkin and Rapoport 1974 in Maynard Smith 1982, 2).

syn. theory of games

cf. game, strategy

Comment: Game theory requires a single scale of measure of game outcomes and assumes that human behavior is rational. Because these criteria are not met well in human economics, game theory has been more fruitful in measuring how nonhuman animals should behave in order to maximize their fitnesses (Dawkins 1982, 287).

gemmule theory See ³theory: theory of pangenesis.

germ-plasm theory *n.* The true hypothesis that only reproductive tissues transmit the heredity factors of an entire organism, and changes that occur in nonreproductive somatic tissues are not transmitted (Strickberger 2000, 30).

syn. germ-line theory (Lincoln et al. 1985)

Comments: August Weismann's experiments showed that this hypothesis was correct and that the theory of pangenesis was wrong (Strickberger 2000, 30).

Hamilton's-inclusive-fitness theory See ³theory: kin-selection theory.

hit theory, target theory *n.* Muller's hypothesis that if genes are well-defined corpuscles of definite size, bombarding with ionizing radiation (electrons or short-wave rays) would "hit" the genes and produce mutations (Mayr 1982, 803).

Comment: Testing the "hit theory" gave mixed results (Mayr 1982, 803).

inflow theory *n.* In Vertebrates: An individual's brain distinguishes between the movement of its retinal images that are independent of the individual and movement due to its eyeballs, because receptors in its extraocular muscles send messages to its brain comparator whenever its eyes are moved (Sherrington 1918 in McFarland 1985, 249).

cf. ³theory: outflow theory; principle: reaference principle

information theory See study of: mathematics: cybernetics.

intelligent-design theory *n.* The idea that human biology and evolution are so complex that they require "the creative hand of an intelligent force" (Powell 2004, A1).

syn. intelligent design (ID) (Powell 2004, A20)

cf. creationism; special creation; study of: evolution
Comment: In 2004, the school board of Dover, Pennsylvania, U.S., wanted both intelligent-design theory and evolution to be taught in science classes (Powell 2004, A1, A20). Some people consider intelligent-design theory to be a religious belief "dressed in the cloth of science." People in other U.S. states are in favor of teaching intelligent-design theory. In 1987, the U.S. Supreme Court ruled that Louisiana could not make creationism (*q.v.*) part of the state's science curriculum. Michael J. Behe, a biology professor at Lehigh University is a leading advocate of intelligent-design theory which does not make a special reference to God (Anonymous 2005, A15). Other main ID advocates are William Dembski and Philip Johnson (Alcock 2006, 135).

James-Lange theory *n.* The concept that a person's subjective emotional feelings are generated by his sensory receptors involved in his emotional reaction, *e.g.*, a frightening stimulus elicits certain behavioral and psychological changes, and these give rise to his subjective experience of fear (McFarland 1985, 524).

[after William James (1890) and Carl Lange, contemporary psychologists, who proposed similar explanations of emotional experience]

kin-selection theory, theory of kin selection *n.* Hamilton's (1964a, b) ideas regarding the evolution of altruism; altruism can evolve because an altruistic organism helps relatives that share genes with it due to common descent and, thus, the altruist promotes these shared genes (which are identical to its own) by helping (Maynard Smith 1964 in West Eberhard 1975, 2).

syn. kinship theory (C. K. Starr, pers. comm.)

cf. fitness: inclusive fitness; rule: Hamilton's rule; selection: kin selection

learning theory *n.* The hypothesis that a person's brain at the time of his birth is a *tabula rasa*, *q.v.* (Montagu 1962, Skinner 1971 in Heymer 1977, 116).

life-history theory *n.* Theory that analyzes "the trade-offs that organisms face in making decisions that affect their fecundity and mortality schedules"; most such trade-offs are concerned with either current versus future reproduction or with offspring size versus their number (Clark 1993, 205).

local-odor theory See hypothesis: locale-odor hypothesis.

MacArthur-Wilson theory of island biogeography See ³theory: theory of island biogeography.

marginal-value theorem *n.* The optimal rule that a foraging animal should depart from a food patch when its instantaneous feeding rate falls to the average expected for its habitat (Charnov 1973, 1976 and Parker and Stuart 1976 in Giraldeau and Kramer 1982, 1036).

Comment: This theorem predicts that an animal's time spent within patches will increase as the average travel time between them increases (Giraldeau and Kramer 1982, 1036).

Mayr's theory of geographical speciation See speciation: Mayr's theory of geographical speciation.

mechanical-physical theory of evolution *n.*

Nägeli's hypothesis that the activity of idioplasm (genetic material) is due to differential states of excitation of different groups of molecules within its strands (Mayr 1982, 671).

mechanistic theory, mechanism *n.* The hypothesis (or belief) that natural phenomena can be explained by the laws of chemistry and physics (Mayr 1982, 835).

syn. physicalism

cf. holism, physicalism, vitalism

Comments: Important controversies in the history of biology are "mechanism" versus "vitalism" and "mechanism" versus "teleology" (Mayr 1982, 835). Some biologists, *e.g.*, Karl Wilhelm von Nägeli (1884) considered "mechanistic" to be synonymous with "scientific" (Mayr 1982, 851–852). Gherardi (1984) discusses "mechanism" with regard to the history of ethology.

Mendel's theory of inheritance *n.*

1. The concepts that (1) only one particle (which we now call a gene) not many identical determinants of a given unit character, is transmitted to a germ cell, (2) particles underlying a certain trait exist in sets (now called alleles) and these particles do not change one another while they are associated in heterozygote organisms, and (3) one particle that affects a character is obtained from each parent (Mayr 1982, 718, 721).

2. "Non-blending inheritance by means of pairs of discrete hereditary factors (now identified with genes), one member of each pair coming from each parent" (Dawkins 1982, 290).

Note: "The main theoretical alternative is 'blending inheritance.' In Mendelian inheritance, genes may blend in their effects on a body, but they themselves do not blend, and they are passed on intact to future generations" (Dawkins 1982, 290).

syn. Mendelian inheritance

cf. inheritance; laws: Mendel's laws

Mendel's theory of particulate inheritance

n. The hypothesis that genetic factors transmitted to an individual from its parents do not fuse after fertilization but retain their integrity throughout its entire life cycle (Mayr 1982, 781).

syn. theory of particulate inheritance, particulate concept of heredity (Mayr 1982, 781)

cf. blending concept; ³theory: Sutton-Boveri chromosome theory

Comment: This theory has been widely accepted since the late 19th century (Mayr 1982, 781).

modern synthetic theory of evolution

See evolutionary synthesis.

modern theory of the gene *n.* Goldschmidt's (1955) hypothesis that (1) localized genes do not exist; instead there is "a definite molecular pattern in a definite section of a chromosome; (2) any change of pattern (position effect in the widest sense) changes the action of the chromosomal part and thus appears as a mutant;" and (3) a chromosome, as a whole, is a molecular "field" and genes are discrete, or even overlapping, sections of this field (Mayr 1982, 799).

cf. gene

Comment: The "modern theory of the gene" was proposed to replace the "corpuscular theory" of genes; however, the "modern theory of the gene" was not widely accepted and is now refuted (Mayr 1982, 799).

molecular theory of inheritance *n.* The hypothesis that specific molecules are hereditary factors (Mayr 1982, 774).

Comment: This idea was first proposed in the 1880s by Weismann, de Vries, and others, and later promoted by Muller in the 1940s (Mayr 1982, 774).

molecular theory of evolution *n.* A modification of Darwin's theory of evolution as it relates to genetic-level changes (Mayr 1982, 584).

Comment: "At this time it is still uncertain whether some of the recent discoveries of molecular genetics (repetitive DNA, gene splicing, wandering genes) do or do not require any revision of the synthetic theory of evolution" (Mayr 1982, 584).

mosaic inheritance theory See principle: principle of mosaic evolution.

mutation theory See mutationism.

Neo-Darwinian theory See evolutionary synthesis.

neutral theory

1. The hypothesis that "most of the mutant genes that are detected only by the chemical techniques of molecular genetics are selectively neutral, that is, they are adaptively neither more nor less advantageous than the genes they replace; at the molecular level most evolutionary changes are caused by the 'random drift' of selectively equivalent mutant genes" Kimura (1978, 98).

Note: This idea can be traced to Kimura (1968) as indicated in Kimura (1978, 98).

2. The hypothesis "that 'most' of the observed sequence variation in DNA and proteins both within and between species is due to the random fixation of nearly neutral alleles by genetic drift" (Gillespie 1984).

Note: Neutral genes are presumably eliminated from populations by chance, not natural selection (Stebbins and Ayala 1985, 76).

3. The hypothesis "that the great majority of evolutionary changes at the molecular (DNA) level do not result from Darwinian natural selection acting on advantageous mutants but, rather from random fixation of selectively neutral or very nearly neutral mutants through random genetic drift, which is caused by random sampling of gametes in finite populations" (Kimura 1992, 225).

cf. hypothesis: null hypothesis (comment)

Note: Selectively neutral means selectively equivalent — neither advantageous nor disadvantageous (Kimura 1992, 225).

syn. neutral gene theory of molecular evolution (King and Stansfield 1985), neutral mutation hypothesis (Li and Tanimura 1987, 93), neutral mutation random drift hypothesis (Kimura 1985, 42), neutral theory of molecular evolution (Kimura 1979; Kimura 1987, 24), neutralism (Curtis 1983, 905; Kimura 1992), non-Darwinian evolution (King and Jukes 1969 and Crow and Kimura 1970 in Mayr 1982, 593, who says this is a misleading term), random-walk evolution (Mayr 1982, 593)

cf. drift: genetic drift; ²evolution: non-adaptive evolution, non-Darwinian evolution; ⁴model: stepping-stone model; random walk; selectionist view; ³theory: non-Darwinian evolution

Comment: Motoo Kimura was in the first group of biologists to embrace the "neutral theory" in the late 1960s and is its main architect in its present form. This hypothesis is now invoked as routinely as natural selection was a few years back to account for evolutionary DNA changes because a large number of DNA sequences have been published (Gillespie 1984, 732–733). Kimura (1991) summarizes data that support the "neutral theory."

[coined as the "neutral theory" and "neutral mutation random drift hypothesis" (Kimura 1985, 41–42)]

non-Darwinian evolution *n.* A theory of evolution different from that of Charles R. Darwin's theory, e.g., (1) random-walk evolution, (2) Lamarckism, (3) mutationism, and (4) orthogenesis (Mayr 1982, 593). See ²evolution: non-Darwinian evolution.

Comment: The term "non-Darwinian evolution" is confusing because different authors use it to refer to one, or more, of the above concepts of evolution.

optimal-diet theory *n.* The concept that predators select prey types in a manner that maximizes their net rate of energy intake (Lincoln et al. 1985).

optimal-foraging theory (OFT) *n.* The concept that natural selection favors a strategy in which a predator, or other kind of feeder, utilizes food in a manner that optimizes its net energy gain per unit feeding time (Lincoln et al. 1985).

cf. ⁴model: optimality model

optimality theory, optimization theory *n.*

1. The hypothesis that an organism should optimize (maximize its fitness or correlated characteristics) as much as possible given its genetic and environmental constraints (Wilson 1975, 135; Barash 1981, 47–63).

- syn.* compromises of evolution (Mayr 1982, 589)
2. A theory that predicts that natural selection should result in optimal traits, those with benefit-to-cost ratios that are greater than those associated with alternative traits that have arisen over the history of a particular species (Thornhill and Alcock 1983, 16).

Note: Many researchers indicate that optimality theory does not hypothesize, or predict, optimization (D. L. Kramer, pers. comm.). Rather, a researcher assumes optimization as a basis for predicting particular traits or tactics. Critics, not proponents, of optimality theory often assert that it predicts optimization.

cf. function; cost function, goal function

Comments: An “optimal trait” is not necessarily the one that gives the highest possible benefit-to-cost ratio. Such a ratio is unlikely to be obtained due to numerous constraints on organisms. Gross (1984, 56–57) explains the cost-benefit function in optimality theory.

organismal theory, organismal theory of multicellularity *n.* A theory that interprets the developmental relationship of cells to organisms and has the principal tenets: (1) ontogenesis is a function primarily of an organism as a whole, and consists in the growth and progressive internal differentiation of a single protoplasmic individual which often, but not always, involves the septation of the living mass into subordinate semi-independent parts — the cells, (2) because septation is rarely complete, all parts remain connected, and the whole continues to act as a unit, (3) development is not primarily the establishment of an association of multiplying elementary units that form a new whole, but rather the resolution of one whole into newly formed parts, and (4) development should be thought of, not as a multiplication and cooperation of cells, but rather as a differentiation of protoplasm (Sharp 1926 in Kaplan and Hagemann 1991, 694).

cf. ³theory: cell theory

Comment: The organismal theory considers unicellular protozoa, to be homologous not with individual cells of an organism but to an organism as a whole (Kaplan and Hagemann 1991, 694).

organismic theory *n.* The theory that rejects human mind-body dualism and conceives a human as a psychobiological entity endowed with certain capacities (Storz 1973, 187).

outflow theory *n.* An animal’s brain distinguishes between the movement of its retinal images that are independent of the animal and movement due to its eyeballs, because instructions to its eye muscles that move its eyeballs are accompanied by parallel signals to a comparator in its brain (von Hemholtz 1867 in McFarland 1985, 249).

cf. principle: reafference principle; ³theory: inflow theory

Pavlov’s-reflex theory See ³theory: chain-reflex theory.

pangenesis, panspermey See ²theory: theory of pangenesis.

POC theory See ³conflict: parent-offspring conflict (comment).

reflex theory See ³theory: chain-reflex theory.

selection theory See selection: natural selection.

Sewall-Wright’s theorem *n.* In the absence of any other evolutionary force besides drift, fixation, and loss each proceed at a rate of about $1/(4N)$ per

locus per generation; where N is population size (Wilson 1975, 65).

shifting-balance theory See ²theory: shifting-balance theory.

signal-detection theory *n.* The concept that a person’s sensitivity to a stimulus depends not only upon stimulus intensity, but also upon his experience, expectation, and motivation (Storz 1973, 255).

somatic-mutation theory *n.* The hypothesis that aging is the result of an accumulation of mutations in somatic tissue (Lincoln et al. 1985).

stigmergy theory *n.* The hypothesis that with regard to social insects, once a nest builder has identified what construction step its nest (or nest section) is in, it “needs” only to make one decision about whether to continue building as before or to switch to the next step of construction (Grassé 1959 in Downing and Jeanne 1988, 1729).

Comment: Observations on solitary nest-building insects support this hypothesis, but it requires modification for a paper-wasp species (Downing and Jeanne 1988, 1729).

stochastic theory of mass behavior *n.* The theory that transition probabilities in individual social insects’ behaviors are programmed and produce optimal-response of their colonies, these probabilities are determined by selection at the colony level, and they represent a sensitive adaptation to particular environmental conditions in which their species have existed during recent evolutionary time (Hölldobler and Wilson 1990, 643).

Sutton-Boveri-chromosome theory *n.* The hypothesis that genes are located on chromosomes and each chromosome has its particular set of genes (Boveri 1891; Sutton 1902 in Mayr 1982, 749).

syn. chromosomal theory of heredity, Sutton-Boveri-chromosome theory of inheritance (Mayr 1982, 749)

Comment: This hypothesis has become widely accepted since about 1930.

[Sutton’s professor E.B. Wilson named this hypothesis in 1928 (Mayr 1982, 749)]

synthetic theory See evolutionary synthesis.

target theory See ³theory: hit theory.

tetranucleotide theory of the structure of DNA *n.* The hypothesis that a DNA molecule is composed of four nucleotides and has a total molecular weight of about 1,500 (Mayr 1982, 815, 819).

cf. DNA

theory of biphasic processes See ³theory: approach-withdrawal theory.

theory of continuity of germ plasm *n.* Weissmann’s (1885) hypothesis that the “germ track” is separate from the body (soma) track from the very beginning and thus acquired somatic characters are not transmitted to genetic material (Mayr 1982, 700).

cf. Lamarckism

theory of evolution *n.*

1. Charles R. Darwin’s original statement of how (organic) evolution, *q.v.*, occurs (Stebbins and Ayala 1985, 72).

2. The accepted hypothesis that organic evolution has occurred (Brownlee 1981, iv).

cf. Darwinism: Darwin’s own theory

3. “A modified, expanded version of Darwinism that took shape in the 1930s and 1940s” (Stebbins and Ayala 1985, 72).

Note: This version was first known as “Neo-Darwinian theory” (= “Neo-Darwinism”), and later the “synthetic theory of evolution,” *q.v.* (Stebbins and Ayala 1985, 72).

4. “A body of interconnected statements about natural selection and the other processes that are thought to cause evolution” (Futuyma 1986, 15).

syn. encasement theory (obsolete, Oxford English Dictionary 1972)

cf. ²evolution; ³theory; encasement theory

theory of games See ³theory: game theory.

theory of genetic equivalence of all chromosomes *n.* The false hypothesis that every chromosome in an organism’s genome has the same effects on all given traits (Mayr 1982, 751).

Comment: McClung’s (1901) finding sex chromosome’s refuted this hypothesis (Mayr 1982, 751).

theory of island biogeography *n.* The concept that the number of species that inhabit an island is a function of the island’s area and distance from the mainland and is determined by the relationship between immigration (greater on larger and nearer islands) and extinction (greater on smaller islands) (Lincoln et al. 1985).

syn. MacArthur-Wilson theory of island biogeography

cf. curve: species-area curve; hypothesis: nonequilibrium hypothesis

theory-of-mind hypothesis See hypothesis: theory-of-mind hypothesis.

theory of monistic evolution *n.* The view that evolutionary changes can be explained by single factors or events (Lincoln et al. 1985).

cf. evolutionary synthesis

theory of pangenesis *n.*

1. The hypothesis that all parts of an organism’s body contribute genetic material (= gemmules) to its reproductive organs, and particularly to its gametes (Mayr 1982, 959; Strickberger 2000, 31, illustration).

Notes: This idea dates back to Anaxagoras (*ca.* 500–428 BC) and “had representatives at least to the end of the 19th century, including Charles Darwin.” This hypothesis also holds that there is an alternation between the “formation of the body (phenotype, soma) and through it the formation of seed stuff (sperm, genotype) which then directly through growth is converted again into the body of the next generation” This concept was essentially maintained until first challenged by Francis Galton and August Weismann in the 1870s and 1880s (Mayr 1982, 635–636).

2. A false hypothesis that somatic cells contain particles (= gemmules) which can be influenced by an organism’s environment and activity of organs and contain them, and these particles can move to sex cells to influence the course of heredity (Darwin 1868, Lincoln et al. 1985).

syn. Darwin’s theory of gemmules, gemmule theory, pangenesis, pansperm (Lincoln et al. 1985)

cf. hypothesis: transportation hypothesis

theory of parent-offspring conflict (POC theory) See ³conflict: parent-offspring conflict (comment).

theory of particulate inheritance See ³theory: Mendel’s theory of particulate inheritance.

theory of plate tectonics *n.* The hypothesis that continents sit on a series of plates, and slow,

convective flows within Earth’s mantle force neighboring plates apart and carry the continents piggyback (Lightman and Gingerich 1992, 692).

cf. hypothesis: continental drift

Comments: This hypothesis, proposed in this form in the 1960s, is now widely accepted by scientists. In 1756, Theodor Christoph Lilienthal concluded that Earth’s surface tore apart after the Biblical Flood based on the shape of coastlines; around 1800, Alexander von Humboldt proposed that lands bordering the Atlantic were once joined; in 1838, Thomas Dick mentioned the possibility that continents moved apart; in 1858, Antonio Snider-Pellegrini claimed that continents were once joined based on fossil evidence; in 1881, Reverend Osmond Fisher published a mechanism to explain the good fit of continents; in 1908, Frank Bursley Taylor proposed that the moon came so close to the Earth that its gravity dragged continents toward the Equator; in 1912, Alfred Wegener argued for an ancient continuity of landmasses based on geological, fossil, and other evidence (Sullivan 1974, 2–3; Goodacre 1991, 261; Lightman and Gingerich 1992, 692).

theory of preformation See ³theory: encasement theory.

theory of pure blending inheritance, exclusively-blending inheritance *n.* A now refuted hypothesis subscribed to by Nägeli and a few other biologists, that during fertilization, maternal and paternal idiosperms blend, owing to the fusing of homologous strings of micelles into a single strand (Mayr 1982, 723, 780).

theory of recapitulation See law: biogenetic law.

theory of symbiosis See hypothesis: serial-endosymbiosis theory.

theory of synthetic evolution See evolutionary synthesis.

theory of volition See hypothesis: volition.

transmutation, theory of transmutation *n.* The hypothesis that all animals have developed from a common original form (Mayr 1982, 388).

tropism theory *n.* The hypothesis that all behavior can be explained as a sequence of tropisms (taxes) (Tinbergen 1951, 101).

syn. Loeb’s theory, Loeb’s-tropism theory, theory of tropisms

cf. ³theory: chain-reflex theory

Comment: This hypothesis appears to be a “grotesque simplification” (Tinbergen 1951, 101).

uniformitarianism *n.*

1. The doctrine, or principle, held by the uniformitarian school of geologists; the theory of uniformity in the action and processes of inorganic nature; opposed to catastrophism (Oxford English Dictionary 1972, entries from 1865).

2. The doctrine, or hypothesis, that the evolution of the Earth and life on it are affected by secondary natural causes and possibly original direct divine intervention or occasional divine interventions; the same causes have operated throughout the history of the Earth; these causes have always operated at the same intensity; configurational causes have been the same during all geological periods; many changes were gradual, but some were rather catastrophic; and changes did not occur in a directional manner, instead the world always changed in a steady-state condition at most changing cyclically (Mayr 1982, 365, 375–378).

3. The hypothesis that natural geological processes that affect the Earth are still operating at essentially

the same rate and intensity as they have throughout geological time (Lincoln et al. 1985).

syn. actualism, principle of uniformity (Lincoln et al. 1985)

cf. catastrophism, naturalism, special creation

[coined by Whewell (1832) according to Mayr (1982)]

► **progressive uniformitarianism** *n.* Uniformitarianism that involves organisms' changing toward a goal of increased perfection (Lamarck in Mayr 1982, 358).

Weismann's-dissection theory *n.* Weismann's (1892) now refuted hypothesis that during cell division, daughter cells may receive different kinds and numbers of biophores (particles that relate to particular traits) and so forth (Mayr 1982, 703).

Weismann's-genetic theory *n.* Weismann's (1883, 1885) hypothesis that includes two dominant insights: all genetic material is contained in a cell's nucleus and acquired characters are not inherited in any form (Mayr 1982, 699).

Comment: The second part of this hypothesis was vigorously attacked by neo-Lamarckians and orthodox Darwinians (Mayr 1982, 701).

"Wilson's-caste theorem" *n.* Insect castes tend to proliferate in evolution until there is one for each task in the colony (Wilson 1975, 399).

Zuckerman's theory *n.* The hypothesis that binding force of primate sociality is sexual attraction (Zuckerman 1932 in Wilson 1975, 514).

Comment: This hypothesis dominated thought in primate sociobiology from about 1932 through 1959 and is no longer supported (Wilson 1975, 514).

♦ **theory of mind (TOM, TTM)** *n.* An individual animal's possible system of inferences in which it imputes mental states to itself and another conspecific, or heterospecific, animal(s) (Premack and Woodruff 1978, 515; Heyes 1998, 101).

syn. commonsense psychology and folk psychology in reference to children (Moore and Fry 1991 in Astington 1998, 32), Machiavellian intelligence (Byrne & Whiten 1988 and Whiten & Byrne 1988 in Heyes 1998, 101), metacognition (Povinelli 1993 in Heyes 1998, 101), metarepresentation (Whiten & Byrne 1991 in Heyes 1998, 101), mind reading (Whiten 1991 in Astington 1998, 33), mentalizing ability (Frith 1989, Happé 1994 in Astington 1998, 33), mental-state attribution (Cheney & Seyfarth 1990a, 1990b, and 1992 in Heyes 1998, 101), panmorphism, pongomorphism (Povinelli 1995 in Heyes 1998, 101), perspective-taking (Astington 1998, 32)

♦ **therium** See ²succession: therium.

♦ **-therm, thermo** *comb. f.* "Heat; of, related to, or caused by heat" (Michaelis 1963).

adj. -thermal, -thermic

cf. -cryo

[Greek *therme, thermos*, heat, warmth]

allotherm See -therm: poikilotherm.

autotherm See -therm: homeotherm.

cold-blooded animal See -therm: poikilotherm.

ectotherm *n.* An animal whose body temperature depends on its behaviorally and autonomically regulated heat uptake from its environment; contrasted with endotherm (inferred from "ectothermy" in Bligh and Johnson 1973, 946).

See -therm: poikilotherm.

[Greek *ektos*, outside; *therme*, heat]

endotherm *n.* An animal whose body temperature depends on its high (= tachymetabolic) and controlled rate of heat production; contrasted with

ectotherm (inferred from endothermy in Bligh and Johnson 1973, 946).

See -therm: homeotherm, poikilotherm.

[Greek *endos*, inside; *therme*, heat]

eu^rytherm *n.* An organism that is tolerant of a wide range of ambient temperatures; contrasted with stenotherm (Lincoln et al. 1985).

cf. ¹-phile: thermophile: eurytherophile

[Greek *eurus*, wide; *therme*, heat]

haemato^rherm See -therm: homeotherm.

hekisto^rherm *n.*

1. A plant that requires a temperature of less than 10°C in the warmest month of the year and typically occurs in regions with a mean annual temperature below 0°C (Lincoln et al. 1985).

2. An organism that lives above the tree line in heavy snow (Lincoln et al. 1985).

heliotherm *n.* An ectothermic animal that regulates its core temperature by changing its exposure to the sun (inferred from "heliothermy" in Bligh and Johnson 1973, 948).

[Greek *helios*, sun; *therme*, heat]

hetero^rherm *n.*

1. A tachymetabolic animal whose core-temperature variation, either nycthemerally or seasonally, exceeds that which defines homeothermy (inferred from heterothermy in Bligh and Johnson 1973, 948).

2. An animal that can appreciably elevate its body temperature metabolically at certain times but also allows its body temperature to fluctuate with the environmental temperature, *e.g.*, in *Apis mellifera* (Western Honey Bees), *Bombus* spp. (Bumble Bees), and some hawkmoth (Sphingidae) species (Heinrich 1979, 39, 1990, 55).

cf. -therm: homeotherm, poikilotherm

Comments: "Hetero^rherm" is an arbitrary term in two senses: (1) "hetero" means "different from," rather than "a wide range," and (2) the distinction that is being made between thermostable and rather less thermally stable species depends on an arbitrary division (Bligh and Johnson 1973, 948). Some plants, including many aroid species (Araceae) and *Nelumbo nucifera* (Sacred Lotus) raise their inflorescence temperatures by metabolic heating (Darnton 1996, Raskin et al. 1987, Skubatz et al. 1990). This heating increases floral odors, warms pollinators, or both depending on the species.

[Greek *hetero*, different; *therme*, heat]

homeo^rherm *n.* A tachymetabolic animal that maintains its core temperature, either nycthemerally or seasonally, within arbitrarily defined limits ($\pm 2^{\circ}\text{C}$), when it is active, despite much larger variations in ambient temperature; contrasted with poikilotherm (Bligh and Johnson 1973, 958).

syn. autotherm, endotherm, haemato^rherm (*Brit.*), homoeotherm, homoiotherm, homotherm, idiotherm, warm-blooded animal (Lincoln et al. 1985), temperature regulator (Bligh and Johnson 1973, 954). Warm-blooded animal is a poor and misleading synonym (Curtis 1983, 736).

Comments: Birds and Mammals are homeotherms. Some species, *e.g.*, hummingbirds and bears, let their temperatures drop which saves energy. Researchers debate whether Dinosaurs were homeotherms (Morell 1996).

[Greek *homoi*, like, similar; *therme*, heat]

hydromegatherm *n.* An organism that inhabits a warm, wet environment, *e.g.*, a lowland, tropical rain forest (Lincoln et al. 1985).

idiotherm See -therm: homeotherm.

megatherm, macrotherm, macrothermophyte, megistotherm *n.* A plant that lives in warm habitats and requires a minimum temperature of 18°C in the coldest month (Lincoln et al. 1985).

mesotherm, mesothermophyte *n.* A plant that lives under intermediate temperatures with a minimum of 22°C in the warmest month and from 6 through 18°C in the coldest month (Lincoln et al. 1985).

microtherm *n.* A plant that lives in a relatively cold habitat with a minimum temperature of 6°C in the coldest month and from 10 through 22°C in the warmest month (Lincoln et al. 1985).

oligotherm *n.* An organism that tolerates relatively low temperatures (Lincoln et al. 1985).

cf. -therm: polytherm

poikilotherm *n.* (pwah KILL low therm) An animal whose core temperature fluctuates with environmental temperature; that is, is proportional to ambient temperature; contrasted with homeotherm (= temperature regulator) (Bligh and Johnson 1973, 952; Curtis 1983, 736; Lincoln et al. 1985).

syn. cold-blooded animal (*a poor and misleading synonym*, Curtis 1983, 736), ectotherm, heterotherm (*in some cases*) (Lincoln et al. 1985); temperature conformer (*the preferred term for this phenomenon according to Bligh and Johnson 1973, 952 who discuss why "cold blooded" and "warm blooded" are problematical terms*)

adj. ectothermal, haematocryal, poikilothermic (Lincoln et al. 1985)

Comments: Amphibians, Fish, most invertebrate species, and terrestrial reptiles are poikilotherms (Curtis 1983, 736–737). “Poikilotherm” should perhaps be “poecilotherm” or “pecilotherm” to conform with other uses of this root in biology (Bligh and Johnson 1973, 952).

[Greek *poikilos*, changeable, diversified, variegated; *therme*, heat]

polytherm *n.* An organism that tolerates relatively high temperatures (Lincoln et al. 1985).

cf. -therm: oligotherm

stenotherm *n.*

1. An organism that occurs naturally within a narrow range of environmental temperatures and which, singly or collectively, is intolerant of, or accommodates ineffectually, to wide changes in its usual thermal environment; contrasted with eurytherm (*inferred from "stenothermy" in Bligh and Johnson 1973, 954*).

2. An organism that tolerates only a narrow range of environmental temperatures; contrasted with eurytherm (Lincoln et al. 1985).

[Greek *stenos*, narrow; *therme*, heat]

warm-blooded animal See -therm: homeotherm.

♦ **thermal homeostasis** See homeostasis: thermal homeostasis.

♦ **thermal strain** *n.* Any change in an organism's physiological state caused by thermal stress, *q.v.* (Bligh and Johnson 1973, 957).

♦ **thermal stress** See ²stress: thermal stress.

♦ **thermal sweating** See sweating: thermal sweating.

♦ **thermatology** See study of: dermatology.

♦ **-thermia** *comb. f.* “Heat; of, related to, or caused by heat” (Michaelis 1963).

cf. -therm, -thermy

[Greek *therme*, *thermos*, heat, warmth]

hyperthermia *n.* A temperature-regulating animal's condition when its core temperature is more than 1 standard deviation above its species' mean temperature in resting conditions in a thermoneutral environment; contrasted with cenothermy (Bligh and Johnson 1973, 948).

[Greek *hyper*, over; *therme*, heat]

hypothermia *n.* A temperature-regulating animal's condition when its core temperature is more than 1 standard deviation below its species' mean temperature in resting conditions in a thermoneutral environment; contrasted with cenothermy (Bligh and Johnson 1973, 948).

[Greek *hypo*, below; *therme*, heat]

♦ **thermum** See ²community: thermum.

♦ **thermodynamics** See study of: thermodynamics.

♦ **thermogenesis** *n.* An organism's producing heat, *e.g.*, in Birds, Mammals, and *Sauromatum venosum* (Voodoo-lily).

nonshivering-obligatory thermogenesis

(NST(O)) *n.* The component of nonshivering thermogenesis that is independent of short-term ambient-temperature changes (Bligh and Johnson 1973, 957). *Comment:* NST(O) corresponds to basal metabolic rate or standard metabolic rate. NST(O) is unaffected by short-term exposure to cold; however, acclimatization to sustained cold, or heat, stress, may change NST(O) (Bligh and Johnson 1973, 957).

nonshivering thermogenesis (NST) *n.*

1. An animal's increasing its heat-production rate during cold exposure due to processes that do not involve contractions of voluntary muscles; contrasted with shivering thermogenesis (Bligh and Johnson 1973, 957).

2. Nonshivering thermoregulatory thermogenesis, *q.v.* *Note:* “Nonshivering thermogenesis” usually refers to “nonshivering thermoregulatory thermogenesis” (Bligh and Johnson 1973, 957).

nonshivering-thermoregulatory thermogenesis (NST(T)) *n.* An animal's increase in nonshivering thermogenesis that occurs when it is acutely exposed to cold (Bligh and Johnson 1973, 957).

syn. nonshivering thermogenesis (a confusing synonym)

shivering thermogenesis *n.* An animal's increasing its heat-production rate during cold exposure by contracting its voluntary muscles; contrasted with nonshivering thermogenesis (Bligh and Johnson 1973, 957).

Comment: Shivering thermogenesis progresses, as its intensity increases, from thermoregulatory muscle tone, through microvibrations, through clonic contractions of both flexor and extensor muscles (Bligh and Johnson 1973, 958).

♦ **thermoluminescence (TL)** See method: dating method: thermoluminescence.

♦ **thermoneutral zone (TNZ)** See zone: thermoneutral zone.

♦ **thermophile** See ¹-phile: thermophile.

♦ **thermophobe** See -phobe: thermophobe.

♦ **thermopreferendum** *n.* The thermal conditions that an individual organism, or a species, selects for its ambient environment in natural, or experimental, circumstances (Bligh and Johnson 1973, 958).

♦ **thermoreception** See modality: thermoreception.

♦ **thermoreceptor** See ²receptor: thermoreceptor.

♦ **thermoregulation hypothesis of insect wing origin** See hypothesis: hypotheses of origin of insect wings: thermoregulation hypothesis of insect wing origin.

♦ **thermotropism** See -tropism: thermotropism.

♦ **thermy** *comb.f.* “Heat; of, related to, or caused by heat” (Michaelis 1963).

cf. -therm

Comments: “Thermy” refers to the temperature condition of many of the kinds of “-therms” given above, e.g., heterothermy, homeothermy, and poikilothermy. Below, I give terms that specifically relate to a temperature condition, not a kind of “-therm.”

[Greek *therme*, *thermos*, heat, warmth]

cenothermy *n.* A temperature-regulating animal’s condition of being within ± 1 SD of the mean core temperature of its species measured under resting conditions in a thermoneutral environment (Bligh and Johnson 1973, 944).

syn. eutherm, normothermy

[*cen-* < Greek *koinos*, common; *therme*, heat]

cryotherapy *n.* A supercooled organism’s thermal status (Bligh and Johnson 1973, 945).

Comment: The temperature of a supercooled organism’s body mass is below the freezing point of its tissue (Bligh and Johnson 1973, 945).

[Greek *kruos*, cold; *therme*, heat]

therodrymium See ²community: therodrymium.

♦ **thesia** *comb.f.*

alliesthesia *n.*

1. An animal’s changed sensation for a given peripheral stimulus that results from stimulation of an internal sensor(s) (Bligh and Johnson 1973, 943).
2. An animal’s thermal sensation’s dependence on both its core and skin temperatures (Bligh and Johnson 1973, 943).

[Greek *alloioo*, to alter; *aisthesia*, sensation]

chromesthesia, colored hearing *n.* Sound’s evoking a person’s images of colors (Storz 1973, 272).

kinesthesia See modality: kinesthesia.

synesthesia *n.* A person’s producing a subjective sensation of a modality, other than the one that is stimulated, by linking his perceptions of his stimulated modality with images from another modality, e.g., chromesthesia, *q.v.* (Storz 1973, 272).

♦ **theta waves** See brain waves: theta waves.

♦ **thicket** See ²community: thicket, habitat: thicket.

♦ **thief** *n., pl. thieves* In some bee, other-insect, and anthophilous-bird species: An individual that takes nectar, pollen, or both through holes in a flower corolla that another animal made (Barrows 1976c, 132; Inouye 1980).

syn. secondary robber (Morse 1978, 191)

cf. dysteleology, robber

♦ **thinicole** See -cole: thinicole.

♦ **thinking** *n.*

1. A person’s forming (something) in his mind; a person’s conceiving (a thought, etc.); a person’s having a notion, idea, etc., in his mind (Oxford English Dictionary 1972, verb entries from *ca.* 888).

2. A person’s exercising his mind, especially understanding, in any active way; a person’s forming connected ideas of any kind; a person’s having, or making, a train of ideas pass through his mind; meditating, cogitating (Oxford English Dictionary 1972, verb entries from *ca.* 1000).

3. A person’s calling to mind; considering, reflecting upon, remembering, bearing in mind (Oxford English Dictionary 1972, verb entries from *ca.* 1020).

4. A person’s forming, or having, an idea of (a real, or imaginary, thing, action, or circumstance) in his mind; imagining, conceiving, fancying, picturing (Oxford English Dictionary 1972, verb entries from *ca.* 1200).

5. A person’s thinking of himself of something in the way of a plan or purpose; finding out, or hitting upon, a way to do something by mental effort; contriving, devising, planning, plotting (Oxford English Dictionary 1972, verb entries from *ca.* 1330).

6. A person’s conceiving, or entertaining, the notion of doing something; meditating, contemplating, intending, purposing, meaning, having (in mind), having thoughts (of) (Oxford English Dictionary 1972, verb entries from Beowulf).

7. A person’s behavior from which one can infer that he is using symbolic representations of events and objects and manipulating ideas, images, or concepts, or a combination of these things (Storz 1973, 276).

8. In more derived vertebrate species, some more derived invertebrate species: Inferential reasoning (Immelman and Beer 1989, 311).

See behavior: symbolic behavior.

cf. cognition, intelligence

Comment: The Oxford English Dictionary (1972) gives many more definitions of thinking (in verb form).

♦ **thinophile** See ¹-phile: thinophile.

♦ **thiol** See molecule: thiol.

♦ **thiophile** See ¹-phile: thiophile.

♦ **thirst drive** See drive: thirst drive.

♦ **30-nm chromatin fiber** *n.* A beaded string of nucleosomes (*q.v.*) that is about 30 nm in thickness (Campbell et al. 1999, 346).

♦ **Thomism** *n.* The system of dogmatic theology of St. Thomas Aquinas and his followers that formed the basis of 13th-century scholasticism (Michaelis 1963).

Comment: This was the dominant philosophy of “scholasticism” (Mayr 1982, 92).

♦ **threat, threat behavior** See behavior: threat.

♦ **threat face** See facial expression: threat face.

♦ **threat gape** See facial expression: threat yawn.

♦ **threat greeting** See greeting: threat greeting.

♦ **threat mimic** See display: bared-teeth display.

♦ **threat yawn** See facial expression: threat yawn.

♦ **threatened** *adj.* Referring to a species, or population, that could soon face extinction if not monitored and saved (Cooper 1984 in Norden et al. 1984, 9).

cf. endangered, extant, extinct, extirpated

♦ **Three R's** *n.* Reduction, refinement, and replacement of animals used in education, research, and testing (Roush 1996, 168).

Comment: Implementing the Three R's is increasing in some parts of the world (Roush 1996, 168).

♦ **“3ST” method** See method: “3ST” method.

♦ **thremmatology** See study of: thremmatology.

♦ **threonine kinase** See enzyme: threonine kinase.

♦ **threshold** *n.*

1. The minimum strength of a stimulus necessary to elicit an animal’s response (Immelman and Beer 1989, 312).

2. An animal’s lowest perceivable level of a stimulus, e.g., the threshold of a specific tone (Immelman and Beer 1989, 312).

syn. stimulus threshold

cf. ²stimulus: subthreshold stimulus

♦ **threshold selection** See selection (table).

♦ **throughfall** *n.*

1. Precipitation that is first intercepted by vegetation and then falls to the ground (Allaby 1994).
2. The water that drips from and falls through a tree canopy and reaches the forest floor (Kimmins 1996, 274).

Comment: Throughfall does not include stemflow, the precipitation that flows down plant stems (Kimmins 1996, 274).

♦ **thwarting** *n.*

1. Something's successfully opposing; preventing (a person, etc.) from accomplishing a purpose; preventing the accomplishment of (a purpose); foiling, frustrating, balking, defeating (Oxford English Dictionary 1972, verb entries from 1581).
2. Cessation, or frustration, of an animal's ongoing behavior due to its not receiving a requisite stimulus (Immelman and Beer 1989, 313).
3. Failure of an individual's behavior to achieve the stimulus that is necessary for the completion of its activated behavior sequence (Immelman and Beer 1989, 313).

♦ **thymosin** See hormone: thymosin.

♦ **thyrotropic hormone** See hormone: thyrotropic hormone.

♦ **Ti plasmid** See plasmid: Ti plasmid.

♦ **tidal rhythm** See rhythm: tidal rhythm.

♦ **tidbitting** See display: tidbitting.

♦ **tic** *n.* A persistent muscle movement; *e.g.*, in Humans, mouth twitching, lip licking, eye blinking, throat clearing, face making, neck turning, or shoulder shrugging (Storz 1973, 278).

Comment: A person with a tic might not be aware of it (Storz 1973, 278).

♦ **tidal-freshwater marsh** See habitat: marsh: tidal-freshwater marsh.

♦ **tie** *n.* In some mammalian carnivore species: Joining of a male and female by their sex organs for up to 1 hr, or longer, after copulation (Immelman and Beer 1989, 61).

cf. copulation: postcopulatory behavior

♦ **tiered hierarchy of social groupings** *n.* For example, in Elephants: A system of organization comprising individuals, family units, and kinship groups (Wilson 1975, 494).

♦ **Tiglon, Tigon** See hybrid: Tigon.

♦ **time** *n.*

1. A limited stretch, or space, of continued existence, as the interval between two successive events or acts; or the period through which an action, condition, or state continues; a finite portion of 'time' (in its infinite sense): a long time, a short time, some time, for a time (Oxford English Dictionary 1972, entries from *ca.* 893); "the general concept, relation, or fact of continuous existence, capable of division into measurable portions, and comprising the past, present, and future" (Michaelis 1963).
2. A period of duration (Oxford English Dictionary 1972, entries from *ca.* 1000); a definite portion of duration; especially, a definite, specific, or appointed moment, hour, day, season, year, etc.: The time is 3:33 p.m.; autumn is my favorite time (Michaelis 1963).

ecological time *n.* A period from about 10^5 through 10^{11} sec during which large sequences of organismic responses occur but during which extensive evolutionary changes usually do not occur within in species (inferred from Wilson 1975, 145).

Comment: Pigliucci (2007, 2745) suggests that the distinction between ecological and evolutionary time is a counterproductive dichotomy.

evolutionary time *n.* A period approximately 10^6 sec through much longer during which evolutionary change occurs (inferred from Wilson 1975, 145).

generation time *n.*

1. The mean duration of an organism's life cycle from its birth through its reproduction (Lincoln et al. 1985).
2. The average period from the reproduction of an organism's parental generation through reproduction of its first filial generation (Lincoln et al. 1985).

presentation time *n.* The minimum time that an organism takes to respond to a stimulus after it is presented with the stimulus (Lincoln et al. 1985).

reaction time (RT) *n.* The time between a stimulus' impinging on an organism and its response to the stimulus (Lincoln et al. 1985).

syn. latent period, utilization time

cf. period: refractory period

residence time *n.* The time that a given substance remains within a system (Lincoln et al. 1985).

utilization time See time: reaction time.

♦ **time budget** See budget: time budget.

DURATIONS OF KINDS OF BIOLOGICAL TIME^a

KIND OF BIOLOGICAL TIME

APPROXIMATE DURATION (SECONDS)

biochemical-response time	up through 10^3
instinctive-and-reflex-response time	$10^{0.5} - 10^5$
learning-response time	$10^{0.7} - 10^{5.5}$
hormonal-response time	$10^{1.5} - 10^6$
reproductive-life-cycle-response time	$10^2 - 10^{7.5}$
morphogenetic-response time	$10^{2.5} - 10^8$
demographic-response time (<i>syn.</i> ecological time)	$10^5 - 10^9$
evolutionary time	$\geq 10^6$
species-replacement time	$\geq 10^{10}$
species-group-replacement time	$\geq 10^{13}$

^a Wilson (1975, 145).

- ♦ **time-energy budget** *n.* A summary of the amounts of time and energy allotted by an animal to its various activities (Wilson 1975, 142, 597).
- ♦ **time minimizer** See ²species: time minimizer.
- ♦ **time-sampling** See sampling technique: instantaneous sampling.
- ♦ **time sense** See clock: biological clock.
- ♦ **time-sharing** *n.* The phenomenon in which the onset and duration of an activity B are under the control of factors normally controlling activity A, in which B occurs due to disinhibition by A, and after a period, A reestablishes itself by competition (McFarland 1974 in McFarland 1985, 464; Immelmann and Beer 1989, 314). *cf.* experiment: masking experiment
- ♦ **time-stability hypothesis** See hypothesis: stability-time hypothesis.
- ♦ **time's arrow** See law: laws of thermodynamics: second law of thermodynamics.
- ♦ **Tinbergian research programme** See program: Tinbergian research program.
- ♦ **Tinbergen's hierarchical model, Tinbergen's hierarchical model of behavior regulation** See model: Tinbergen's hierarchical model.
- ♦ **tiphicole** See -cole: tiphicole.
- ♦ **tiphiump** See ²community: tiphiump.
- ♦ **tiphophile** See ¹-phile: tiphophile.
- ♦ **tissue** *n.*
 1. The substance, structure, or texture of which an organism's body or any part, or organ, of it is composed; especially any one of various structures each composed of similar cells or modifications of cells, that make up the organism (Oxford English Dictionary 1972, entries from 1831).
 2. In multicellular organisms: A mass, or sheet, of cells of the same, or similar, histology (e.g., muscle tissue, skeletal tissue, epithelial tissue, or glandular tissue), that form a part of an organ (Immelmann and Beer 1989, 314).
- ♦ **tit for tat** *n.* "Retaliation in kind; blow for blow" (Michaelis 1963).
See game: tit-for-tat game.
[Possibly an alternative of tip for tap; < Middle French *tant pour tant*, tit for tat]
- ♦ **tit-for-tat game** See game (table).
- ♦ **titration method** See method: titration method.
- ♦ **TL** See method: dating method: thermoluminescence.
- ♦ **T-maze** See maze: T-maze.
- ♦ **TNZ** See zone: thermoneutral zone.
- ♦ **tobacco juice** See enteric discharge.
- ♦ **tobogganing** See sliding.
- ♦ **tocotropism** See -tropism: tocotropism.
- ♦ **toe clip** *v.t.* To cut one, or more, toes off a research animal so that it can later be identified in laboratory cultures or in the field (Townsend et al. 1984, 422).
Comment: Research animals that are toe-clipped include some species of amphibians (Townsend et al. 1984, 422), lizards, and rodents.
- ♦ **toft** See ²group: toft.
- ♦ **tok** See ²group: tok.
- ♦ **tokogenetic relationship** *n.* The genetic relationship between individuals (Lincoln et al. 1985).
- ♦ **-toky** *comb.f.*
See -parity.
- ♦ **arrhenotoky** See parthenogenesis: arrhenotoky.
- ♦ **atoky** *n.* An organism's having no offspring (Lincoln et al. 1985).
cf. atokous

- ♦ **ditotoky** *n.* An organism's production of two offspring per brood (Lincoln et al. 1985).
- ♦ **epitoky** *n.* In some species of polychaete worms: Formation of a reproductive individual (epitoke) that differs in a varying number of secondary sexual characteristics from a nonsexual form (atoke) (Barnes 1974, 275).
- ♦ **gametoky** See parthenogenesis: amphitoky.
- ♦ **monotoky** *n.*
 1. An organism's having only one offspring per brood (Lincoln et al. 1985), e.g., in *Glossina* spp. (Tsetse Flies).
 2. A plant's fruiting only once during its life cycle (Lincoln et al. 1985), e.g., in some *Agave* species or some tropical-tree species.
syn. monocarp, uniparity, monotocy (Lincoln et al. 1985)
cf. parity: semelparity
- ♦ **oligotoky** *n.* An organism's having only a few offspring per brood (Lincoln et al. 1985)
adj. oligotokous, oligotocous (Lincoln et al. 1985)
- ♦ **polytoky** *n.*
 1. An organism's having many offspring per brood (Lincoln et al. 1985).
 2. A plant's fruiting many times during its life cycle (Lincoln et al. 1985).
syn. caulocarp, multiparity, olytocy (Lincoln et al. 1985)
- ♦ **thelytoky** See parthenogenesis: thelytoky.
- ♦ **TOL** See database: Tree of Life (Appendix 3).
- ♦ **tolerated-ambient-temperature range** See ²range: tolerated-ambient-temperature range.
- ♦ **TOM** See hypothesis: theory-of-mind hypothesis.
- ♦ **tomiparity** See parity: tomiparity.
- ♦ **Tongass National Forest** See place: Tongass National Forest.
- ♦ **tongue flicking** *n.*
 1. A person's brief extension of his tongue often accompanied by licking movements, occurring during flirtation and that may represent ritualized licking (Heymer 1977, 206).
 2. A individual reptile's extending and vibrating its tongue which, e.g., in lizards, transfers chemicals from an individual's external environment to its vomeronasal organ (Graves and Halpern 1989 in Graves and Halpern 1990, 692).
- ♦ **tongue-lashing behavior** See lingulation.
- ♦ **tonic immobility** See playing dead.
- ♦ **tonotaxis** See taxis: tonotaxis.
- ♦ **tool** *n.* An object employed in tool use (*q.v.*).
- ♦ **blade** *n.* A bifacially-shaped tool used for cutting (Lewin 1993, 141).
Comments: *Homo s. sapiens* made very sharp, thin blades (Lewin 1993, 141).
- ♦ **cleaver** *n.* A bifacially-shaped tool used for chopping (Lewin 1993, 141).
- ♦ **hand axe** *n.* A bifacially-shaped tool used for pounding and cutting food and other materials (Lewin 1993, 141; 142, illustration).
Comments: *Homo habilis* made crude hand axes in its Oldowan Tool Industry (Lewin 1993, 141–145). *Homo erectus* and *H. sapiens* made refined tear-drop shaped hand axes, thought to characterize a new technology, the Acheulian Tool Industry. Some researchers describe Acheulian hand axes as Oldowan tools with the addition of large bifaces. Humans used Acheulian hand axes as axes and possibly also as heavy duty knives and prey-killing projectiles. Humans used

hand axes on bone, hide, meat, and wood, based on microwear studies.

pick *n.* A bifacially-shaped tool used for poking and breaking material apart (Lewin 1993, 141).

♦**tool industry** *n.* A tool-making technology of a particular hominid group (inferred from Michaelis 1963).

Acheulean Tool Industry *n.* The tool industry of *Homo erectus* (Michaelis 1963).

syn. Acheulian Tool Industry (Michaelis 1963) [Acheulean, after St. Acheul, France, where researchers found tools of *H. erectus* (Michaelis 1963)]

Aurignacian Tool Industry *n.* The tool industry of *Homo sapiens sapiens* (Michaelis 1963).

[Aurignacian, after Aurignac, a town in Haute-Garonne, France, where researchers found tools of *Homo sapiens sapiens* (Michaelis 1963)]

Mousterian Tool Industry *n.* The tool industry of *Homo sapiens neanderthalensis* (Brace and Montagu 1977, 198).

[Mousterian, after Le Moustier, France, near where researchers first discovered bones of this species (Brace and Montagu 1977, 198)]

Oldowan Stone Industry *n.* The tool industry of *Homo habilis* which includes production of crude stone axes (Lewin 1993, 141–145).

[Oldowan, after the Oldovai Gorge, Africa, where researchers found fossils of *Homo habilis* and its tools (Brace and Montagu 1977, 26)]

♦**tool making** *n.* In *Pan troglodytes* (Chimpanzees), *Corvus monedulaoides* (New Caledonian Crows), and Humans: An animal's modifying an object that it uses as a tool (Goodall 1965 in Heymer 1977, 200).

Comments: A Chimpanzee can fashion twigs that it uses for termite catching and chew a handful of leaves into a spongy mass before dipping the mass into water and squeezing the water from the mass into its mouth (Goodall 1965 in Heymer 1977, 200). *Corvus monedulaoides* appears to have the most complex tool-making behavior, next to Humans. This bird appears to make a tool kit that includes a hook made from a branchlet and lockpick-like, zig-zag probe (= a stepped-cut tool) made from a *Pandanus* leaf (Browne 1996, 30 January, C1, illustrations). It uses these tools for removing insects from cavities and crevices.

♦**tool use, tool using** *n.*

1. An animal's using an object, or another living organism, as a means of achieving an advantage by extending its range of movement or increasing its efficiency (Hall 1963 in Pierce 1986); *e.g.*, a primate's using a conspecific young in agonistic buffering, an ant's using other ants that form a living bridge, an *Aphaenogaster* ant's using a small piece of a leaf or twig as a food-absorbing sponge, an antlion's using a pit that it constructs as a means of trapping ant prey (fig. 44, an antlion's pit and antlion larval doodles on the sand surface in Central Florida, U.S.), or a Weaver Ant's using silk from a conspecific larva which glues leaves together.
2. An animal's using an external object as a functional extension of its mouth, beak, hand, claw, etc., in attaining an immediate goal (Lawick-Goodall 1970 in Pierce 1986).
3. An animal's manipulating an inanimate object, not internally manufactured, resulting in the animal's improving its efficiency in altering the form, or position, of some separate object (Alcock 1972 in Pierce 1986).

Comment: For example, *Ammophila* wasps pound shut their nest entrances with a small pebble held in their mandibles (Peckham 1904 in Heymer 1977, 200); Archer Fish spit drops of water at arthropods, knocking them into the water where they eat them; Egyptian Vultures pick up rocks in their beaks and hurl them at Ostrich eggs, and this action breaks open their shells.

4. An animal's using an unattached environmental object that alters more efficiently the form, position, or condition of another object, another organism, or itself; this involves carrying its tool during, or just prior to, its use and being responsible for its tool's proper and effective orientation (Beck 1980 in Pierce 1986); *e.g.*, a Egyptian Vulture's opening an egg by dropping stones on it, a primate's throwing its feces at an intruder, a primate's using a conspecific young in agonistic buffering, and a female water strider's using a copulating male that repels other courting males, but not a Herring Gull's opening a mussel by dropping it on rocks or a primate's only aiming its defecation at an intruder.
5. An animal's using an external object as a functional extension of its body enabling it to attain an immediate goal (Lawick-Goodall 1970 in McFarland 1985, 510, who lists many examples, some which are in disagreement with other workers).

6. An animal's "active external manipulation of a moveable or structurally modified inanimate environmental object, not internally manufactured for this use, which, when oriented effectively, alters more efficiently the form, position, or condition of another object, another organism, or the user itself" (Pierce 1986, 96).

Note: This kind of tool use includes an ant's using an absorbent, or adsorbent, material as a means of carrying liquid food to her nest (Feller 1987, 1466; Barber et al. 1989), an ant's dropping small pebbles on potential competitors, an ant-lion's throwing sand at a prey, an assassin bug's using termite carton as camouflage material, a tortoise beetle larva's using a shield of dried feces and exuviae that repels ants, and a tree cricket's using a leaf with a small hole gnawed in it as a sound baffle (Pierce 1986, 96).

7. An animal's manipulating an object (an inanimate object or a conspecific individual) that it uses in caring for its body or obtaining and preparing its food (Immelmann and Beer 1989, 314).

cf. tool making

Comments: In the above definitions, an animal's using parts of its own body in altering its environment, or other activity, is not a kind of tool use. For example, a primate's using its finger nail in manipulating objects or a spider's using its web in catching prey, are not examples of "tool use" based on these definitions. Bottlenose Dolphins, Cactus Finches, *Enhydra lutris* (Sea Otters), and Humans also use tools. Captive Bottlenose Dolphins use tools and wild ones might also use tools (references in Smolker et al., 1997, 463). A captive Bottlenose Dolphin rubbed pieces of broken tile along its tank walls and dislodged pieces of seaweed that it ate; another Dolphin in the same tank copied the first one. When two other captive Dolphins attempted to dislodge a moray eel from its crevice, one Dolphin searched for and killed a spiny Scorpion Fish, took it to the crevice and poked at the eel with this Fish, the eel abandoned the crevice, and the Dolphin caught it. Several Dolphins, usually females, showed

possible tool use in nature (Smolker et al., 1997, 454). Each held a sponge in its rostrum and probably used it for digging into the sandy ocean bottom as a means of uncovering food. *Amphioctopus marginatus* (Veined Octopi) hide under Coconut-shell halves which they carry from place to place by stilt-walking (Finn et al. 2009, R1069).

social-tool use *n.* Tool use (def. 1) in which an animal uses a conspecific animal as a tool (Kummer 1982 in Pierce 1986).

♦ **tooth** *n., pl. teeth*

1. In bony vertebrate species: A hard oral structure, consisting chiefly of dentine covered on the outer surface of its crown with enamel and a root leading into a pulp cavity richly supplied with blood vessels and nerves (Michaelis 1963).

Comments: A vertebrate uses its teeth for chewing food, defense, offense, seizing food, or a combination of these activities. Humans normally have 32 adult teeth.

2. In invertebrates: a hard calcareous, or chitinous, body of the oral or gastric region (Michaelis 1963).
3. A small tooth-like projection, *e.g.*, on the margin of a leaf (Michaelis 1963).
4. In Bivalve Molluscs: A process near a shell hinge (Michaelis 1963).

collateral adjective dental

[Old English *tōh*]

canine, canine tooth *n.*

1. A pointed mammalian tooth situated between incisors and premolars (Michaelis 1963; Strickberger 1996, 422, illustration).

syn. *cuspid* (Michaelis 1963)

2. A pointed reptilian tooth, situated between incisors and cheek teeth (Benton 1991, 24, illustration).

Comment: Two canines normally occur in a mammal's lower jaw and two occur in its upper jaw.

[Latin *caninus* < *canis*, dog]

cheek tooth *n.* A pointed reptilian tooth situated posterior to canine teeth (Benton 1991, 24–25, illustrations).

Comment: Cheek teeth evolved into molars and premolars (Strickberger 1996, 418).

deciduous tooth *n.* One of the first set of a mammal's teeth that is replaced by a permanent tooth (Strickberger 1996, 418).

syn. *milk tooth* (Strickberger 1996, 418)

incisor, incisor tooth *n.*

1. A mammalian front tooth adapted for cutting (Michaelis 1963; Strickberger 1996, 422, illustration).

2. A pointed reptilian tooth, situated between incisors and cheek teeth (Benton 1991, 24).

Comment: Humans normally have eight incisors, four in each jaw (Michaelis 1963).

[New Latin]

labyrinthine tooth, labyrinthodont tooth *n.*

A vertebrate tooth with complex (labyrinthine), internal patterns of infolding (Benton 1990, 41, illustration).

Comment: Labyrinthine teeth occurred in Eusthenopteron (Sarcopterygii: Osteolepiformes) and early tetrapods (Benton 1990, 41).

molar, molar tooth *n.* A mammalian tooth adapted for grinding, situated posterior to premolar teeth (Michaelis 1963; Strickberger 1996, 422, illustration).

Comment: Humans normally have 12 molars, six in each jaw (Michaelis 1963).

[Latin *molaris* < *mola*, mill]

premolar, premolar tooth *n.* A mammalian tooth adapted for grinding, situated posterior to canine teeth and anterior to molar teeth (Michaelis 1963; Strickberger 1996, 422, illustration).

syn. *bicuspid*

Comment: Humans normally have eight premolars, four in each jaw (Michaelis 1963).

tricodont tooth *n.* A mammalian molar tooth whose three cusps are aligned along its anterior-posterior axis; contrasted with a tribosphenic tooth (Strickberger 1996, 422, illustration).

Comment: Tricodont teeth occur in Subclass Prototheria (Strickberger 1996, 422).

tribosphenic tooth, tritubercular tooth *n.* A mammalian upper-molar tooth whose three cusps are aligned along its anterior-posterior axis; contrasted with a tricodont tooth (Strickberger 1996, 423, illustration).

Comments: Tribosphenic teeth occur in Group Theria which includes the subclasses Eutheria, Metatheria, and Pantotheria (Strickberger 1996, 422). These teeth might be a key to the early diversification and evolutionary success of extant therians and their close relatives (Tribosphenidans) (Luo et al. 2001, 53). Researchers debate whether mammals with tribosphenic teeth might have evolved twice more than 150 Ma ago — once in Gondwana in the ancestor of Echidnas and the Platypus and once in Laurasia in the ancestor of living Eutherians and Metatherians.

♦ **top-down control** See ³control: top-down control.

♦ **-topic** See -topy.

♦ **topo-, top-, -topic, -topy** *comb.f.* "A place or region; regional" (Michaelis 1963).

[Greek *topos*, place]

♦ **topocentric pollination** See pollination: topocentric pollination.

♦ **topoclone** See cline: topoclone.

♦ **topodeme** See deme: topodeme.

♦ **topogalvanotaxis** See taxis: topogalvanotaxis.

♦ **topogamodeme** See deme: topogamodeme.

♦ **topological psychology** See study of: psychology: topological psychology.

♦ **topographic memory** See memory: topographic memory.

♦ **topology** See study of: mathematics: topology.

♦ **topotaxis** See taxis: topotaxis.

♦ **-topy** *comb.f.*

adj. -topic

See topo-.

amphitopy *n.* A population's, or species', showing a broad, variable tolerance of habitat and environmental conditions, reflected in its having clines and subspecies (Lincoln et al. 1985).

eutropy, generalization *n.*

1. An organism's being tolerant of a wide range of habitats (Lincoln et al. 1985).

2. An organism's being physiologically tolerant (Lincoln et al. 1985).

3. An organism's having a wide geographic distribution (Lincoln et al. 1985).

stenotopy, specialization *n.*

1. An organism's being tolerant of a narrow range of habitats (Lincoln et al. 1985).

2. An organism's being physiologically intolerant (Lincoln et al. 1985).

3. An organism's having a narrow geographic distribution (Lincoln et al. 1985).

♦ **tornado** *n., pl. tornadoes, tornados*

1. A whirling wind of exceptional violence that is accompanied by a pendulous, funnel-shaped cloud that marks its narrow path (Michaelis 1963).
 2. A violent thunderstorm, or squall in the region of the west coast of Africa (Michaelis 1963).
 3. Any whirlwind, or hurricane (Michaelis 1963).
 4. A violently rotating column of air that is in contact with the ground and extends from the base of a thunderstorm (Branick 1996).
- adj.* tornadic

Comments: Most tornados (def. 1 and 4) have winds of < 112 mi per hr (National Oceanic and Atmospheric Administration 2001, illustrations). Tornadic winds can be up to 318 mi per hr. The Fugita scale rates tornados from F0 through F6; with F0–F1 being weak tornados; F2–F3, strong tornados; F4–F5, violent tornados. F6 tornados (= those with winds greater than 318 mi per hr) might not exist. F0 tornados have winds up to 72 mi per hr and can break tree branches and uproot shallowly rooted trees. Higher order tornados can do much more damage to trees and other wildlife. A “tornado watch” indicates that conditions are favorable for tornado formation. A “tornado warning” indicates that people have sighted a tornado. Tornados occur throughout the world, with a high frequency in the U.S. 48 contiguous states (Alden et al. 2007, 57). [alternative of *tornado*, probably an alternative of Spanish *tronada*, thunderstorm < *trona*, to thunder < Latin *tonare*; influenced in form by Spanish *tornar*, to turn]

- ♦ **torpidity, torpor** See dormancy.
- ♦ **torrenticole** See -cole: torrenticole.
- ♦ **total assimilation** See ²production: gross primary productivity.
- ♦ **total environment** See environment: total environment.
- ♦ **total extinction rate** See rate: total extinction rate.
- ♦ **total load** See genetic load: total load.
- ♦ **total photosynthesis** See ²production: gross primary productivity.
- ♦ **total phenotypic variance of a trait (V_p)** See variance: total phenotypic variance of a trait.
- ♦ **total range** See ³range: total range.
- ♦ **TOTE** See Test-Operate-Test-Exit.
- ♦ **totipotent** *adj.*
 1. Referring to a cell's ability to retain a zygote's potential to form all parts of a mature organism (Campbell et al. 1999, 393).
 2. In Ants: Referring to an individual, e.g., a founding queen, that is capable of performing all essential tasks in her colony (Hölldobler and Wilson 1990, 644).
- ♦ **touch** See modality: mechanoreception: touch.
- ♦ **tower** See ²group: tower.
- ♦ **town** See ²group: town.
- ♦ **Townes-style Malaise trap** See trap: Malaise trap: Townes-style Malaise trap.
- ♦ **toxicology** See study of: toxicology.
- ♦ **toxicophobia** See -phobia: toxicophobia.
- ♦ **toxin** *n.*
 1. Any of a class of more, or less, poisonous compounds produced by an organism, which can be a disease causative agent (Michaelis 1963).
 2. Any toxic matter generated by a living, or dead, organism (Michaelis 1963).

Comments: I list and define only a few of the hundreds of animal toxins below.
[Middle Latin *toxicus*, poisoned, poisonous]

adrenalin *n.* A toxin produced by toads (Brodie 1989, 88).

Comments: Adrenalin acts as a local irritant, causes numbing, and stimulates heart rate (Brodie 1989, 88).

bufotoxin *n.* A toxin produced by toads (Brodie 1989, 88).

Comments: Bufotoxin acts as a local irritant, causes numbing, and stimulates heart rate (Brodie 1989, 88). The Colorado-River Toad produces the highly hallucinogenic toxin O-methyl-bufotenin.

bufotenin *n.* A toxin produced by toads (Brodie 1989, 88).

Comment: Bufotenin acts as a local irritant, causes numbing, and stimulates heart rate (Brodie 1989, 88).

cantharidin *n.* A compound produced by blister beetles and soldier beetles that blisters human skin and is a severe irritant of a person's urinary tract when taken internally, sometimes as a dangerous aphrodisiac (Borror et al. 1989, 446; Brodie 1989, 62).

Comment: Cantharidin is the active component from dried bodies of *Lytta vesicatoria* (Spanishfly), a blister beetle (Borror et al. 1989, 8, 11). People have used it to treat urogenital-system problems.

formic acid *n.* A component of the venom of some ant species, the defensive sprays of some beetle species, and the ejecta and the urticating hairs of some caterpillar species (Brodie 1989, 56, 58, 63).

quinone *n.* A component of defensive sprays of Bombardier Beetles (Carabidae) (Brodie 1989, 63).

salamandarin *n.* A component of the defensive spray of *Salamandra salamandra* (Fire Salamanders) (Brodie 1989, 103).

serotonin *n.* A component of the skin secretion of some frog species that repels predators (Brodie 1989, 91).

tetrodotoxin *n.* A neurotoxin found in some species of fish (e.g., Filefishes, Ocean Sunfish, Puffers, Spikefishes, Triggerfishes, and Trunkfishes) frogs, octopuses, salamanders, and snails (Brodie 1989, 63).

venom *n.* A toxin that an animal secretes and usually transmits by a bite or sting (Robinson and Challinor 1995, 227).

Comment: Venom-producing animals include Centipedes, Jellyfish, *Ornithorhynchus anatinus* (Platypuses), a shrew species, Sea Anemones, and Scorpions, as well as many ant, bee, lizard, snake, and wasp species (Robinson and Challinor 1995, 227). In *O. anatinus*, only adult males are venomous.

♦ **toxin hypothesis** See hypothesis: toxin hypothesis.

♦ **TPN** See enzyme: nicotinamide adenine dinucleotide phosphate.

♦ **¹trace** See ²group: trace.

♦ **²trace, trace fossil** See fossil: trace fossil.

♦ **trace element** See element: trace element.

♦ **tracking** See environmental tracking; method: tracking.

♦ **trade-off** *n.* A direct comparison of the costs and benefits of a particular trait (McFarland 1985, 432).

♦ **tradition** *n.*

1. That which people hand down; a statement, belief, knowledge, custom, doctrine, practice, etc., that is transmitted (especially orally) from generation to generation (Oxford English Dictionary 1972, entries from ca. 1380).

2. Persons' transmitting, or handing down, information from one to another, or from generation to generation; transmitting statements, beliefs, rules, customs,

or the like, especially orally, or by practice without writing, chiefly in the phrase "by tradition" (Oxford English Dictionary 1972, entries from 1591).

3. In some animal species: An individual's creation of a specific form of behavior that is passed from generation to generation by learning (Wilson 1975, 168); e.g., dialects in bird songs, traditional migration routes of some toad and bird species and reindeer, traditional calving places of reindeer, traditional game trails of deer and other mammals, milk stealing by *Cyanistes caeruleus* (Blue Tits), oyster feeding in *Haematopus* sp. (oystercatchers, birds) (McFarland 1985, 515), and placer mining and sweet-potato washing in *Macaca fuscata* (Japanese Macaques) (Kawai 1965 in Heymer 1977, 175).

cf. cultural exchange, culture, learning: social-imitative learning

Comment: Tradition is an "ultimate refinement in environmental tracking" (Wilson 1975, 168).

direct tradition *n.* Tradition in which a neophyte learns, e.g., by imitation from an instructor that is usually an adult (Immelmann and Beer 1989, 316).

indirect tradition *n.* Tradition in which a neophyte is placed in a situation where particular information can be learned without an experienced animal; e.g., in many insect species, a mother lays eggs on plants of choice, and her offspring lay their eggs on the same plant species (Immelmann and Beer 1989, 316).

interspecies tradition *n.* One species' acquiring behavior of another, e.g., mimicking vocalizations of other bird species by *Mimus polyglottis* (Northern Mockingbird) (Immelmann and Beer 1989, 317).

nonobject-bound tradition *n.* Tradition in which information about a specific object (e.g., location and quality of food) is transmitted even in the absence of the object by some form of symbolic representation, e.g., dance communication of *Apis mellifera* (Western Honey Bees) (Immelmann and Beer 1989, 316).

object-bound tradition *n.* Tradition in which experienced and inexperienced conspecific animals gather with the object (e.g., food) about which they are to acquire knowledge or learn a treatment (Immelmann and Beer 1989, 316).

♦ **tradition drift** See drift: tradition drift.

♦ **traditional homology** See homolog: traditional homology.

♦ **traditional-rabbit-skin test** See test: traditional-rabbit-skin test.

♦ **trail communication** See communication: trail communication.

♦ **trail kairomone** See chemical-releasing stimulus: semiochemical: allelochemical: allomone: kairomone: trail kairomone.

♦ **trail-marking substance** See substance: trail-marking substance.

♦ **trail pheromone, trail substance** See chemical-releasing stimulus: pheromone: trail pheromone.

♦ **train** See ²group: train.

♦ **training** *n.* A broad term for learning procedures that are very different from one another and are controlled by Humans (Immelmann and Beer 1989, 317). *syn.* conditioning (in many cases, Immelmann and Beer 1989, 317)

cf. shaping

spaced training *n.* Training in which a researcher paces learning sessions of a laboratory animal with rest intervals (Hall 1998, 32).

cf. memory

Comments: In 1885, the German psychologist Hermann Ebbinghaus, used himself as a sole subject in a spaced-training experiment and found that he could memorize a list of nonsense syllables much better if he had a rest interval between his learning sessions compared to having no rest interval (Hall 1998, 32). *Drosophila* that undergo spaced training develop robust long-term memories that last at least 1 week (Tim Tully in Hall 1998, 32).

♦ **trait** See character.

♦ **trait group** See ²group: trait group.

♦ **tramp, tramp species** See ²species: tramp species.

♦ **trampling zone** See zone: trampling zone.

♦ **trance reaction** See playing dead.

♦ **trans-** prefix

1. "Across; beyond; through; on the other side of" (Michaelis 1963).

2. "Through and through; changing completely" (Michaelis 1963).

3. "Surpassing; transcending; beyond" (Michaelis 1963).

4. Anatomically, "across; transversely" (Michaelis 1963). [Latin *trans*, across, beyond, over]

♦ **trans-kingdom sex** See ³sex: trans-kingdom sex.

♦ **transcription** *n.*

1. In organisms: Formation of an RNA molecule upon a DNA template by complementary base pairing that is mediated by RNA polymerase (King and Stansfield 1985).

2. In RNA viruses: Formation of an RNA molecule upon an RNA template by complementary base pairing that is mediated by RNA polymerase (Rieger et al. 1991).

syn. genetic transcription (Rieger et al. 1991)

cf. translation

Comment: Transcription is the first step in gene expression and involves initiation, elongation, and termination of RNA transcripts (Rieger et al. 1991).

♦ **transcription factor** See factor: transcription factor.

♦ **transduction** *n.* Gene transfer between prokaryotes by a virus (Campbell 1996, 504).

cf. ¹transformation

♦ **transfer-brooding** See brooding: transfer-brooding.

♦ **transfer host, transport host** See ³host: paratenic host.

♦ **transfer of training** *n.* The influence of an organism's past learning on its new learning (Storz 1973, 280).

♦ **transfer ribonucleic acid** See nucleic acid: ribonucleic acid (comment).

♦ **transform** *v.t.* One's performing a mathematical procedure on a quantitative datum, e.g., taking its arcsine square root, log, or square root.

Comment: A main reason to transform data in a set is to change the data's variance to meet the assumption of equality of variances of a statistical test. For example, taking the log of data in a set yields a new set of logs with a lower variance than the original set, and these variances might not be significantly different.

♦ **¹transformation** *n.*

1. An organism's change due to its acquisition of foreign genetic material (Lincoln et al. 1985).

2. Genetic material's moving from one individual organism to another (Bonner 1988, 17).

3. A prokaryote's obtaining genes from its surrounding environment (Campbell 1996, 504).
cf. transduction.

Note: This enables considerable gene transfer among bacteria (Campbell 1996, 504).

♦ **transformation** See ²evolution: monotypic evolution, phyletic evolution.

♦ **transformational mimicry** See mimicry: transformational mimicry.

♦ **transforming principle** *n.* The heredity information (later identified as DNA) (Mayr 1982, 818).

Comment: Griffith (1928) found that living, avirulent pneumococci "picked up" virulence from heat-killed virulent pneumococci after both kinds of pneumococci were injected into mice (Mayr 1982, 818).

♦ **transgenation** See ²mutation: gene mutation.

♦ **transgenic** *adj.* Referring to an organism to which a researcher has added a novel gene(s) to its genome, e.g., a transgenic mouse (Cohen 1995b, 1715).

♦ **transgenesis** *n.* Transfer of genes from one species to an unrelated one, in which they are maintained and manifested phenotypically (Lincoln et al. 1985).
cf. transposable element: transposon.

♦ **transgressive segregation** See genetic segregation: transgressive segregation.

♦ **transient polymorphism** See morphism: polymorphism.

♦ **transition** See ²mutation: transition.

♦ **transition matrix** *n.* A means of analyzing Markoff chains (Lehner 1979, 274).

Comment: Kinds of transition matrices include "first-order-transition matrix," "second-order-transition matrix," and "nth-order-transition matrix."

♦ **transition probability** See probability: transition probability.

♦ **transitional action** See action: transitional action.

♦ **transitional adaptive zone** See zone: adaptive zone: transitional adaptive zone.

♦ **transitional load** See load: transitional load.

♦ **translation** *n.* A protein's formation that is directed by a specific messenger RNA molecule (King and Stansfield 1985).
cf. transcription
syn. genetic translation

♦ **translational load** See load: translational load.

♦ **translocation** *n.* A person's moving individuals of a species from one place to another place which it may or may not have previously occupied, often as part of a conservation program (New 2009, 168).
Comment: Insect translocation is a complicated process that requires systematic planning (Meads 1994 in New 2009, 169).

cf. introduction, restocking, restoration

♦ **translocation** *n.* A chromosomal aberration that results in a change in a chromosomal-segment position within an organism's genome but does not change its total number of genes (King and Stansfield 1985).

Comment: Kinds of translocations include "insertional translocation," "intrachromosomal translocation" (= a "shift"), "interchromosomal translocation," "nonreciprocal translocation" (= "aneupcentric translocation"), and "reciprocal translocation" (King and Stansfield 1985).

reciprocal translocation *n.* "A two-break aberration that results in an exact interchange of chromosomal segments between two nonhomologous chromosomes and produces two monacentric translocated chromosomes" (King and Stansfield 1985).

Comment: *Helianthus annuus* (Annual Sunflower) has reciprocal translocations (Kim and Rieseberg 1999, 966).

♦ **transmitter substance** See neurotransmitter.

♦ **transmission genetics** See study of: genetics: transmission genetics.

♦ **transmutation** See ³theory: transmutation.

♦ **transparency** See camouflage: background imitation: transparency.

♦ **transpecific evolution** See ²evolution: transpecific evolution.

♦ **transpiration** *n.* A plant's loss of water vapor through its stomata (Curtis 1983, 614, 1109). [Latin *trans*, across + *spirare*, to breath]

evapotranspiration *n.* The sum of transpiration and water evaporation from soil and water bodies in a particular place over time (Lincoln et al. 1985; Odum et al. 1988, 13).

♦ **transport** *n.* Something's carrying, or conveying, a thing or a person; conveyance (Oxford English Dictionary 1972, entries from 1611).

adult transport *n.* In many social-insect species: One adult's carrying, or dragging, another adult, usually during colony emigration (Hölldobler and Wilson 1990, 635).

chain transport *n.* In some ant species: One worker's relaying food to another in the course of transporting it back to their nest (Hölldobler and Wilson 1990, 636).

group transport *n.* In Ants: Two, or more, worker's coordinated transport of a food item (Hölldobler and Wilson 1990, 638).

♦ **transport host** See host: paratenic host.

♦ **transport of young** *n.* A parent animal's carrying its young either inside, or outside, its body (Immelman and Beer 1989, 318).
cf. carrying in, clinging young

♦ **transportation hypothesis** See hypothesis: transportation hypothesis.

♦ **transposable element** *n.* A member of a class of DNA sequences that can move from one chromosomal site to another (King and Stansfield 1985).
See transposable element: transposon.

syn. controlling element (McClintock in King and Stansfield 1985), transposon (a confusing synonym) (King and Stansfield 1985)
cf. nucleic acid: deoxyribonucleic acid: selfish DNA

Comments: Transposable elements are classified into families based on their structure, kinds of genes, and model of movement (King and Stansfield 1985). They seem to make up at least 10% of more derived eukaryote genomes. As a transposable element moves in and out of a chromosome, it can change a gene from a coding to a noncoding form and vice versa, and duplicate, lose, merge, and move genes (Arms and Camp 1995, 200). Transposable elements can affect gene regulation and thus cause mutations. They might function in formation of new species. Movements of these elements require a transposase and a resolvase that recognize short nucleotide sequences that are repeated in inverted order at both ends of an element. Transposable elements have also been classified as selfish DNA (Alberts et al. 1989, 605–606). Purugganan (1993) discusses transposable elements that can act as introns, and he lists kinds of transposable-element-intron alleles. Some bacterial strains transmit plasmids with drug resistance and have received transposon insertions from

other bacteria (Strickberger 1996, 217). Such horizontal DNA transmission might occur between different species and phyla. The Singa-toxin gene moves from one bacterium to another via a virus and causes human hemorrhagic colitis and hemolytic-uremic syndrome (Hilts 1996, 23 April, C1). Barbara McClintock received the Nobel Prize in 1983 for her work with transposable elements in Maize which she started in the 1940s. Some of the many kinds of transposable elements are defined below.

Ac-Ds *n.* A transposable element in Maize (Alberts et al. 1989, 105).

Comments: Arms and Camp (1995, 199) describe *Ac* and *Ds* as different transposable elements. *Ds* (a disabled gene) stops purple coloration of a corn seed. *Ac* (an activator gene) apparently enables *Ds* to move around within a genome.

Alu *n.* One of a family of possible transposable elements in *Homo sapiens sapiens* of about 300 nucleotide pairs and derived from a 7SL-RNA gene that constitutes about 5% of human DNA (Alberts et al. 1989, 605, 608).

Comments: *Alu* sequences (discovered by Houck et al. 1979) represent the great majority of short interspersed nucleotide elements in Humans (Zuckerkandl et al. 1989, 505). These sequences are variable in structure, number, location, orientation, and transcriptional regulation. *Alus* might be unusually mobile pseudogenes (Alberts et al. 1989, 605, 608) or some kinds might have a function (Zuckerkandl et al. 1989, 505).

[*Alu* refers to a tetranucleotide present in most *Alu* sequences, AGCT, which is specifically cut by a restriction enzyme (Zuckerkandl et al. 1989, 505).]

cin4 *n.* A transposable element in Maize (Alberts et al. 1989, 105).

copia element *n.* A transposable element in *Drosophila* that is a member of a family of closely related base sequences that code for abundant mRNAs (King and Stansfield 1985).

syn. Copia (Alberts et al. 1989, 105)

Comment: Several *Drosophila* mutations are known that result from insertions of copia-like elements (King and Stansfield 1985).

insertion sequence (IS) *n.* A small transposable element in *Escherichia coli* that usually encodes proteins for its own transposition and catalyzes the transposition of a sequence it flanks (King and Stansfield 1985).

syn. jumping gene (King and Stansfield 1985)

Comment: Insertion sequences can produce lethal mutations (King and Stansfield 1985).

lambda (λ) *n.* A bacteriophage that splices its genes into the DNA of *Escherichia coli* (Arms and Camp 1995, 199).

L1 *n.* A transposable element in Humans that constitutes about 4% of a genome's mass (Alberts et al. 1989, 105).

mariner transposons *n. pl.* A group of transposable elements that were first found in insects (Grady 1996, 5 March, C1).

Comments: David Hartl found the first mariner transposon (Grady 1996, 5 March, C1). Some mariner transposons occur in Humans and might have entered our genome from insects via malaria mosquitoes, directly from other insects, or from other organisms. One mariner transposon could be responsible for unequal crossing over near the myelin gene on chromosome-17

in Humans. The resultant duplication can lead to Charcot-Marie-Tooth Syndrome which is a disease involving degeneration of hand and feet nerves (and named after its three discoverers). The resultant deletion can lead to hereditary neuropathy (HNPP).

P element *n.* A transposable element in *Drosophila melanogaster* that is responsible for one type of hybrid dysgenesis (Rubin et al. 1982 in Rieger et al. 1991; King and Stansfield 1985).

cf. gene: *Indy*

Comment: A DNA molecule that carries a P element can be microinjected into a *Drosophila* embryo, and the P element may integrate into the germ line chromosomes and be transmitted to the progeny of injected flies (King and Stansfield 1985).

P transposon *n.* A transposon in *Drosophila melanogaster* that probably entered *D. willistoni* in the 1940s (Daniels et al. 1990 in Strickberger 1996, 217).

retrotransposon *n.* A transposon that resembles a retrovirus (Travis 1992, 884).

transposon *n.*

1. A gene that is repetitive within a cell and can change positions on a chromosome (e.g., in some bacteria) (Gould 1981, 7).
2. A kind of transposable element that is immediately flanked by inverted repeat sequences that, in turn, are immediately flanked by direct repeat sequences (King and Stansfield 1985).

Note: Transposons usually have genes in addition to those needed for their insertion into chromosomes (King and Stansfield 1985).

See transposable element.

syn. jumping gene, mobile genetic element, transposable element (confusing synonym), transposable gene (confusing synonym) (King and Stansfield 1985)

Comments: The gene for leghemoglobin, used in nitrogen fixation in legumes, might have been translocated to a legume from an animal by a virus (Lewin 1981, 636). Circumstantial evidence indicates that a mite carried transposable elements called "P elements," *q.v.*, between *Drosophila* species (Travis 1992, 885). Transposons can alter gene expression that might be favored by natural selection; they might cause gene-regulation changes that lead to speciation.

Tam3 *n.* A transposable element in *Antirrhinum* (Alberts et al. 1989, 105).

tn3 *n.* A transposable element in *Escherichia coli* (Alberts et al. 1989, 105).

ty element *n.* A transposable element in the yeast *Saccharomyces cerevisiae* (King and Stansfield 1985).

syn. Ty (Alberts et al. 1989, 105)

[*ty*, transposon-yeast]

♦ **transposon** See transposable element: transposon.

♦ **transreplication** See gene conversion.

♦ **transversion** See 2mutation: transversion.

♦ **transvestism** *n.*

1. A person's dressing himself, or herself, in garments of the opposite sex (Oxford English Dictionary 1972, entries from 1652).

2. A person's compulsive need to dress in garment appropriate for members of the opposite sex (Michaelis 1963).

cf. eonism; mimicry; automimicry: female mimicry [trans- + Latin, *vestitus*, past participle of *vestire*, to clothe]

♦ **trap** *n.* A device used to catch game or other animals, or collect seeds (based on Michaelis 1963).

Comment: Many factors affect the sizes and compositions of trap samples including age, population-size, sex, and species of organisms; geographical location; habitat type; microhabitat conditions; moon phase; time of day and year; trap design, emptying times, kind, and size; and weather (Southwood 1978, chapter 7; Handley and Kalko 1993).

[Old English *treppe, træppe*]

SOME KINDS OF TRAPS

- I. attractive trap
 - A. bait trap
 - B. host-plant trap
 - C. shelter trap
 - D. vertebrate-host trap
- II. attractive-interceptive trap
 - A. light trap
 - B. sticky trap
 - C. water trap
- III. interceptive trap
 - A. aquatic trap
 - B. emergence trap
 - C. flight trap
 - D. pitfall trap

light trap *n.* A trap that uses ultraviolet, visual light, or both in attracting animals (Southwood 1978, 253).

Comment: Light traps are probably the most widely-used insect traps, and include the Haufe-Burgess visual trap, Manitoba trap (= canopy trap) New-Jersey trap, Pennsylvanian trap, Robinson trap, Rothamsted trap, and Texas trap (Southwood 1978, 253).

Malaise trap *n.* A trap used for catching arthropods, and that is made of gauze, a supporting frame, and a collecting head which collects living or dead specimens (Steyksal 1981).

Comments: Malaise traps catch primarily certain taxa of flying insects, but also collect some taxa that walk into them (Barrows 1986). These traps come in different colors, mesh sizes, overall sizes, and shapes. Some are used with baits such as CO₂.

[after René Malaise, Swedish entomologist who published a description of a Malaise trap in 1937 (Steyksal 1981, 225)]

♦ **Cornell-style Malaise trap** *n.* A pyramid-shaped Malaise trap with four openings in its lower area, a square cross-section at its base, and a collection head at its apex (Matthews and Matthews 1983, fig. 1).

♦ **Townes-style Malaise trap** *n.* A Malaise trap with a rectangular cross-section at its base and a collection head at one or both of its top corners (Townes 1962, 253; Matthews and Matthews 1983, fig. 1; Darling and Packer 1988, 787, figures). This kind of trap is useful for surveys of some insect taxa such as Butterflies, Fireflies, Flower Flies, Mecoptera, Moths, and Wasps (Barrows et al. 2008, 47; Barrows and Flint 2009, 223). Figure 45 depicts a floating Townes-style Malaise trap used for sampling insects in a freshwater tidal marsh in Dyke Marsh Wildlife Preserve, Virginia, U.S.

[after Henry Townes, American Entomologist, who modified Malaise's original trap design]

mist net *n.* A net made of fine, strong thread, used for trapping flying bats and birds of many species (Allen 1996, 639).

Comments: Researchers often place these nets in vertebrate flyways (Allen 1996, 639, 641). Some people use these nets for capturing these animals for food.

pitfall trap *n.* A steep-sided pit in the ground that captures primarily cursorial animals (Southwood 1978, 247).

Comments: A pitfall trap primarily comprises a container that is put into the ground so that its mouth is level with the soil surface (Southwood 1978, 247). Researchers modify pitfall traps by adding baits, collecting fluids, precipitation guards, timing devices that segregate catches from different periods, and adjusting trap size. Studies on mammals with the use of pitfall traps include using arrays of traps, drift fences, transects of traps, and traps of different sizes (Handley and Varn 1994, 285; Handley and Kalko 1993, 19; Kalko and Handley 1993, 3).

♦ **traplining** *n.* In some insect and bird species: An individual's daily following a "trapline" of blooming plants in a set order (Buchmann and Nabhan 1996, 255).

Comment: These animals appear to be familiar with the exact locations and statuses of these plants (Buchmann and Nabhan 1996, 256).

♦ **traumatic insemination** See insemination: traumatic insemination.

♦ **traumatotaxis, traumotaxis** See taxis: traumatotaxis.

♦ **tread** See copulate.

♦ **¹treading** *n.*

1. A person's stepping on; pacing, or walking, on (the ground, etc.); walking (in a place); hence, to go about (in a place, etc.) (Oxford English Dictionary 1972, verb entries from ca. 700).

2. A person's stepping on (something in his way); a person's accidentally, or intentionally, putting his foot down upon; especially so as to press upon (Oxford English Dictionary 1972, intransitive verb entries from 1384).

3. A person's stepping, or walking, upon something with pressure so as to crush, beat down, injure, or destroy it; trample (Oxford English Dictionary 1972, entries from ca. 825).

♦ **²treading** *n.* In male birds of some species: Copulating (Oxford English Dictionary 1972, entries from ca. 1250).

cf. copulation

♦ **³treading, kneading** *n.* In many mammal species: A young's using either its front, or hind, paw in eliciting milk from a teat during nursing (Heymer 1977, 116).

♦ **treadling** See running on the spot.

♦ **treatment, treatment effect** See effect: main effect.

♦ **treaty** *n.*

1. A formal agreement, or compact, duly concluded and ratified, between two or more states (Michaelis 1963).

2. The document that contains a treaty (def. 1) (Michaelis 1963).

Comment: Under treaty, I include agreements, pacts, protocols, and treaties.

[Anglo-French *treté*, Old French *traitie*, past participle of *traitier* < Latin *tractare*, to handle, frequentative of *trahere*, to draw]

Biodiversity Treaty *n.* A treaty that links traditional conservation with sustainable development of both terrestrial and marine biological resources, which many nations signed at the 1992 Earth Summit in Rio de Janeiro (www.edf.org, 1994).

Comment: Ratification commits a nation to develop strategies for conservation and sustainable use of diverse biological resources, identify and protect critical ecosystems, and control risks associated with releases of genetically-engineered organisms (www.edf.org, 1994). As of March 2000, the U.S. was the only major industrialized country which has not ratified this treaty.

Kyoto Protocol *n.* A 1997 international agreement, drafted by more than 170 countries in Kyoto, Japan, that called for 38 industrialized nations, including the U.S., to cut their emissions by 5% of 1990 levels by 2012 when the Protocol expires (Warrick 1998, 2 November, A1; Revkin 2000, 3 October, D1; <http://www.unfccc.de/resource/docs/convkp/kpeng.html>, <http://www.unfccc.de/resource/docs/convkp/kpeng.html>, 2000, full text).

syn. Kyoto Accord, Kyoto Pact (Warrick 1998, 2 November, A1)

Comments: By October 1998, 55 countries had signed the Pact, but only Fiji had ratified it (Warrick 1998, 2 November, A1). By October 2000, more than 100 countries signed the Protocol, but industrial powers had not yet ratified it (Revkin 2000, 3 October, D1). In November 2000, delegates from 175 countries met in the Hague, and debated ways to slow emissions of greenhouse gases to refine the Kyoto Protocol. No industrialized countries had ratified the Protocol (Revkin 2000, 24 November, A13).

Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) *(SIGH TEASE) n.* A voluntary, international conservation agreement among governments that aims to insure that international trade in specimens of wild animals and plants does not threaten their survival (Reuters 1996, 24 August, 9; CITES 2009).

See Convention on International Trade in Endangered Species of Wild Fauna and Flora (Appendix II).

syn. CITES Convention (New 2009, 17)

Comments: Authorized people signed CITES in Washington, D.C., in 1973, and CITES came into force in 1975 (Slater 1994, 1). There are now 175 CITES Parties. The Convention has been the largest, and according to some people, the most effective international wildlife conservation agreement in the world. This agreement protects about 33,000 animal and plant species, subspecies, and populations which are listed in three appendices based on their threat levels. The appendices include taxa with large individuals such as cacti, cetaceans, orchids, parrots, and sea turtles. The international wildlife trade is worth \$US billions annually and has caused massive declines in the numbers of many species (www.wcmc.org.uk/CITES). The Convention's aims are major components of *Caring for the Earth, a Strategy for Sustainable Living*, launched in 1991 by the United Nations Environment Programme (UNEP), the World Conservation Union (IUCN), and the World Wide Fund for Nature (WWF).

Convention on the Conservation of Migratory Species of Wild Animals (CMS) *n.* An intergovernmental treaty that aims to conserve avian, marine, and terrestrial migratory species throughout their ranges (United Nations Environment Programme 2009).

syn. Bonn Convention

Comments: This treaty is under the aegis of the United Nations Environment Programme, concerned with the conservation of wildlife and habitats on a global scale (United Nations Environment Programme 2009). As of 1 August 2009, the CMS's membership included 112 Parties from Africa, Asia, Central and South America, Europe, and Oceania.

Treaty on Persistent Organic Pollutants *n.*

The first global agreement to abolish persistent organic pollutants, POPs (Kaiser and Enserink 2000, 2053).

Comments: This treaty will ban, or phase out, 12 long-lived pesticides and other toxic chemicals still used in many developing countries (Kaiser and Enserink 2000, 2053). The chemicals are Aldrin, Chlordane, DDT, Dieldrin, Dioxins, Furans, Endrin, Heptachloro, Hexachlorobenzene, Mirex, PCBs, and Toxaphene. These chemicals break down slowly and accumulate in body fat. The treaty allows one exemption which is the use of DDT for malaria control.

♦ **tree** See -gram: dendrogram; organism (Appendix 1, Part 3).

♦ **tree island** See habitat: hummock.

♦ **Tree of Life** See database: Tree of Life.

♦ **tree-ring chronology** See method: dendrochronology.

♦ **TreeBase** See database: TreeBase.

♦ **trekking** See behavior: trekking.

♦ **trembling dance** See dance: bee dance: quiver dance.

♦ **trend** *n.*

1. A biostratigraphic character gradient in a taxon (Eldredge and Gould 1972, 111).
2. An evolutionary path up to improved adaptation, e.g., a growth form, growth rate, or potential for greater habitat choice (Ruse 1993, 56).

♦ **trends** See -genesis: orthogenesis.

♦ **treptic behavior, treptics** See behavior: treptic behavior.

♦ **triadic awareness** See awareness: self-awareness: triadic awareness.

♦ **trial** *n.* One run of part of an entire experiment; e.g., in a learning experiment, exposure of one of a group of animals to a test and control situation can be considered a trial.

♦ **trial-and-error behavior** See kinesis: klinokinesis.

♦ **trial-and-error learning** See learning: trial-and-error learning.

♦ **trial-and-error orientation** See taxis: phobotaxis.

♦ **tribe** See ²group: tribe.

♦ **trigenetic** See -genetic: trigenetic.

♦ **trigenic** See -genic: trigenic.

♦ **triggered behavior** See behavior: triggered behavior.

♦ **trimmed mean** See mean: trimmed mean.

♦ **trimonoecism** See -oecism: trimonoecism.

♦ **trinomial** See name: trinomial.

♦ **trio** *n.* For example, in *Hyla* frogs: Three calling individuals that alternate sounds (Wilson 1975, 443). See ²group: trio.

cf. animal sounds: duet, quartet; group: chorus

♦ **trioecism** See -oecism: trioecism.

♦ **trip** See ²group: trip.

♦ **triploidy** See ploidy: triploidy.

♦ **¹tripping** *n.*

1. A person's moving quickly and lightly (Oxford English Dictionary 1972, entries from 1567).
2. A person's stumbling, erring, sinning (Oxford English Dictionary 1972, entries from 1577).

♦²**tripping** *n.*

1. A bee's causing a flower's anthers to hit it very rapidly when it visits a flower, *e.g.*, when Western Honey Bees visit some legume species such as Alfalfa (Bohart 1971, etc., in Faegri and van der Pijl 1979, 162, 183).
2. The "explosive" anther movement of a flower due to a bee's movements inside it (Faegri and van der Pijl 1979, 162, 183).

♦³**tripping** *n.* A provocative, violent behavior, often observed in children, in which one child suddenly holds out his leg and deliberately causes another to stumble over it (Heymer 1977, 39).

♦**triptorelin** See drug: medroxyprogesterone.

♦**trisomy** See -somy: trisomy.

♦**triumph ceremony** See ceremony: triumph ceremony.

♦**Trivers-parental-investment hypothesis** See hypothesis: Trivers'-parental-investment hypothesis.

♦**Trivers-Willard hypothesis, Trivers-Willard principle** See hypothesis: Trivers-Willard hypothesis.

♦**trivial alteration** *n.* A heated argument between, or among, people that arises for seemingly insignificant reasons (Wilson and Daly 1985, 59).

♦**trixeny** See -xeny: trixeny.

♦**tRNA** See nucleic acid: ribonucleic acid (comment).

♦**troglodyte** *n.* A subterranean organism or a cave dweller (Lincoln et al. 1985).

cf. ¹-phile: troglophile

♦**troglon** See biotope.

♦**troglophile** See ¹-phile: troglophile.

♦**trogloxene** See -xene: trogloxene.

♦**trogloxenous** See -xene: trogloxene.

♦**troop** See ²group: troop.

♦**-troph-, tropho-, -trophy** *comb. f.* Referring to nutrition and its processes (Michaelis 1963).

adj. -trophic

Comment: "-Trophs" are classified in many ways including whether an organism makes all of its own organic compounds used in metabolism, uses organic compounds obtained from other organisms, or both; the kind of energy source an organism uses; the kind of energy source and electron-transfer donors an organism uses; the kind of food an organism consumes; where in a habitat an organism obtains its food; and where an organism feeds on its host.

[Greek *trophikos* < *trophē*, nourishment < *trephein*, to feed, nourish]

♦**acidotroph** *n.* An organism that feeds on acidic food or substrates (Lincoln et al. 1985).

♦**allotroph** See -troph-: heterotroph.

♦**amphotroph** *n.* An organism that is a phototroph during daylight hours and a chemotroph during dark hours (Lincoln et al. 1985).

♦**anauxotroph** See -troph-: autotroph.

♦**atroph** *n.* An organism, or life cycle stage, that does not feed, *e.g.*, an insect pupa or an adult of some moth species (Lincoln et al. 1985).

♦**autotroph** *n.* An organism that can build all the organic molecules it requires using carbon dioxide (in air or water) and energy from its physical environment (Curtis 1983, 83; Starr and Taggart 1989, glossary), *e.g.*, some single-celled-organism species or green plants; contrasts with heterotroph and mixotroph.

syn. auxotroph, holophyte, holotroph, mesotroph, phytotroph, primary producer, prototroph, protroph (Lincoln et al. 1985)

cf. producer

SOME CLASSIFICATIONS OF FEEDING TYPES (-TROPHS)

- I. Classification by kinds of required organic compounds that an organism manufactures
 - A. autotroph (*syn.* auxotroph, holophyte, holotroph, mesotroph, phytotroph, primary producer, prototroph, protroph)
 1. chemoautotroph (*syn.* chemotroph, chemosynthetic autotroph)
 2. photoautotroph (*syn.* phototroph, photosynthetic autotroph)
 - B. heterotroph (*syn.* allotroph, organotroph)
 - C. mixotroph
- II. Classification by an organism's energy source
 - A. amphitroph
 - B. autotroph
 - C. chemolithotroph
 - D. heterotroph
 - E. lithotroph
 - F. mixotroph
- III. Classification by an organism's energy source and electron-transfer donors
 - A. chemoorganotroph
 - B. photolithotroph
 - C. photoorganotroph (*syn.* photoheterotroph)
- IV. Classification by an organism's food type
 - A. acidotroph
 - B. auxotroph
 - C. biotroph
 - D. caecotroph
 - E. hemotroph (*syn.* haemotroph)
 - F. methanotroph
 - G. minerotroph
 - H. monotroph
 - I. myxotroph
 - J. oligotroph
 - K. planktotroph
 - L. polytroph
 - M. prototroph
 - N. saprotroph
- V. Classification by an organism's food location
 - A. ombratroph
 - B. rheotroph
- VI. Classification by an organism's location of feeding on its host
 - A. dermatotroph
 - B. ectendotroph
 - C. ectotroph
 - D. endotroph
- VII. Classification by an organism's symbiotic relationship
 - A. mycotroph
 - B. myrmecotroph
 - C. paratroph (*syn.* parasite)
 - D. symbiotroph
 - E. syntroph
- VIII. Classification by other criteria
 - A. atroph
 - B. cteinotroph
 - C. metatroph
 - D. osmotroph

Comment: Some autotrophs live far under Earth's surface (Fredrickson and Onstoot 1996, 69).

♦**chemoautotroph, chemotroph** *n.* An autotroph that obtains metabolic energy from oxidation of inorganic substances, such as ammonia,

ferrous ions, and hydrogen sulfide (Jannasch and Mottl 1985, 718; Lincoln et al. 1985; Campbell 1996, 505).

syn. chemosynthetic autotroph (Starr and Taggart 1989, glossary)

cf. ¹-phile: thiophile

Comment: Some bacterium species are chemoautotrophs, including the archaeabacterium *Sulfobolus* which oxidizes sulfur (Starr and Taggart 1989, 109; Campbell 1996, 505).

► **photoautotroph, phototroph** *n.* An autotroph that obtains metabolic energy from sunlight by a photochemical process and uses CO₂ as a carbon source (Lincoln et al. 1985; Campbell 1996, 505).

syn. photosynthetic autotroph (Starr and Taggart 1989, glossary)

Comments: Photoautotrophs include cyanobacteria, certain protists, and plants (Campbell 1996, 505).

biotroph *n.* An organism that derives nutrients from a living host; a parasite (Lincoln et al. 1985). See parasite.

caecotroph *n.* An animal that eats caecotrophs (feces), *q.v.*, not caecum feces (Heymer 1977).

cf. -phage: coprophage

chemoautotroph, chemotroph See -troph-: autotroph; chemoautotroph.

chemoheterotroph See -troph-: chemoorganotroph.

chemolithotroph *n.* An organism, *e.g.*, one of many bacterium species, that uses certain reduced inorganic compounds as energy sources by obtaining energy from oxidation-reduction reactions (Jannasch and Mottl 1985, 718; Lincoln et al. 1985).

cf. -troph-: chemoorganotroph, lithotroph

chemoorganotroph *n.* An organism that obtains energy from oxidation-reduction reactions and uses organic electron donors (Lincoln et al. 1985).

syn. chemoheterotroph

cf. -troph-: chemolithotroph

cteinotroph *n.* A parasite that destroys its host (Lincoln et al. 1985), *e.g.*, the AIDS virus or an ichneumon wasp.

dermatotroph *n.* An organism that lives in, or on, skin (Lincoln et al. 1985), *e.g.*, follicle and scabies mites.

ectendotroph *n.* A parasite that feeds from both the exterior and interior of its host (Lincoln et al. 1985).

ectotroph *n.* An organism that obtains nourishment externally without marked penetration into its food source (Lincoln et al. 1985), *e.g.*, many phytophagous-arthropod species.

cf. -troph-: endotroph

endotroph *n.* An organism that obtains nourishment internally by marked penetration into its food source (Lincoln et al. 1985), *e.g.*, mycorrhizal-fungus species or a plant-boring-arthropod species.

cf. -troph-: ectotroph

hemotroph, haemotroph *n.* An organism that obtains nutrients from blood; especially an embryo that feeds from its mother's blood (Lincoln et al. 1985).

cf. parasitism: haemoparasitism

heterotroph *n.* An organism that obtains its carbon and all metabolic energy from organic molecules that have already been assembled by autotrophs (Curtis 1983, 83; Starr and Taggart 1989, glossary); contrasted with autotroph.

syn. allotroph, organotroph (Lincoln et al. 1985); chemoheterotroph (Campbell 1996, 505)

Comment: Some plant species, most bacteria, many protists, and all fungus and animal species are heterotrophs (Starr and Taggart 1989, glossary; Campbell 1996, 505).

► **chemoheterotroph** *n.* An heterotroph species, that must consume organic molecules for both carbon and energy (Campbell 1996, 505).

holotroph See -troph-: autotroph.

hypotroph *n.* An "organism" that uses host-cell substances as food, *e.g.*, a bacterium (Lincoln et al. 1985).

lecitotroph *n.* An organism's developmental stage that feeds on egg yolk (Lincoln et al. 1985).

lithotroph *n.* An organism, *e.g.*, one of many bacterium species, that uses inorganic compounds as electron donors in its energetic processes (Lincoln et al. 1985).

cf. -troph-: chemolithotroph, photolithotroph

mesotroph *n.* An organism that is completely autotrophic (Lincoln et al. 1985).

See -troph-: autotroph.

metatroph *n.* An organism that uses organic nutrients as sources of both carbon and nitrogen (Lincoln et al. 1985).

methanotroph *n.* An organism that metabolizes methane, *e.g.*, a symbiont in a mytilid-mussel species (MacDonald et al. 1990).

minerotroph *n.* An organism that is nourished by minerals (Lincoln et al. 1985).

mixotroph *n.* An organism that is both autotrophic and heterotrophic (Lincoln et al. 1985).

Comment: Lincoln et al. (1985) are not clear whether a mixotroph can make all of its required organic compounds as an autotroph can.

monotroph *n.* An organism that uses only one kind of food such as one plant species (Lincoln et al. 1985), *e.g.*, many insect species.

cf. -phagous: monophagous

mycotroph *n.* A plant that lives in symbiosis with a fungus on which it is nutritionally dependent (Lincoln et al. 1985), *e.g.*, many orchid species with mycorrhizal associations.

myrmecotroph, myrmecobromous organism *n.* An organism that produces food used by ants (Lincoln et al. 1985), *e.g.*, many aphid species.

cf. ²-phile: myrmecophile

myxotroph *n.* An organism that obtains nutrients through ingestion of particles (Lincoln et al. 1985), *e.g.*, some caddisfly species.

oligotroph *n.*

1. An organism that requires only a small nutrient supply, or is restricted to a narrow range of nutrients (Lincoln et al. 1985).

2. An insect species that uses only a few plant species as food (Lincoln et al. 1985).

cf. -lecty: oligolecty

ombrotroph *n.* An organism that obtains nutrients largely from precipitation (Lincoln et al. 1985).

organotroph See -troph-: heterotroph.

osmotroph *n.* An organism that is capable of absorbing organic nutrients directly from an external medium (Lincoln et al. 1985), *e.g.*, *Tillandsia usneoides* (Spanish-moss, a bromeliad).

paratroph, parasite *n.* A organism that feeds in a parasitic manner (Lincoln et al. 1985).

See parasite.

phagotroph *n.* A cell that ingests organic particulate matter, *e.g.*, blood cells that ingest foreign particles (Lincoln et al. 1985).

photoautotroph See -troph-: autotroph: photoautotroph.

photoheterotroph See -troph-: photoorganotroph.

photolithotroph *n.* An organism that utilizes radiant energy and inorganic electron donors (Lincoln et al. 1985).

cf. -troph-: chemolithotroph, lithotroph, photoorganotroph

photoorganotroph, photoheterotroph *n.* An organism that uses radiant energy and organic electron donors (Lincoln et al. 1985).

cf. -troph-: photolithotroph

phototroph See -troph-: autotroph: photoautotroph.

planktotroph *n.* A organism that feeds on plankton (Lincoln et al. 1985).

cf. 1-phile: planktophile

polytroph *n.* An organism that feeds on a variety of different food substances or food species (Lincoln et al. 1985), e.g., American Black Bears and Humans.

cf. -vore: omnivore

prototroph *n.* An organism that obtains nourishment from only one source (Lincoln et al. 1985). See -troph-: autotroph.

rheotroph *n.* An organism that obtains its nutrients largely from percolating, or running, water (Lincoln et al. 1985).

saprotroph *n.* An organism that obtains nourishment from dead, or decaying, organic matter (Lincoln et al. 1985), e.g., many fungus species.

syn. saprobe (Campbell 1996, 505)

cf. -phage: sapophage, saprophytophage, zoosapophage

symbiotroph *n.* An organism that obtains nourishment through a symbiotic relationship (Lincoln et al. 1985), e.g., many bee species.

syntroph *n.*

1. One member of a pair of organisms that is mutually dependent on the other member for food (Lincoln et al. 1985).

2. One member of a pair of organisms that derives one, or more, essential nutrients from the other member (Lincoln et al. 1985).

zootroph See -troph-: heterotroph.

♦ **trophallactic appeasement** See behavior: appeasement behavior: trophallactic appeasement.

♦ **trophallaxis** *n.*

1. In social wasps: Larval donation of salivary secretions to their adult winged sisters (Rouband 1916 in Wilson 1975, 30).

2. In Ants and some species of wasps: Colony members' exchange of salivary secretions (Wheeler 1918).

3. In social insects: Colony members' reciprocal exchange of food and odors (Wheeler 1928 in Wilson 1975, 30).

Note: "If we select the broadest definition allowed by Wheeler . . . trophallaxis must be the equivalent of all of chemical communication in the modern sense" (Wilson 1975, 30).

4. In social insects: Colony members' exchange of food, odors, and tactile stimuli (Schneirla 1946).

5. Animal communication in general (LeMasne 1953).

Note: This definition is so broad that it is not very useful.

6. In social insects: Interindividual exchange of liquid food delivered by regurgitation from their crops or as secretions from special glands associated with their alimentary tracts (Wilson 1975, 207–208).

7. In some social-insect species: Mutual, or unilateral exchange of alimentary liquid, between, or among, colony members and heterospecific organisms (social parasites if present) (Wilson 1975, 597).

Note: This definition seems appropriate for wide use. "Trophallaxis" can serve as chemical communication in some species (Immelmann and Beer 1989, 319).

syn. ecotrophobiosis, oecotrophobiosis, reciprocal feeding (Lincoln et al. 1985)

adj. trophallactic

cf. biosis: trophobiosis

anal feeding, anal trophallaxis See trophallaxis: proctodeal trophallaxis.

oral trophallaxis See trophallaxis: stomodeal trophallaxis.

proctodeal trophallaxis *n.* For example, in Kalotermitid and Rhinotermitid Termites: Trophallaxis that involves food's originating in an animal's hindgut and passing out of its anus (Wilson 1975, 207).

cf. -phage: coprophage

syn. anal feeding, anal trophallaxis

Comment: Young *Phascolarctos cinereus* (Koalas) feed on a special form of feces from their mothers, appearing to show a kind of trophallaxis (Minchin 1937 in Wilson 1975, 207).

stomodeal trophallaxis *n.* For example, in a few theridiid-spider species, many species of more derived social insects, and *Necrophorus* (burying beetles): Trophallaxis that involves an individual's regurgitation from its crop or secretions from special glands associated with its alimentary tract (Wilson 1975, 207, 208 and references therein).

syn. oral trophallaxis

♦ **trophic cascade, cascade** *n.* A reciprocal predator-prey effect that alters the abundance, biomass, productivity, or a combination of these characteristics, of a population, community, or trophic level across more than one link in a food web (Pace et al. 1999, 483).

Comments: Trophic cascades can result from bottom-up control, top-down control, or both (Pace et al. 1999, 484–485). In a three-level food chain, abundant top predators directly cause lower abundances of mid-level consumers and indirectly cause a higher abundance of basal producers (Pace et al. 1999, 484–485). Trophic cascades occur in many kinds of ecosystems.

[Greek, *trophic*, referring to feeding; *cascade*, referring to a series of operations (Morris 1982)]

♦ **trophic egg** *n.* For examples, in some ant species, *Anurogryllus muticus* (a burrowing cricket): A usually degenerate, inviable egg that a worker ant feeds to other members of her colony or a mother cricket feeds to her young (Wilson 1975, 207, 414, 597; West and Alexander 1963 in Wilson 1975, 208).

♦ **trophic level** *n.* A species' position in a food chain, "determined by which species it consumes and which consumes it" (Wilson 1975, 597).

♦ **trophic parasitism** See parasitism: trophic parasitism.

♦ **tropho-** *comb.f.* Also, before vowels, troph-. See -troph-.

♦ **trophobiont** See -biont: trophobiont.

♦ **trophobiosis** See -biosis: trophobiosis.

♦ **trophogenesis** See -genesis: trophogenesis.

♦ **trophology** See study of: trophology.

♦ **trophoparasitism** See parasitism: trophoparasitism.

♦ **trophotaxis** See taxis: trophotaxis.

♦•**trophy** *comb.f.* See -troph-.*cf.* -topic

eutrophy *n.* Visitation of particular kinds of flowers only by certain specialized insect pollinators (Lincoln et al. 1985), *e.g.*, orchid-bee species that visit only certain orchid species.

cf. pollination: exendotropy

polytropy *n.* An organism's feeding on a variety of different food substances or species (Lincoln et al. 1985).

adj. polytrophic♦•**tropic** *comb.f.*

See -lectic.

allotropic *adj.* Referring to a floral visitor that is poorly adapted for pollinating a particular species, and uses resources from this species' flowers for only part of its food (Faegri and van der Pijl 1979, 48).

dystropic *adj.* Referring to a floral visitor that is unadapted for pollinating a particular flower species (Faegri and van der Pijl 1979, 48).

Comment: A dystropic visitor may be destructive to a flower, but it may effect pollination (Faegri and van der Pijl 1979, 48).

eutropic *adj.* Referring to a floral visitor that is fully adapted for pollinating a particular species, and uses resources from this species' flowers as its main food source (Faegri and van der Pijl 1979, 48).

hemitropic, hemilectic *adj.* Referring to a floral visitor that has an intermediate degree of specialization for pollinating a particular flower species (Faegri and van der Pijl 1979, 48).

homotropic *adj.* Referring to a flower that is fertilized by its own pollen (Lincoln et al. 1985).

♦•**tropical** *adj.*

1. Referring to the Torrid Zone of the Earth between the Tropic of Cancer ($23^{\circ}27'$ north) and the Tropic of Capricorn ($23^{\circ}27'$ south) (Lincoln et al. 1985).

2. Referring to a climate with high temperature, high rainfall (at least part of the year), and no frosts (or very rare light frosts at night); contrasted with polar, subtropical, temperate (Lincoln et al. 1985).

Comment: The more southern islands of Hawai'i are in the tropics.

♦•**tropical rain forest** See ²community: rain forest; tropical rain forest.♦•**tropism** *n.*

1. In organisms: An individual's turning itself, or part of itself, in a particular direction (either in the way of growth, bending, or locomotion) in response to a particular external stimulus (Oxford English Dictionary 1972, entries from 1899).

2. In organisms: An individual's "forced movement" due to immediate physical and chemical effects of stimuli upon its protoplasm (Loeb in Dewsbury 1978, 10).

Note: Fraenkel and Gunn (1961, 9–10) discuss Loeb's conceptions of "tropism." Kühn (in Fraenkel and Gunn 1961, 317) called Loeb's tropisms "taxes." "Tropism" is now usually distinguished from "taxis," and Fraenkel and Gunn (1961) use "taxis," instead of "tropism" with regard to animals.

3. In organisms: An individual's involuntary response to an external stimulus; an individual's automatic reaction to a stimulus (Michaelis 1963).

4. In plants and "plant-like" organisms: An individual's response, such as spatial orientation in growth to stimulus direction; *e.g.*, in water in a transparent container, a seedling's moving its leaves toward light

and roots away from light (Harman 1953 in Heymer 1977, 182).

syn. orientation (sometimes), taxis (sometimes)*adj.* -tropic

cf. taxis; ³theory: tropism theory
[Greek *τρόπεῖ*, a turning]

♦•**-tropism**

eutropism *n.* An organism's exhibiting a marked response, or adaptation, to changing environmental conditions (Lincoln et al. 1985).

cf. tropism: stenotropism

extropism *n.* An organism's orientation movement of its lateral organs away from its main axis (Lincoln et al. 1985).

adj. extropic

gamotropism *n.* Gametes' orientation to one another (Lincoln et al. 1985).

cf. taxis: zygotaxis

geotropism *n.* Tropism with regard to gravity (Lincoln et al. 1985).

syn. epitropism, helicotropism

haptropism See tropism: stereotropism.

heliotropism *n.* A plant's, or plant part's, directional movement, growth, or both with regard to the direction of light (Allaby 1994, 191).

Comments: Some flowers, *e.g.*, *Claytonia virginica* (Spring-beauty) and flower heads, *e.g.*, *Helianthus annuus* (Annual Sunflower), turn toward the Sun for at least part of a day (LaPlaca Reese and Barrows 1980, 685; pers. obs.). This heliotropism might increase the plants' pollination by insects.

cf. tropism: eutropism[Greek *helios*, Sun + TROPISM]

narcotropism *n.* An organism's "orientation movements resulting from the effects of narcotics" (Lincoln et al. 1985).

phototropism *n.* Tropism with regard to light.

stenotropism *n.* An organism's exhibiting a limited response, or adaptation, to changing environmental conditions (Lincoln et al. 1985).

cf. tropism: eutropism

stereotropism *n.* An organism's orientation to a contact stimulus (Lincoln et al. 1985).

syn. haptropism, thigmotropism

thermotropism *n.*

1. An organism's being adapted to warm conditions as occurs in some ant species (Wheeler 1930, 9).

2. A plant's turning toward a temperature stimulus (Bligh and Johnson 1973, 958).

cf. ¹-phile: thermophile; taxis: thermotaxis

► **negative thermotropism, cryophily** *n.* An organism's being adapted to cold conditions as occurs in some ant species and many other insect species (Wheeler 1930, 9, 11).

cf. ¹-phile: cryophile, thermophile

thigmotropism See tropism: stereotropism.

tocotropism *n.* An orientation of an organism shown when it gives birth (Lincoln et al. 1985).

♦•**tropism theory** See ³theory: tropism theory.

♦•**tropodrymium** See ²community: tropodrymium.

♦•**tropoparasite** See parasite: tropoparasite.

♦•**tropophile** See ¹-phile: tropophile.

♦•**tropotaxis** See taxis: tropotaxis.

♦•**-tropous** *comb.f.*

n. -tropy*cf.* ²-phile

- allotropous** *adj.* Referring to an unspecialized insect species that is able to feed on many kinds of flowers (Lincoln et al. 1985).
- eutropous** *adj.* Referring to a specialized insect species adapted to feed on particular kinds of flowers (Lincoln et al. 1985).
- ♦**-tropy** See -tropous.
- ♦**true altruism** See altruism (def. 2 and 4).
- ♦**true biosphere** See -sphere: biosphere: eubiosphere.
- ♦**true-breeding** *adj.* Referring to a plant that self-pollinates and produces offspring of its same variety (Campbell et al. 1999, 240).
Comments: For example, a purple-flowered plant is true-breeding if its seeds that result from self-pollination all give rise to purple-flowered offspring.
- ♦**true-Baconian method** See inductivism.
- ♦**true communication** See communication.
- ♦**true consciousness** See consciousness.
- ♦**true extinction** See ²extinction: true extinction.
- ♦**true heritability** See heritability.
- ♦**true hibernation** See dormancy: hibernation: true hibernation.
- ♦**true hypothesis** See hypothesis: true hypothesis.
- ♦**true imitation** See learning: true imitation.
- ♦**true lek** See ²lek, arena.
- ♦**true parthenogenesis** See parthenogenesis: true parthenogenesis.
- ♦**true socialization** See socialization.
- ♦**true symbiosis** See symbiosis: mutualism.
- ♦**truism** *n.* A self-evident truth, especially one of slight importance; a statement that is so obviously true that it does not require discussion (Oxford English Dictionary 1972, entries from 1708); an obvious, or self-evident, fact (Michaelis 1963).
syn. axiom, bromide, platitude (Michaelis 1963)
cf. axiom, doctrine, dogma, law, principle, rule, theorem, theory
Comment: In careful criticism, a truism is always tautological, either explicitly or implicitly; two truisms are that opium puts one to sleep because of its soporific qualities, and a healthy mind requires a healthy body (Michaelis 1963).
- ♦**truly altruistic behavior** See altruism: altruism: true altruism.
- ♦**truly eusocial** See sociality: eusociality.
- ♦**truly personal recognition** See recognition: individual recognition.
- ♦**truly separate strategy** See strategy: truly separate strategy.
- ♦**truly social** See eusociality.
- ♦**trumpet** See animal sounds: trumpet.
- ♦**trumpet call** See animal sounds: call: trumpet call.
- ♦**truncation selection** See selection: truncation selection.
- ♦**Tryon effect** See effect: Tryon effect.
- ♦**T-species** See ²species (comments).
- ♦**TTM** See theory of mind.
- ♦**tubicole** See -cole: tubicole.
- ♦**tumor** *n.*
1. A local swelling on, or in, any human body part, especially from some abnormal autonomous growth of tissue that may, or may not, become malignant; a neoplasm (Michaelis 1963).
 2. An organism's circumscribed, noninflammatory growth arising from its existing tissue but growing independently of the normal rate, or structural devel-

- opment, of such tissue and serving no physiological function (Morris 1982).
3. An organism's abnormally swollen part (Morris 1982).
[Latin tumor < *tumēre*, to swell]
- crown-gall tumor** *n.* A tumor found in dicotyledons that results from incorporation of plasmid DNA from *Agrobacterium tumefaciens* (Crown-gall Tumor Bacterium) (Niesbach-Klösgen et al. 1987, 223).
- ♦**turfophile** See ¹-phile: turfophile.
- ♦**turmoil** See ²group: turmoil.
- ♦**turn** See ²group: turn.
- ♦**turnover hypothesis** See ³theory: theory of island biogeography.
- ♦**"turnover-pulse hypothesis"** See hypothesis: "turnover-pulse hypothesis."
- ♦**turret** *n.* A mud, tubular structure, up through 10 cm high, that a cicada larva builds at its tunnel exit, e.g., in *Magicicada septendecim* (Linnaeus' 17-yr Cicada, fig. 46).
- ♦**turtle-homing hypotheses** See hypothesis: turtle-homing hypotheses.
- ♦**tussock** See ²group: tussock.
- ♦**tutoring** See teaching.
- ♦**twin** *n.*
1. One of two young produced by an organism at the same birth event (Michaelis 1963).
 2. The counterpart, or exact mate, of another (Michaelis 1963).
 3. *v.i.* "To bring forth twins" (Michaelis 1963).
- fraternal twin** *n.* A twin whose counterpart originated from a different fertilized ovum.
- identical twin** *n.* A twin whose counterpart originated from the same fertilized ovum.
Comments: Human identical twins are clones that occur about once in every 250 births in the U.S. (Allen 1998, 8; illustration, 7). Behavior and life styles of these identical twins vary with the pair from being similar to different. In 1998, the majority of researchers believed that nature (genetics) is more important than nurture (environment) in determining behaviors of human twins (Allen 1998, 9–10). On the average human identical twins that are raised together are about 80% and those raised separately are about 50% similar in their characters including health, IQ, and political views.
- ♦**twin species** See ²species: sibling species.
- ♦**TWINSPAN** See method: Two-way indicator-species analysis.
- ♦**two-parent family** See ¹family: two-parent family.
- ♦**two-sided test, two-tailed test** See test: two-tailed test.
- ♦**two-state character** See character: binary character.
- ♦**Two-way indicator-species analysis** See method: Two-way indicator-species analysis.
- ♦**Tr** See temperature: mean radiant temperature.
- ♦**tychocava1** See -xene: trogloxene.
- ♦**tychoparthenogenesis** See parthenogenesis: tychoparthenogenesis.
- ♦**tychoplankton** See plankton: pseudoplankton.
- ♦**tychothelotoky** See parthenogenesis: tychothelotoky.
- ♦**Tyler Prize** See award: Tyler Prize.
- ♦**-type, type** *comb.f.* "Representative of form; type" (Michaelis 1963).
- archetype** *n.*

- One of a limited number of forms, or real essences, represented by organisms (Mayr 1982, 458).
syn. archetype, archetype, arquetype, type, *Urform* (Mayr 1982, 458)

Note: Researchers proposed the concept of archetype in the 19th century before Darwin published his theory of evolution in 1859 (Mayr 1982, 458).

- The hypothetical ancestral type; the earliest common ancestor of a line of descendants (Lincoln et al. 1985).

See *Bauplan*.

syn. ancestor, *Bauplan*, praeform (Lincoln et al. 1985)

cf. phylotypic body plan

behavior type See behavior type.

cytotype *n.* Any group of conspecific individuals that is defined cytologically (Bell 1982, 504).

ecophene *n.* All of the naturally occurring phenotypes produced within a given habitat by a single genotype (Lincoln et al. 1985).

See ecad; type: phenotype: ecophenotype.

syn. ecad, oecophene

ecotype *n.*

- A plant ecological unit that arises as a result of genotypical response of an ecospecies to a particular habitat [coined by Turesson 1922 in Lawrence 1975, 177].

- A plant population that is distinguished by often quantitative morphological and physiological characters and that is interfertile with other ecotypes of the same ecospecies, but prevented from freely exchanging genes by ecological barriers (Gregor et al. 1936 in Lawrence 1957, 177).

Notes: One ecotype differs from another of the same ecospecies by many genes, and the ecotype unit is similar to a subspecies (Lawrence 1957, 177). Some ecotypes are equivalents of geographic subspecies, but more than one ecotype may be included in these, particularly ecotypes that are physiologically but not morphologically distinct. Ecotypes remain distinct through selection and isolation (Lincoln et al. 1985).

- A local plant population that has been selected for its habitat's edaphic and biotic conditions, and expresses this in its phenotype (Mayr 1982, 277, 560, 958).

- A locally adapted organism population (Lincoln et al. 1985).

syn. ecological race (Lincoln et al. 1985)

- An infraspecific organism group that has distinctive traits that result from the selective pressures from its local environment (Lincoln et al. 1985); in animals, these traits can be physiological, morphological, behavioral, or a combination of kinds (Immelmann and Beer 1989, 83).

cf. ecad; ¹race: climatic race; ²group: variety; ³species: ecospecies

epigenotype See -type, type: genotype.

ethotype *n.* An individual organism that shows behavior different from other members of its population (Curio 1975 in Heymer 1977, 65).

cf. ²species: ethospecies

genophenes *n. pl.* Different phenotypes of the same genotype of a species (Lincoln et al. 1985).

genotype *n.*

- "The genetic constitution of a biont, designated with reference either to a single trait or to a set of traits" [coined by Johannsen (1909 in Mayr 1982, 44, 781)].

Note: This term helped to cause a wide acceptance of a difference between an organism's genetic and phenotypic traits (Mayr 1982, 44, 781).

- "The particular combination of alleles carried by an individual at one or more gene loci" (Wittenberger 1981, 616).

- "The total genetic constitution of an organism" (Mayr 1982, 958).

cf. genome

- All of the genetic material of a cell, usually referring only to its nuclear material (Lincoln et al. 1985).

- "All of the individuals sharing the same genetic constitution" (Lincoln et al. 1985).

syn. biotype (Lincoln et al. 1985)

- "The specimen on which a genus-group taxon is based; the primary type of the type species" (Lincoln et al. 1985).

syn. genericity, genotype (Lincoln et al. 1985)

cf. -type, type: phenotype

► **background genotype** *n.* The part of a genotype that is not primarily responsible for producing its phenotype (Lincoln et al. 1985).

syn. residual genotype

► **epigenotype** *n.* The entire developmental complex of gene interactions that produces a phenotype (Lincoln et al. 1985).

► **residual genotype** See -type, type: genotype: background genotype.

► **sisyphean genotype** *n.* A changing genotype found in a sexually reproducing species that is never completely adapted to a changing environment due to gene recombination in offspring (Williams 1975 in Willson 1983, 50).

[after Sisyphus, a man who was condemned by Zeus to roll a huge boulder up a mountain that forever escaped and rolled back down just as he got it near the top (Willson 1983, 50)]

haplotype *n.*

- A set of alloantigens coded by a single allele or by closely linked genes, as occurs with antigens of the major-histocompatibility system (King and Stansfield 1985).

syn. pheno-group (King and Stansfield 1985)

- A set of closely linked genes that tend to be inherited together, as occurs with the A, B, and C loci of the human-leukocyte-antigen gene complex (HLA gene complex) (King and Stansfield 1985) and chloroplast-genome insertion haplotypes in an Amazonian tree species (Hamilton 1999, 129).

karyotype, caryotype *n.*

- An individual's, or species, somatic chromosomal complement (King and Stansfield 1985).

- A photomicrograph of an individual's metaphase chromosomes arranged in a standard sequence (King and Stansfield 1985; Campbell et al. 1999, 229, illustration).

Note: A researcher can use a karyotype to look for an organism's chromosome abnormalities (Campbell et al. 1999, 229). These authors explain how to make a karyotype.

mating type *n.* A group of individuals that have genetically controlled mating behavior, such that they

do not usually mate among themselves but with individuals of a complementary type (Lincoln et al. 1985).

mimotype *n.* A form that resembles another phenotypically, but not genotypically, and that occupies a similar niche in a different geographical area (Lincoln et al. 1985).

morphotype *n.*

1. A specimen selected to represent a given intrapopulation variant or morph (Lincoln et al. 1985).
2. A list of morphological characters presumed to be present in an ancestral species (Lincoln et al. 1985).

mutant type *n.* Any type that is derived from a wild type by a mutational change (Lincoln et al. 1985).

necrotype *n.* An extinct organism (Lincoln et al. 1985).

phenotype *n.*

1. The statistical mean value of a sample (Johannsen 1909 in Mayr 1982, 782).
2. "The totality of characteristics of an individual [organism]" (Johannsen in Mayr 1982, 44; 959), including its biochemistry, morphology, physiology, and behavior (Dewsbury 1978, 114; Wittenberger 1981, 619), but not including its genotype (West-Eberhard 1989, 250).
3. An organism's observable properties, produced by its genotype in conjunction with its environment (King and Stansfield 1985).

Note: This definition is appropriate for wide use. "Phenotype" may also "include functionally important consequences of gene differences, outside the bodies in which the genes sit" (Dawkins 1982, 292).

syn. phaenotype (*Brit.*), phenome, phenon, reaction type (Lincoln et al. 1985)

cf. phenocopy; -type, type: genotype

► **alternative phenotype** *n.* One of two, or more, "forms of behavior, physiological response, or structure, maintained in the same life stage in a single population and not simultaneously expressed in the same individual" (West-Eberhard 1986, 36; 1989, 250).

allelic-switch-alternative phenotype *n.* An alternative phenotype that depends on the allele(s) present at one, or more, genetic-switch loci (West-Eberhard 1986, 36; 1989, 251).

combined-switch alternative phenotype *n.*

An alternative phenotype that depends on a combination of allelic and environmental factors (West-Eberhard 1989, 251).

conditional phenotype, condition-sensitive phenotype *n.* The sole alternative phenotype that a particular individual adopts, or one of a group of phenotypes that an individual adopts at a particular time (West-Eberhard 1986, 36; 1989, 251).

► **ecophenotype, ecad** *n.* A phenotype that exhibits nongenetic adaptations associated with a particular habitat, or to a particular environmental factor (Lincoln et al. 1985).

cf. ^group: variety; -type, type: ecotype

► **extended phenotype** *n.* "All effects of a gene upon the world" (Dawkins 1982, 286).

cf. phenotype

Comment: "The 'effect' of a gene is understood as meaning in comparison with its alleles. The conventional phenotype is the special case in which the effects are regarded as being confined to the individual body in which the gene sits. In practice it is convenient to limit 'extended phenotype' to cases where

the effects influence the survival chances of the gene, positively or negatively" (Dawkins 1982, 286).

► **phenocopy** *n.*

1. A phenotype that is altered by nutritional factors, or exposure to environmental stress, during its development to a form that imitates one characteristically produced by a specific gene; *e.g.*, rickets (due to a lack of vitamin D) is a phenocopy of vitamin-D-resistant rickets (King and Stansfield 1985).
2. "An environmentally induced phenotypic variation that resembles the effect of a known gene mutation" (Lincoln et al. 1985).

► **phenon** *n., pl. phenia* One of two, or more, different forms or phenotypes that may be encountered within a single population (Mayr 1982, 870).

syn. variety (of older literature, Mayr 1982, 870)

Comments: This includes an organism's "sexes (when there is sexual dimorphism), age stages, seasonal variants, and individual variants (morphs, and so on)" (Mayr 1982, 870). In numerical taxonomy, "phenon" replaces "taxon."

plasmon *n.* All extrachromosomal hereditary factors (plasmagens) considered collectively (King and Stansfield 1985).

syn. plasmotype (Lincoln et al. 1985)

reaction type See -type, type: phenotype.

serotype, serological type *n.* An infraspecific variant characterized by antigenic structure (Lincoln et al. 1985).

wild type *n.*

1. A gene's, strain's, or species' natural, or typical form, that one arbitrarily designates as standard, or "normal," for comparison with mutant, or aberrant, forms (*e.g.*, wildtype fruit fly) (Muller in Mayr 1982, 591; Lincoln et al. 1985).
2. An organism's most frequently observed phenotype (King and Stansfield 1985).

cf. feral

♦ **type** *n.*

1. A certain general plan of structure that characterizes a group of organisms (Oxford English Dictionary 1972, entries from 1850).

2. A species, or genus, that best exhibits the essential characteristics of its family, or group, and from which the family, or group, is (usually) named (Oxford English Dictionary 1972, entries from 1840); a taxonomic group that is considered to be representative of the next higher category in a system of classification: a *type* genus (Michaelis 1963).

3. An individual that embodies all of the distinctive characters of a species, etc. (Oxford English Dictionary 1972, entries from 1840); "an organism whose structural and functional characteristics make it representative of a group, species, class, etc." (Michaelis 1963).

[Middle French < Latin *typus* < Greek, *typus*, impression, figure, type < *typtein*, to strike]

♦ **type-1-functional response, type-2-functional response, type-3-functional response**

See response: functional response: type-1-functional response, type-2-functional response, type-3-functional response.

♦ **type-I error, type-II error** See error: type-I error, type-II error.

♦ **type-I restrictase, type-II restrictase, type-III restrictase** See enzyme: restriction enzyme (comment).

- ♦ **type-1 survivorship curve, type-2 survivorship curve, type-3 survivorship curve** See curve: type-1 survivorship curve, type-2 survivorship curve, type-3 survivorship curve.
- ♦ **type-A territory, type-B territory, type-C territory, type-D territory, type-E territory** See territory: type-A territory, type-B territory, type-C territory, type-D territory, type-E territory.
- ♦ **type species** See ²species: type species.
- ♦ **-typic** *comb. f.* See -type.
- endophenotypic** *adj.* Referring to characters, or components, of a phenotype that are not directly adaptive and may not affect an organism's competitive abilities; contrasted with exophenotypic (Lincoln et al. 1985).
- exophenotypic** *adj.* Referring to characters, or components, of a phenotype that are adaptive and affect an organism's competitive abilities; contrasted with endophenotypic (Lincoln et al. 1985).
- oligotypic** *adj.* Referring to a group, or assemblage, largely composed of one type of organism or species (Lincoln et al. 1985).
- ♦ **typical intensity** *n.* The constancy of form of a ritualized and emancipated display resulting from a range of stimulus intensities (Morris 1957 in Immelmann and Beer 1989, 319).
- ♦ **Typic Haplorthod** See soil: Typic Haplorthod.
- ♦ **typogenesis** See -genesis: typogenesis.

- ♦ **typological species** See ²species: typological species.
- ♦ **typology** See study of: typology.
- ♦ **typolysis** *n.* A period of evolutionary history preceding the extinction of a form (Lincoln et al. 1985). *cf.* genesis: typogenesis; stasis: typostasis
- ♦ **typostasis** See -stasis: typostasis.
- ♦ **-typy** *cf.* -type
- symplesiotypy** *n.* Organisms' common possession of a plesiomorphous character state (Lincoln et al. 1985).
- synapotypy** *n.* Organisms' common possession of a derived (apomorphic) character state (Lincoln et al. 1985).
- ♦ **tyrant** *n.*
 1. A human king, or ruler, who exercises his power in an oppressive, unjust, or cruel manner; a despot (Oxford English Dictionary 1972, entries from 1227).
 2. Any person who exercises power, or authority, oppressively, despotically, or cruelly (Oxford English Dictionary 1972, entries from 1290).
 3. A person who seizes the sovereign power in a state without legal right; absolute ruler; a usurper (Oxford English Dictionary 1972, entries from *ca.* 1300).
 4. For example, in some reptile species: A male that dominates other males in a group territory (Wilson 1975, 444).
- ♦ **tyrosine-kinase receptor** See ²receptor: tyrosine-kinase receptor.

U

♦ **ubiquist, ubiquitist** *n.* An organism that has a world-wide distribution, effect, or influence (Lincoln et al. 1985).

♦ **ubiquitous** *adj.*

1. Referring to a ubiquist, *q.v.*
2. "Widespread, cosmopolitan, ecumenical, pandemic" (Lincoln et al. 1985).

♦ ***Ubx*** See gene: *ultrabithorax*.

♦ **uliginous** *adj.* Referring to an organism that inhabits its swampy soil or wet muddy habitats (fig. 24, 25) (Lincoln et al. 1985).

syn. uliginose, helobius, paludal, paludine, paludinous, paludose, palustrine

♦ **ultimate cause, causation** See causation: ultimate causation.

♦ **ultimate factor** See factor: ultimate factor; causation: ultimate causation.

♦ **ultimate function of behavior** See function: ultimate function of behavior.

♦ **ultimatum game** See game: ultimatum game.

♦ ***ultrabithorax*** See gene: *ultrabithorax*.

♦ **ultradian rhythm** See rhythm: ultradian rhythm.

♦ **ultrasound** See ¹sound: ultrasound.

♦ **ultrasound detector** See instrument: bat detector.

♦ **umami** *n.* A person's taste of glutamate (Willoughby 1998, C3; D. A. M. Mackay, pers. comm.).

cf. modality: chemoreception: gustation

Comments: Kukunae Ikeda (1908) described umami as a separate and distinct taste, our fifth taste (in addition to bitter, salty, sour, and sweet) (Willoughby 1998, C3). Umami is the brothiness taste of miso soup or the meatiness taste of sautéed mushrooms. Human mouths have specific receptors that seem to respond only to glutamate. Japanese describe the taste of glutamates as umami (= Ajinomoto), a glutamate-based food additive. Some U.S. citizens describe the taste of glutamates as beef bouillon, fishy, hamburger grease, seaweed, and most commonly salty. Monosodium glutamate, MSG, produces umami which can greatly enhance food flavor, not only changing its taste but also how one's mouth feels. Many foods, including mushrooms, Parmesan cheese, peas, soy sauce, and Tomatoes contain free glutamates that enhance food flavors.

[Japanese *umami*, roughly translated as deliciousness (Willoughby 1998, C3)]

♦ **umbraticole** See -cole: umbracticole.

♦ **umbrella, umbrella species** See ²species: umbrella species.

♦ **umbrophile** See ¹-phile: umbrophile.

♦ **umwelt, *Umwelt*** See -welt: umwelt.

♦ **unbalanced-hermaphrodite population** See ¹population: unbalanced-hermaphrodite population.

♦ **unbeatable strategy** See strategy: unbeatable strategy.

♦ **uncle** *n.*

1. The brother of a person's father or mother; a person's aunt's husband (= uncle-in-law) (Oxford English Dictionary 1972, entries from *ca.* 1290).

2. In the African wild dog, Humans, possibly other primates: A male that takes care of an offspring to which he is not related (Wilson 1975, 349).

cf. aunt, male care

Comment: Itani (1959) described paternal care that male *Macaca fuscata* (Japanese Macaques), of unspecified relationship, gave to young Macaques. He may have been describing "uncle behavior."

♦ **unconditional reflex, unconditional response, unconditioned reflex, unconditional response** See learning: conditioning: Pavlovian conditioning.

♦ **unconditional stimulus, unconditioned stimulus** See stimulus: unconditional stimulus.

♦ **unconscious biological mimicry** See mimicry.

♦ **unconventional statistics** See study of: statistics: unconventional statistics.

♦ **uncorrelated-asymmetry hypothesis** See hypothesis: uncorrelated-asymmetry hypothesis.

♦ **undefended territory** See territory: undefended territory.

♦ **underdispersed distribution, underdispersion** See distribution: underdispersed distribution.

♦ **understanding** See need: understanding.

♦ **undirected tree** See -gram: unrooted tree.

♦ **undulation swimming** See swimming: undulation swimming.

♦ **unequal crossing over** See crossing over: unequal crossing over.

♦ **unguligrade** See -grade: unguligrade.

♦ **uni-** *comb.f.* Having, or consisting of, one only (Michaelis 1963).

[Latin *unus*, one]

♦ **unicolonial** See colonial: unicolonial.

♦ **unifactorial** See -genic: monogenic.

♦ **uniform-convergence hypothesis** See hypothesis: uniform-convergence hypothesis.

♦ **uniform distribution** See distribution: uniform distribution.

♦ **uniform-species-substance hypothesis** See hypothesis: uniform-species-substance hypothesis.

- ♦ **uniformitarian** *n.* One who believes in uniformitarianism, *q.v.* (Oxford English Dictionary 1972, entries from 1840).
- ♦ **uniformitarianism, uniformity, principle of**
See ³theory: uniformitarianism.
- ♦ **unigenesis** See -genesis: unogenesis.
- ♦ **unilateral display** See courtship: unilateral display.
- ♦ **unimale society** See ²group: one-male group.
- ♦ **uninterrupted swimming** See swimming: uninterrupted swimming.
- ♦ **uniparental reproduction** See parthenogenesis: uniparental reproduction.
- ♦ **uniparity** See parity: uniparity.
- ♦ **uniparous** See -parous: uniparous.
- ♦ **uniquely derived character, uniquely-derived-character concept** See law: Dollo's law; morph: apomorph.
- ♦ **unisexual** See sexual: bisexual, unisexual.
- ♦ **unison-bout singing** See animal sounds: song: unison-bout singing.
- ♦ **unit-character hypothesis** See hypothesis: one-gene-one-character hypothesis.
- ♦ **unit of natural selection, unit of selection** *n.*
 1. A biont (Darwin 1859; Mayr 1982; Thornhill and Alcock, 1983, 9; many other biologists).
 2. An individual gene (Fisher 1930; Haldane 1957; Dawkins 1978, 1982).
 3. Groups of organisms (Wilson, 1983).*cf.* selection: group selection
Comment: Lloyd (1992) discusses units of natural selection.
- ♦ **unit of measure**
- ♦ **base pair (bp)** *n.* One base pair composed of two bases that always chemically bond together in a DNA double helix (Rudin 1997, 35).
cf. unit of measure: megabasepair
- ♦ **centimorgan (cM)** *n.* One map unit in a genetic map, *q.v.*, that is equivalent to a 1%-recombination frequency (Campbell et al. 1999, 267).
syn. map unit (Campbell et al. 1999, 267)
[coined by Alfred H. Sturtevant in honor of his teacher the U.S. embryologist Thomas Hunt Morgan (Campbell et al. 1999, 267)]
- ♦ **cron** *n.* One million years (Ma); the basic unit of evolutionary time [coined by Huxley 1957, 454].
- **kilocron** *n.* One billion years (Ga) [coined by Huxley 1957, 454].
cf. unit of measure: Ga.
- **millicron** *n.* One thousand years; 1 millennium [coined by Huxley 1957, 454].
- ♦ **dalton (d)** *n.* A unit equal to the mass of a hydrogen atom (1.67×10^{-24} g), used for measuring molecular masses (King and Stansfield 1985).
Comment: An electron has a mass of about 0.0005 d; a neutron, 1.009 d; and a proton, 1.007 d (Campbell et al. 1999, 25).
[after John Dalton, 1766-1844, British chemist and physicist who helped to develop atomic theory around 1800]
- ♦ **darwin** *n.*
 1. A unit of measure of rate of evolutionary change that is a factor of e (the base of natural logarithms, ~2.718) per million years [coined by Haldane 1949 in Futuyma 1986, 398].
 2. A change in a trait of 1% per 1 Ma (Weiner 1994, 110).*Note:* In the short term, a population may change many darwins, but in the long-term its average change

may be only a fraction of a darwin (Weiner 1994, 110-111). A population of Darwin's Finches quickly changed by 25,000 darwins after a major drought.

syn. Haldane's evolutionary unit (Lincoln et al. 1985)

cf. macarthur

[after the British evolutionist Charles R. Darwin, 1809-1882]

day (d) *n.* Twenty-four hr.

► **degree day** *n.* The product of number of days and their mean temperatures (Lincoln et al. 1985); *e.g.*, $70^{\circ}\text{F} \times 20$ days = 1,400 degree days.

Comment: Researchers use degree days to estimate the duration of an organism's life-cycle or its particular growth phase (Lincoln et al. 1985).

► **scientist-day** *n.* Eight scientist hr, *q.v.* (Lawton et al. 1998, 72).

decibel (dB) *n.* A unit of measurement that expresses the relative difference in power, often between acoustic or electric signals, that is equal to 10 times the common logarithm of the ratio of the two levels (Morris 1982).

Comments: With regard to sound, *e.g.*, the threshold of human hearing is 0 dB. The sound of rustling leaves is 10 times this threshold (10^1) which is 10 dB ($= 1 \times 10$). A human whisper is about 100 times this threshold (10^2) which is 20 dB ($= 2 \times 10$). Normal conversation is about 60 dB; the full sound of a large orchestra is about 98 dB, and the sound in the front-row seats of a loud rock concert is 110 dB. A 160-dB sound, which is 16 trillion times the threshold of human hearing can cause the instant perforation of a person's eardrum (Henderson 2007). Exposure to sudden, very loud noise, usually about 130 dB, can cause immediate and permanent damage to a person's hearing (Clayman 1989, 729). Loud noise over a period can cause gradual destruction of the cochlear hair cells and permanent hearing loss.

[French *décî* < Latin *decimus*, tenth < *decem*, ten; bel, the ratio between the two levels of power < Alexander Graham Bell (1847-1922)]

diameter at breast height (d.b.h., dbh) *n.*

The diameter of a plant trunk at 4.5 ft (1.4 m) from the surface of the ground in which the plant grows (Adams et al., 1994).

functional conservation unit (FCU) *n.* An habitat area of a species of conservation concern (New 2009, 34).

Comment: Functional conservation units can be in three scales: (1) habitat patches currently occupied by the focal species plus nearby peripheral areas, (2) those habitat patches and more distant peripheral areas, and (3) the species' potential recolonization sites (New 2009, 34).

Ga *n.* One billion years, which is 10^9 yr in the U.S. and 10^{12} yr in most of Europe (Price 1996, 123; D. A. M. Mackay, pers. comm.).

Comment: "Ga" in this book means 10^9 yr, unless specified otherwise.

[Latin *giga*, giant; *annum*, year]

global-warming potential *n.* A measure of the relative effect of a greenhouse gas, expressed as the ratio of global warming from one unit mass of the gas to that of one unit mass of CO₂ over 100 yr (Revkin 2000, 3 October, D1).

hertz (Hz, hz) *n.* A unit of electromagnetic wave frequency, equal to 1 cycle per sec (Michaelis 1963).
[after Heinrich Rudolph Hertz, German physicist]

joule (J) *n.* Physics, a measure of work: the force of 1 newton acting through a distance of 1 m and equal to 10 million ergs or 0.737324 ft-lb.

megajoule (MJ) *n.* 1 million joules.

Ma *n.*

1. One million years (Bowring et al. 1993, 1293).
syn. M.Y. (Flessa et al. 1975, 76), My (Benton 1995, 53), Myr (Futuyma 1986, 328; Horai et al. 1992, 32)
Note: Ma, My, and Myr have no periods when they are not at the end of a sentence.
2. One million years ago (Benton 1995, 52; Price 196, 123).

See cron.

[Ma < Latin *mega*, very large; *annum*, year (Price 1996, 123)]

macarthur (ma) *n.*

1. The rate at which the probability of a discrete event per 500 yr is 0.5 (Van Valen 1973, 12).
2. The rate of extinction (Ω) that gives a half-life of 500 yr (Van Valen 1973, 12).
3. The occurrence of one origin of a discrete event per 1000 yr per potential ancestor (Van Valen 1973, 12).

cf. darwin

Comment: Van Valen (1973, 23) gives computational aids for macarthurs, kilomacarthurs, and megamacarthurs.

[coined by Van Valen (1973) after Robert H. MacArthur, biologist, who showed the importance of extinction in ecology]

► **millimacarthur (mma)** *n.* In molecular evolution, the rate of one substitution per 1,000,000 yr (Van Valen 1973, 23).

syn. pauling (Van Valen 1973, 23)

megabasepair (Mb) *n.* One million base pairs (*q.v.*) (Lee and Lee 2000, 171).

syn. megabase (Goffeau et al. 1996, 566)

mole *n.*

1. The amount of an element equivalent to its atomic weight expressed in g (Curtis 1983, 42).
2. The amount of a substance equivalent to its molecular weight expressed in g (Curtis 1983, 42).

Comments: A mole contains 6.02×10^{23} molecules, which is Avogadro's number. A mole of hydrogen atoms is 1 g of hydrogen; a mole of water is 18 g of water molecules.

pH *n.* The negative logarithm (base 10) of the hydrogen ion concentration, $[H^+]$ (in moles per liter) of a solution (Michaelis 1963; Curtis 1983, 42).

syn. pH (Michaelis 1963)

Comment: pH expresses relative acidity and alkalinity with a pH of 0 being highly acidic, pH of 7 being neutral, and pH of 14 being highly alkaline. Human stomach acid is pH 1–2; Coca Cola, 3; human blood and tears, 7.2; and household ammonia, 12 (Campbell 1996, 49).

[from potential of Hydrogen]

PART OF THE pH SCALE

CONCENTRATION OF H ⁺ IONS (MOLE L ⁻¹)	pH	CONCENTRATION OF OH ⁻ IONS (MOLE L ⁻¹)
$1.0 = 10^0$	0	10^{-14}
$0.1 = 10^{-1}$	1	10^{-13}
$0.000001 = 10^{-6}$	6	10^{-8}
$0.000000000000001 = 10^{-14}$	14	10^0

scientist-hour *n.* One hour of continuous work by a scientist (inferred from Lawton et al. 1998, 72).

year (y, y., yr, yr.) *n.* The time that it takes the Earth to revolve around the Sun once, consisting of approximately 365.25 days and now reckoned as beginning 1 January and ending 31 December and consisting of approximately 365 days in regular years and 366 in leap years (Michaelis 1963).

► **flight year** *n.* The year when a group of birds makes an unpredictable appearance in a particular locality (Kricher and Morrison 1988, 307).

Comments: The unpredictable appearance is due to a mass movement called an irruption (Kricher and Morrison 1988, 307). Birds of at least 10 seed-eating species and six raptorial species exhibit flight years which may be caused by food shortages in their breeding areas.

► **light year (ly.)** *n.* The distance that light (or any other electromagnetic radiation) travels in a vacuum in 1 yr; 9.4605×10^{12} km; 63,240 astronomical units; 0.30660 parsecs (Mitton 1993).

Comment: In 1 yr, light in a vacuum travels 5,912,000,000,000 mi (about 6 trillion mi) or 9,460,500,000,000 km.

► **mast year** *n.* A year in which a tree species shows masting (Kricher and Morrison 1988, 302).

► **scientist-year** *n.* Two-hundred and fifty scientist days, *q.v.* (Lawton et al. 1998, 72).

Comment: Some highly enthusiastic scientists work more than 250 days per yr (pers. obs.).

► **water year** *n.* A year that starts when soil of an area is fully charged with moisture (inferred from Adams et al. 1994, 4).

Comment: In the Fernow Experimental Forest, West Virginia, U.S., the water year is from May 1 through 30 April of the following year (Adams et al. 1994, 4).

► **wasp year** *n.* A year during which adult yellowjackets are very common as seen in the continental U.S., especially in the Northwestern states of the contiguous U.S. (Akre 1995, 26).

syn. outbreak year

Comment: Many people abandon areas where yellowjackets are common, *e.g.*, fishing, hiking, picnicking, and log-milling and staging locations and crop fields.

♦ **universals** *n. pl.* Ethologically speaking, behavior patterns that occur in the same context in all Humans regardless of their culture, or race; each elicits a particular same response, has the same meaning, and is interpreted in the same way across cultures, *e.g.*, crying, laughing, smiling, expressions of mistrust, expressions of sadness, pain, or threat (Eibl-Eibesfeldt 1973, Morin and Piattelli-Palmarini 1974 in Heymer 1977, 186).

♦ **Universe** *n.* The aggregate of all existing things; the Cosmos (Michaelis 1963); space and all things in it including our Solar System, Milky Way Galaxy, other galaxies, interstellar dust, and black holes.

Comment: Our Universe began about 15 Ga ago; Earth is about 4.6 Ga old; and as our Universe continues to evolve, all of its stars might disappear by about $10^{1,500}$ yr after our Universe began (Overbye 2002, D1). *cf.* SETI Institute (Appendix 2)

♦ **universe** See ²population: universe.

♦ **univoltine** See -voltine: univoltine.

♦ **univore** See -vore: univore.

♦ **univorous** See -vorous: univorous.

♦ **Unken reflex** See reflex: *Unken* reflex.

- ♦ **unkindness** See ²group: unkindness.
- ♦ **unplanned-multiple-comparisons procedure** See statistical test: multiple-comparisons test: unplanned-multiple-comparisons procedure.
- ♦ **unrooted phylogenetic tree** See -gram: unrooted phylogenetic tree.
- ♦ **unstable equilibrium** See equilibrium: unstable equilibrium.
- ♦ **Upper Devonian impact hypothesis** See hypothesis: Upper Devonian impact hypothesis.
- ♦ **upper temperature survival limit** See temperature survival limit: upper temperature survival limit.
- ♦ **upward classification** See grouping.
- ♦ **Upsilon Andromedae** See star: Upsilon Andromedae.
- ♦ **upward stretch** See display: upward stretch.
- ♦ **Urform** See -type: archetype.
- ♦ **urge** *n.*
 1. Something's impelling, or prompting, motive, stimulus, or force; inciting or stimulating; exerting pressure or constraint (Oxford English Dictionary 1972, entries from 1645).
 2. In animal's "manifest motivation as expressed in behavior;" distinguished from a drive when it is defined as an animal's "latent readiness to act in a particular manner" (Immelmann and Beer 1989, 80).
cf. drive
Comment: The Oxford English Dictionary (1972) gives many definitions of the verb "urge" as it relates to Humans.
- ♦ **urination** See elimination: urination.
- ♦ **urination ceremony** See ceremony: urination ceremony.
- ♦ **urine licking** *n.* One animal's licking up the urine of a conspecific; *e.g.*, in *Canis lupus* (Gray Wolves), an alpha male's licking the urine of an alpha female or a female's licking urine of young, or in ruminants, a male's licking up a female's urine (Heymer 1977, 83).
cf. Flehmen

- ♦ **urine marking** See behavior: marking behavior: urine marking.
- ♦ **urine sampling** *n.* In many mammal species: A male's testing the readiness of a female for mating by approaching her during urination and allowing her urine to run over his nose while he smells it which may be followed by *Flehmen* (Heymer 1977, 84).
- ♦ **urophile** See ¹-phile: urophile.
- ♦ **urophilia** See -philia: paraphilia.
- ♦ **urushiol** See compound: urushiol.
- ♦ **use and disuse, principle of** See law: Lamarck's first law.
- ♦ **utility** *n.*
 1. A useful, advantageous, or profitable thing, feature, etc.; a use; used chiefly in the plural: utilities (Oxford English Dictionary 1972, entries from 1483).
 2. An economic term used by biologists who study optimality that is roughly equivalent to an organism's "satisfaction" or "pleasure" (Dawkins 1986, 30).
syn. long-term optimality (Rubenstein 1980 in Dawkins 1986, 30)
 3. An organism's short-term optimization, *e.g.*, energy intake per unit time (McFarland and Houston 1981 in Dawkins 1986, 31).
syn. goal function (McFarland and Houston 1981 in Dawkins 1986, 31)
 4. An organism's long-term optimization, *e.g.*, energy intake per lifetime (McFarland and Houston 1981 in Dawkins 1986, 31).
syn. cost function (McFarland and Houston 1981 in Dawkins 1986, 31)
 5. A quantity that is maximized in the choice behavior of a rational economic person (McFarland 1985, 442).
 6. Benefit, or negative cost, of a nonhuman animal (McFarland 1985, 443).
See resource: utility.
- ♦ **utility function** See function: utility function.
- ♦ **utilization time** See time: utilization time.

V

- ♦ **V** See variance.
- ♦ **vacancy-chain process** See process: vacancy-chain process.
- ♦ **vacant niche** See niche: vacant niche.
- ♦ **vacuum activity** See activity: vacuum activity.
- ♦ **vacuum behavior** See behavior: vacuum behavior.
- ♦ **vagility, mobility** *n.* A tendency of an organism, or population, to change its location, or distribution, with time (Lincoln et al. 1985).
- ♦ **vagina** See organ: copulatory organ: vagina.
- ♦ **vaginicole** See -cole: vaginicole.
- ♦ **vagrant** *n.*
1. An organism that is wind-blown, moves about by its own means, or both (inferred from Lincoln et al. 1985).
 2. An organism that is outside of its normal population range (inferred from New 2009, 21).
- adj.* vagrant
- ♦ **vague mimicry** See mimicry: vague mimicry.
- ♦ **validity** *n.* How well the behavior units in a person's study and the methods he employs answer a research question or test a research hypothesis (Storz 1973, 282; Lehner 1979, 75).
- external validity** *n.* Validity with regard to an entire animal population, other species, or other situations (Lehner 1979, 75, pers. comm.).
- internal validity** *n.* Validity with regard to a person's experimental sample (Lehner 1979, 75).
- ♦ **value** *n.* The material, or monetary, worth of a thing; the amount at which it may be estimated in terms of some medium of exchange or other standard of a similar nature (Oxford English Dictionary 1972, entries from 1303).
- breeding value** *n.* The value of an individual organism defined by the mean value of its progeny, *i.e.*, the heritability of a character (Rieger et al. 1991). *Comment:* Researchers use breeding values to help them to choose the appropriate methods for improving organisms in agriculture (Rieger et al. 1991).
- mean-phenotypic value** *n.* "The average value of any quantitative character within a population" (Lincoln et al. 1985).
- reproductive value (RV)** *n.*
1. Demographically, "the standard measure of the contribution of an individual to the next generation" (Wilson 1975, 93).
 2. Demographically, "the relative number of female offspring remaining to be born to each female of age x" (Wilson 1975, 93).
3. "An organism's age-specific expectation of reproducing" (references in Willson 1983, 18).
4. A measure of a female's expected offspring number when she is a particular age (Lincoln et al. 1985).
- ♦ **van Valen's law** See law: law of constant extinction.
- ♦ **variegated-leaf chimera** See chimera: variegated-leaf chimera.
- ♦ **variable** *n.*
1. The actual property measured by individual observations (Sokal and Rohlf 1969, 9). *syn.* character (Sokal and Rohlf 1969, 9)
 2. A property with respect to which individual observations in a sample differ in some ascertainable way (Sokal and Rohlf 1969, 11). *cf.* observation, parameter, ²population, sample of observations

CLASSIFICATION OF BIOLOGICAL VARIABLES^a

-
- I. measurement variable
 - A. continuous variable
 - B. discontinuous variable
 - II. ranked variable
 - III. qualitative variable
-

^a Sokal and Rohlf (1969, 11).

antecedent variable See variable: independent variable.

background variable See variable: independent variable.

continuous variable *n.* A variable that has all possible values in its range, at least theoretically, *e.g.*, 110, 111, 112, etc. and all values between these numbers (Sokal and Rohlf 1969, 11).

controlled variable See variable: independent variable.

explanatory variable See variable: independent variable.

dependent variable *n.*

1. A variable, *e.g.*, a behavioral one, that is influenced, or controlled, by one or more independent variables (Sokal and Rohlf 1969, 406).

syn. parameter (restricted to dependent variable by some workers, used to mean both dependent and independent variables by other workers)

2. In regression analysis: the variable Y (Upton and Cook 2006, 364).

syn. outcome variable, response variable (Upton and Cook 2006, 364)

cf. parameter, variable: independent variable

explanatory variable See variable: independent variable.

discontinuous variable *n.* A variable that has only certain fixed numerical values with no intermediate values between them, *e.g.*, the number of plants in a quadrant or the number of grasshoppers in a field (Sokal and Rohlf 1969, 11).

syn. discrete variable, meristic variable

in-the-head variable See variable: intervening variable.

independent variable *n.*

1. A variable, *e.g.*, a behavioral one, that influences, or controls, a dependent variable (Sokal and Rohlf 1969, 406).

Comment: Researchers often control the magnitudes or presences or absences of dependent variables in experiments (Sokal and Rohlf 1969, 406).

2. In regression analysis: an X variable (X_1, X_2, \dots, X_n) (Upton and Cook 2006, 364).

syn. antecedent variable, background variable, controlled variable, explanatory variable, predictor variable (Upton and Cook 2006, 364)

cf. parameter, variable: dependent variable

intervening variable *n.*

1. An animal's internal, directly unobservable psychological process that in turn affects behavior (Tolman 1958 in Lehner 1979, 63).

syn. in-the-head variable (Lehner 1979, 63)

2. A coefficient in an equation related to behavior that is introduced to express the quantitative relationship between its dependent and independent variables (Immelmann and Beer 1989, 72).

syn. drive (Immelmann and Beer 1989, 157)

3. A process, state, or entity that accounts for the relationship between dependent and independent variables in an equation related to behavior (Immelmann and Beer 1989, 157).

syn. drive, hypothetical construct (Immelmann and Beer 1989, 157)

nuisance variable *n.* An undesired source of variation that may affect a dependent variable being measured, and may bias results of an experiment (Lehner 1979, 63).

outcome variable See variable: dependent variable.

predictor variable See variable: independent variable.

qualitative variable, attribute *n.* A variable that indicates a data class, or category, but not magnitude of data, *e.g.*, dead or alive; African, American, Asian, or European (Sokal and Rohlf 1969, 12).

quantitative variable *n.* A variable that varies in magnitude.

random variable *n.* "A variable that can assume any of a given set of values with assigned probability" (Lincoln et al. 1985).

cf. sample of observations, observation

ranked variable, ordered variable *n.* A variable of an ordered set that has a specific relation to other variables, *e.g.*, first, second, or twentieth (Sokal and Rohlf 1969, 11).

Comment: Ranked variables are expressed only as ranks, *e.g.*, 1, 2, 3, 4, 5; with no indication of the size of intervals between them (Sokal and Rohlf 1969, 11).

response variable See variable: dependent variable.

♦ **variable-interval reinforcement schedule**

See reinforcement schedule: variable-interval reinforcement schedule.

♦ **variable-number-of-tandem-repeats-polymorphism marker** See marker: variable-number-of-tandem-repeats-polymorphism marker.

♦ **variable-ratio reinforcement schedule** See reinforcement schedule: variable-ratio reinforcement schedule.

♦ **variance (V)** *n.* A statistical measure of the variation of individual values about their mean, given in terms of the squares of the units used to measure the values (Rieger et al. 1991).

additive-genetic variance (VA) *n.*

1. The fraction of total phenotypic variance among individuals of a population due to differences between them in breeding value (= the mean value of a progeny) (*q.v.*); variance in breeding values (Falconer 1960, 135; Wade 1992, 149).
2. The genetic variance associated with the average effects of substituting one allele for another (Rieger et al. 1991).

syn. genetic variance (Rieger et al. 1991, a confusing synonym)

Comments: Researchers use additive genetic variance as a measure of degree of resemblance between a parent and offspring. It enables a prediction of a population's response to natural, or artificial, selection when the response is quantified as the change in the mean value of phenotype distribution. This variance describes the extent to which phenotypic change is possible by natural selection, and it is, thus, the most frequently used definition of heritability (Wade 1992, 149–150).

environmental variance (VE) *n.* In genetics, the variance of a character (in an entire population) that is caused by external environmental factors (Wilson 1975, 68).

genetic variance (VG) *n.*

1. In genetics, the phenotypic variance of a character that is caused by genetic factors alone (Wilson 1975, 68).
2. In genetics, the part of phenotypic variance of individuals in a population that is produced by differences, or changes, in their genetic constitution alone, such as mutation or recombination (Lincoln et al. 1985).

cf. ¹heritability, variance: phenotypic variance

Comment: The components of genetic variance are (1) the variance that is due to differences between homozygotes (= additive genetic variance), (2) the variance that is due to specific effects of various alleles in heterozygotes (= dominance variance), and (3) the variance that is due to combinations of non-homologous loci (= epistatic variance = nonadditive variance) (Rieger et al. 1991).

cf. ¹heritability, variance: phenotypic variance

phenotypic variance (Vp) *n.* In genetics, the total variation (= variance) in a particular phenotypic character, comprising both environmental and genetic variance (Lincoln et al. 1985).

cf. ¹heritability, variance: genetic variance

population variance (σ^2) *n.* In statistics, the variance that is calculated using all members of a population; the square of the population's standard deviation; population variance = $\sigma^2 = \Sigma(\bar{x} - x_i)^2/N$; where \bar{x} is the population mean of the variable x ; x_i is

a quantitative measure of a specific variable x ; and N is the population size (Sokal and Rohlf 1969, 54).
cf. standard deviation; variance: sample variance

Comments: To compute the population variance, use all members (= values) of a population. For example, let the entire population be the five values 1, 2, 3, 4, and 5. Subtract each value from the population's mean (= 3), square the differences (getting 4, 1, 0, 1, 4), sum these squares (= 10), and divide the sum by N (the population size); this equals 10/5, or 2. The standard deviation of the entire population, σ , is the square root of 2, or 1.41.

residual variance *n.* In statistics, the part of the variability of a dependent variable, in an analysis of variance or regression analysis, that cannot be attributed to a specific source of variation (e.g., an independent variable) (Lincoln et al. 1985).

sample variance (s^2) *n.* In statistics, a variance based on a sample from a population: sample variance = $s^2 = \sum(\bar{x} - x_i)^2/(N - 1)$; the symbols are the same as for population variance.
cf. variance: population variance

Comments: Sample variance is "the most commonly used statistical measure of variation (dispersion) of a trait within a population" (Wilson 1975, 597). To compute the sample variance, use all members of a chosen data set from an entire population. For example, let the chosen data set of values be 1, 2, 3, 4, 5. Subtract each value from the set's mean (= 3), square the differences (getting 4, 1, 0, 1, 4), sum these squares (= 10), and divide the sum by $N - 1$ (the sample size minus 1); this equals 10/4, or 2.5. The standard deviation of this sample, (*q.v.*), is the square root of 2.5 which is 1.58. The denominator ($N - 1$) is a correction for sampling error, but when N is reasonably large, the correction is minor (Hartl 1987, 219).

standardized variance (I) *n.* The population variance of a character divided by its mean value squared (Crow 1958 in Cabana and Kramer 1991, 228).

Comment: A population's I is equivalent to its opportunity for selection, *q.v.* (Cabana and Kramer 1991, 228).

♦ **variance enhancement** *n.* The increase in the reproductive-potential variance among members of a parent's brood that results in more brood members' being brought to lie above, or below, their breeding threshold and, thus, increasing the proportion of brood that become breeders or potential helpers, respectively (Brown 1987, 307).

♦ **variance utilization** *n.* A parent's utilization of aid from its offspring that are unable to breed for reasons not imposed by the parent (Brown 1987, 299).

♦ **variation** *n.* Divergence among individuals of a group, specifically an individual's difference from conspecifics that cannot be ascribed to a difference in age, sex, life-cycle stage, or a combination of these factors (King and Stansfield 1985).

Comment: Variations of evolutionary significance are gene-controlled phenotypic differences (King and Stansfield 1985).

coarse-grained variation *n.* Variation in an organism's environment with a period greater than its life span (Futuyma 1986, 39).
cf. environment: fine-grained environment; variation: fine-grained variation

continuous-phenotypic variation, continuous variation *n.* The existence of different gradations of phenotypic (and its underlying genotypic) variation within a population (Darwin 1859 in Mayr 1982, 738).

syn. individual differences, individual variation, fluctuating variation (Mayr 1982, 738)

cf. law: Galton's law of ancestral inheritance; variation: discontinuous variation

Comment: Strictly speaking, "continuous variation" is not a separate category from "discontinuous variation," *q.v.*, although it was believed to be by breeders and naturalists well into the first quarter of the 20th century (Mayr 1982, 683).

discontinuous (phenotypic) variation *n.* A striking deviation from a species "type" ("normal individual") that is not connected to it by a series of intermediates, *e.g.*, an albino (Mayr 1982, 682–683).
cf. variation: continuous variation

Comment: Essentialists considered discontinuous variations to be bases of new species. Discontinuous variation is not really a category separate from continuous variation contrary to Darwin's belief, and this caused conceptual difficulties for him. An individual discontinuous variation is a member of a species at one extreme of a continuum of variation (Mayr 1982, 682–683).

fine-grained variation *n.* Variation in an organism's environment within a period less than its life span (Futuyma 1986, 39).

cf. environment: coarse-grained environment; variation: coarse-grained variation

geographic variation *n.* The phenomenon that a species may have different, geographically isolated forms or subspecies that are often connected with each other by a graded chain of intermediates (Mayr 1982, 411, 566).

cf. speciation: allopatric speciation, geographical speciation

Comment: "The principle of geographic variation" greatly helped to destroy the "essentialist-species concept" (Mayr 1982, 411, 566).

♦ **variegated-leaf chimera** See chimera: variegated-leaf chimera.

♦ **variety** *n.*

1. A deviation from the species type (Mayr 1982, 288).

Note: Linnaeus "did not distinguish between inheritable and noninheritable varieties, nor between those that refer to individuals and those that represent different populations (such as domestic and geographic races). This confusion continued for two hundred years, and some residues of it can be found even in the contemporary literature" (Linnaeus 1751, 158 in Mayr 1982, 288). Linnaeus is generally credited with having formalized the concept "variety."

2. A plant changed by an accidental cause (Mayr 1982, 640).

Note: Linnaeus wrote that there are as many varieties as there are different plants produced from the seed of the same species. He considered a variety to be what we now call "nongenetic modifications of phenotypes" (Mayr 1982, 640).

3. A nongenetic climatic animal variant, breed of domestic animal, intrapopulation genetic animal variant, or a geographical animal variant (Linnaeus 1751 in Mayr 1982, 640).

4. A population of organisms, a geographically isolated portion of a species, a variant (or aberrant individual) within a population (Darwin in Mayr 1982, 43, 268).

Note: By using "variety" and "form" instead of "population" and "individual," Darwin inadvertently made his writing confusing and confounded two rather

different modes of speciation, geographic and sympatric speciation (Darwin in Mayr 1982, 43, 268).
 5. A cultivated plant variant (*syn.* cultivar) or an intrapopulational variant (Mayr 1982, 641).
abbr. cv.

Note: Mueller et al. (1998, 2034) consider a fungus variety farmed by certain attine ants to be a “cultivar,” although a fungus is not a plant. Those ants started fungus growing about 50 Ma ago, and the less-derived attines currently cultivate many fungus species, mostly in the Lepiotaceae (Basidiomycotina: Agaricales).

6. An animal geographic race (Mayr 1982, 641).
 7. An individual (intrapopulational) variant (Esper in Mayr 1982, 289).

syn. individual variety (Mayr 1982, 683)
 8. An individual or a group of organism individuals that differs from a type species in certain characters and is usually fertile with any other members of its species; a subdivision of a species (Michaelis 1963).
syn. geographical race (animals), intrapopulational variant (plants) (Mayr 1982, 641)

[Medieval French *variété* < Latin *varietas* < *varius*, various]

♦ **Vascular Tropicos Nomenclatural Database**

See database: Vascular Tropicos Nomenclatural Database.

♦ **vasopressin** See hormone: vasopressin.

♦ **VAST Nomenclatural Database** See database: Vascular Tropicos Nomenclatural Database.

♦ **Vavilovian mimicry** See mimicry: Vavilovian mimicry.

♦ **vector** *n.* An object that carries something else.
 [Latin *vector*, carrier < *vehere*, to carry]

artificial chromosome *n.* A human-made vector that contains the essential parts of an eukaryotic chromosome, including an origin for DNA replication, a centromere, and two telomeres, all with foreign DNA (Campbell et al. 1999, 370).

Comment: An artificial chromosome behaves like a normal chromosome in mitosis and clones the foreign DNA when its cell divides (Campbell et al. 1999, 367). An artificial chromosome can carry more DNA than a cloning vector, enabling cloning of very long DNA pieces.

cloning vector *n.* A plasmid that is a DNA molecule that carries foreign DNA into a cell and replicates there (Campbell et al. 1999, 367).

Comment: Researchers use cloning vectors for gene cloning (Campbell et al. 1999, 367).

expression vector *n.* A cloning vector that contains the requisite prokaryotic promoter just upstream of a restriction site where an eukaryotic gene is inserted (Campbell et al. 1999, 369).

Comment: Using an expression vector overcomes the problem of getting a bacterium to express a foreign gene that is linked to the promoter (Campbell et al. 1999, 369).

yeast-artificial chromosome (YAC) *n.* A cloning vector that can carry inserted fragments a million base pairs long (Campbell et al. 1999, 377).

♦ **vegetation** *n.* A mosaic of plant communities (Küchler 1964, 1).

cf. -coenosis

♦ **vegetative division** See parthenogenesis: vegetative reproduction.
syn. vegetative propagation, vegetative reproduction

♦ **vehicle** *n.* “Any relatively discrete entity, such as an individual organism, which houses a replicator, and which can be regarded as a machine programmed to preserve and propagate the replicators that ride inside it” (Dawkins 1982, 295).

cf. gene machine

♦ **ventromedial prefrontal cortex** See organ: brain: ventromedial prefrontal cortex.

♦ **venom** See toxin: venom.

♦ **verbal behavior** See behavior: verbal behavior.

♦ **verbal learning** See learning: verbal learning.

♦ **vernal** *adj.*

1. “Belonging to, appearing in, or appropriate to spring” (Michaelis 1963).

2. “Youthful; fresh” (Michaelis 1963).

cf. prevernal

[Latin *vernalis* < *vernus*, belonging to spring < *ver*, spring]

♦ **vernal equinox** See equinox: vernal equinox.

♦ **vertebrate zoology** See study of: zoology.

♦ **vertical evolution** See ²evolution: vertical evolution.

♦ **vertigo** *n.* A person’s disordered condition in which he has a sensation of whirling, either of external objects, or himself, and tends to lose his equilibrium and consciousness; “swimming” in a person’s head; giddiness; dizziness (Oxford English Dictionary 1972, entries from 1528); a person’s state of confusion, or uneasiness, about spatial position, or movement, which may be accompanied by intense dizziness (Storz 1973, 282).

♦ **very likely** See frequency: very likely.

♦ **vesicle** See organized structure: membranous droplet.

♦ **vestibular organ** See labyrinth.

♦ **vestigial character** See character: vestigial character.

♦ **vestigiofossil** See fossil: trace fossil.

♦ **veterinary ethology** See study of: ethology: applied ethology.

♦ **VG** See variance: genetic variance.

♦ **viability** *n.* An organism’s capacity to live, grow, germinate, or develop (Lincoln et al. 1985).
adj. viable

♦ **vibratile pollination, vibration, vibración** See pollination: buzz pollination.

♦ **vibration dance, vibratory dance** See dance: bee dance: dorso-ventral abdominal vibration.

♦ **vibrational communication** See communication: vibrational communication.

♦ **vibrotaxis** See taxis: vibrotaxis.

♦ **vicar, vicarious species, vicariad** See ²species: vicarious species.

♦ **Vicar-of-Bray hypothesis** See hypothesis: hypotheses of the evolution and maintenance of sex: Vicar-of-Bray hypothesis.

♦ **vicariance biogeography** See study of: geography: biogeography: vicariance biogeography.

♦ **vicarism, vicariation** *n.* The existence of vicarious species (*q.v.*) that replace each other geographically (Lincoln et al. 1985).

♦ **pseudovicarism** *n.* The existence of pseudovicars that occupy different geographical areas (Lincoln et al. 1985).

♦ **vigilance** *n.* Especially in prey animals: An animal’s alertness; its readiness in detecting events that are potentially of serious concern to it or its companions (Immelman and Beer 1989, 323).

syn. vigilant behavior (Desportes et al. 1989, 771)

<p>social vigilance <i>n.</i> An animal's alertness to signs of possible sexual, or aggressive, interactions with others, or for location signals that ensure that it does not lose contact with its group (Immelman and Beer 1989, 324).</p> <p>◆ vigilant behavior See vigilance.</p> <p>◆ violence <i>n.</i> An animal's behavior that "inflicts some form of injury" to another animal (Southwick 1970, 1).</p> <p>◆ viral sex See ³sex: viral sex.</p> <p>◆ Virchow's aphorism <i>n.</i> <i>Omnis cella e cella</i> (Virchow 1855 in Mayr 1982, 658): Every cell [arises] from a pre-existing cell. <i>Comment:</i> This concept is widely accepted by biologists.</p> <p>◆ virgin <i>n.</i></p> <ol style="list-style-type: none"> 1. A person of either sex who remains in the state of chastity (Oxford English Dictionary 1972, entries from <i>ca.</i> 1300). 2. A woman, especially a young one, who remains in a state of inviolate chastity; "an absolutely pure maiden or maid;" an old maid, a spinster (Oxford English Dictionary 1972, entries from 1310). 3. In many insect species: A female that produces fertile eggs by parthenogenesis (Oxford English Dictionary 1972, entry from 1883), <i>e.g.</i>, some walkingstick or aphid species. 4. A female animal that has not copulated (Lincoln et al. 1985). <p>◆ ²virgin <i>adj.</i> Pertaining to a native habitat, fauna, or flora that is essentially unaffected by human activities (Lincoln et al. 1985).</p> <p>◆ virgin birth See parthenogenesis.</p> <p>◆ virgin flower See organ: flower: virgin flower.</p> <p>◆ virginiparity, virginiparous See parity: virginiparity.</p> <p>◆ "virtual-model mimicry" See mimicry: "virtual-model mimicry."</p> <p>◆ virus <i>n., pl. viri, viruses</i></p> <ol style="list-style-type: none"> 1. "Any of a class of filterable, submicroscopic pathogenetic agents, chiefly protein in composition but often reducible to crystalline form, and typically inert except when in contact with certain living cells" (Michaelis 1963). <i>syn.</i> filterable virus (Michaelis 1963) 2. Any virulent substance developed within an animal's body, and capable of transmitting a specific disease (Michaelis 1963). 3. "Venom, as of a snake" (Michaelis 1963). 4. Any of various submicroscopic pathogens that consist of a core of a single nucleic acid (a capsid) surrounded by a protein coat (envelope), having the ability to replicate only inside a living cell (Morris 1982; Campbell 1996, 330). <i>Notes:</i> Human virally-caused diseases include Chicken Pox, the Common Cold, Influenza, and Polio. 5. A specific pathogen (Morris 1982). <i>cf.</i> living <i>Comments:</i> The Garry Lab (2008) presents a wealth of information on Viruses including their genomes, hosts, morphology, and taxonomy. Although, many researchers do not consider Viruses to be organisms, some specialists classify them by phylum, class, order, family, genus, and species. <p>arbovirus <i>n.</i> An arthropod borne virus; <i>e.g.</i>, the West Nile Arbovirus, which killed some bird species and Humans in New York in 1999 (Wadler 1999, 1 October, A25).</p>	<p style="text-align: right;">A</p> <p style="text-align: center;">TAXA OF ANIMAL VIRUSES GROUPED BY THEIR TYPE OF NUCLEIC ACID^a</p> <hr/> <p>I. Doublestranded DNA (dsDNA) Viruses</p> <ol style="list-style-type: none"> A. Adenovirus (respiratory disease, tumors in some nonhuman animals) B. Herpesvirus <ol style="list-style-type: none"> 1. The subclasses within each class differ mainly in their capsid structures and in the presence, or absence, of envelopes.</p> <p>Asian Flu Virus of 1957 <i>n.</i> A virus that caused an epidemic in Humans in 1957 (Associated Press 1998, 8 February, 26). <i>Comments:</i> This virus probably mutated in <i>Sus scrofa domestica</i> (Domestic Pigs) (Associated Press 1998, 26).</p>
--	--

Ebola Virus *n.* One of two members of the Filoviridae, a family of RNA viruses (Centers of Disease Control and Prevention, 2000, 21 November).
cf. virus: Marburg Virus

Comments: Three of the four subtypes of Ebola Virus identified so far have caused disease in Humans: Ebola-Ivory Coast, Ebola-Sudan, and Ebola-Zaire. The fourth, Ebola-Reston, has caused disease in nonhuman primates, but not in Humans. Ebola Virus causes haemorrhages and fevers and causes death rates of up to 90% in some outbreaks (Burton and Parren 2000, 527). Death usually results from shock, typically about 10 days after the first symptoms appear. This virus does not “liquefy” internal organs. Infested Humans transmit this virus through direct contact, such as a handshake (Burton and Parren 2000, 527). The Ebola Virus emerged in an African rainforest in 1976 from an unknown natural reservoir, presumed to be a nonhuman animal. Sullivan et al. (2000 in Burton and Parren 2000, 527) developed an Ebola vaccine that protects monkeys.

[after the Ebola River, Democratic Republic of the Congo (formerly Zaire), where people first recognized Ebola hemorrhagic fever]

herpesvirus *n.* A virus with an envelope derived from its host's nuclear membrane, a capsid with double stranded DNA, and reproduction within a host's cell nucleus (Campbell 1996, 331).

Comments: Herpesviruses use a combination of their own and host enzymes to replicate and transcribe their DNA. A herpesvirus can become integrated into a host cell's genome as a “provirus” (Campbell 1996, 331). Herpesviruses cause cold sores and genital sores in Humans.

Hong-Kong-Flu Virus of 1968 *n.* A virus that caused an epidemic in Humans in 1968 (Associated Press 1998, 8 February, 26).

Comments: This virus probably mutated in Pigs (Associated Press 1998, 8 February, 26).

Human Immunodeficiency Virus (HIV) *n.* A retrovirus that causes acquired-immunodeficiency syndrome, AIDS, in Humans (Campbell 1996, 331; illustration, 873).

Comments: A family of HIVs causes AIDS (Goudsmit 1997 in Ryan 1997, 24 August, 17). Researchers first recognized AIDS in the U.S. in 1981 (Campbell 1996, 873–875). Virologists identified its causative agent as the HIV in 1983 and found it in preserved blood samples from Africa and England from 1959. An HIV might have been extant first as proto-1B and evolved from Simian Immunodeficiency Viruses, SIV (Goudsmit 1997 in Ryan 1997, 24 August, 17). HIV-1A and HIV-C are the main lethal strains in Africa; HIV-1B, Australia, Japan, U.S., and Western Europe; HIV-1E, Southeast Asia. Viral sex between HIV-1A and an unknown strain might have given rise to HIV-1E. The HIV readily infects helper-T cells of immune systems (Campbell 1996, 873–875). Factors that make it difficult to eradicate AIDS include that the HIV can become a provirus and that the HIV mutates extremely rapidly. It takes an average of 10 yr for an HIV infection to develop into full-blown AIDS in Humans older than infants. Infants can be infected with HIV *in utero*. HIV is transmitted in infected blood, breast milk, cells, and semen. Some antiviral drugs (e.g., AZT, ddC, and dDI) inhibit HIV reverse transcriptase and may extend a patient's life, but do not completely eliminate HIV.

JC Virus *n.* A human virus first isolated from a person, whose initials are J. C., in 1971 (Brown 1999, 9 August, A7, illustration).

Comments: This virus causes the disease progressive multifocal leukoencephalopathy, which is similar to multiple sclerosis, but is much more rapid, killing patients in about 6 mo (Brown 1999, 9 August, A7). This virus has seven major types about 20 subtypes. It evolves very slowly and can be used to trace dispersal of human populations over thousands of years.

Marburg Virus *n.* One of two members of the Filoviridae, a family of RNA viruses (Burton and Parren 2000, 527).

cf. virus: Ebola Virus

Comment: This virus originated in Uganda and causes haemorrhages and fevers and causes death rates of up to 90% in some outbreaks (Burton and Parren 2000, 527).

1918 Flu Virus *n.* A virus that killed about 30 million people (including 700,000 in the U.S.) in 1918 (Associated Press 1998, 8 February, 26).

syn. Spanish Flu (Associated Press 1998, 8 February, 26)

Comments: This virus apparently was a virus mutation that evolved in U.S. *Sus scrofa domestica* (Domestic Pigs) and troops who were mobilized for World War I spread it (Associated Press 1998, 8 February, 26). The epidemic from this virus was the deadliest of all known human epidemics. Flu viruses from *S. s. domestica* might be the most virulent for Humans.

provirus *n.* A form of a virus that is integrated into its host cell's genome (Campbell 1996, 331).

Comment: Herpesviruses and Human Immunodeficiency Viruses can become proviruses (Campbell 1996, 331, 874).

retrovirus *n.* An RNA virus that transcribes DNA from an RNA template with a reverse transcriptase (Campbell 1996, 331).

Retroviruses integrate as proviruses composed of transcribed DNA into a host's genome (Campbell 1996, 331).

[Latin *retro*, backward + virus]

RNA virus *n.* A virus with a capsid composed of RNA (Campbell 1996, 331).

Comment: Some animal viruses, bacterial viruses (= phages), and most plant viruses are RNA viruses (Campbell 1996, 331).

Simian Immunodeficiency Virus (SIV) *n.* A virus of nonhuman primates that might have evolved into a Human Immunodeficiency Virus, *q.v.* (Goudsmit 1997 in Ryan 1997, 24 August, 17).

West Nile Virus *n.* A member of Flavivirus (Flaviviridae) which can cause fatal encephalitis (inflammation of the brain) in *Equus ferus caballus* (Domestic Horses) and Humans and sicken, or kill, domestic and wild birds (e.g., Common Crows) (Centers for Disease Control and Prevention, 2002).

Comments: This Virus currently occurs in Africa, west and central Asia, Europe, the Middle East, North America, and Oceania (Centers for Disease Control and Prevention, 2002). Mosquitoes (mostly *Culex* spp.) transmit this virus among some bird species and from them to *E. f. caballus* and Humans.

[after the West Nile District, Uganda, where a researcher first isolated it from a febrile woman in 1937]

♦ **viral sex** See sex: viral sex.

♦ **viscosity** *n.* “The slowness of individual dispersal and hence the low rate of gene flow” in a population

(Hamilton 1964 in Alexander 1987, 65; Wilson 1975, 597).

syn. population viscosity (Lincoln et al. 1985)

♦ **Virunga National Park** See place: Virunga National Park.

♦ **Virunga Volcano Region** See place: Virunga Volcano Region.

♦ **visible light** See light: visible light.

♦ **vision** See modality: vision.

♦ **visual cliff** *n.* An apparatus used to test for animal visual depth perception, *e.g.*, in chicks, goslings, ducklings, or human infants (Storz 1973, 283).

♦ **visual imagery** *n.* A person's recreation of an experience seen with his eyes in the absence of the actual experience (*e.g.*, his creating an image of the Pantheon in his mind) (Miyashita 1995, 1719).

♦ **visual-scene analysis** See analysis: visual-scene analysis.

♦ **visuospatial-construction cognition** See cognition: visuospatial construction cognition.

♦ **visuospatial sketch pad** See working memory (comments).

♦ **vitalism** *n.* The doctrine that life and its phenomena arose from and are the product of a hypothetical vital force that is outside of the jurisdiction of chemical and physical laws; contrasted with mechanism (*q.v.*) (Michaelis 1963; Campbell et al. 1999, 49).

cf. idealism, materialism, organicism, physicalism

Comments: Aristotle, William Harvey (1578–1657), and Kaspar Friedrich Wolff (1733–1794) believed in vitalism in the sense that mystical, nonphysical forces caused differentiation of embryonic tissue (Strickberger 2000, 13). A European school of vitalism emerged in the 17th century as an antimovement against the scientific mechanistic philosophy of the Scientific Revolution and the physicalism of Galileo Galilei (1564–1642) through Isaac Newton (1642–1727) (Mayr 1997, 9). "By the 1920s or 1930s biologists had almost universally rejected vitalism" (Mayr 1982, 36, 52, 66). Pioneers of organic chemistry (*q.v.*) helped to shift the mainstream of biological thought from vitalism to mechanism (*q.v.*). Some researchers thought that animal behavior is an ideal product of a supernatural life force, neither requiring nor accessible to natural explanations (Gherardi 1984, 370).

[Old French < Latin *vitalis* < *vita*, life]

extreme vitalism *n.* The belief that "organisms are completely controlled by a sensitive, if not thinking soul" (Mayr 1982, 114).

♦ **viticole** See -cole: viticole.

♦ **Vivanite** See mineral: Vivanite.

♦ **viviparity** See -parity: viviparity.

♦ **viviparous** See -parous: viviparous.

♦ **VNTR marker** See marker: variable-number-of-tandem-repeats-polymorphism marker.

♦ **vocal dialect** See dialect: vocal dialect.

♦ **vocal imitation** See learning: vocal mimicry.

♦ **vocal matching** *n.* For example, in Bonobos: Two animals' making calls that change in quality over the course of an encounter, but remain similar to each other (Waal and Lanting 1997, 24).

♦ **vocal mimicry, vocal mocking** See learning: vocal mimicry.

♦ **vocal-pouch-brooding** See brooding: vocal-pouch-brooding.

♦ **vocal repertory** See repertory: vocal repertory.

♦ **vocal stimulation** *n.* A person's presenting natural, or artificial, sounds, usually by tape recorder, to

test their effects on an animal that is being studied for its auditory responsiveness (Immelmann and Beer 1989, 325).

♦ **vocalization** See animal sounds: vocalization.

♦ **volant** *adj.* Referring to a trait, or animal, that is adapted for flying or gliding (Lincoln et al. 1985).

♦ **"volcano hypothesis"** See hypothesis: hypotheses regarding the origin of the Cambrian explosion: "volcano hypothesis."

♦ **Volcano National Park** See place: Volcano National Park.

♦ **volery** See ²group: flock.

♦ **volicitin** See molecule: volicitin.

♦ **volition** *n.* A person's (consciously) willing or resolving; a person's decision, or choice, made after due consideration, or deliberation; a resolution or determination (Oxford English Dictionary 1972, entries from 1615). See hypothesis: volition.

[French< Medieval Latin *volitio*, -onis < Latin *vol-*, stem of *velle*, will]

♦ **-voltine** *adj.* Referring to the number of broods, or generations, per year, or per season, in a species, or population (Lincoln et al. 1985).

bivoltine, digoneutic *adj.* "Having two generations or broods per year" (Lincoln et al. 1985).

monovoltine See -voltine: univoltine.

multivoltine, polyvoltine, polygoneutic *adj.*

Referring to a species, or population, that has several broods, or generations, per year (Lincoln et al. 1985).

cf. cyclic: monocyclic

polyvoltine See -voltine: multivoltine.

quadrivoltine *adj.* Referring to a species that has four broods per year or season (Lincoln et al. 1985).

trivoltine *adj.* Referring to a species that has three broods per year or season (Lincoln et al. 1985).

univoltine *adj.* Referring to a species, or population, that has one generation per year (Lincoln et al. 1985).

syn. monogoneutic, monovoltine

♦ **von Baer's laws** See law: von Baer's laws.

♦ **-vore** *comb. f.* Feeding on; referring to an organism that feeds on a particular category(ies) of food (Lincoln et al. 1985).

cf. -biont, -cole, guild, -phage, phagy, -ophile, -troph-, -zoite

[< Latin *voro*, eat greedily, devour]

ambivore *n.* An animal that feeds on grasses and broad-leaved plants, *e.g.*, *Bison bison* (American Bison) (Lincoln et al. 1985).

aphidivore *n.* An animal that eats aphids, *e.g.*, a *Chrysopa* sp. (green lacewing) (Lincoln et al. 1985).

apivore *n.* An animal that feeds on bees, *e.g.*, a *Bembix* sp. (beewolf, a wasp) (Lincoln et al. 1985).

calcivore *n.* A plant that lives on limestone or in soils rich in calcium salts (Lincoln et al. 1985).

carnivore, sacrophage *n.* An animal that feeds on animal flesh, *e.g.*, *Panthera tigris* (Tigers) (Lincoln et al. 1985).

detrivore, deposit feeder *n.* An animal that feeds on detritus, *e.g.*, a filter-feeding insect such as a caddisfly species (Trichoptera) (Lincoln et al. 1985).

erucivore *n.* An animal that feeds on caterpillars, *e.g.*, *Cuculus canorus* (Common Cuckoos) (Lincoln et al. 1985).

exudativore, gumivore *n.* An animal that feeds on tree gum and other exudates from trees, *e.g.*, *Nymphalis antiopa* (Mourning Cloak Butterflies) (Lincoln et al. 1985).

folivore, phyllophage *n.* An animal that feeds on foliage, e.g., *Odocoileus virginianus* (White-tailed Deer) (Lincoln et al. 1985).
Comment: The chrysomelid *Odontota dorsalis* (Locust Leafminer) makes blotch leaf mines in leaflets of *Robinia pseudoacacia* (Black Locust) (fig. 47).

forbivore *n.* An animal that feeds on forbs, e.g., *Aepyceros melampus* (Impala) or *Pyrrharcia isabella* (Banded Woollybear, a moth) (Lincoln et al. 1985).

frugivore *n.* An animal that feeds on fruit, e.g., a fruit-eating bat (Lincoln et al. 1985).

fucivore *n.* An animal that feeds on seaweed, e.g., a periwinkle (snail) species (Lincoln et al. 1985).
syn. algicole

fungivore *n.* An animal that feeds on fungus, e.g., a fungus gnat (Lincoln et al. 1985).
syn. mycetophage, mycophage

gallivore *n.* An animal that feeds on galls (Lincoln et al. 1985).
syn. galliphage

graminivore *n.* An animal that feeds on grass, e.g., a grasshopper (Lincoln et al. 1985).

granivore *n.* An animal that feeds on grain or seeds, e.g., the Slate-colored Junco (Lincoln et al. 1985).

gumivore See -vore: exudativore.

herbivore *n.* An animal that feeds on plants (Lincoln et al. 1985).
cf. -phage: macrophytophage, necrophytophage
Comments: Thousands of arthropod and other species are herbivores, including *Euchaetes egle* (Milkweed Tiger Moth). Aggregations of aposematically colored, late-instar *E. egle* consume leaves of *Asclepias syriaca* (Common Milkweed) at night as seen in Maryland, U.S. (fig. 48). The larvae avoided consuming main leaf veins which are filled with toxic latex.

insectivore *n.* An animal that feeds on insects, e.g., *Tenodera sinensis* (Chinese Mantis) (Lincoln et al. 1985).
syn. entomophage

larvivore *n.* An animal that feeds on larvae, e.g., *Calosoma sycophanta* (Forest Caterpillar-hunter) (Lincoln et al. 1985).

lignivore *n.* An animal that feeds on wood, e.g., *Reticulitermes flavipes* (Eastern Subterranean Termite) (Lincoln et al. 1985).
syn. dendrophage, hylophage, xylophage

limivore *n.* An animal that feeds on mud (Lincoln et al. 1985).
syn. limiphage, limophage

mellivore *n.* An animal that feeds on honey, e.g., the *Ursus americanus* (American Black Bear) (Lincoln et al. 1985).
syn. meliphage

merdivore *n.* An animal that feeds on dung or feces, e.g., a dung-rolling scarab beetle (Lincoln et al. 1985).
syn. coprobiont, coprophage, scatophage
cf. -zoite: coprozoite

microbivore *n.* An animal that feeds on microbes, e.g., a paramecium (Lincoln et al. 1985).

molluscivore *n.* An organism that feeds on molluscs, e.g., a cichlid fish (Seehausen et al. 1997, 894).

muscivore *n.* An animal that feeds on flies, e.g., *Argiope aurantia* (Golden Garden Spider) (Lincoln et al. 1985).

nectarivore *n.* An organism that feeds on nectar, e.g., *Archilochus colubris* (Ruby-throated Hummingbird) (Lincoln et al. 1985).

nuscivore *n.* An animal that feeds on nuts, e.g., *Tamias striatus* (Eastern Chipmunk) (Lincoln et al. 1985).

omnivore *n.*
1. An organism that consumes both animals and plants, e.g., Human or *Ursus americanus* (American Black Bear) (Allaby 1994, 277).
2. An organism that indiscriminately feeds on all kinds of food (after Michaelis 1963, Lincoln et al. 1985).
syn. diversivore (Allaby 1994, 277), euryphage, panthophage, pleophage (Lincoln et al. 1985)
cf. -troph: polytroph

phytoplanktivore *n.* An organism that feeds on phytoplankton (= photosynthesizing plankton), e.g., a cichlid fish (Seehausen et al. 1997, 895).

phytosuccivore *n.* An animal that feeds on sap, e.g., *Icerya purchasi* (Cottony Cushion Scale, an insect) (Lincoln et al. 1985).

piscivore *n.* An animal that feeds on fish, e.g., *Esox lucius* (Northern Pike) (Lincoln et al. 1985).
syn. ichthyophage (Lincoln et al. 1985)

plurivore *n.* An animal that feeds on many kinds of food or species, e.g., *Lymantria dispar* (Gypsy Moth) or *Ursus americanus* (American Black Bear) (Lincoln et al. 1985).
syn. euryphage, pleophage (Lincoln et al. 1985)

pollinivore *n.* A organism that consumes pollen; e.g., a bee, masarid wasp, or syrphid fly (Labandeira 1998, 57).
Comment: Pollinivory has generally been the precursor to pollination (Labandeira 1998, 57).

pupivore *n.* An animal that feeds on pupae, e.g., an ichneumonid wasp or *Peromyscus leucopodus* (White-footed Mouse) (Lincoln et al. 1985).

radicivore *n.* An animal that feeds on roots, e.g., *Popillia japonica* (Japanese Beetle) (Lincoln et al. 1985).
syn. rhizophage (Lincoln et al. 1985)

ranivore *n.* An animal that feeds on frogs, e.g., *Rana catesbeiana* (American Bull Frog) (Lincoln et al. 1985).

sanguivore *n.* An animal that feeds on blood, e.g., *Desmodus rotundus* (Common Vampire Bat) (Lincoln et al. 1985).
syn. haematophage, sanguinivore (Lincoln et al. 1985)
cf. parasite: haemoparasite

sporivore *n.* A organism that consumes spores, e.g., an arthropod (Labandeira 1998, 57).
Comment: Early sporivory occurs in the Late Silurian through Early Devonian in terrestrial ecosystems (Labandeira 1998, 57).

univore *n.* An animal that feeds on one kind of food or host, e.g., *Phytomyza aquilegivora* (Columbine Leafminer, a fly) (Lincoln et al. 1985).

zooplanktivore *n.* An organism that feeds on zooplankton (= nonphotosynthesizing plankton), e.g., a cichlid fish (Seehausen et al. 1997, 895).

zoosuccivore, zoosaprophage *n.* An animal that feeds on liquid animal secretions or decaying animal matter, e.g., a rove-beetle species (Lincoln et al. 1985).
cf. -zoite: saprozoite

♦ **vulva presentation** See display: genital display.

W

- ♦ **W** See fitness: genetic fitness.

♦ **waggle dance** See dance: bee dance: waggle dance.

♦ **Wagner tree** See -gram: Wagner tree.

♦ **Waldbauerian-Batesian mimicry** See mimicry: Batesian mimicry: Waldbauerian-Batesian mimicry.

♦ **walk** See ²group: walk.

♦ **Wallace's hypothesis** See effect: Wallace effect.

♦ **Wallace's law** See law: Wallace's law.

♦ **Wallace's line** *n.* An imaginary line that separates the Oriental and Australian zoogeographical regions and runs to the west of Weber's line, *q.v.*, and southwest between the Philippines and Maluku (Moluccas), between Sulawesi and Borneo, and between Lombok and Bali (Wallace 1876 in Mayr 1982, 449; Lincoln et al. 1985).

Comment: Wallace's line divides a richer continental biota from a poorer oceanic one (C. K. Starr, pers. comm.).

[after Alfred Russel Wallace, 1823–1913, English naturalist]

♦ **wallowing** See behavior: wallowing.

♦ **war** *n.*

 1. “Hostile contention by means of armed forces, carried on between nations, states, or rulers, or between parties of the same nation or state; the employment of armed forces against a foreign power, or against an opposing party in the state” (Oxford English Dictionary 1972, entries from 1554).
 2. Overt aggression between ant worker groups from different colonies that results in one group’s appropriation of territorial space or a nest site (Hölldobler and Wilson 1990, 644).

cf. conflict

♦ **war-of-attrition game** See game: war-of-attrition game.

♦ **ward** See ²group: ward.

♦ **warm-blooded animal** See therm: homiotherm.

♦ **warning behavior** See behavior: alarm behavior.

♦ **warning coloration** See coloration: aposematic coloration.

♦ **warning substance** See chemical-releasing stimulus: semiochemical: pheromone: alarm pheromone.

♦ **warp** See ²group: warp.

♦ **Warrawoona Formation, Warrawoona Rocks** See formation: Warrawoona Rocks.

♦ **warren** *n.*

 1. A piece of land that is enclosed and preserved for breeding game (obsolete definition, Oxford English Dictionary 1972, entries from 1377); a place granted by a king for keeping certain animals including
 - hares, conies, partridge, and pheasants, *e.g.*, a rabbit warren (Sparkes 1975).
 2. A piece of land that is appropriated for rabbit breeding, formerly also hare breeding (Oxford English Dictionary 1972, entries from *ca.* 1400).
 - syn.* cony-warren, hare-warren, rabbit-warren (Oxford English Dictionary 1972)
 3. A human-inhabited building or settlement likened to a rabbit-warren; a brothel; a building or cluster of dwellings (especially if partly underground) that is densely populated by poor tenants (Oxford English Dictionary 1972, entries from *ca.* 1649).
 4. A place where rabbits live and breed in communities (Michaelis 1963).
 5. A place in a river used for keeping fish (Sparkes 1975). See ²group: warren.

[Anglo-French *warenne*, game park, rabbit warren < *warir*; to preserve < Germanic]

♦ **Wasmannian mimicry** See mimicry: Wasmannian mimicry.

♦ **water** See molecule: water.

♦ **wasp nest** See nest: wasp nest.

♦ **wasp year** See unit of measure: year: wasp year.

♦ **waste ground, waste place** *n.* An area that is seriously disturbed, but not cultivated, by Humans; *e.g.*, a roadside, vacant lot, dump, or construction site (Voss 1972, 20).

♦ **watch** See ²group: watch.

♦ **water-level recorder** See instrument: water-level recorder.

♦ **water parasitism** See parasitism: water parasitism.

♦ **water pollination** See pollination: water pollination.

♦ **water spitting** See spitting: water spitting.

♦ **water year** See unit of measure: year: water year.

♦ **watershed** *n.*

 1. “The line of separation between two contiguous drainage valleys” (Michaelis 1963).
syn. divide (in Great Britain) (Bates and Jackson 1984), water parting (Michaelis 1963)
 2. The whole region from which a river receives its water supply (Michaelis 1963).
 3. “A drainage basin” (Bates and Jackson 1984).
syn. catchment (Griffith and Perry 1992)

Note: This definition refers to drainage basins of streams and rivers.

[Probably from German *Wasserscheide*, water parting]

Comment: For example, the Fernow Experimental Forest has dozens of watersheds of primary through quaternary streams.

- ♦ **W-chromosome** See chromosome: W-chromosome.
- ♦ **weak altruism** See altruism: weak altruism.
- ♦ **weak cooperation** See cooperation: weak cooperation.
- ♦ **weak selfishness** See selfishness: weak selfishness.
- ♦ **weak spite** See spiteful behavior: weak spite.
- ♦ **weaning** *n.*
1. A person's accustoming a child, or young nonhuman animal, to the loss of its mother's milk; a person's causing the termination of suckling by a child, or other young nonhuman animal (Oxford English Dictionary 1972, entries from *ca.* 960 as a transitive verb).
 2. An experimenter's removal of a mother from her young (Martin 1985).
Note: This is the most frequent use of "wean" in the behavioral literature according to Martin (1985) who discusses the dubiousness of considering this mother removal as weaning. Counsilman and Lim (1985) disagree with Martin's definition and vice versa.
[Old English *wenian*, to accustom]
- ♦ **2weaning** *n.*
1. A parent animal's decreasing the amount of, or ceasing to give, resources to its offspring (Trivers 1972).
 2. A mother animal's breaking her offspring's dependence on her, especially with regard to feeding; which can be a lengthy process in some more derived-mammal species (Immelmann and Beer 1989, 237).
cf. ³conflict: parent-offspring conflict, weaning conflict
- ♦ **3weaning** *n.* An offspring's decreasing the amount of, or ceasing, to take resources (*e.g.*, food, space, or time) from its parent (Trivers 1972).
- ♦ **4weaning** *n.*
1. The period during ontogeny when the rate of parental investment (*sensu* Trivers 1972) drops most sharply (Martin 1984, 1985).
 2. The period when a mother stops suckling a young (Counsilman and Lim 1985).
- ♦ **weaning aggression** See aggression: weaning aggression.
- ♦ **weaning conflict** See ³conflict: weaning conflict.
- ♦ **weapon automimicry** See mimicry: automimicry: weapon automimicry.
- ♦ **weather** *n.*
1. The general atmospheric condition with regard to moisture, temperature, winds, and other meteorological phenomena (Michaelis 1963).
 2. A particular kind of meteorological condition (Michaelis 1963).
 3. Bad weather; storm (Michaelis 1963).
cf. tornado
Comments: Live Storm Watch gives current weather conditions in the U.S. (National Oceanic and Atmospheric Administration 2001).
[Old English *weder*]
- ♦ **4weaving** *n.*
1. A person's forming or fabricating (a stuff or material) by interlacing yarns, or other filaments of a particular substance, in a continuous web (Oxford English Dictionary 1972, verb entries from *ca.* 900).
 2. A person's practicing weaving; working with a loom (Oxford English Dictionary 1972, verb entries from *ca.* 1000).
 3. In many spider and insect species: An individual's spinning (a web or cocoon) (Oxford English Dictionary 1972, verb entries from 1538).
v.i., v.t. weave
- ♦ **2weaving** *n.* A person's signaling (to a ship, or its occupants) by waving a flag or something used as a substitute (Oxford English Dictionary 1972, verb entries from 1593).
- ♦ **3weaving** *n.*
1. A person's moving repeatedly from side to side; tossing to and fro; swaying his body alternately from one side to the other; pursuing a devious course; treading his way amid obstructions (Oxford English Dictionary 1972, verb entries from 1596).
 2. A person's moving (his, or her, hand, or something held by it) to and fro, up and down (Oxford English Dictionary 1972, verb entries from 1607).
- ♦ **4weaving** *n.* A person's enmeshing, entangling, or wrapping up as in a net, etc. (Oxford English Dictionary 1972, verb entries from 1620).
- ♦ **5weaving** *n.*
1. A Horse's moving its head, neck, and body restlessly from side to side in its stall (Oxford English Dictionary 1972, verb entries from 1831).
 2. In gazelles and antelopes: A buck's thrusting his horns into grass, or bushes, and then moving them from side to side parallel to the ground (Walther 1968 in Heymer 1977, 197).
Note: Weaving may be used for enhanced signaling (Walther 1968 in Heymer 1977, 197).
- ♦ **Web** See World Wide Web.
- ♦ **Weber's fraction** See law: Weber's law.
- ♦ **Weber's line** *n.* An imaginary line that separates the Oriental and Australian zoogeographical regions and runs to the east of Wallace's line, *q.v.*, and south between the Maluku (Moluccas) and Sulawesi and between Timor and the Kei Islands (Wallace 1876 in Mayr 1982, 449; Lincoln et al. 1985).
- ♦ **weed** *n.* A plant that is in the wrong place in a person's opinion (Allaby 1994, 408).
Comments: Weeds usually occur opportunistically in environments disturbed by Humans (Allaby 1994, 408). Weeds compete for resources used by cultivated plants, causing much crop reduction in many situations. The "weed" concept can be extended to other kinds of organisms that are in the wrong place from a person's standpoint.
- ♦ **weighting** *n.*
1. A person's loading (something) with a weight; supplying with additional weight; making weighty (Oxford English Dictionary 1972, verb entries from 1747).
 2. A person's assigning a usefulness value to a taxonomic character for the purpose of using it in classification (Mayr 1982, 866, 960).
Note: Weighting is based on the assumption that a reliance on certain characters leads to better, more "natural," classifications than use of other characters. Exactly how to determine the weight of a character has remained controversial although it is traditional to give some characters more weight than others (Mayr 1982, 866, 960).
- ♦ **weir** *n.*
1. An obstruction, or dam, placed in a stream to raise its water, divert it into a millrace or irrigation ditch, etc. (Michaelis 1963).
 2. An aperture of a weir (def. 1) used to determine the quantity of water flowing through it (Michaelis 1963).
 3. A series of wattled enclosures in a stream used to catch fish (Michaelis 1963).
[Old English *wer* > *werian*, to dam up]

- ♦ **Weismann's-dissection theory** See ³theory: Weismann's-dissection theory.
- ♦ **Weismann's genetic theory** See ³theory: Weismann's genetic theory.
- ♦ **Weismannism** See central dogma of genetics, germplasm theory.
- ♦ **Welch's test** See statistical test: multiple-comparisons test: planned-multiple-comparisons procedure: Welch's test.
- ♦ **-welt comb. f.**
- Merkwelt** *n.* An animal species' perceptual world; contrasted with *umwelt* (von Uexküll 1921 in Tinbergen 1951, 16).
- umwelt, Umwelt** *n.* The total sensory input of an animal (Wilson 1975, 597).
cf. environment, -welt: *Merkwelt*
Comment: Each species has its own distinctive "Umwelt" (Wilson 1975, 597). [coined by Jacob von Uexküll (1909); German *Umwelt*, world around us, (social) surroundings (Dewsbury 1978, 14)]
- ♦ **West Nile Virus** See virus: West Nile Virus.
- ♦ **Western blotting** See method: Western blotting.
- ♦ **wet prairie** See habitat: prairie: wet prairie.
- ♦ **whale swallow** See habitat: bay.
- ♦ **wheel position, wheel posture** See posture: wheel posture.
- ♦ **whisp** See ²group: whisp.
- ♦ **whistle** See animal sounds: whistle.
- ♦ **white matter** See organ: brain: white matter.
- ♦ **Whitten effect** See effect: Whitten effect.
- ♦ **whole-animal view of behavior** See black-box view of behavior.
- ♦ **Wicken Fen** See place: Wicken Fen.
- ♦ **Wicklerian-Barlowian mimicry** See mimicry: Wicklerian-Barlowian mimicry.
- ♦ **Wicklerian-Eisnerian mimicry** See mimicry: Wicklerian-Eisnerian mimicry.
- ♦ **Wicklerian-Guthrian mimicry** See mimicry: Wicklerian-Guthrian mimicry.
- ♦ **Wicklerian mimicry** See mimicry: Wicklerian mimicry.
- ♦ **widespread** See ubiquitous.
- ♦ **widow's peak** See character: widow's peak.
- ♦ **wiggling call** See animal sounds: call: wiggling call.
- ♦ **Wiki, wiki** (WIH-key, WEYE-ki, VIH-key) *n.*
1. A Web application that allows users to add content, as on an Internet forum, but also allows anyone to edit the content (Wikipedia 2005).
 2. The collaborative software used to create a Wiki Website (Wikipedia 2005).
- [Hawaiian, *wiki wiki*, quick, super-fast]
- ♦ **Wikipedia** *n.* A "Web-based, free-content encyclopedia, which is written collaboratively by volunteers" (Wikipedia 2005). *Comments:* Wikipedia "consists of 195 independent language editions sponsored by the nonprofit Wikimedia Foundation. Entries on traditional encyclopedic topics exist alongside those on almanac, gazetteer and current events topics" (Wikipedia 2005). Wikipedia's "purpose is to create and distribute, worldwide, a free encyclopedia in as many languages as possible. It gives definitions of many works." Wikipedia is one of the highly popular reference sites on the Web, and it receives around 50 million hits per day.
- [Hawaiian, *wiki wiki*, quick, super-fast + PEDIA]
- ♦ **wildlife** *n.*
1. "Wild animals, trees, and other plants collectively" (Michaelis 1963).
2. "Any undomesticated organism" (Allaby 1994). *Note:* "Wildlife" is sometimes restricted to wild animals excluding plants (Allaby 1994). It might be appropriate to extend this term to all wild organisms from the standpoint of wildlife conservation.
cf. biota, flora, fauna
- ♦ **Wildlife and Countryside Act 1981** See law: Wildlife and Countryside Act 1981.
- ♦ **wildlife corridor** *n.* An area of narrow habitat of a species that connects its larger habitat patches, *e.g.*, elongate areas of the Karner Blue Butterfly larval food plant, *Lupinus perennis* (Wild Lupine), through which this animal can move among larger patches (New 2009, 225).
- ♦ **wild type** See -type, type: wild type.
- ♦ **wild-type allele** See allele: wild-type allele.
- ♦ **Williams' hypothesis** See hypothesis: hypotheses of the evolution and maintenance of sex: best-man hypothesis.
- ♦ **Williams syndrome** See syndrome: Williams syndrome.
- ♦ **Wilson's-caste theorem** See ³theory: Wilson's-caste theorem.
- ♦ **Wilson's disease** See disease: Wilson's disease.
- ♦ **wilting point** *n.* The percentage of water remaining in soil after a specified test plant has wilted under defined conditions, so that it will not recover unless it is watered (Allaby 1994).
syn. permanent wilting percentage, permanent wilting point, wilting coefficient (Allaby 1994)
Comment: If a plant is wilted too long due to lack of water, it can die (USDA Forest Service, 1993).
- ♦ **wind pollination** See pollination: wind pollination.
- ♦ **wind rose** See graph: wind rose.
- ♦ **wing** See ²group: wing.
- ♦ **wing display** See display: wing display.
- ♦ **wing fanning** See behavior: wing fanning.
- ♦ **wing rule** See law: See law: Rensch's laws (def. 2).
- ♦ **Winkler Method** See method: Winkler Method.
- ♦ **winter** See season: winter.
- ♦ **winter solstice** See solstice: winter solstice.
- ♦ **wiping reflex** See reflex: expulsion reflex.
- ♦ **Wisconsin-general-test apparatus** See puzzle box: Wisconsin-general-test apparatus.
- ♦ **wisp** See ²group: wisp.
- ♦ **witch's circle** *n.* A hunters' term for circular tracks resulting from display circling, *q.v.* (Kurt 1968 in Heymer 1977, 127).
- ♦ **withdrawal** *n.* The act, or process, of drawing, or taking, away; removal (Michaelis 1963).
- ♦ **passive withdrawal** *n.* "The removal of sinus (or cistern) milk which at low intramammary pressure can be brought about by the action of suckling or milking or by cannulation without the intervention of the special contractile tissue of the mammary glands" (Cowie et al. 1951).
- ♦ **wnt** See gene: *unt*.
- ♦ **wolf-in-sheep's-clothing strategy** See strategy: wolf-in-sheep's-clothing strategy.
- ♦ **Wolff's theory** See -genesis: epigenesis.
- ♦ **Wolong Nature Reserve** See place: Wolong Nature Reserve.
- ♦ **woodland** See ²community: woodland.
- ♦ **wood, woods** See ²community: wood.
- ♦ **wood choir** See chorus: wood choir.
- ♦ **woodland** See ²community: woodland.

♦work *n.*

1. Something that a person is doing or has done; a person's act, deed, proceeding, business (Oxford English Dictionary 1972, entries from 971).
2. Any structure, or impression, including a tube, burrow, nest, and track, made by an individual animal (Lincoln et al. 1985).

v.i., v.t. work

♦work division See division of labor.**♦worker** *n.*

1. A person "who makes, creates, produces, or contrives;" applied to God and Humans (Oxford English Dictionary 1972, entries from the 14th century).
2. A person who works or does work of any kind (Oxford English Dictionary 1972, entries from 1382).
3. A Domestic Dog, Horse, etc. that works (well) (Oxford English Dictionary 1972, entries from 1844).

See caste: worker; Appendix 1, Part 3, bee: worker bee.

♦worker sperm See sperm: worker sperm.**♦working hypothesis** See hypothesis: working hypothesis.**♦working memory** See memory: working memory.**♦world** *n.* A division of existing, or created, things that belong to our Earth, *e.g.*, the animal world (Michaelis 1963).

"DNA world" *n.* The present situation on Earth in which DNAs work in concert with proteins and RNAs in organism heredity (Zimmer 1995, December, 39). *syn.* nucleoprotein world (Illangasekare et al. 1995, 646)

"PNA world" *n.* The hypothetical situation on Earth before life evolved about 4 Ga ago when peptide-NA (PNA) was the replicating nucleic acid, rather than RNA or DNA (Peter Nielson et al. in Zimmer 1995, December, 39, illustration).

Comments: The PNA world might have evolved into the RNA world which evolved into the DNA world (Zimmer 1995, December, 39). DNA is more stable than RNA which is more stable than PNA.

RNA world *n.*

1. The hypothetical situation on Earth before life evolved about 4 Ga ago when RNA replicated itself and chemical selection occurred on it (Campbell 1990, 526).
2. The hypothetical situation on Earth when RNA catalyzed all the reactions necessary for survivorship and replication of a precursor of life's last common ancestor (Orgel 1994, 78).

cf. hypothesis: RNA-world hypothesis

Note: The RNA world could have occurred if RNA had two properties not evident today: A capacity to

replicate without help from proteins and an ability to catalyze every step of protein synthesis (Orgel 1994, 78).

♦World Heritage Site See place: World Heritage Site.**♦World Wide Web, Web (WWW)** *n.*

1. A computer program that organizes related information on the Internet (*q.v.*) (Goodkin and Wang 1995, 464).

2. An imaginary space of information in the form of words, pictures, sounds, and video images that resides in the Internet (a network of computer networks, basically comprising computers and cables through which packets of information move) (www.w3.org/People/Berners-Lee, 2000).

cf. organization: World Wide Web Consortium (Appendix 1); search engine; server

Comments: The WWW contained about 800 million pages, encompassing about 6 terabytes of text data on about 3 million servers in July 1999 (Lawrence and Giles 1999, 8 July, 107). Connections between information sites on the WWW are hypertext links in the Internet (www.w3.org/People/Berners-Lee). Tim Berners-Lee, while working at European Particle Physics Laboratory, European Organization for Nuclear Research (CERN), proposed the idea of the WWW to his administrator in 1989 (www.w3.org/History, 2000). He originally described the WWW as "a global hypertext space in which any network-accessible information could be referred to by a single 'Universal Document Identifier.'" The High Energy Physics Community used a prototype WWW in 1991. His dream was to make the Web a common information space in which people communicated by sharing information (www.w3.org/People/Berners-Lee, 2000). The Web would be universal with a hypertext link that could point to anything, from personal through local through global, with information varying from draft through highly-polished documents. Further, the Web would be generally used and become a "realistic mirror (or in fact the primary embodiment)" of the ways people work, play, and socialize.

[World Wide Web, coined by Berners-Lee in 1990 (www.w3.org/People/Berners-Lee). He wanted a term for a global hypertext system that stressed that it is decentralized and allowed anything to link to anything else, as does a mathematical graph in the form of a web.]

♦Wright's-inbreeding coefficient See coefficient: coefficient of relatedness.**♦Wright's principle of maximization of W** See adaptive peak.**♦WWW** See World Wide Web.

X

- ♦ **\bar{x} , \hat{x}** See mean.
- ♦ **x-axis** See abscissa.
- ♦ **$x\{p\}$** See mean: trimmed mean.
- ♦ **X-chromosome** See chromosome: X-chromosome.
- ♦ **xaptonuon** See nuon: xaptonuon.
- ♦ **xenautogamy** See -gamy: xenautogamy.
- ♦ **xenia** *n.*
 1. A supposed direct action, or influence, of foreign pollen upon a seed, or fruit, that it pollinates (Oxford English Dictionary 1972, entries from 1899).
 2. "The direct influence of pollen of one species upon the maternal tissues of another species after hybrid fertilization" (Michaelis 1963).
- ♦ **xene**, **xeno**, **xen-** *comb. f.* Guest, stranger, foreigner (Oxford English Dictionary 1972).
See -xenic, -xeny.
[Greek *xenos*, stranger]
- geoxene** *n.* An organism that becomes a temporary, or accidental member, of soil fauna (Lincoln et al. 1985).
- rheoxene** *n.* An organism that occurs only occasionally in running water (Lincoln et al. 1985).
- trogloboxene** *n.* An organism that is found only occasionally in underground caves or passages (Lincoln et al. 1985).
adj. troglobenous, stygobenous
syn. stygoxene, tychocaval, xenocaval
cf. cole: cavernicole; ¹-phile: troglophilic
- **aphyletic trogloboxene** *n.* An organism that is found only occasionally in caves and does not reproduce in them (Lincoln et al. 1985).
- **eutrogloxene** *n.* An organism found only occasionally in subterranean caves and passages and is not fully tolerant of cave conditions and does not reproduce in cave habitats (Lincoln et al. 1985).
- **phyletic trogloboxene** *n.* An organism that is found only occasionally in caves and reproduces in them (Lincoln et al. 1985).
- **planktoxene** *n.* An organism that is found only occasionally in plankton (Lincoln et al. 1985).
- **subtrogloxene** *n.* An organism that is found only occasionally in subterranean caves and passages, can reproduce in them, but is not fully tolerant of cave conditions (Lincoln et al. 1985).
- ♦ **xenic** *comb. f.* See -xene, -xeny.
- alloxenic** *adj.* Referring to two, or more, different parasite species that occur on different host species (Lincoln et al. 1985).
- axenic** *adj.* Referring to an organism culture that is free from contaminant organisms (Lincoln et al. 1985).
cf. -xenic: dixenic, monoxenic
- dixenic** *adj.* Referring to an organism culture with two other species (Lincoln et al. 1985).
cf. -xenic: axenic, monoxenic
- homoxenic** *adj.* Referring to two, or more, parasite species that occur in the same host species (Lincoln et al. 1985).
- monoxenic** *adj.* Referring to a mixed culture of an organism with one prey species (Lincoln et al. 1985).
- planktoxenic** *adj.* Referring to an organism that only occasionally occurs in plankton (Lincoln et al. 1985).
- polyxenic** See -xenous: pleioxenous.
n. polyxeny
- synxenic** *adj.* Referring to a culture comprising two, or more, organisms under controlled conditions (Lincoln et al. 1985).
- ♦ **xeno-** See -xene.
- ♦ **xenobiont** See biont: xenobiont.
- ♦ **xenobiosis** See parasitism: social parasitism.
- ♦ **xenocaval** See -xene: trogloboxene.
- ♦ **xenodeme** See deme: xenodeme.
- ♦ **xenoecy** *n.* An organism that inhabits empty domiciles, or shells, of another species (Lincoln et al. 1985).
adj. xenoecic
- ♦ **xenogamy** See fertilization: cross-fertilization; -gamy: allogamy: xenogamy.
- ♦ **xenogenic** *adj.* Referring to a character in one species that originated in a member of another species (Lincoln et al. 1985).
- ♦ **xenogenesis** See -genesis: xenogenesis.
- ♦ **xenogenous** See -genous: xenogenous.
- ♦ **xenology** See study of: xenology.
- ♦ **xenomixis** See mixis: xenomixis.
- ♦ **xenomone** See chemical-releasing stimulus: semiochemical: allelochemical.
- ♦ **xenomorphosis** See -morphosis: heteromorphosis.
- ♦ **xenoparasite** See parasite: xenoparasite.
- ♦ **xenoparasitism** See parasitism: xenoparasitism.
- ♦ **xenophobia principle** See principle: xenophobia principle.
- ♦ **-xenous** See -xeny.
- ♦ **-xeny** *adj.* -xenous.
See -xenic, -xene.
- dixeny** *n.* A parasite's using two host species during its life cycle (Lincoln et al. 1985).

- euryxeny** *n.* An organism's tolerating a wide range of host species (Lincoln et al. 1985).
cf. -xeny: stenoxeny
- heteroxeny** See -xeny: pleioxeny.
- lipoxeny** *n.* A parasite's leaving its host after feeding (Lincoln et al. 1985).
- metaxeny** See -xeny: pleioxeny.
- monoxeny** *n.* A parasite's using one host species during its entire life cycle (Lincoln et al. 1985).
syn. homoeism, host specificity
- myrmecoxeny** *n.* A plant's providing food and shelter for ants or termites (Lincoln et al. 1985).
- oligoxeny** *n.* A parasite's using a few host species during its life cycle (Lincoln et al. 1985).
- patoxeny** *n.* An organism's inhabiting forest litter for only part of its normal life cycle (Lincoln et al. 1985).
adj. patacolous, patoxenous
cf. -cole: patacole
- pleioxeny** *n.* A parasite's not being host specific, or having two, or more hosts during its life cycle (Lincoln et al. 1985).
syn. heteroecism, heterocism, metaxeny, polyxeny
adj. heteroxenous, pleioxenous, polyxenic

- stenoxeny** *n.* An organism's tolerating only a narrow range of host species (Lincoln et al. 1985).
cf. -xeny: euryxeny
- trixeny** *n.* A parasite's using three host species during its life cycle (Lincoln et al. 1985).
- ♦ **xerarch succession, xerosere** See ²succession: xerarch succession.
- ♦ **xeriscaping** See method: xeriscaping.
- ♦ **xerocole** See -cole: xerocole.

- ♦ **xerohylium** See ²community: xerohylium.
- ♦ **xerohyophile** See ¹-phile: xerohyophile.
- ♦ **xerophile** See ¹-phile: xerophile.
- ♦ **xerophobe** See -phobe: xerophobe.
- ♦ **xeropodium** See ²community: xeropodium.
- ♦ **xeropoophile** See ¹-phile: xeropoophile.
- ♦ **xerosium** See ²succession: xerosium.
- ♦ **xerotaxis** See -taxis: xerotaxis.
- ♦ **xerothamnium** See ²community: xerothamnium.
- ♦ **XIST** See gene: *XIST*.
- ♦ **xylium** See ²community: woodland.
- ♦ **xylophage** See -vore: lignivore.
- ♦ **xyophile** See ¹-phile: xyophile.

Y

- ♦ **Ŷ, ŷ** See mean.
- ♦ **y, yr** See unit of measurement: year.
- ♦ **y-axis** See ordinate.
- ♦ **Y-chromosome** See chromosome: Y-chromosome.
- ♦ **Y-maze** See maze: Y-maze.
- ♦ **Y-maze globe** See maze: Y-maze globe.
- ♦ **YAC** See vector: yeast-artificial chromosome.
- ♦ **Yarrell's law** See law: Yarrell's law.
- ♦ **yawl** See animal sounds: yowl.
- ♦ **yawn, yawning** *n.*
 1. A person's voluntarily opening his mouth wide, especially to swallow, or devour, something (Oxford English Dictionary 1972, entries from *ca.* 725).
 2. A person's involuntarily making a prolonged inspiration with his mouth wide open and lower jaw much depressed, as from drowsiness or fatigue (Oxford English Dictionary 1972, entries from 1450).
 3. A person's behavior characterized by gaping of his mouth that is accompanied by a long inspiration followed by a shorter expiration and often body stretching and sometimes vocalization (Provine 1986, 109).

cf. threat gape
syn. gaping, *q.v.* (Oxford English Dictionary 1972, entries from 1660)

n. yawner
v.i. yawn
cf. pattern: fixed-action pattern, stimulus: releaser
Comment: Human yawn-like behavior has been reported in some fish, reptile, bird, and other mammal species; the function of yawning is unclear (Provine 1986, 110), but Immelmann and Beer (1989, 49) include yawning under comfort behavior, *q.v.*
[probably a fusion of Old English *geonian*, to yawn and *gānian*, to gape]
- ♦ **clenched-teeth yawning** *n.* Yawning in which a person blocks the gaping component of a yawn by keeping his jaw closed (Provine 1986, 113).
- ♦ **sniff yawning** *n.* In females of many bovid species: A cow's raising her head, licking her snout and nostrils, and yawning (with the top of her nose wrinkled, her eyes almost, or completely, closed, and her tongue rolled upwards) after she licks her amniotic fluid, placenta after parturition, and offspring (Schenkel 1972 in Heymer 1977, 148).
- ♦ **threat yawning** See facial expression: threat yawn.
- ♦ **year** See unit of measure: year.
- ♦ **yeast-artificial chromosome** See vector: yeast-artificial chromosome.
- ♦ **yellow rain** *n.* The mass defecation of airborne *Apis dorsata* (Giant Honey Bees) (Buchmann and Nabhan 1996, 256).
- ♦ **Yerkes-Dodson law** See law: Yerkes-Dodson law.
- ♦ **Yerkish** *n.* An artificial grammar taught to a chimpanzee (Rumbaugh 1977 in McFarland 1985, 493).
cf. language: sign language: Ameslan
- ♦ **yoke** See ²group: team.
- ♦ **you-first principle** See principle: you-first principle.
- ♦ **young-male syndrome** See syndrome: young-male syndrome.
- ♦ **yowl** See animal sounds: yowl.

Z

- ♦ **Zajonc effect** See effect: Zajonc effect.
- ♦ **Z-chromosome** See chromosome: Z-chromosome.
- ♦ **zeal** See ²group: herd.
- ♦ **zeitgeber, Zeitgeber** See ²stimulus: zeitgeber.
- ♦ **zelotypic** See sexual: asexual.
- ♦ **zero-truncated-generalized-inverse-Gaussian-Poisson curve** See curve: rank-abundance curve: zero-truncated-generalized-inverse-Gaussian-Poisson curve.
- ♦ **zero-truncated-Poisson distribution** See distribution: zero-truncated-Poisson distribution.
- ♦ **zeroth order** See order: zeroth order.
- ♦ **zigzag dance** See dance: zigzag dance.
- ♦ **-zoan** *comb. f.* Referring to an animal (Michaelis 1963).
[Greek *zōion*, animal]
- metazoan** *n.* “A multicellular animal” (Lincoln et al. 1985).
- ♦ **-zoic** *comb. f.*
cf. -zoan, -zoon
- holozoic** *adj.* Referring to an organism that ingests complex organic matter (Lincoln et al. 1985).
- isozoic** *adj.* Referring to habitats that have similar faunas (Lincoln et al. 1985).
- polyzoic** *adj.* Referring to a habitat that contains a wide variety of animal life (Lincoln et al. 1985).
- ♦ **-zoite** *comb. f.*
cf. -biont, -cole, -phage, -phagy, ¹-phile, -vore, -zoic, -zoan, -zoon
- coprozoite** *n.* An animal that lives on, or in, dung or feces (Lincoln et al. 1985).
cf. -biont: coprobiont; -cole: fimicole; -phage: coprophage, scatophage; ¹-phile: coprophile; -vore: merdivore
- histozoite** *n.* An organism that lives within the tissues of another organism (given as an adjective in Lincoln et al. 1985).
syn. parasite (in some cases)
cf. -cole: piscicole, planticole
- saprozoite** *n.* An animal that feeds upon decaying plant, or animal, matter in the form of dissolved organic compounds. (Lincoln et al. 1985).
cf. ¹-phile: saprophile, sathrophile; -vore: zoosuccivore
- ♦ **zoidiogamy** See -gamy: zoidiogamy.
- ♦ **zoidiophile** See ¹-phile: zoidiophile.
- ♦ **zone** *n.*
 1. An area, tract, or section of the Earth, distinguished from other, or adjacent, areas by some special

quality, purpose, or condition; *e.g.*, a mountainous zone (Oxford English Dictionary 1972, entries from 1822; Michaelis 1963).

2. In ecology, a belt, or area, of the Earth that is delimited from others by the character of its organisms, climate, geological formations, etc. (Oxford English Dictionary 1972, entries from 1829).
3. One of the five divisions of the Earth’s surface, enclosed between two parallels of latitude and named for its prevailing climate: the Frigid Zones, North Temperate Zone, South Temperate Zone, and Torrid Zone (Michaelis 1963).
4. In geology, a bed, or stratum, that is usually characterized by one to several index fossil species (= guide fossil species) (Ashby 1986; Stanley 1989, 669).

Notes: The upper and lower boundaries of a zone are approximately the same ages everywhere that this zone is found on Earth (Stanley 1989, 660). A zone is usually named for a particular species that characterizes it (Stanley 1989, 110). A zone that includes the stratigraphic ranges of more than one species that belong to the same genus may be named for this genus. Some zones are divided into subzones.
syn. biostratigraphic zone (Stanley 1989, 660)

cf. formation, member

[Latin *zona* < Greek *zōnē*, girdle]

adaptive zone *n.*

1. The ecological pathways along which taxa evolve (Lincoln et al. 1985).
2. The way of life and organizational level of a higher taxonomic group (Lincoln et al. 1985).
3. The fundamental niche at the species level (Lincoln et al. 1985).

cf. adaptive landscape

► **nonadaptive zone** *n.* An intermediate area between two adaptive zones that can be regarded as a relatively unstable ecological zone that must be crossed when a group evolves from one adaptive zone to another (Lincoln et al. 1985).

► **transitional adaptive zone** *n.* “An evolutionary pathway across a nonadaptive zone between major adaptive zones, in which the strength of selection and rate of evolution are not significantly greater than in the adaptive zones” (Lincoln et al. 1985).

biodeterioration zone *n.* In a central-place system, “the zone around a core area within which resources have been depleted but not exhausted” (Wittenberger 1981, 613).

Carolinian zone See region: Carolinian zone.

heterozone *n.* An organism that is not restricted to a single habitat during its development (Lincoln et al. 1985).

cf. zone: homozone

homozone *n.* An organism that is restricted to a single habitat during its development (Lincoln et al. 1985).

cf. zone: heterozone

hybrid zone, hybrid belt, intergradation zone, suture zone *n.* The overlap zone between adjacent populations, subspecies, or species in which interbreeding occurs (Lincoln et al. 1985).

intergradation zone *n.* A “boundary zone between two adjacent subspecies occupied by a population of intergrades” (Lincoln et al. 1985).

See zone: hybrid zone.
life zone See region: life zone.

suture zone See zone: hybrid zone.

thermoneutral zone (TNZ) *n.* The ambient-temperature range within which an animal has a minimum metabolic rate and regulates its temperature by nonevaporative physical processes alone (Bligh and Johnson 1973, 958).

Comment: Nonevaporative physical processes include autonomic and behavioral responses that vary the thermal conductance between an organism and its environment, *i.e.*, by changes in body conformation and variations in peripheral vasomotor tone and piloerection, but excluding changes in thermal conductance due to additional external insulation (*e.g.*, bedding or clothing) (Bligh and Johnson 1973, 958).

trampling zone *n.* In a central-place system, the area around the core area that has been damaged by the many individuals' frequent movements along or through it (Wittenberger 1981, 622).

zone of thermal comfort *n.* The ambient-temperature range associated with specified air movement, humidity, and mean radiant temperature, within which a human in specified clothing expresses satisfaction with his thermal environment for an indefinite period (Bligh and Johnson 1973, 958).

♦ **zoo-, zo-** *comb.f.* Animal; of or related to animals, or animal forms (Michaelis 1963)

cf. -zoan, -zoon

[Greek *zōion*, animal]

♦ **zoo** See ²group: zoo.

♦ **zoo biology** See study of: ethology: applied ethology; study of: biology.

♦ **zoo hypothesis** See hypothesis: zoo hypothesis.

♦ **zooapocrisis** *n.* The strategy, or response, of animals to environmental factors (Lincoln et al. 1985).

♦ **zones of intergradation** See intergradation zones.

♦ **zoobiotic** See -biotic: zoobiotic.

♦ **zoocentric** *adj.* Referring to a comparison of a nonhuman animal with Humans or their attributes, *e.g.*, designation of *Panthera leo* (Lion) as the king of beasts (Wilson 1975, 504).

cf. anthropocentricity; -morphism: zoomorphism

♦ **zoochore** See -chore: zoochore.

♦ **zoodynamics** See study of: physiology.

♦ **zooecology** See study of: ecology: zooecology.

♦ **zoogamete** See gamete: zoogamete.

♦ **zoogamy** See -gamy: zoogamy.

♦ **zoogenesis** See -genesis: zoogenesis.

♦ **zoogenetics** See study of: genetics: zoogenetics.

♦ **zoogenic, zoogenous** See -genic: zoogenic.

♦ **zoogeny, zoogeogenesis** See -genesis: zoogenesis.

♦ **zoogeography** See study of: geography: biogeography: zoogeography.

♦ **zoogony** See -parity: viviparity.

♦ **zoogygogamete** See gamete: zoogamete.

♦ **zooid** *n.*

1. Any organism, usually very small, capable of spontaneous movement and independent existence, *e.g.*, a spermatozoon or spermatozoid (Michaelis 1963).

2. Any organism capable of independent existence that is produced other than by sexual reproduction (Michaelis 1963).

3. One of the distinct members of a compound, or colonial, organism, as in a bryozoan (Michaelis 1963).

Note: Kinds of zooids include “autozooid,” “gonozooid,” and “kenozoid” (Wilson 1975, 394).

4. A free-swimming medusa produced as a stage in the life of a jellyfish (Michaelis 1963).

cf. -biont

♦ **zoological garden, zoological park** See ²group: zoo.

♦ **zoology** See study of: zoology.

♦ **zoometry** See -metrics: zoometrics.

♦ **zoomimesis** See mimesis: zoomimesis.

♦ **zoomorphic** See -morphic: zoomorphic.

♦ **zoomorphism** See -morphism: zoomorphism.

♦ **-zoon** *comb.f.* Referring to an animal

Comment: Many biologists now classify most animal-like, one-celled species as protists, or some other group, not Animalia. Thus, *e.g.*, a dermatozoon is not an animal parasite according to many biologists.

[New Latin < Greek *zōion*, animal]

dermatozoon *n.* “An animal parasite of skin” (Lincoln et al. 1985).

ectozoon *n.* An “animal” parasite (Lincoln et al. 1985).

epizoon, epizoite, epizoan *n.* An organism that lives attached to an animal's body (Lincoln et al. 1985).

haemacytozoon *n.* A parasite that lives in a blood cell (Lincoln et al. 1985).

cf. parasitism: haematoparasitism

haematozoon *n.* An “animal” parasite that lives freely in blood (Lincoln et al. 1985).

cf. parasitism: haematoparasitism

microzoon *n.* “A microscopic animal” (Lincoln et al. 1985).

♦ **zoonomy** See study of: physiology: animal physiology.

♦ **zooparasite** See parasite: zooparasite.

♦ **zoopharmacognosy** See pharmacognosy: zoopharmacognosy.

♦ **zoophase** See -plont: diplont.

♦ **zoophile** See ²-phile: zoophile.

♦ **zoophobia** See -phobia: zoophobia.

♦ **zooplanktivore** See vore: molluscivore.

♦ **zooplankton** See plankton: zooplankton.

♦ **zoosaprophage** See -phage: zoosaprophage.

♦ **zoosemiotics** See study of: semiotics: zoosemiotics.

♦ **zoosuccivore** See -vore: zoosuccivore.

♦ **zootaxy** See study of: taxonomy: zootaxy.

♦ **zootic climax** See ²community: climax: zootic climax.

♦ **zootroph** See -troph-: zootroph.

- ♦ **Zuckerman's theory** See ³theory: Zuckerman's theory.
- ♦ **Zugunruhe** See migratory restlessness.
- ♦ **zygogamy** See -gamy: zygogamy.
- ♦ **zygogenesis** See -genesis: zygogenesis.
- ♦ **zygoid parthenogenesis** See parthenogenesis: zygoid parthenogenesis.
- ♦ **zygosis** See conjugation.
- ♦ **zygosity** *comb.f.*
- heterozygosity** *n.* The overall statistical, within-locus heterogeneity of alleles averaged over all loci in an individual or population (Dawkins 1982, 288); contrasted with homozygosity (*q.v.*).
- homozygosity** *n.* The overall statistical, within-locus homogeneity of alleles averaged over all loci in an individual or population (Dawkins 1982, 288); contrasted with heterozygosity (*q.v.*).
- ♦ **zygotaxis** See taxis: zygotaxis.
- ♦ **zygote** *n.*
1. A cell, or cell nucleus, that is formed from the conjugation of two such bodies in reproduction; a zygospore, or any germ-cell that results from the union of two gametes (Oxford English Dictionary 1972, entries from 1891); "the cell created by the union of two gametes (sex cells), in which the gamete nuclei are also fused" (Wilson 1975, 598).
 2. The organism developed from a union of two gametes (Michaelis 1963).
 3. "The earliest stage of the diploid generation" (Wilson 1975, 598).
- syn.* syngamete
- adj.* zygote
- [Greek *zygōtos* < *zygoein* < *zygon*, yoke]
- azygote** *n.*
1. A haploid propagule that does not have the capacity for syngamy and develops directly into a new organism (Bell 1982, 503).
 2. An organism that is produced by haploid parthenogenesis, *e.g.*, a male ant, bee, or wasp (Lincoln et al. 1985).
- heterozygote** *n.* A diploid organism with different alleles of a given gene on its pair of homologous chromosomes that carry the gene (Wilson 1975, 586). [coined by Bateson (1901 in Mayr 1982, 733)]

- homozygote** *n.* A diploid organism with the same alleles of a given gene on its pair of homologous chromosomes that carry the gene (Wilson 1975, 586).
- ♦ **-zygotic** *comb.f.*
- dizygotic** *n.* Referring to twins derived from two fertilized eggs, each fertilized by a different sperm (King and Stansfield 1985).
syn. fraternal (Lincoln et al. 1985)
- monozygotic, monovular, uniovular** *n.* Referring to twins derived from a single fertilized egg (Lincoln et al. 1985).
- ♦ **zygotic meiosis** See meiosis: zygotic meiosis.
- ♦ **-zygous** *comb.f.*
- allozygous** *adj.* "Referring to two genes on the same chromosome locus that are different or at least whose identity is not due to common descent" (Wilson 1975, 578).
cf. -zygous: autozygous
- autozygous** *adj.* "Referring to two more alleles on the same locus that are identical by common descent" (Wilson 1975, 579).
- hemizygous** *adj.* Referring to unpaired genes, or chromosome segments, in a diploid cell (Lincoln et al. 1985).
- heterozygous** *adj.*
1. Referring to a heterozygote, *q.v.*
 2. Referring to the overall statistical, within-locus heterogeneity of alleles averaged over all loci in an individual or population (Dawkins 1982, 288).
cf. -zygous: homozygous
- homozygous** *adj.*
1. Referring to a homozygote, *q.v.*
 2. Referring to the overall statistical within-locus homogeneity of alleles averaged over all loci in an individual or population.
cf. -zygous: heterozygous
- Comment:* "An organism can be a homozygote with respect to one gene and at the same time a heterozygote with respect to another gene" (Wilson 1975, 586).
- ♦ **zymogen** *n.* "The enzymatically inactive precursor of a proteolytic enzyme" (King and Stansfield 1985).
- ♦ **zymotechnology** See technology: zymotechnology.

APPENDIX 1. ORGANISMS

This appendix includes hierarchical taxonomic tables of organism groups and lists full names of and describes a few of the millions of organism taxa, including fossils. Appendix 1 has three main parts: I. Domain Archaea, II. Domain Bacteria, and III. Domain Eukarya. Eukarya has four parts: Kingdoms Animalia, Fungi, Plantae, and Protista. For convenience, fungus-like organisms and lichens are included within Fungi, although a few lichens are algal-bacterium associations, not algal-fungal ones. Appendix 1 also contains the fossil hoax Piltdown Man (in Animalia: Class Mammalia), made of parts of different primate species. Viruses, which many researchers classify as nonorganisms, are in the main body of this book.

A term that is not part of a hierarchy, or one that is the first term in a hierarchy (= a first-level term), is preceded by a diamond (♦). Second- through eight-level terms are increasingly indented. Second-, fourth-, sixth-, and eighth-level terms are not preceded by symbols. Third-level terms are preceded by arrowheads (►); fifth-level terms, black squares (■); seventh-level terms, open squares (□); eighth-level terms, closed circles (●); ninth-level terms, open circles (○).

There are many Websites that give taxonomic information including the site of the National Center for Biotechnology Information (www.ncbi.nlm.nih.gov/htbin-post/Taxonomy/, 2001) which provides direct links to many organisms used as research models. Appendix 1 includes a small fraction of Earth's organisms, and it includes some historical classifications of many organisms. Researchers continue to find new phylogenetic relationships among organisms, and information regarding recent work on phylogeny is the Tree of Life Web Project (<http://tolweb.org/tree/>).

♦ **organism** *n.*

1. An organized body that consists of mutually connected and dependent parts that maintain a common life; the material structure of a living being (Oxford English Dictionary 1972, entries from 1842); "any living creature" (Wilson 1975, 590).
2. A dead organism (def. 1).
3. A hierarchically ordered system with many emergent properties never found in inanimate matter, with the system's activities governed by genetic programs that contain historically acquired information (Mayr 1997, 20–21).

Note: An organism is dualistic in that it contains both a genotype and a phenotype (Mayr 1997, 21). Biological explanations of them require different kinds of inquiry.

cf. -cole, living, name, -phile, psilic (in the main text)
Comments: Below are tables of taxonomic hierarchies for organisms and entries for a few of the millions of extinct and extant organisms. These entries contain the common and scientific names of organisms, their taxonomic positions, and some comments about their biologies and other subjects. You should consult taxonomic publications to determine how to identify these taxa, because such information is beyond the scope of this book. The listed species are ones of particular conservation, epidemiological,

and research importance and interest. For further information regarding organism relationships, taxa, or both, see Biosis (www.york.biosis.org), Discover Life, Richard Stafursky's World Species (www.envirolink.org/species), the Traité de Zoologie, the Tree of Life, the Zoological Record (www.york.biosis.org/zrdocs/zrprod/zro.html), field guides and other books devoted to the different taxa, many of which I indicate in the entries that follow. King and Stansfield (1985) include many organisms of research interest. I capitalize a nonscientific name when it refers to a particular species, *e.g.*, Sugar Maple, or a whole taxonomic unit, *e.g.*, Bumble Bees, meaning all of them. I do not capitalize a common name when I use it to mean only some of a taxon that the name designates, *e.g.*, some bumble bees. There is more information about my capitalization conventions under "nonscientific name."

[Greek *organon*, instrument, tool]

Ediacaran [ee dee AC car an] *n.* An organism from the Ediacara Epoch (570–543 Ma ago), Vendian Sub-period, Sinian Era (Erwin et al. 1997, 128, illustration). *Comments:* Some Ediacarans might have lived in the Varanger Epoch before the Ediacara Epoch (Wright 1997, March, 56). Ediacaran fossils occur in rocks worldwide (Wright 1997, March, 53). Fossils of Ediacaran fauna suggest that they had no bone, heads, shells, tails, teeth, or obvious circulatory, digestive, and nervous systems. Researchers debate whether Ediacarans were: animals, lichens, or plants; single or multicellular; and ancestors of other extant phyla or evolutionary dead ends.

[after Ediacara Hills, southern Australia, which harbor a large number of fossils of Ediacaran organisms (Wright 1997, March, 53)]

epiorganism See organism: superorganism.

microbe *n.* A microscopic organism, especially a disease-causing bacterium (Michaelis 1963).

cf. bacterium, microorganism, virus

syn. germ (Michaelis 1963)

Comments: Microbe is not a technical term (Morris 1982). People sometimes confuse the words "bacillus," "bacterium," "germ," "microbe," "microorganism," and "virus" (Michaelis 1963). "Microbe" at first referred to a protozoan and then to a bacterium. "Germ" originally meant a reproductive cell. Both "germ" and "microbe" are commonly used to refer to a disease-producing bacterium. "Microorganism" was a general term for bacteria, protozoa, and viruses. A bacillus is one of several types of bacteria.

[French < Greek, *mikros*, small + *bios*, life]

microorganism *n.* An organism of microscopic, or ultramicroscopic size, commonly including Bacteria, Cyanobacteria, Yeasts, some lichens and fungi, Protists, Viroids, and Viruses (Lincoln et al. 1985). *cf.* microbe; virus, which some biologists do not consider to be an organism

model organism *n.* The organism that a researcher chooses for a particular study (Campbell et al. 1999, 389).

Comments: A model organism for elucidating the role of cell movement in morphogenesis is the African Clawed Frog, because its development is easy to observe and it is a fairly typical vertebrate (Campbell et

al. 1999, 389). Researchers use *Arabidopsis thaliana*, *Caenorhabditis elegans*, *Danio rerio*, *Drosophila melanogaster*, *Mus musculus*, and other species as model organisms for developmental genetics.

superorganism *n.*

1. Any society, such as the colony of a eusocial-insect species, that acts as a functional unit, possessing features of organization analogous to the physiological properties of a single organism (Wilson 1975, 383, 596).
 2. Any group of organisms that acts as a single functional unit (Lincoln et al. 1985).
- syn.* epiorganism, supraorganism (Lincoln et al. 1985)

Comment: An insect colony, *e.g.*, “is divided into reproductive castes (analogous to gonads) and worker castes (analogous to somatic tissue); it may exchange nutrients by trophallaxis (analogous to the circulatory system), and so forth” (Wilson 1975, 383, 596).

[coined by Herbert Spencer (1862, 316 in Laurent 1990)]

supraorganism See organism: superorganism.

transgenic organism *n.* An organism that contains genes from another species (Campbell et al. 1999, 383).

Comments: The majority of Earth’s species are likely to be transgenic organisms.

A CLASSIFICATION OF ORGANISMS: DOMAINS AND KINGDOMS^a

- I. Domain Archaea (Archaeans)
- II. Domain Eubacteria (Bacteria)
- III. Domain Eukarya, (Eukaryans = Eukaryotes)
 - A. Kingdom Animalia (Animals)
 - B. Kingdom Fungi (Fungi)
 - C. Kingdom Plantae (Plants)
 - D. Kingdom Protista (Protists)

^a I list groups in alphabetical order. The classification of the larger taxa of life is in a state of flux. This classification is based on publications by Carl Woese (1983 in Strickberger 2000, 173), Neil Campbell (1996, 496), Stephen Jay Gould (1996, 13 November); and Curt Suplee (1996, 23 September, A3). The delineation of Kingdom Protista is under much research, with some researchers even dividing historical members of the Protista into five new Kingdoms (Campbell et al. 1999, 525).

♦ **Prokaryota** *n.* One of the two large divisions of life that contains the Domains Archaea and Eubacteria, unicellular organisms without nuclear membranes and many of the kinds of organelles found in Eukaryota; contrasted with Eukaryota (Woese 1983 in Strickberger 2000, 173; Campbell 1996, 498; Suplee 1996, 23 September, A3).

cf. Eukaryota, organism (table)

Comments: Researchers have designated about 4,000 living prokaryotic species; there may be as many as 4 million species (Campbell 1996, 499). A prokaryote’s DNA is one double-stranded molecule in the form of a ring and concentrated into a region called a “nucleoid.” Prokaryotes, in contrast to Eukaryotes, have plasmids (smaller rings of DNA with only a few genes that endow a cell with resistance to antibiotics).

[Greek *pro*, before; *karyon*, *kernal*, referring to the fact that this taxon does not have a true nucleus enclosed by a membranous nuclear envelope (Campbell 1996, 114)]

PART 1. DOMAIN ARCHAEA

♦ **Domain Archaea** *n.* A domain of life that includes one-celled organisms that have cell walls with no mu-rein (a protein) and produce proteins using a process more similar to that of Eukarya than Bacteria; distinguished from Bacteria and Eukarya (Woese 1983 in Strickberger 2000, 173; Suplee 1996, 23 August, A3). See the Table (Archaea) at the beginning of this appendix.

syn. Domain Archaeabacteria (Strickberger 2000, 173) *cf.* bacterium, basalt archaean, extreme halophile, extreme thermophile, *Methanocaldococcus jannaschii*, methanogen, subsurface archaean

Comments: Karl Woese described Archaea as a new domain (as Archaeabacteria) in the 1980s. Archaea live in many habitats including extreme environments such as boiling water, a highly acidic area, or salt flats, which resemble habitats probably on Earth about 4 Ga ago. Many Archaea feed on CO₂ and produce methane as a waste product; many others feed on H₂S and produce sulfur as a waste product (Suplee 1996, 23 September,

TWO CLASSIFICATIONS OF ARCHAEA^a

Biological Classification

- I. Extreme Halophiles
- II. Extreme Thermophiles
 - A. Subsurface Archaeans
 - B. *Sulfolobus*
- III. Methanogens
 - A. Basalt Bacteria
 - B. *Methanococcus jannaschii*

Taxonomic Classification

- I. Kingdom Crenarchaeota
 - A. *Acidianus*
 - B. *Desulfurococcus*
 - C. *Hyperthermus*
 - D. *Igneococcus*
 - E. *Metallosphaera*
 - F. *Pyrobaculum*
 - G. *Pyrodictium*
 - H. *Pyrolobus*
 - I. *Staphylothermus*
 - J. *Sulfolobus*
 - K. *Thermodiscus*
 - L. *Thermofilum*
 - M. *Thermoproteus*
 - N. *Thermosphaera*
- II. Kingdom Euryarchaeota
 - A. Archeoglobales
 - B. Halobacteriales
 - C. Methanobacteriales
 - D. Methanococcales, including *Methanococcus*
 - E. Methanomicrobiales
 - F. Methanopyrales
 - G. Thermococcales
 - H. Thermoplasmatales
- III. Kingdom Korarchaeota

^a Maddison and Maddison (1998, www.phylogeny.arizona.edu/tree/homepages/recent1998.html)

A3). The photosynthetic types do not use chlorophyll and perform a kind of photosynthesis completely distinct from all other Archaea and Bacteria. The Archaea might share a common most recent ancestor with Bacteria (Doolittle et al. 1996; Morell 1996, 26 January, 448); however the relationships of the domains are unresolved. Astrobiology Web (2000) has many links to Archaea including lists of and information about taxa. Researchers classify Aracheans biologically and taxonomically.

[Greek *archaio*, ancient; *bacterion*, rod; referring to Archaea's origin from very early cells (Campbell 1996, 499)]

"basalt archaean" *n.* Methane-producing archaeans (= methanogens) that live up to 4,500 ft below the Earth's surface and apparently subsist on hydrogen from basalt and water (Todd Stevens and James McKinley in Anonymous 1996, March, 23–24, illustration).

eocyte See extreme thermophile.

extreme halophile *n.* An archaean that lives in a salty habitat (Campbell 1996, 509).

Comments: Some species live in very saline places such as the Dead Sea and Great Salt Lake (Campbell 1996, 509). Some halophiles merely tolerate a saline environment; other halophiles require a highly saline environment (10 times saltier than seawater). Some halophiles produce a purple-red scum, colored by their bacteriorhodopsin.

[Greek *halo*, salt + *philos*, lover (Campbell 1996, 509)]

extreme thermophile *n.* An archaean that thrives in a hot environment (Campbell 1996, 509).

syn. eocyte

Comments: The optimal conditions for extreme thermophiles range from 60 through 80°C (Campbell 1996, 509). *Sulfolobus* inhabits hot sulfur springs in Yellowstone National Park, U.S., obtaining its energy by oxidizing sulfur. Another sulfur metabolizing thermophile lives in 105°C water near deep-sea hydrothermal vents. Extreme thermophiles might be the prokaryotes most closely related to eukaryotes.

[Greek *eos*, dawn + *cyte*, cell; James Lake in Campbell 1996, 509].

Haloarcula sp. *n.* An archaean that lives in crusted salt in Baja California (Sawyer 1999, 4 October, A11).

Comment: This species, *Bacillus subtilis*, and *Synechococcus cyanobacteria* can survive prolonged periods in the vacuum of outer space (Sawyer 1999, 4 October, A11). A few percent of *Haloarcula* and *S. cyanobacteria* survived 10,000 kilojoules of ultraviolet radiation after 2 weeks in space. These two species do not form spores.

Methanocaldococcus jannaschii (Jones et al. 1984) Whitman 2002 *n.* A micron-long archaeon that flourishes 2 mi deep in the Pacific Ocean and at pressures at least 200 times those at sea level (Supplee 1996, 23 August, A3).

syn. *Methanococcus jannaschii* (former name)

Comments: Researchers discovered this archaeon in 1982 above a hydrothermal vent chimney (Supplee 1996, A3). This organism converts carbon dioxide and hydrogen into methane. Geneticists sequenced the some 12 million bases in the genome of this bacterium in 1996 (Bult et al. 1996, 1058; Supplee 1996, 23 August, A3). Fully 56%, or 1738 of its genes, are unlike genes known in other prokaryotes or eukaryotes. Each of these genes might code for a protein unknown to science.

jannaschii, after Holger Jannasch, a leader of the 1998 expedition that discovered this bacterium (Supplee 1996, A3)]

methanogen *n.* An archaean that consumes CO₂ and hydrogen and produces methane as a waste product (Campbell 1996, 509; Vogel, 1998, 13 March, 1633).

Comments: Methanogens are obligate anaerobes (Campbell 1996, 509). Many species live in bogs, marshes, and swamps where other microbes have consumed all the oxygen, and produce bubbles of methane known as marsh gas. Some methanogen species live in animal guts, playing an important role in the nutrition of cattle, termites, and other herbivores that subsist mainly on cellulose. A methanogen which engulfed one or more bacteria that made CO₂ and hydrogen as waste products might have been the first eukaryotic cell (Vogel 1998, 13 March, 1633).

subsurface archaean *n.* An archaean that lives deep in the Earth's crust (Fredrickson and Onstoot 1996, 69, 71, illustration).

cf. Archaea

Comments: Subsurface bacteria live in temperatures as high as 75°C up to 2.8 km below Earth's surface (Fredrickson and Onstoot 1996, 71). Some subsurface bacteria can grow at 140°C. Some fungal and protozoan species also live deep below Earth's surface.

PART 2. DOMAIN BACTERIA

♦ **Domain Bacteria, Bacteria** *n.* A domain of life that includes the bacteria, one-celled organisms with muramic acid in their cell walls and protein production that uses a process markedly different from Archaea and Eukarya (Woese 1983 in Strickberger 2000, 173; Supplee 1996, 23 September, A3).

syn. Domain Eubacteria

cf. organism (table), Prokaryota (Appendix 1, Part 1)

A CLASSIFICATION OF BACTERIA^a

- I. Chlamydia (including *Chlamydia trachomatis* (Nongonococcal Urethritis Bacterium))
- II. Cyanobacteria (including *Anabaena*)
- III. Gram-positive Bacteria (including some Gram-negative Bacteria)
 - A. *Actinomycetes*
 1. Leptospiral Bacterium
 2. *Streptomyces*
 3. Tuberculosis Bacterium
 - B. *Bacillus*
 - C. *Clostridium*
 - D. Mycoplasmas
 1. *Mycoplasma pneumoniae* (Walking Pneumonia Bacterium)
- IV. Proteobacteria
 - A. Chemoautotrophic Proteobacteria, including *Rhizobium*
 - B. Chemoheterotrophic Proteobacteria
 1. *Escherichia coli*
 2. *Salmonella* spp. (Food-poisoning Bacterium)
 3. *Salmonella typhi* (Typhoid Fever Bacterium)
 - C. Purple Bacteria
 - V. Spirochetes
 - A. *Borrelia burgdorferi* (Lyme Disease Bacterium)
 - B. *Treponema pallidum* (Syphilis Bacterium)

^a Campbell (1996, 509–512).

Comments: Researchers published approved lists of bacterial names (Skerman et al. 1980). Bacteria often occur on and within other organisms. For example, human forearms have over 182 bacterial species (Stein 2007, A6).

acetogen *n.* An autotrophic bacterium that lives in basalt, uses hydrogen gas for energy, derives carbon from inorganic carbon dioxide, and excretes simple organic compounds consumed by other kinds of bacteria (Fredrickson and Onstoot 1996, 72).

cf. system: subsurface lithoautotrophic microbial ecosystem

Comment: In the basalt, oxygen-poor water reacts with iron-bearing minerals and produces hydrogen gas.

***Agrobacterium tumefaciens* (Smith and Townsend 1907) Conn, 1942; Crown-gall**

Tumor Bacterium *n.* A bacterium that causes crown gall disease in many dicot species (King and Stansfield 1985).

cf. plasmid: Ti plasmid

α-Proteobacteria *n.* The bacterial taxon that includes *Bradyrhizobium*, *Paracoccus*, *Rhodobacter*, and *Rickettsia* (Gray et al. 1999, 1478, 1480).

cf. hypothesis: endosymbiosis hypothesis

***Bacillus subtilis* (Ehrenberg, 1835) Cohn, 1872** *n.* A Gram-positive, rod-shaped, spore-forming bacterium that lives in fresh water and soil (Sawyer 1999, 4 October, A11).

Comments: This species readily grows on a chemically-defined medium and undergoes transduction and transformation (King and Stansfield 1985). This species, *Haloarcula* sp., and *Synechococcus cyanobacteria* can survive prolonged periods in the vacuum of outer space (Sawyer 1999, 4 October, A11). *Bacillus subtilis* survived the tremendous jolt of being blasted into space, and after 6 yr in space, *B. subtilis* showed an 80% survival in a dry preparation of spores shielded from radiation either by at least one other layer of spores or a thin layer of glucose and salts. Those exposed to radiation did not survive. Other *Bacillus* are *B. cereus* and *B. megatherium*.

***Bacillus thuringiensis* Berliner, 1915 (Bt, BT)**

n. A Gram-positive, facultatively anaerobic, spore-forming bacterium (Bacillaceae) naturally found in some insect species and on dark surfaces of plants (Bravo et al. 2007, 423; Vetbac.org, 2010).

Comments: People use different strains of *B. thuringiensis* as biocontrol agents of some kinds of insects, including some lepidopteran species, disease-carrying mosquitoes, and nematodes (Bravo et al. 2007, 423). Farmers plant transgenic crop plants that contain toxin-producing genes from Bt. This insecticide might not generally have ill effects on vertebrates. [Latin *bacillus*, small rod; *thuringiensis*, after the German Province Thuringia]

bacterium *n.* An individual, or species, in Domain Eubacteria.

cf. Archaea, Eubacteria

Comments: More than 4,000 kinds of eubacteria live in human intestines, forming a complex ecosystem (Anonymous 1997, February, 23). These bacteria absorb vitamins, make vitamins, and digest food.

cyanobacterium *n.* An autotrophic bacterium that obtains energy from sunlight and uses oxygen as an electron acceptor in electron transport (Campbell 1996, 508).

syn. blue-green alga (Campbell 1996, 508)

Comments: Cyanobacteria may have appeared on Earth as early as 2.7 Ga ago based on fossil 2 α -methylhopanes from the Pilbara Craton, Australia (Brocks et al. 1999, 1033); they transformed life on Earth by producing much free oxygen (Campbell 1996, 508), and they and other prokaryotes evidently produced fossil stromatolites.

dwarf bacterium *n.* A starved bacterium that has shrunk from a healthy size of a few microns through less than a thousandth of its usual volume as it used up its stores (Fredrickson and Onstoot 1996, 73).

syn. ultramicro-bacterium (Fredrickson and Onstoot 1996, 73)

Comments: Dwarf bacteria are common deep in Earth's crust (Fredrickson and Onstoot 1996, 73). These bacteria might divide as infrequently as once per century, instead of at the much faster rates of non-starved bacteria.

***Epulopiscium fishelsoni* Schulz et al., 1999**

n. A huge bacterium, previously known as the world's largest bacterium (E. R. Angert and N. R. Pace in Associated Press 1992, 31 May, A4).

Comments: This bacterium has a width of about 0.5 mm and is found in intestines of surgeonfish (Associated Press 1992, 31 May, A4). A researcher discovered it in 1985 and originally classified it as a protozoan.

***Escherichia coli* (Migula, 1895) Castellani and Chalmers, 1919** *n.* A chemoheterotrophic proteobacterium that inhabits guts of mammals including Humans (Campbell 1996, 514; Suplee 1997, 23 August, A10).

Comments: This bacterium is one of the better understood organisms (Campbell 1996, 509). Alien strains cause traveler's diarrhea. There are hundreds of strains of this bacterium (Suplee 1997, 23 August, A10). This species commonly causes human urinary-tract infections. Some strains (e.g., O157:H7 which was first identified in 1982) dissolve cell membranes of various animal tissues and cause up to 20,000 human infections and about 250 human deaths in the U.S. annually. Humans contract O157:H7 from contaminated beef, milk, and water. DNA sequence information for *E. coli* is online (www.genome.wisc.edu, 2001).

Gram-negative bacterium *n.* A bacterium that has a cell wall with less peptidoglycan than a Gram-positive bacterium and has peptidoglycan located in a periplasmic gel between a plasma membrane and an outer membrane; contrasted with Gram-positive bacterium (Campbell 1996, 501).

Comments: Gram staining works with many eubacterial species. It results in a red dyeing of Gram-negative bacteria and violet dyeing of Gram-positive bacteria (Campbell 1996, 501).

[Gram, after Hans Christian Gram, a Danish physician, who developed Gram staining in the late 1800s (Campbell 1996, 501)]

Gram-positive bacterium *n.* A bacterium that has a cell wall with a large amount of peptidoglycan compared to Gram-negative bacteria that is located outside a plasma membrane; contrasted with Gram-negative bacterium (Campbell 1996, 501).

***Hemophilus influenzae* (Lehmann and Neumann, 1896) Winslow et al., 1917** *n.* A bacterium that parasitizes Humans (Wade 1995, 1 August, C1).

Comments: This bacterium does not cause influenza; it colonizes human tissues where in its virulent form it can cause earaches and meningitis (Wade 1995, 1 August, C1, C9, illustration). The Institute for Genomic Research (TIGR, U.S.) sequenced this bacterium, which is the first organism to be sequenced (Lee and Lee 2000, 171). It has 1,830,137 base pairs and 1,743 genes.

Mycoplasma Nowak, 1929 *n.* A bacterial genus in Phylum Aphragmabacteria (Norstog and Meyerriecks 1983, 38, illustration; King and Stansfield 1985).

Comments: Mycoplasmas are smaller and less complex than typical bacteria, and each has a plasma membrane enclosing its DNA, RNA, enzymes, and numerous ribosomes (Norstog and Meyerriecks 1983, 38). Mycoplasmas do not digest their own food, but are usually parasites that live on predigested food. Mycoplasmas can live freely in a nutrient broth. They are the simplest organisms capable of independent life (King and Stansfield 1985), and the only prokaryotes that lack cell walls (Campbell 1990, 533, illustration). *Mycoplasma pneumonia* causes one type of bacterial pneumonia.

prochlorophyte *n.* A prokaryote that performs oxygenic photosynthesis using chlorophyll *b*, as do Green Algae and Land Plants (Tomitani et al. 1999, 161).

purple-nonsulfur bacterium *n.* A bacterium that uses an electron-transport system that is a hybrid of photosynthetic and respiratory equipment (Campbell 1996, 508).

Rickettsia prowazekii da Rocha-Lima, 1916 *n.* The causative agent of epidemic louse-borne typhus (Gray et al. 1999, 1476).

Comment: This species has the most mitochondrial-like eubacterial genome known (Gray et al. 1999, 1476).

Streptococcus mitis Andrewes and Horder, 1906 emend. Judicial Commission, 1993 *n.* A bacterium (Streptococcaceae) that lives in human mouths, noses, and throats (Sawyer 1999, 4 October, A11).

Synechococcus cyanobacteria *n.* A bacterium that lives in crusted salt in Baja California (Sawyer 1999, 4 October, A11, illustration).

cf. gene (table); organism: Archaea: *Haloarcula* sp.; Bacteria: *Bacillus subtilis*

PART 3. DOMAIN EUKARYA

♦ **Domain Eukarya, Eukaryans** *n.* One of the three domains of life comprising unicellular and multicellular organisms with nuclear membranes and many kinds of organelles not found in Prokaryota (Domains Archaea and Bacteria); distinguished from Prokaryota which contains Archaea and Eubacteria (Woese 1983 in Strickberger 2000, 173; Campbell 1996, 498; Suplee 1996, 23 September, A3).

cf. Prokaryota

syn. Domain Eucaryota, Domain Eukaryota, Eukaryotes
Comments: Researchers have named over 1 million extant eukaryon species; there may be as many as 100 million such species (Campbell 1996, 499). An eukaryon's DNA comprises linear molecules packaged along with proteins into the number of chromosomes that are characteristic of a particular species. The first eukaryon may have arisen on Earth about 2.7 Ga ago,

based on fossil steranes, particularly cholestanone and its 28- through 30-carbon analogs from the Pilbara Craton, Australia (Brocks et al. 1999, 1033).

[Greek *eu*, true; *karyon*, kernel, referring to a true nucleus enclosed by a membranous nuclear envelope (Campbell 1996, 114)]

Crown Eukaryotes *n.* The eukaryote group composed of Animalia, Fungi, Plantae, and a number of mitochondria-containing protistan groups (Gray et al. 1999, 1480).

► **animal** *n.*

1. A sentient living organism typically capable of voluntary motion and sensation, distinguished from a fungus, plant, and protist (Oxford English Dictionary 1972, entries from 1398; Michaelis 1963).
2. Nonscientifically, an animal other than a human; a beast; a brute (Oxford English Dictionary 1972, entries from 1600; Michaelis 1963).
3. Colloquially, a domestic quadruped (e.g., Domestic Cow, Dog, or Horse) (Oxford English Dictionary 1972, entries 1600; from Michaelis 1963).
4. Colloquially, any vertebrate other than a bird or fish (Michaelis 1963).

Note: This is a common definition.

5. Scientifically, a member of the kingdom Animalia; an organism characterized by having eukaryotic cells with mitochondria and nuclear envelopes, heterotrophic nutrition, no chloroplasts or cell walls, multicellularity, and usually fertilization, meiosis, and a nervous system (Curtis 1983, 387; Lincoln et al. 1985).

cf. animal names, -zoan, -zoite, zooid, -zoon (main body); Animalia (Appendix 1)

Comment: Curtis (1983, 387) lists the traits of Animals, Fungi, Plants, Prokaryotes, and Protists in a useful table.

[Latin *animal*, a living being < *anima*, breath, soul, life]

companion animal *n.* A nonhuman animal that a person keeps for its intrinsic appeal, rather than its usefulness; provides for its well-being, at least in part; holds in particular regard (from a subordinate treated as a possession of somewhere between property and a person to a family member with well prescribed social roles); and lives with in intimate association (Veevers 1984 in Veevers 1985, 12; Quackenbush 1985, 395; Young 1985, 298–299).

cf. pet

Comments: Aquarium fish are the most numerous companion animals in the U.S. (Katcher 1985, 403). Companion animals are legally defined in most western countries as property, or chattels, with which owners can do as they please as long as laws are not broken (Fogle 1981, 335). Companion animals can facilitate their human companions' sociability and supplement their human companionship or be an alternative to it (Veevers 1985, 27). Companion animals may contribute to a person's well-being (Voith 1985, 295). Young (1985, 299) suggests that "companion animal" should not be synonymized with "pet," but should be reserved for "the ancient and emerging companion animal functions now being given more attention."

contact animal *n.* A species that lacks individual distance and may seek bodily contact with con-

specifics (Heymer 1977, 102; Immelmann and Beer 1989, 58).

Comment: "Contact animal" grades into "distance animal," *q.v.* (Immelmann and Beer 1989, 58). Contact animals include some lizard and snake species; most parrot, primate, and rodent species; Catfish, Chelonians, and Eels including Moray Eels, Penguins; and the Domestic Pig, Hippopotamus, Mousebird, and White-eye Bird.

control animal *n.* In *Cebus* sp. (Capuchin Monkey): A male that maintains vigilance, interposes himself between an intruder and his group, and terminates fights between group members, without exercising aggressive dominance toward other troop members (Bernstein 1966 in Wilson 1975, 282).

density-intolerant animal *n.* An animal species that has low reproductive rates, lives in isolated pairs, or families, does not have large population density fluctuations, disperses at the end of each breeding season, and is a distance animal (Immelmann and Beer 1989, 72).

density-tolerant animal *n.* An animal species that has high reproductive rates, maintains these rates even when its population densities approach overcrowding, disperses when crowding exceeds a particular limit, and is generally a contact animal (Immelmann and Beer 1989, 72).

distance animal *n.* For example, in Flamingos, Gulls, Pike, Salmon, Swallows, Trout; most raptor and ungulate species: A species whose members keep particular distances from one another except during copulation and suckling of young (Hediger 1941 in Immelmann and Beer 1989, 76).

cf. animal: contact animal

► **Kingdom Animalia** *n.* A eukaryotic kingdom comprising organisms characterized by having heterotrophic nutrition, multicellularity, no chloroplasts or cell walls, nuclear membranes, and usually fertilization, meiosis, and nervous systems; distinguished from Kingdoms Fungi, Plantae, and Protista (Curtis 1983, 387; Lincoln et al. 1985).

cf. animal (Appendix 1)

Comment: Animals might have first arisen on Earth from 900 through 1,000 Ma ago (Vermeij 1996, 525; Wray et al. 1996, 568). Tables that show hierarchical classifications of some animal taxa and descriptions of a few of the millions of animal taxa are below.

A CLASSIFICATION OF KINGDOM ANIMALIA^a

- I. Group Parazoa, animals without true tissues
 - A. Phylum Mesozoa (Mesozoans)
 - B. Phylum Placozoa (Placozoans)
 - C. Phylum Porifera (Poriferans = Sponges)
- II. Group Eumetazoa (animals with true tissues)
 - A. Group Radiata (Radiates = Diploblasts)
 - 1. Phylum Cnidaria (Cnidarians including Corals, Hydra, and Jellyfish)
 - a. Class Anthozoa (Anthozoans including Corals and Sea Anemones)
 - b. Class Cubozoa (Cubozoans = Box Jellyfish)
 - c. Class Hydrozoa (Hydrozoans = Hydroids)
 - d. Class Scyphozoa (Scyphozoans = Jellyfish)
 - 2. Phylum Ctenophora (Ctenophorans = Combjellies)

B. Group Bilateria (Bilateria = Triploblasts)

- 1. Group Acoelomata (Acoelomates)
 - a. Phylum Gnathostomulida (Gnathostomulids)
 - b. Phylum Platyhelminthes (Flatworms and kin)
 - (1) Class Cestoda (Cestodes = Tapeworms)
 - (2) Class Monogenea (Monogeneans = Flukes)
 - (3) Class Trematoda (Trematodes = Flukes)
 - (4) Class Turbellaria (Turbellarians = Flatworms)
 - c. Phylum Rhynchocoela (Rhynchocoelans)
- 2. Group Pseudocoelomates (Pseudocoelomates)
 - a. Phylum Acanthocephala (Spiny-headed Worms)
 - b. Phylum Cycliophora (Cycliophorans)
 - c. Phylum Endoprocta (Endoprocts)
 - d. Phylum Gastrotricha
 - e. Phylum Kinorhyncha
 - f. Phylum Loricifera (Loriciferans)
 - g. Phylum Nematoda (Aschelminthes = Nematodes, Roundworms and kin)
 - h. Phylum Nematomorpha (Horsehair Worms)
 - i. Phylum Nemertea (Rhynchocoela = Nemerteans)
 - j. Phylum Rotifera (Rotifers)
- 3. Group Coelomata (Coelomates)
 - a. Group Protostomia (Protostomes)
 - (1) Group Protostome (Lophophorates)
 - (a) Phylum Brachiopoda (Brachiopods = Lamp Shells)
 - (b) Phylum Bryozoa (Bryozoans = Moss Animals)
 - (2) Group Ametameria (Pseudometameria = Ametamerians)
 - (a) Phylum Echiura
 - (b) Phylum Mollusca (Molluscs)
 - (i) Class Bivalvia (Bivalves including Clams, Oysters, and kin)
 - (ii) Class Cephalopoda (Cephalopods including Nautilus, Octopuses, and Squids)
 - (iii) Class Gastropoda (Gastropods including Slugs and Snails)
 - (iv) Class Polyplacophora (Chitons)
 - (v) 4 other classes
 - (c) Phylum Pentastomida (Pentastomids)
 - (d) Phylum Priapulida (Priapulids)
 - (e) Phylum Sipunculida (Sipunculids)
 - (f) Phylum Tardigrada (Tardigrades)
 - (3) Group Metameria (Metamerians)
 - (a) Phylum Annelida (Annelids)
 - (i) Class Hirudinea (Hirudineans = Leeches)
 - (ii) Class Oligochaeta (Oligochaetes = Earthworms)

- (iii) Class Polychaeta (Polychaetes)
- (b) Phylum Arthropoda (Arthropods)
- (c) Phylum Onychophora (Onychophorans = Velvet Worms)
- (d) Phylum Pogonophora (Pogonophorans = Beard Worms)
- b. Group Deuterostomia (Deuterostomes)
 - (1) Group Deuterostome Lophophorates (Phylum Phoronida = Horseshoe Worms)
 - (2) Group Nonlophophorate Deuterostomia
 - (a) Phylum Chaetognatha^b (Arrow Worms)
 - (b) Phylum Echinodermata (Echinoderms)
 - (i) Class Asteroidea (Sea-stars)
 - (ii) Class Concentricycloidea (Sea-daisies)
 - (iii) Class Crinoidea (Sea-lilies)
 - (iv) Class Echinoidea (Echinoids including Sand-dollars and Sea Urchins)
 - (v) Class Holothuroidea (Sea-cucumbers)
 - (vi) Class Ophiuroidea (Brittle-stars)
 - (c) Phylum Hemichordata (Hemichordates)
 - (i) Class Pterobranchia (Pterobranchs)
 - (ii) Class Enteropneusta (Enteropneustans (Acorn Worms))
 - (d) Phylum Chordata (Chordates)
 - (i) Calcichordata^c (Calcichordates)
 - (ii) Conodonta^c (Conodonts)
 - (iii) Subphylum Urochordata (Urochordates)
 - (iv) Subphylum Cephalochordata (Cephalochordates including Lancelets = "Headless Fishes")
 - (v) Subphylum Vertebrata (Vertebrates)

^a After Strickberger (1996) and others. Cnidaria and Ctenophora are the Diploblasts (Ferrier and Holland 2001, 33).

^b Strickberger (1996, 338).

^c Some researchers place Chaetognatha in Chordata.

A CLASSIFICATION OF PHYLUM ARTHROPODA^a

- I. Subphylum Trilobita (Trilobites, extinct)
- II. Subphylum Chelicerata (Chelicerates)
 - A. Class Merostomata (Horseshoe Crabs and extinct Eurypterids)
 - B. Class Arachnida (Arachnids: Spiders and their kin)
 - C. Class Pycnogonida (Sea Spiders)

- III. Subphylum Crustacea (Crustaceans)
 - A. Class Branchiopoda (Branchiopods)
 - B. Class Branchiura
 - C. Class Cephalocarida
 - D. Class Cirripedia (Barnacles)
 - E. Class Copepoda (Copepods)
 - F. Class Malacostraca (Malacostracans including Order Isopoda, Isopods)
 - G. Class Mystacocarida
 - H. Class Ostracoda (Ostracods)
 - I. Class Remipedia
 - J. Class Tantulocarida
- IV. Subphylum Atelocerata (Atelocerates)
 - A. Class Chilopoda (Centipedes)
 - B. Class Diplopoda (Millipedes)
 - C. Class Hexapoda (Hexapods)
 - D. Class Pauropoda (Pauropods)
 - E. Class Symphyla (Symphylans)

^a After Borror et al. (1989).

A CLASSIFICATION OF CLASS ARACHNIDA^a

- I. Order Acari, Mites and Ticks
 - A. Group I. Opilioacariformes
 - B. Group II. Parasitiformes
 - 1. Suborder Holothyrida
 - 2. Suborder Ixodida (Ticks)
 - 3. Suborder Mesostigmata
 - C. Group III. Acariformes
 - 1. Suborder Astigmata
 - 2. Suborder Oribatida
 - 3. Suborder Prostigmata
- II. Order Amblypygi (Tailless Whipscorpions, Whipspiders)
- III. Order Araneae (Spiders)
- IV. Order Opiliones (Daddylonglegs = Harvestmen)
- V. Order Palpigrada (Microwhipscorpions)
- VI. Order Pseudoscorpiones (Pseudoscorpions)
- VII. Order Ricinulei (Ricinuleids)
- VIII. Order Schizomida (Short-tailed Whipscorpions)
- IX. Order Scorpiones (Scorpions)
- X. Order Solifugae (Windscorpions)
- XI. Order Uropygi (Whipscorpions)

^a After Borror et al. (1989, 104–105).

SOME FAMILIES OF ORDER ARANEAE, SPIDERS^a

- I. Suborder Orthognatha (Tarantulas and kin)
- II. Suborder Labidognatha (True Spiders)
 - A. Section Cribellatae (Hackled-band Spiders)
 - B. Section Ecribellatae (Plain-thread Weavers)
 - 1. Family Agelenidae (Grass Spiders = Funnel-web Spiders)
 - 2. Family Araneidae (Orb Weavers)
 - 3. Family Clubionidae (Two-clawed Hunting Spiders = Sac Spiders)
 - 4. Family Hahniidae (Hahniid Sheet-web Spiders)
 - 5. Family Linyphiidae (Sheet-web Spiders, including *Frontinella pyramitela* = Bowl-and-doily Spider)
 - 6. Family Loxoscelidae (Recluse Spiders)
 - 7. Family Lycosidae (Wolf Spiders = Ground Spiders)
 - 8. Family Pholcidae (Long-legged Spiders = Cellar Spiders)

9. Family Pisauridae (Nursery-web Spiders, Fishing Spiders, including *Dolomedes* sp.)
10. Family Salticidae (Jumping Spiders)
11. Family Theridiidae (Comb-footed Spiders = Cobweb Spiders, including Widows)
12. Family Thomisidae (Crab Spiders, including *Misumena vatia*)

^a After Borror et al. (1989).

A CLASSIFICATION OF CLASS HEXAPODA^a

- I. Group Entognatha, 6859
 - A. Order Collembola (Springtails, 6000)
 - B. Order Diplura (Diplurans, 659)
 - C. Order Protura (Proturans, 200)
- II. Group Insecta (Exognatha, 780)
 - A. Group Apterygota (Wingless Insects)
 1. Order Microcoryphia (Bristletails, 250)
 2. Order Thysanura (Silverfish, 320)
 - B. Group Pterygota (Winged insects)
 1. Order Blattaria (Cockroaches, 4,000; 5 families)
 2. Order Coleoptera (Beetles, 300,000; 113 families in 4 suborders)
 - a. Suborder Adephaga
 - (1) Family Cantharidae (Soldier Beetles)
 - (2) Family Carabidae (Ground Beetles)
 - (3) Family Cicindellidae (Tiger Beetles)
 - (4) Family Gyrinidae (Whirligig Beetles)
 - b. Suborder Polyphaga
 - (1) Family Bruchidae (Seed Beetles)
 - (2) Family Buprestidae (Metallic-woodboring Beetles)
 - (3) Family Cerambycidae (Long-horned Beetles)
 - (4) Family Chrysomelidae (Leaf Beetles)
 - (5) Family Cleridae (Checkered Beetles)
 - (6) Family Coccinellidae (Ladybird Beetles = Ladybugs)
 - (7) Family Curculionidae (Weevils = Snout Beetles)
 - (8) Family Dermestidae (Skin Beetles)
 - (9) Family Elateridae (Click Beetles)
 - (10) Family Lampyridae (Fireflies = Lightningbugs)
 - (11) Family Lucanidae (Stag Beetles)
 - (12) Family Lycidae (Net-winged Beetles)
 - (13) Family Meloidae (Blister Beetles)
 - (14) Family Mordellidae (Tumbling-flower Beetles)
 - (15) Family Scarabaeidae (Scarab Beetles)
 - (16) Family Scolytidae (Ambrosia Beetles and Bark Beetles = Engraver Beetles)
 - (17) Family Silphidae (Carrion Beetles)
 - (18) Family Staphylinidae (Rove Beetles)
 - (19) Family Tenebrionidae (Darkling Beetles)
 3. Order Dermaptera (Earwigs, 1,100; 6 families)
 4. Order Diptera (Flies, 120,000; 108 families)
 - a. Suborder Brachycera (Short-horned Flies)
 - (1) Family Asilidae (Grass Flies and Robber Flies)

- (2) Family Bombyliidae (Bee Flies)
- (3) Family Dolichopodidae (Long-legged Flies)
- (4) Family Drosophilidae (Pomace Flies = Fruit Flies, Vinegar Flies)
- (5) Family Syrphidae (Flower Flies = Hover Flies)
- (6) Family Tabanidae (Deer Flies and Horse Flies)
- (7) Superfamily Oestroidea (Oestroid Flies; 5 families)
 - (a) Family Calliphoridae (Bot Flies)
 - (b) Family Sarcophagidae (Flesh Flies)
 - (c) Family Tachinidae (Tachinid Flies)
- (8) Superfamily Muscoidea (Muscid Flies; 3 families)
 - (a) Family Anthomyiidae (Anthomyiid Flies)
 - (b) Family Muscidae (Muscid Flies, including House Flies)
- b. Suborder Nematocera (Long-horned Flies)
 - (1) Family Ceratopogonidae (Biting Midges, No-see-ums, Punkies)
 - (2) Family Chironomidae (Midges)
 - (3) Family Cicidomyiidae (Gall Midges = Gall Gnats)
 - (4) Family Culicidae (Mosquitoes)
 - (5) Family Simuliidae (Black Flies = Buffalo Gnats)
 - (6) Family Tipulidae (Crane Flies)
5. Order Embiidina (Webspinners, 150; 4 families)
6. Order Ephemeroptera (Mayflies, 4,870)
7. Order Grylloblattaria (Rock Crawlers, 20)
8. Order Hemiptera (Bugs, 50,000; 42 families)
 - a. Family Coreidae (Leaf-footed Bugs and Squash Bugs)
 - b. Family Gelastocoridae (Toad Bugs)
 - c. Family Gerridae (Water Striders)
 - d. Family Lygaeidae (Seed Bugs)
 - e. Family Miridae (Leaf Bugs and Plant Bugs)
 - f. Family Pentatomidae (Stink Bugs)
 - g. Family Reduviidae (Assassin Bugs, Thread-legged Bugs)
 - h. Family Scutelleridae (Shield-back Bugs)
 - i. Family Tingidae (Lace Bugs)
 - j. Family Veliidae (Broad-shouldered Water Striders)
9. Order Homoptera (Homopterans including Aphids, Cicadas, Hoppers, Psyllids, Scale Insects, and Whiteflies, 32,000)
 - a. Family Adelgidae (Pine and Spruce Aphids)
 - b. Family Aphidae (Aphids = Plantlice)
 - c. Family Cercopidae (Froghoppers = Spittle Bugs)
 - d. Family Cicadidae (Cicadas)
 - e. Superfamily Coccoidea (Scale Insects)
 - f. Family Fulgoridae (Fulgorid Planthoppers)
 - g. Family Membracidae (Treehoppers)
 - h. Family Phylloxeridae (Phylloxerans)
 - i. Family Psyllidae (Psyllids, Jumping Plantlice)

10. Order Hymenoptera (Hymenopterans (Ants, Bees, Sawflies, Wasps), 108,000)
- Suborder Symphyla (Horntails and Sawflies, 4 superfamilies)
 - Suborder Apocrita (16 superfamilies)
 - Superfamily Chalcidoidea (Chalcidoid Wasps)
 - Superfamily Cynipoidea (Cynipoids including Family Cynipidae = Gall Wasps)
 - Superfamily Formicoidea (Formicoids including Family Formicidae = Ants)
 - Superfamily Ichneumonioidea
 - Family Braconidae (Braconid Wasps)
 - Family Ichneumonidae (Ichneumon Wasps)
 - Superfamily Pompiloidea (Pompiloids including Family Pompilidae = Spider Wasps)
 - Superfamily Sphecoidea (Sphecoids)
 - Group Apiformes (Bees; 7 families)
 - Family Apidae (Apid Bees)
 - Family Halictidae (Sweat Bees)
 - Group Spheciformes (Sphecid Wasps)
 - Superfamily Tiphioidea (Tiphoids)
 - Family Tiphidae (Tiphiid Wasps)
 - Family Mutillidae (Velvet-ants)
 - Superfamily Vespoidea (Vespoids including Family Vespidae = Vespid Wasps)
11. Order Isoptera (termites, 1,900; 4 families)
12. Order Lepidoptera (Lepidopterans including Butterflies, Moths, Skippers, 112,000; 75 families)
- Suborder Dacnonypha
 - Suborder Ditrysia (17 superfamilies)
 - Superfamily Bombycoidea
 - Family Lasiocampidae (Lappet Moths, Tent Caterpillars, and kin)
 - Family Saturniidae (Giant Silkworm Moths and Royal Moths)
 - Superfamily Geometroidea (Geometroids including Geometridae, Cankerworms, Geometers, and kin)
 - Superfamily Hesperoidea (Skippers)
 - Superfamily Noctuoidea (Noctuoids)
 - Family Arctiidae (Arctiid Moths)
 - Family Lymantriidae (Lymantriid Moths including Gypsy Moths, Tussock Moths, and kin)
 - Family Noctuidae (Noctuid Moths)
 - Family Notodontidae (Prominent Moths)
- (5) Superfamily Papilionidae (Butterflies)
- Family Papilionidae (Parnassians and Swallowtails)
 - Family Pieridae (Orange-tips, Sulphurs, and Whites)
 - Family Lycaenidae (Blues, Coppers, Hairstreaks, Harvesters, and Metalmarks)
 - Family Nymphalidae (Brush-footed Butterflies)
 - Family Satyridae (Arctics, Satyrs, and Wood Nymphs)
- (6) Superfamily Pyraloidea (Grass Moths, Snout Moths, and kin)
- (7) Superfamily Sphingoidea (including Family Sphingidae, Sphinx Moths (= Hawkmoths and Hornworms))
- (8) Superfamily Tineoidea (including Family Psychidae = Bagworms)
- (9) Superfamily Yponomeutoidea (including Family Yponomeutidae)
- (10) Superfamily Zygaenoidea (including Family Limacodidae = Saddleback Caterpillars and Slug Caterpillars)
- Suborder Exoporia
 - Suborder Monotrysia
 - Suborder Zeugloptera
13. Order Mantodea (Mantids, 1,500)
14. Order Mecoptera (Scorpionflies, 480)
15. Order Neuroptera (Neuropterans including Alderflies, Antlions, Dobsonflies, Fishflies, Owlflies, and Snakeflies, 4,670; 13 families)
- Family Chrysopidae (Common Lacewings and Green Lacewings)
 - Family Hemerobiidae (Brown Lacewings)
 - Family Mantispidae (Mantidflies)
 - Family Myrmeleontidae (Antlions)
16. Order Odonata (Damselflies and Dragonflies, 4,870)
- Suborder Anisoptera (Dragonflies)
 - Suborder Zygoptera (Damselflies)
17. Order Orthoptera (Crickets, Grasshoppers, and kin, 12,500, 10 families)
- Family Acrididae (Short-horned Grasshoppers)
 - Family Gryllidae (Crickets)
 - Family Tettigoniidae (Long-horned Grasshoppers)
18. Order Phasmida (Timemas and Walkingsticks, 2,000)
19. Order Phthiraptera (Lice, 5,500; 16 families)
20. Order Plecoptera, Stoneflies, 1,500; 9 families)
21. Order Pscoptera (Pscopterans, 2,400; 24 families)
22. Order Siphonaptera (Fleas, 2,300)
23. Order Strepsiptera (Twisted-wing Parasites, 300)
24. Order Thysanoptera (Thrips, 4,000; 5 families)
25. Order Trichoptera, Caddisflies, 7,000)
26. Order Zoraptera (Zorapterans, 24; 1 family)

^a After Borror et al. (1989, Chapter 7). Numbers after orders are numbers of described species worldwide. Most families are not included.

A CLASSIFICATION OF LIVING GROUPS OF PHYLUM CHORDATA, CHORDATES

- I. Subphylum Urochordata (Urochordates)
- II. Subphylum Cephalochordata (Cephalochordates including Lancelets = "Headless Fishes")
- III. Subphylum Vertebrata (Vertebrates)
 - A. Class Acanthodii (Spiny Sharks)
 - B. Class Agnatha (Jawless Fishes)
 - C. Class Amphibia (Amphibians including Frogs, Salamanders, Toads, and kin)
 - D. Class Aves (Birds)
 - E. Class Chondrichthyes (Cartilaginous Fishes)
 - F. Class Mammalia (Mammals)
 - G. Class Osteichthyes (Bony Fishes)
 - H. Class Placodermi (Placoderms = Plated Fishes)
 - I. Class Reptilia (Reptiles (Lizards and Snakes)

A CLASSIFICATION OF CLASS AMPHIBIA^a

- I. Subclass Ichthyostegida (^aIchthyostegids = Ancestral Labryinthodonts, extinct)
- II. Subclass Labryinthodonta (^aLabryinthodonts, extinct)
 - A. Order Anthracosaura (Anthracosaurs, extinct)
 - B. Order Temnospondyli (Temnospondyles = Late Paleozoic and Triassic Labryinthodonts, extinct)
- III. Subclass Lepospondyli (Lepospondyls = Late Paleozoic amphibians with spool-shaped vertebrae, extinct)
- VI. Subclass Lissamphibia (Frogs, Legless Amphibians, Newts, Salamanders, and Toads)
 - A. Order Proanura (ancestor of Frogs and Toads, extinct)
 - B. Order Anura (Frogs and Toads)
 - C. Order Apoda (Legless Amphibians)
 - D. Order Urodela (Newts, Salamanders)

^a After Strickberger (1996).

A CLASSIFICATION OF CLASS REPTILIA^a

- I. Subclass Anapsida (Anapsids)
 - A. Order Captorhinida (Cotylosauria, Captorhinids = Stem Reptiles, extinct)
 - B. Order Mesosauria (Mesosaurs (aquatic freshwater reptiles, extinct)
 - C. Order Testudinata (Chelonia = Turtles)
- II. Subclass Diapsida (Diapsids)
 - A. Infraclass Lepidosauromorpha (Lepidosauromorphs, extinct)
 - B. Order Younginiformes (extinct)
 - C. Superorder Ichthyopterygia (Ichthyosaurs, extinct)
 - D. Superorder Lepidosauria (extinct)
 - 1. Order Sphenodontida (extinct)
 - 2. Order Squamata (Squamates)
 - a. Suborder Lacertilia (Sauria = Lizards)
 - b. Suborder Serpentes (Ophidia = Snakes)
 - E. Superorder Sauropterygia (Sauropterygians = marine Mesozoic reptiles, extinct)

- F. Infraclass Archosauromorphs (Archosauromorphs)
- 1. Superorder Archosauria (Archosaurs)
 - a. Order Crocodylia (Alligators, Crocodiles, and Ghavials)
 - b. Order Ornithischia (Ornithischians = Bird-hipped Dinosaurs, extinct)
 - c. Order Pterosauria (Pterosaurs, extinct)
 - d. Order Saurischia (Saurischians = Lizard-hipped Dinosaurs, extinct)
 - e. Order Thecodontia (Thecodonts, extinct)
- III. Subclass Parareptilia (extinct)
- IV. Subclass Synapsida (Synapsids, extinct)^c
 - A. Order Pelycosauria (Pelycosaurs, extinct)
 - B. Order Therapsida (Therapsids, Mammal-like Reptiles, extinct)

^a This classification is based primarily on Kemp (1982), Benton (1990) and Strickberger (1996).

^b Benton (1990, 329) includes all Class Aves in Saurischia. Thus, according to him, only the nonbird saurischians are extinct.

^c Benton (1990, 80) includes all Mammalia in Synapsida. Thus, according to him, only the reptilian synapsids are extinct. Kemp (1988 in Strickberger 1996, 418) distinguishes Synapsida from Sauropsida (the rest of the Reptilia).

A CLASSIFICATION OF CLASS AVES, BIRDS^a

- I. Subclass Odontoholcae (Toothed Diving Birds, extinct)
- II. Subclass Ornithurae (True Birds includes Neornithes and Ornithurines)
 - A. Order Aepyornithiformes (Elephant Birds, extinct)
 - B. Order Apodiformes (Hummingbirds and Swifts)
 - C. Order Apterygiformes (Kiwi)
 - D. Order Anseriformes (Ducks, Geese, screamers, and Swans)
 - E. Order Casuariiformes (Cassowaries, Emu)
 - F. Order Charadriiformes (Avocets, Gulls, Jaçanas, Phalaropes, Plovers, Oyster-catchers, Sandpipers, Snipes, and Stilts)
 - G. Order Caprimulgiformes (Frogmouths and Nightjars)
 - H. Order Ciconiiformes (Flamingos, Herons, and Storks)
 - I. Order Coliiformes (Colies)
 - J. Order Coraciiformes (Bee-eaters, Hoopoe, and Hornbills)
 - K. Order Columbiformes (Pigeons and Sandgrouse)
 - L. Order Cuculiformes (Cuckoos and Turacos)
 - M. Order Diatrymiformes (*Diatryma* and kin, extinct)
 - N. Order Dinornithiformes (Moas; *Aepyornis*, *Diatryma*, and *Dinornis*, all extinct)
 - O. Order Falconiformes (Eagles, Hawks, and Vultures)
 - P. Order Galliformes (Curassows, Fowl, Grouse, Guinea Fowl, and Turkeys)
 - Q. Order Gaviiformes (Loons)

- R. Order Gruiformes (Bustards, Coots, Cranes, Kagu, Quails, Limpkin, Mesites, Moorhens, Pinfeathers, Seriamas, Rails, Sun Bittern, and Trumpeters)
- S. Order Passeriformes, Passerines ("Perching Birds:" Bluejays, Cardinals, Crows, Sparrows, etc.)
- T. Order Pelecaniformes (Boobies, Cormorants, Darters, Frigate Birds, Gannets, Pelicans, Shags, and Tropic Birds)
- U. Order Piciformes (Barbets, Toucans, and Woodpeckers)
- V. Order Podicipediformes (Grebes)
- W. Order Procellariiformes (Albatrosses, Petrels, and Shearwaters)
- X. Order Psittaciformes (Cockatoos, Lories, Macaws, Parakeets, and Parrots)
- Y. Order Rheiformes (Rheas)
- Z. Order Sphenisciformes (Penguins)
- AA. Order Strigiformes (Owls)
- BB. Order Struthioniformes (Ostrich)
- CC. Order Tinamiformes (Tinamous)
- DD. Order Trogoniformes (Trogons, Kingfishers, Kookaburras, Motmots, Rollers, and Todies)
- III. Subclass Sauriurae (Archaeornithes = Toothed Reptile-like Birds, including *Urvögels* (*Archaeopteryx* and kin and Enantiornithines = Opposite Birds))
- (c) Family Mustelidae (Skunks, Weasels, and kin)
- (d) Family Ursidae (Bears)
- (e) Family Procyonidae (Coatis and Raccoons)
- (2) Order Cimolesta (extinct)
- (3) Order Credonta (extinct)
- d. Grandorder Ictopsita (extinct)
- e. Grandorder Insectivora (*Asioryctes* (extinct), Hedgehogs, Moles, Shrews, and kin)
 - (1) Family Soricidae (Shrews)
 - (2) Family Talpidae (Moles)
- f. Grandorder Ungulata
 - (1) Order Acreodi (extinct)
 - (2) Order Arctocyonia (extinct)
 - (3) Order Artiodactyla (Even-toed Ungulates)
 - (a) Family Bovidae (Bison, Cattle, Goats, Muskox, Pigs, and Sheep)
 - (b) Family Cervidae (Deer)
 - (c) Other Families
 - (4) Order Astrapotheria (extinct)
 - (5) Order Cetacea (Dolphins, Porpoises, Whales, and kin)
 - (6) Order Condylarthra (extinct)
 - (7) Order Desmostylia (extinct)
 - (8) Order Dinocerata (extinct)
 - (9) Order Embrithopoda (extinct)
 - (10) Order Hyracoidea (Hyraxes)
 - (11) Order Lithopterna (extinct)
 - (12) Order Notoungulata (extinct)
 - (13) Order Pantodonta (extinct)
 - (14) Order Perissodactyla (Odd-toed Ungulates: Horses, Rhinos, Tapirs, Zebras, and kin)
 - (15) Order Proboscidea (Elephants)
 - (16) Order Pyrotheria (extinct)
 - (17) Order Sirenia (Dugongs, Manatees, and Sea Cows)
 - (18) Order Taeniodonta (extinct)
 - (19) Order Tilloidontia (extinct)
 - (20) Order Trigonostylopoida (extinct)
 - (21) Order Tubulidentata (Aardvark)
 - (22) Order Xenungulata (extinct)
 - g. Grandorder uncertain
 - (1) Order Pholidota (Scaly Anteaters)
 - (2) Order Rodentia (Rodents)
 - (a) Family Castoridae (Beavers)
 - (b) Family Cricetidae (Lemmings, Mice, Rats, and Voles)
 - (c) Family Erethizontidae (Porcupine)
 - (d) Family Sciuridae (Squirrels)
 - (e) Family Zapodidae (Jumping Mice)
 - B. Infraclass Metatheria (*syn. Marsupialia*)
 - 1. Order Dasyurida
 - 2. Order Diprotodontia (Cucus, Diprotodonts (extinct), Kangaroos, Koala, Possums, Rat-kangaroos, Tree-kangaroo, Sugar Glider, Wallabies, and Wombats)
 - 3. Order Marsupicarnivora (Australian Native-cat, Monitos del Monte, Marsupial-mice, Marsupial-moles, O'possums (Opossums), Numbat, Tasmanian-devil, and Tasmanian Pouched-wolf)

^a Based on Feduccia (1995).

A CLASSIFICATION OF CLASS MAMMALIA^a

- I. Subclass Prototheria (Protheria = Prototherians)
 - A. Order Docodonta (extinct)
 - B. Order Monotremata (Echidnas, Platypus, and Spiny Anteater)
 - C. Order Triconodonta (extinct)
 - D. Order unnamed (extinct)
 - 1. Amphilestidae (extinct)
 - 2. Kuehneotheriidae (*Kuehneotherium*, extinct)
 - 3. Morganucodontidae (*Megazostrodon* and *Morganucodon*, extinct)
- II. Subclass Theria (Therians)
 - A. Infraclass Eutheria (Euterians)
 - 1. Cohort Edentia (including Order Xenarthra (= Anteaters, Armadillos, Giant Sloth (extinct), Glyptodont (extinct), and Sloths))
 - 2. Cohort Epitheria (Epitherians)
 - a. Grandorder Anagalida
 - (1) Order Lagomorpha (Hares, Pikas, and Rabbits)
 - (2) Order Macroscelidea (Elephant-Shrews)
 - b. Grandorder Arcta
 - (1) Order Chiroptera (Bats, including Family Vespertilionidae = Plain-nose Bats)
 - (2) Order Dermoptera (Flying Lemurs)
 - (3) Order Scandentia (Tree Shrews)
 - (4) Order Primates (Apes (including Humans) and Monkeys)
 - c. Grandorder Ferae
 - (1) Order Carnivora
 - (a) Family Felidae (Cats)
 - (b) Family Canidae (Dogs)
 - (1) Order Pholidota (Scaly Anteaters)
 - (2) Order Rodentia (Rodents)
 - (a) Family Castoridae (Beavers)
 - (b) Family Cricetidae (Lemmings, Mice, Rats, and Voles)
 - (c) Family Erethizontidae (Porcupine)
 - (d) Family Sciuridae (Squirrels)
 - (e) Family Zapodidae (Jumping Mice)
 - B. Infraclass Metatheria (*syn. Marsupialia*)
 - 1. Order Dasyurida
 - 2. Order Diprotodontia (Cucus, Diprotodonts (extinct), Kangaroos, Koala, Possums, Rat-kangaroos, Tree-kangaroo, Sugar Glider, Wallabies, and Wombats)
 - 3. Order Marsupicarnivora (Australian Native-cat, Monitos del Monte, Marsupial-mice, Marsupial-moles, O'possums (Opossums), Numbat, Tasmanian-devil, and Tasmanian Pouched-wolf)

- 4. Order Paucituberculata (Rat-opossums and related fossil forms)
- 5. Order Peramelina (Bandicoots)
- C. Infraclass Pantotheria (extinct)
 - 1. Order Eupantotheria (Eupanthotheres including *Aegialodon*, extinct)
 - 2. Order Symmetrodontia (Symmetrodonts including *Spalacotherium*, extinct)

^a Based primarily on Savage and Long (1986). Taxa are in alphabetical order within their next highest taxon. This table omits many lower taxa. References do not agree on many details of mammal classification (Savage and Long 1986, inside cover; Benton 1991a, 330–331; 1991b). A commonly used evolution textbook (Strickberger 1996) does not give a mammalian classification in a tabular form.

ORDER SCANDENITA (TREE SHREWS) AND ORDER PRIMATES (PRIMATES)

- I. Order Scandentia (Tree Shrews)
- II. Order Primates (Primates)
 - A. Prosimian Grade
 - 1. Suborder Plesiapiformes (Near Primates, extinct)
 - a. Family Paramomyidae (including *Purgatorius* sp.)
 - b. Family Plesiadapidae (including *Plesiadapis* sp.)
 - 2. Family Adapidae
 - a. *Adapis* sp.
 - b. *Notharctus* sp.
 - c. *Pelycodus* sp.
 - d. *Pronycticebus* sp.
 - e. *Smilodectes* sp.
 - 3. Family Omomyidae
 - a. *Hemiacodon* sp.
 - b. *Macrotarsius* sp.
 - c. *Omomys* sp.
 - d. *Tetonius* sp.
 - 4. Suborder Prosimii (Prosimians (Strepsirrhini = “Premonkeys” including Tarsiers, Lorises, and Lemurs)
 - a. Superfamily Lemuroidea (Lemurs)
 - b. Superfamily Lorisoidae (Lorises)
 - c. Superfamily Tarsioidae (Tarsiers)
 - B. Monkey Grade
 - 1. Suborder Anthropoidea (Anthropoids = Haplorhini, Monkeys)
 - a. Infraorder Platyrrhini (New World Monkeys including Capuchins, Marmosets, Spider Monkeys, Squirrel Monkeys, Tamarins, and kin)
 - (1) *Biretia* sp. (extinct)
 - (2) Superfamily Ceboidea (Ceboids)
 - (a) Family Callitrichidae (Marmosets and Tamarins)
 - (b) Family Cebidae (Capuchins, Howler Monkeys, Spider Monkeys, Uakaris, and kin)
 - b. Infraorder Catarrhini (Old-World Monkeys including Baboons, Macaques, Mandrills)
 - (1) *Aeolopithecus* sp. (extinct)
 - (2) *Amphipithecus* sp. (extinct)
 - (3) *Parapithecid* sp. (extinct)
 - (4) *Propriopithecidae* (extinct)

(including *Aegyptopithecus zeuxis* 1965 (= *Propriopithecus* sp., Dawn Monkey, “Dawn Ape,” “Egyptian Ape”))

- (5) Superfamily Cercopithecoidea (Cercopithecoids)
 - (a) Family Cercopithecidae (Baboons, Colobus, Drills, Geladas, Macaques (including Rhesus Monkeys), *Oreopithecus* sp. (extinct), and Vervet Monkeys = Grivets)
 - (b) Family Colobidae (Langurs)

C. Nonhuman-ape Grade

- 1. Suborder Anthropoidea (Anthropoids = Apes, including Humans)
 - a. Superfamily Hominoidea (Hominoids = Apes)
 - (1) Family Dryopithecidae (Dryopithecids, including *Dryopithecus* sp. = Forest Ape, Oak Ape, extinct)
 - (2) Family Hylobatidae (Gibbons and Siamangs)
 - (3) Family Pliopithecidae (including *Pliopithecus* sp., extinct)
 - (4) Family Pongidae (Pongids)
 - (a) *Pongo pygmaeus* (Orangutan)
 - (b) *Gorilla* (Gorillas)
 - (c) *Pan* spp. (Chimpanzees = Chimps)
 - (i) *Pan troglodytes* (Chimpanzee)
 - (ii) *Pan paniscus* (Bonobo = Pigmy Chimpanzee)
 - (5) Family Proconsulidae (including *Proconsul* sp., extinct)
 - (6) Family Ramapithecidae (Ramapithecids)
 - (a) *Gigantopithecus* sp.
 - (b) *Kenyapithecus* sp. (Kenya Ape, extinct)
 - (c) *Ramapithecus* (Rama’s Apes, 2 spp.)
 - (d) *Sivapithecus* spp. (In the broad sense, including *Ramapithecus*)
 - D. Human-Ape Grade, including Family Hominidae (Humans)

FAMILY HOMINIDAE, HUMANS

- I. *Ardipithecus*, including *Ardipithecus ramidus* (Stem Person)
- II. *Australopithecus*
 - A. *Australopithecus aethiopicus* (“Aethiopian Person” = *Parapithecus aethiopicus*)
 - B. *Australopithecus afarensis* (Afar Person)
 - 1. Chad jawbone
 - 2. Desi (= Ricky)
 - 3. First Family
 - 4. Laetoli footprints
 - 5. Little Foot, total skeleton
 - 6. Lucy (= AL 288, “Louis”)
 - 7. 53 new specimens
 - C. *Australopithecus africanus* (Southern Ape Person)
 - 1. *A. a. aethiopicus*

2. *A. a. africanus* (including Taung Child = Taung Boy)
3. *A. a. tanzaniensis* (including Laetoli footprints)
4. *A. a. transvaalensis*
5. Mr. Ples
- D. *Australopithecus anamensis* (Lake Person = Anamen Person)
- E. *Australopithecus bahrelghazalia*
- F. *Australopithecus boisei* (Boise Ape Person = *Parapithecus boisei*, Nutcracker Person = *Zinjanthropus boisei*, Zinj; possibly part of *A. robustus*)
1. Black Skull (= KNM-WT 17000, possibly *A. aethiopicus*)
 2. Dear Boy
- G. *Australopithecus garhi* ("Surprise Ape Person")
- H. *Australopithecus robustus* (Robust Ape Person, several synonymous scientific names including *Parapithecus robustus*)
1. Kromdraai Cave fossils
 2. Swartkrans Cave
- III. *Homo*
- A. Palate (oldest known fossil of *Homo*; Hadar, Ethiopia)
 - B. *Homo antecessor* ("Explorer Person")
 - C. *Homo erectus* Dubois ("Upright Person" = Eugene, *Meganthropus* sp., *Pithecanthropus erectus*)
 1. *Homo erectus pekinensis* ("Beijing Person" = *Sinanthropus pekinensis*, "Peking Person," including Zhoukoutien Cave fossils)
 2. "Java Person" (= Java Man)
 3. Poloyo Skull
 4. several skulls
 - D. *Homo erectus-sapiens* (Solo Person)
 - E. *Homo ergaster* ("Ergaster Person," much of a skull, a few teeth)
 - F. *Homo ergaster* ("Ergaster Person," African specimens formerly classified as *H. erectus*)
 1. Turkana Boy
 2. several skulls
 - G. *Homo floresiensis* (Flores Man)
 - H. *Homo habilis-erectus* ("Handy Upright Person")
 - I. *Homo habilis* (Handy Person = Louis, *Telanthropus* sp.)
 1. Ethiopia
 2. Kenya
 - a. first fossils
 - b. Johnny's Child
 - c. 1963 fossils
 - d. OH62
 3. South Africa
 4. Zaire
 - a. Cindy
 - b. George
 - c. Tiggy
 - J. *Homo rudolfensis* (Rudolf Person)
 - K. *Homo sapiens* (Archaic Humans)
 1. *Homo sapiens neanderthalensis* (Neanderthal Person = *H. neanderthalensis*, Neanderthals)
 2. *Homo sapiens sapiens* (= Human, Human Being, Man, Modern Human, Modern Man)
 - a. first-known fossils
 - b. Cro-Magnon Person
 - c. Qafeh Skull (Israel)

Abang See Animalia: Phylum Chordata: Class Mammalia: Subclass Theria: Infraclass Eutheria: Order Primates: Clovis People.

Acrodipsas illidgei See Animalia: Phylum Arthropoda: *Acrodipsas illidgei*.

Acrodipsas myrmecophila See Animalia: Phylum Arthropoda: *Acrodipsas myrmecophila*.

Adalia bipunctata, Two-spotted Lady Beetle See Animalia: Phylum Arthropoda: *Adalia bipunctata*.

(Addo) Flightless Dung Beetle See Animalia: Phylum Arthropoda: *Circellium bacchus*.

African Elephant See Animalia: Phylum Chordata: Class Mammalia: Subclass Theria: Infraclass Eutheria: Order Proboscidea: *Loxodonta africana*.

Africanized Bee, Africanized Honey Bee See Animalia: Phylum Arthropoda: Group Apiformes: *Apis mellifera*.

Agrotis infusa See Animalia: Phylum Arthropoda: *Agrotis infusa*.

Ailuropoda melanoleuca See Animalia: Class Mammalia: Subclass Theria: Infraclass Eutheria: Order Carnivora: *Ailuropoda melanoleuca*.

Alexandra's Birdwing Butterfly See Animalia: Phylum Arthropoda: *Ornithoptera alexandrae*.

Alkali Bee See Animalia: Phylum Arthropoda: Group Apiformes: *Nomia melanderi*.

American Burying Beetle See Animalia: Phylum Arthropoda: *Nicrophorus americanus*.

American Crow See Animalia: Phylum Chordata: Class Aves: *Corvus brachyrhynchos*.

Amphibians See Animalia: Phylum Chordata: Class Amphibia.

Anser anser See Animalia: Phylum Chordata: Class Aves: *Anser anser*.

Ants See Animalia: Phylum Arthropoda: Formicidae.

Apidae, Apid Bees See Animalia: Phylum Arthropoda: Group Apiformes: Apidae.

Apteryx See Animalia: Phylum Chordata: Class Aves: *Apteryx*.

Archaic Swallowtail See Animalia: Phylum Arthropoda: *Baronia brevicornis*.

Argentine Ant See Animalia: Phylum Arthropoda: Class Aves: *Linepithema humile*.

Archeopteryx See Animalia: Phylum Chordata: Class Aves: *Archaeopteryx*.

Archeornis See Animalia: Phylum Chordata: Class Aves: *Archeornis*.

Archaeornithes See Animalia: Phylum Chordata: Class Aves: Archaeornithes.

Archezoa n. A group of eukaryans that lack mitochondria and diverged early from the eukaryon common ancestor (Gray et al. 1991, 1479).

Comments: Archezoa includes *Giardia lamblia* and other diplomonads. Recent findings suggest that Archezoa once had mitochondria but subsequently lost them, and that Archezoa are not the earliest group of eukaryotes to diverge from the eukaryote common ancestor (Gray et al. 1991, 1479–1480).

Aristolochia elegans See Plantae: plant: *Aristolochia elegans*.

Asian Cerambycid Beetle See Animalia: Phylum Arthropoda: *Anoplophora glabripennis*.

Asian Elephant, Asiatic Elephant See Animalia: Phylum Chordata: Class Mammalia: Subclass Theria: Infraclass Eutheria: Order Proboscidea: *Elephas maximus*.

Asian Long-horned Beetle See Animalia: Phylum Arthropoda: *Anoplophora glabripennis*.

Asian Tiger Mosquito See Animalia: Phylum Arthropoda: *Aedes (Stegomyia) albopictus*.

Northeastern Beach Tiger Beetle See Animalia: Phylum Arthropoda: *Cicindela dorsalis dorsalis*.

- Norway Rat** See Animalia: Phylum Chordata: Class Mammalia: Subclass Theria: Infraclass Eutheria: Order Rodentia: *Rattus norvegicus*.
- nurse bee** See Animalia: Phylum Arthropoda: Group Apiformes: nurse bee.
- Ocybadistes knightorum** See Animalia: Phylum Arthropoda: *Ocybadistes knightorum*.
- Old World Rabbit** See Animalia: Phylum Chordata: Class Mammalia: Order Lagomorpha: *Oryctolagus cuniculus*.
- Old World Swallowtail** See Animalia: Phylum Arthropoda: *Papilio machaon*.
- Opposite Birds** See Animalia: Phylum Chordata: Class Aves: Enantiornithines.
- Orchid Bees** See Animalia: Phylum Arthropoda: Group Apiformes: Apidae, Euglossini
- Orachrysops niobe** See Animalia: Phylum Arthropoda: *Orachrysops niobe*.
- Ornithoptera alexandrae** See Animalia: Phylum Arthropoda: *Ornithoptera alexandrae*.
- Ornithoptera richmondia** See Animalia: Phylum Arthropoda: *Ornithoptera richmondia*.
- Panda** See Animalia: Class Mammalia: Subclass Theria: Infraclass Eutheria: Order Carnivora: *Ailuropoda melanoleuca*.
- Papilio aristodemus ponceanus** See Animalia: Phylum Arthropoda: *Papilio aristodemus ponceanus*.
- Papilio homerus** See Animalia: Phylum Arthropoda: *Papilio homerus*.
- Papilio machaon** See Animalia: Phylum Arthropoda: *Papilio machaon*.
- Papilionidae** See Animalia: Phylum Arthropoda: Papilionidae.
- Paralucia pyrodiscus lucida** See Animalia: Phylum Arthropoda: *Paralucia pyrodiscus lucida*.
- Parazoa** *n.* An animal group that contains organisms with indeterminate shapes and no organs (King and Stansfield 1985).
- Pheidole megacephala** See Animalia: Phylum Arthropoda: *Pheidole megacephala*.
- Phengaris** See Animalia: Phylum Arthropoda: *Phengaris*.
- Phylum Annelida, Annelids, Segmented Worms** *n.* A phylum of animals characterized by having a circulatory system, an elongated and segmented body, a head, nephridia, a one-way digestive tract, a well-defined nervous system, and a well-developed coelom (Curtis 1983, 1082).
cf. fission
Comments: Annelida has about 9,000 species, including Earthworms.
- Phylum Arthropoda, Arthropods** *n.* An animal phylum characterized by having an exoskeleton and jointed appendages (King and Stansfield 1985). Comment: This is the largest and most diverse animal phylum with almost 1 million named species and probably millions of unnamed species (King and Stansfield 1985).
- **Acrodipsas illidgei** Waterhouse & Lyell, 1914; **Il-ridge's Ant-blue Butterfly** *n.* An endangered, ant-associated butterfly (Lycaenidae) from Australian mangroves (International Union for Conservation of Nature and Natural Resources 2009; New, 130).
- **Acrodipsas myrmecophila** (Waterhouse & Lyell), **Small Ant-blue Butterfly** *n.* A rare, ant-associated butterfly (Lycaenidae) from Australia (Britton et al. 1995, 7).

- **Adalia bipunctata** Linnaeus, 1758; **Two-spotted Lady Beetle** *n.* A North American Lady Beetle (Coccinellidae) with a large black spot on each of its orange elytra (Milne and Milne 1997, 580, figure 146). Comment: This species can be common in buildings during the cold season when it diapauses (C. Klass, 1998, www.cce.cornell.edu/factsheets/home/insects).
- **Aedes** *n.* A mosquito genus with over 700 species (Culicidae) (King and Stansfield 1985). Comments: *Aedes aegypti* transmits dengue fever and yellow fever to Humans, and researchers have intensively studied this mosquito's resistance to pesticides (King and Stansfield 1985).
- **Aedes (Stegomyia) albopictus** (Skuse, 1895), **Asian Tiger Mosquito** *n.* A mosquito (Culicidae) that is native to parts of Asia and has invaded many other parts of the world including Eastern North America (Scholte and Schaffner 2007, 241). Comment: This mosquito is a model organism for studying geographic variation of different traits (Armbruster and Conn 2006, 1234).
- **Agrotis infusa** Boisduval, 1932; **Bogong Moth** *n.* A migratory moth (Noctuoidea) native to Australia (New 2009, 79). Comments: Lights attract this species in great numbers, and it is common in the Parliament House in Canberra and in some sports areas (New 2009, 78).
- **Anopheles** *n.* A mosquito genus (Culicidae) of about 150 species (King and Stansfield 1985). Comment: Many *Anopheles* are medically important; *A. albimanus*, *A. atroparvus*, *A. pharoensis*, *A. quadrimaculatus*, and *A. stephensi* transmit malaria (King and Stansfield 1985). Their larval salivary glands have polytene chromosomes.
- **Anophthalmus hitleri** Scheibel, 1937; **Hitler Beetle** *n.* An endangered, blind beetle (Carabidae) native to five caves in Slovenia (New 2009, 121). Comment: Collectors involved in the lucrative Nazi memorabilia market may be threatening this beetle by over-collecting it (Elkins 2006 in New 2009, 121). [*hitleri*, after Adolf Hitler]
- **Anoplophora glabripennis** (Motschulsky, 1853); **Asian Long-horned Beetle** *n.* A tree-consuming, bluish-black, long-horned beetle (Cerambycidae), with adults up to 3.5 cm long that is native to China and Korea (R. J. Favrin, 1998, in www.cfrnia.ca/english/ppc/science/pps/datasheets/anogla; http://willow.ncfes.umn.edu/pa_ceram/ceramb.htm, illustrations). *syn.* Asian Cerambycid Beetle, Starry-sky Beetle (in China) Comments: This beetle entered the U.S. in wood packing from China in 1996, and currently infests and kills trees in Illinois and New York (Warrick 1998, A3; Hevel 2001, 1–2). People are trying to control it because it could become a highly devastating pest in North America. It killed millions of trees in China in 1998.

■ Apiformes, Bees *n.* Insects characterized by two traits (branched hairs and hind basitarsi that are broader than other hind tarsi) that distinguish them from a closely related group, the Sphecid Wasps (Hymenoptera: Apoidea) (Michener 1974, 3; Michener et al. 1994, 2–3). *syn.* This book indicates a true bee in nonscientific names using “bee” as a separate word as in Buff-tailed Bumble Bee, bumble bee, honey bee, and Western Honey Bee. Other sources use words such as “bumblebee” and “honeybee.” Bees occur throughout the world and evolved from a sphecid wasp (Michener et al. 1994, 2–3). Researchers formerly delineated 12 bee families, but Michener (2007, 65) lists 7 bee families. Buchmann and Nabhan (1996, 254) define many kinds of bees not in this book and indicate that there are about 40,000 bee species. Michener (2007, 75) reports that there are 17,533 scientifically described bee species that researchers have placed within a genus or subgenus. Bees might have originated during the Cretaceous Period, 146–65 Ma ago (O’Toole and Raw 1991, 19). The oldest known bee, *Melittosphex burmensis* (Melittosphecidae), is a fossil about 100 Ma old (Poinar and Danforth 2006, 614). Many of the trees in the Petrified Forest, U.S., have traces of what appear to be bee nests and wasp cocoons that are from 207 through 220 Ma old (Wilford 1995, C1). As an example of a group of closely related families and subfamilies, I provide the table below.

A CLASSIFICATION OF BEES (GROUP APIFORMES)^a

- I. Andrenidae (Andrenid Bees = Miner Bees, worldwide except Australia)
 - A. Alocandreninae (Alocandrenine Bees)
 - B. Andreninae (Adrenine Bees)
 - C. Oxaeinae (Oxaeine Bees, American subtropics and tropics)
 - D. Panurginae (Panurgine Bees)
- II. Apidae (Apid Bees, worldwide)
 - A. Anthophorinae (Anthophorine Bees)
 - B. Apinae (Apine Bees including Honey Bees, Stingless Bees)
 - C. Bombinae (Bombine Bees = Bumble Bees)
 - D. Euglossinae (Euglossine Bees = Orchid Bees)
 - E. Nomadinae (Nomadine Bees)
 - F. Xylocopinae (Xylocopinae Bees = Carpenter Bees)
- III. Colletidae (Colletid Bees, worldwide)
 - A. Colletinae (Colletine Bees)
 - B. Diphaglossinae (Diphaglossine Bees)
 - C. Euryglossinae (Euryglossine Bees)
 - D. Hylaeinae (Hylaeine Bees = Yellow-faced Bees)
 - E. Xeromelissinae (Xeromelissine Bees)
- IV. Halictidae (Halictid Bees = Burrowing Bees, worldwide)
 - A. Dufoureinae (Dufoureine Bees)
 - B. Halictinae (Halictine Bees, includes Sweat Bees)
 - C. Nomiinae (Nomiine Bees)
 - D. Nomioidinae (Nomioidine Bees)
 - E. Rophitinae (Rophitine Bees)

- V. Megachilidae (Megachilid Bees, worldwide)
 - A. Fideliinae (Fideliine Bees, South Africa)
 - B. Megachilinae (Megachiline Bees, includes Leaf-cutter Bees)
- VI. Melittidae (Melittid Bees, Africa, Eurasia, North America)
 - A. Dasypodinae (Dasypodaine Bees)
 - B. Meganomiinae (Meganomiine Bees)
 - C. Melittinae (Melittine Bees)
- VII. Stenotritidae (Stenotritid Bees, Australia)

^a These taxa are in alphabetical order, instead of “systematic order.” This classification is from Michener (2007, 67–75).

Africanized Honey Bee See Animalia: Phylum Arthropoda: Group Apiformes: *Apis mellifera*.

Andrena erigeniae Robertson, 1902 *n.* A bee species (Andrenidae) native to Eastern U.S. which evidently collects pollen almost exclusively from *Claytonia virginica*, *q.v.* (Krombein et al. 1979, 1822).

[Greek *erigeniae* after the genus *Erigenia* (Harbinger-of-Spring) < born in the spring]

Apidae, Apid Bees *n.* A family of bees (Apiformes) found throughout most of the world and characterized by having a labrum that is broader than long, a long glossa with a flabellum, three forewing submarginal cells or much-reduced wing venation and a weak marginal cell or an open apex, a scopa (when present) made of marginal hairs on the hind tibia that surround a bare area on its outer surface and forming a corbicula, and no facial fovea or pygidial plate (Michener et al. 1994, 167).

Comment: Apidae comprises the Honey Bees, Orchid Bees, and Stingless Bees (Michener et al. 1994, 167).

Apis mellifera Linnaeus, 1758; **Western Honey Bee** *n.* A highly eusocial, bee (Apidae) native to Europe, the Middle East, and North Africa (O’Toole and Raw 1991, 112).

syn. European Honey Bee, Honey Bee, Honeybee (confusing synonyms, pers. obs.)

Comments: There may be as many as 10 *Apis* spp. (Otis 1991, 29, 31, illustrations). *Apis mellifera* is the basis of a \$US multibillion industry of beeswax, honey, pollen, and pollination. It has about 25 races, including the Carniolan, Caucasian, German, and Italian races (King and Stansfield 1985). *Apis mellifera scutellata* (the Africanized Bee, Africanized Honey Bee, Bravo Bee, Killer Bee) is a subspecies of *Apis mellifera* that is highly defensive (Buchmann and Nabhan 1996, 241). Warwick Kerr, Brazilian geneticist, brought this subspecies into Brazil to use it for breeding a better honey bee for tropical regions. It is now in a large area of South America, Central America, Mexico, and Southern U.S.

crawler *n.* A worker Western Honey Bee that has been stupefied by a toxin and may be found crawling near her colony’s nest entrance (Robinson and Johansen 1978, 16).

Bombus sp., **bumble bee** *n.* An apid bee species in the genus *Bombus*, characterized by

dense hair, often of contrasting colors, primitive eusociality in most species, and other traits (Michener 2000, 761).

Comment: There are about 250 *Bombus* species; recently, many *Bombus* species are declining in numbers or have become extinct (Michener 2000, 761; Xerces Society 2008).

cuckoo bee *n.* A bee species that does not collect provisions for its offspring, but instead uses those of another bee species (Rozen 1989, 1).

cf. homicidal; organism: cuckoo, cuckoo wasp; parasitism: cleptoparasitism

Comments: Cuckoo-bee species occur in many of the 7 families of bees (O'Toole and Raw, 1991).

dancing bee *n.* In stingless bees, the Western Honey Bee: A worker that has returned to her hive and transmits information about exterior resources (food, water, a nesting site) by her movements (Heymer 1977, 161).

cf. dance: bee dance

drone *n.* A male social bee, especially a male Western Honey Bee or bumble bee (Oxford English Dictionary 1972, entries from *ca.* 1000).

cf. caste: king

[Middle English *dronen* < *drone*, male bee]

Euglossini, Orchid Bees *n.* A tribe of apid bees from the American tropics characterized by having bright colors in many species, very long tongues, and very fast flight (O'Toole and Raw 1991, 30).

Comments: Euglossini includes the nonparasitic genera *Eufriesea*, *Euglossa*, and *Eulaema*, and the parasitic genera *Aglae* and *Exaerete*. About 75% of the species of the nonparasitic genera visit orchids. Males of many species collect fragrance from orchid flowers which they transfer to the tibiae of their hind legs (Orchidales, Encyclopaedia Britannica Online. www.eb.com, 2000). In the process of moving around on the flowers, males of the nonparasitic genera may pick up pollinia which they may transfer to other flowers, thereby effecting cross-pollination. Males of some individual euglossine species are attracted to the odors of only one, or a few, orchid species (O'Toole and Raw 1991, 152).

fanning bee *n.* A worker *Apis mellifera* that buzzes her wings and causes water evaporation in her nest that cools it (Heymer 1977, 66).

follower bee *n.* A worker *Apis mellifera* that moves after a dancing bee and may induce her to release a food sample (Heymer 1977, 161).

guard bee *n.* A worker *Apis mellifera* that stands watch at her hive entrance (Michener 1974, 126).

gyne See female: gyne (main part of book).

honey bee *n.* A species, or individual bee, in the genus *Apis* (Michener 1974, 347).

See Animalia: Phylum Arthropoda: Group Apiformes: Apidae *Apis mellifera*.

Killer Bee See Animalia: Phylum Arthropoda: Group Apiformes: *Apis mellifera*.

native bee, non-*Apis* bee See Animalia: Phylum Arthropoda: Group Apiformes: pollen bee.

***Nomia melanderi* Cockerell, 1906; Alkali Bee** *n.*

A bee species (Halictidae) that is native to Western U.S. and nests in alkaline soil (Tepedino and Geer 1991, 4).

Comments: Groups of this bee often inhabit the same patch of soil for many years and can form noisy aggregations of thousands of independently-nesting females (Tepedino and Geer 1991, 4). People manage this bee for pollination of Alfalfa.

nurse bee *n.* A worker *Apis mellifera* that feeds larvae (Michener 1974, 126).

Orchid Bees See Animalia: Phylum Arthropoda: Group Apiformes: Apidae, Euglossini.

pollen bee *n.* A bee species that is not in the genus *Apis*; contrasted with *Apis mellifera*, and other members of the genus *Apis* (inferred from Batra 1994, 591).

syn. native bee, non-*Apis* bee, wild bee (Batra 1994, 591)

Comments: Many researchers are now preferring the name "pollen bee" to designate bees that are not Honey Bees (*Apis* spp.), and are better pollinators than *Apis mellifera* for many plant species. Pollen bees collect and feed pollen and nectar to their young; and some of them do make and store honey as well, *e.g.*, some bumble bees and meliponine bees. *Apis* spp. all make honey, and they also collect pollen and nectar. Therefore, the term "pollen bee" is a useful term, but not a perfect reflection of the biologies of Pollen Bees. These Bees include Bumble Bees, Burrowing Bees, Carpenter Bees, Digger Bees, Leaf-cutter Bees, Miner Bees, Orchid Bees, Stingless Bees, Sweat Bees, and Yellow-faced Bees (table above).

scout bee *n.* A worker *Apis mellifera* that flies off from a swarm, investigates possible sites for a new hive, and communicates the location of a site that she has found to her swarm after returning to it (McFarland 1985, 416).

sterzelnde bee *n.* A worker *Apis mellifera* that fans with her wings, *q.v.*, at her nest entrance. [coined by Frisch 1965 in Heymer 1977, 69].

Stingless Bees See Animalia: Phylum Arthropoda: Group Apiformes: Apidae.

***Trigona prisca* Michener and Grimaldi, 1988** *n.*

A fossil bee (Apidae) from amber from the Upper Cretaceous (96–74 Ma ago) from New Jersey, U.S. (O'Toole and Raw 1991, 21).

wild bee See Animalia: Phylum Arthropoda: Group Apiformes: pollen bee.

worker bee *n.* In Bumble Bees, Honey Bees, Stingless Bees, and other kinds of social bees: A female that lays no eggs, or few eggs relative to a queen, and performs tasks in her nest (Michener 1974, 374).

cf. caste: worker

■ **Arachnida** *n.* A class of Arthropoda that contains Mites, Opilionids, Pseudoscorpions, Scorpions, Spiders, Ticks, and their kin (King and Stansfield 1985).

■ ***Baronia brevicornis* Salvin, 1893; Archaic Swallowtail** *n.* A rare baroniine butterfly

(Papilionidae) native to a small area of Mexico where it lives in successional *Acacia* woodlots (Reed et al. 2007; New 2009, 210).

Comments: This species is the only known baroniine and it may be the most ancestral living papilionid butterfly based on a past study of morphological and molecular data; however, a new study provides evidence that this species may be a sister group of the Parnassiinae, and not all of the rest of the papilionids (Reed et al. 2007).

- ***Biston betularia* (Linnaeus, 1758), Pepper-and-salt Geometer** *n.* A moth (Geometridae) native to Europe and North America (Covell 1984, 356; King and Stansfield 1985).

syn. Peppered Moth (in England)

Comments: This moth is one of scores of insect species that show industrial melanism, *q.v.* (H. B. D. Kettlewell in Covell 1984, 356). The lepidopterist R. S. Edleston found *B. betularia carbonaria*, a once rare melanic form, in 1848 in Manchester, U.K. (Weiner 1994, 272). This form became very common after this time in parts of the United Kingdom and the European Continent. A single gene determines whether a *B. betularia* will be a melanic or a light form.

- ***Brychius hungerfordi* Spangler, 1954; Hungerford's Crawling Water Beetle** *n.* An endangered beetle (Haliplidae) that lives in well-aerated riffles in only a few small, alkaline streams in Michigan, U.S., and Ontario, Canada (U.S. Fish and Wildlife Service 2009a).

- **butterfly** *n.* A species, or individual, in the Superfamily Papilioidea (Ehrlich and Raven 1964, 588; <http://www.tolweb.org/Papilioidea/12027> 2007).

Comments: Some people include the Skippers (Hesperiidae) in the Papilioidea. Specialists distinguish butterflies from moths using morphological characters. Butterflies have the life stages of egg, larva, pupa, and adult. Technically speaking, a papilionoid individual in any of these stages is a “butterfly.”

- ***Cicindela dorsalis dorsalis* Say, 1817; Northeastern Beach Tiger Beetle** *n.* A threatened, beach-dwelling beetle (Cicindelidae) native to the Northeastern U.S. (Drummond 2009, 15; New 2009, 186).

Comment: Re-introduction of this species to formerly inhabited sites failed (Knisley et al. 2005 in New 2009, 187).

- ***Circellium bacchus* (Fabricius, 1781), (Addo) Flightless Dung Beetle** *n.* A flightless, dung-consuming beetle (Scarabaeidae) native to Africa, now with a remaining main population in Addo Elephant National Park and Buffalo Valley Game Farm near Knysna (Cochrane 2009).

Comments: This species is a generalist dung feeder with a preference for eating African Elephant feces and breeding in Buffalo dung (Cochrane 2009). A mother *C. bacchus* usually has only one offspring per breeding cycle and she keeps her dung ball free of fungus through the early developmental period of her young.

- **Coccinellidae, Lady Beetles, Ladybirds, Ladybugs** *n.* A beetle family characterized by having species with oval, convex, often brightly

colored adults, with heads concealed from above by their pronota.

cf. Animalia: Phylum Arthropoda: *Adalia bipunctata*, *Harmonia axyridis*, and *Rodolia cardinalis*

Comments: There are about 4,000 coccinellid species worldwide and about 350 North American species (Baird 2000, 14). Most Lady Beetles consume other insects, or mites, as larvae and adults; a small minority consume plants (Borror et al. 1989, 441–442). Common U.S. species include the Convergent Lady Beetle, Fifteen-spotted Ladybug, Multicolored Asian Lady Beetle, Seven-spotted Lady Beetle, Twelve-spotted Lady Beetle, and Two-spotted Lady Beetle. Marshall (2000) presents illustrations and descriptions of many species of Lady Beetles.

- ***Coenophila subrosea* (Stephens, 1829), Rosy Marsh Moth** *n.* A Eurasian moth (Noctuidae) that is rare in the United Kingdom where it is known from a few raised bogs in Wales where it feeds on *Myrica gale* (Bog Myrtle) (New 2009, 158).

- **Coleoptera, Beetles** *n.* An insect order characterized by having chewing mouthparts, elytra, and holometabolous metamorphosis (Borror et al. 1989, 370).

Comment: Coleoptera is the largest insect order with almost 1,000,000 described species (Buchmann and Nabhan 1996, 244).

- ***Colophon* sp., Barnard's Stag Beetle** *n.* One of 17 described species of beetles in the genus *Colophon* (Lucanidae), each restricted to one mountain range or peak in Western Cape, South Africa (Cochrane 2009, illustrations).

Comments: All *Colophon* species are endangered, mountain-relict species (*q.v.*); *C. primosi* is critically endangered (Cochrane 2009).

[Greek, *kolophon*, peak, summit; Barnard, after Dr. Keppel Barnard (1887–1964) who performed much of the pioneering work on *Colophon* spp.]

- ***Coptotermes formosanus* Shiraki, 1909; Formosan Subterranean Termite** *n.* A termite species (Rhinotermitidae) native to China and Taiwan (Catalog of Termites of the New World, R. Constantino, 1999, <http://www.nb.br/ib/zoo/docente/constant/catal/cat.html>).

Comments: This termite is common in China, Guam, Hawai'i, and Taiwan. Its colonies have up to 6.8 million workers, its winged adults are attracted to lights, and it is now causing losses in the \$US millions in Southern U.S. (J. B. Benavides, 1999, www.netside.net/~jb/images/formosan.html).

- **cuckoo wasp** *n.* A wasp species in the Chrysidae (Borror et al. 1989, 723–724).

cf. hospicidal; organism: cuckoo, cuckoo bee; parasitism: cleptoparasitism

Note: Depending on the species, chrysidiids feed on bee larvae, sawfly larvae, walking-stick eggs, and wasp larvae (Borror et al. 1989, 723–724).

- ***Culex pipiens* Linnaeus, 1758; House Mosquito** *n.* A bird and mammal-biting mosquito (Culicidae) that is found in Northern Conterminous

nous U.S. and other areas (King and Stansfield 1985).

syn. Northern House Mosquito

Comment: Researchers have studied this species' giant polytene chromosomes and its insecticide resistance (King and Stansfield 1985).

■ ***Cyrtodiopsis* Frey, 1928** *n.* A genus of Stalk-eyed Flies (Diopsidae) native to Southeast Asia (Evenhuis 2000).

cf. Animalia: Arthropoda: Diopsidae; ²drive: meiotic drive

Comments: Species include *C. dalmanni*, *C. quinqueguttata*, and *C. whitei*.

■ ***Danaus plexippus* (Linnaeus, 1758), Monarch** *n.*

A butterfly species (Nymphalidae), native to North America, Central America, and South America, characterized by having adults with a wing span of 89–102 mm and with black, orange, and white markings (Pyle 1995, 712).

cf. place: Monarch Butterfly Biosphere Reserve, Oyamel Forest; The Monarch Butterfly Sanctuary Foundation (Appendix 2)

Comments: *Danaus plexippus* in Canada and the U.S. migrate in late summer and fall and overwinter as adults in Southern California, Florida, and Mexico. Adults fly northward in the spring and lay their eggs along the way; successive broods fly northward during the warm season. This species is established in Australia and Hawai'i. The Mexican overwintering site is being degraded by deforestation (Lee 2001, E1). Climate change may severely change the character of current *D. plexippus* overwintering sites in the next 30 yr (Wilson et al. 2007 in New 2009, 119).

[Monarch, after William of Orange, an English Monarch in the 17th century, a time when North American Colonists found many of this species]

■ ***Dendroctonus frontalis* Zimmerman, 1868;**

Southern Pine Beetle *n.* A North American beetle (Scolytidae).

Comments: The Southern Pine Beetle attacks and kills all pine species in its range (Day 1997; Southern Pine Beetle Information Directory, 1999; www.ento.vt.edu/~salom/SPBinfodirect/spbinfodirect.html).

■ ***Diamphidia nigroornata* Ståhl** *n.* A flea beetle (Chrysomelidae: Alticinae) used by Bushmen in Botswana and Namibia for poisoning the tips of their arrows and spears (Furth 1998, 7).

Comments: Bushmen dig prepupae and pupae of this beetle out of soil, grind them, and apply the paste to their arrowheads and spearheads. The highly potent toxin is both a hemotoxin and a neurotoxin and lasts for months on the weapons. Bushmen also use other chrysomelids *D. vittatipennis*, *Polyclada* spp., and possibly *Blepharida* sp. for the same purpose, as well as carabid predators (*Lebistina* spp.) of these flea beetles.

■ ***Diopsidae, Stalk-eyed Flies***

n. A family of possibly up to 300 fly species (Diptera) native to North America (one species) and the Old World tropics (many species) and characterized by having compound eyes on very short through long stalks (= peduncles), depending on the sex and species (Wilkinson and Dodson 1997, 317; Evenhuis 2000).

Comments: Diopsid genera include *Chaetodiopsis*, *Cladodiopsis*, *Cobiopsis*, *Cyrtodiopsis* (*q.v.*), *Diasemopsis*, *Diopsis*, *Eurydiopsis*, *Prophyracephala* (*extinct*), *Pseudodiopsis*, *Sinodiopsis*, *Sphyracephala*, and *Teleopsis* (Evenhuis 2000). Centriionidae is a related family with adults with no eye-stalks that was originally designated as a subfamily of Diopsidae. Gerald S. Wilkinson and colleagues (*e.g.*, Swallow et al. 2000) have investigated many aspects of the evolution of stalked eyes; Wilkinson and Dodson (1997) report many facets of diopsid biology.

■ ***drosophila* *n.*, pl. *drosophilae*** A fruit fly (= pomace fly, Drosophilidae) (Michaelis 1963).

[New Latin < Greek *drosos*, dew + *phileein*, to love, possibly in reference to drinking honeydew by these flies]

■ ***Drosophila, Pomace Flies* *n.*** A genus of flies (Drosophilidae) native to many parts of the world (King and Stansfield 1985).

syn. Fruit Flies

cf. database: FlyBase (Appendix 3); gene (table)

Comments: There are over 900 described *Drosophila* species in eight subgenera, and this genus is the most studied one from the standpoint of cytology and genetics (King and Stansfield 1985). This genus underwent dramatic radiation in Hawai'i. *Drosophila melanogaster*, with its 13,601 genes, is a principal model organism for studying development and genetics (Wade 2000, 11 April, D1).

■ ***Dryococelus australis* Montrouzier, 1855; Lord Howe Island Stick-insect** *n.* A critically endangered Australian stick-insect (Phasmida) (Australian Government Department of the Environment, Water, Heritage, and the Arts 2009c; New 2009, 98)

syn. Land Lobster, Lord Howe Island Phasmid. Land Lobster is better written as "Land-lobster" because this insect obviously is not a lobster (Crustacea)

[after Lord Howe Island Group to which this insect is endemic]

■ ***Ephemeroptera, Mayflies* *n.*** An insect order characterized by having terrestrial adults; an abdomen with two or three threadlike caudal filaments; short, bristlelike, and inconspicuous antennae; membranous forewings and hindwings with numerous cells and veins; mouthparts vestigial in adults; and aquatic nymphs (Borror et al. 1989, 175–176).

Comments: Mayfly larvae of most species consume algae and detritus. Some species eat other plants and animal tissue (Edmunds in Merritt and Cummins 1984, 94–125). A few species are predators. Adults do not feed. There are about 2000 described species worldwide. In North America, there are 16 families and dozens of genera. Mayflies can be abundant in some habitats and are food for many organisms including birds, fish, other arthropods, and salamanders.

■ ***Euphilotes bernardino allyni* (Barnes & McDunnough, 1916), El Segundo Blue** *n.* An endangered butterfly (Lycaenidae) native to California which became notorious be-

cause it is on the property of the Los Angeles International Airport (New 2009, 206).

- ***Euphydryas editha* (Boisduval, 1852), Edith's Checkerspot Butterfly** *n.* A North American butterfly (Nymphalidae) which is a model organism for population studies (New 2009, 111).

- **femme fatale, femme fatale** *n.* A female *Photuris* firefly (Lampyridae) that mimics the species-characteristic flash patterns of females of several other species and preys on *Photinus* males that perceive her as a mate and approach her (Lloyd 1975 in Dewsbury 1978, 284).

cf. Animalia: Lampyridae; signal: deceitful signal; signaler: deceitful signaler

Comment: This is obviously an anthropomorphic term.

[French *femme fatale*, a dangerously seductive woman; vamp]

- **Formicidae, Ants** *n.* Hymenopterans characterized by having eusociality, one or two petioles per individual, metapleural glands (which make an antibiotic spray), and usually elbowed antennae (Borror et al. 1989, 737; Hilts 1998, 29 January, A12).

Comments: There are about 10,000 known species of ants, and ants are a major ecological force on Earth with more than 1,000 trillion individual ants on the planet at any one moment (AntWeb 2009, <http://www.antweb.org/about.jsp>). Researchers found very old ants in amber from New Jersey that is 90 Ma old (Hilts 1998, 29 January, A12). The fossil record shows that ants started flourishing about 50 Ma. *Sphecomyrma*, a 92-Ma-old fossil, is a possible ant, but it lacks a metapleural gland. Ants are a large part of the biomass of some habitats. Alien, invasive ant species are greatly changing some natural communities (Christian 2001, 638). Ant species that are spreading around the world are *Linepithema humile* (Argentine Ant), *Pheidole megacephala*, *Solenopsis invicta* (Fire Ant), and *Wasmannia auropunctata*.

- ***Glauopsyche lygdamus xerces* (Boisduval, 1852); Xerces Blue** *n.* An extinct butterfly subspecies (Lycaenidae) once found on the San Francisco Peninsula, U.S. (Opler 1999, 245; www.xerces.org, 2000, illustrations).

cf. organization: Xerces Society (Appendix 2)
Comments: Mr. W. Harry Lange evidently saw the last living Xerces Blue in 1941. The species *Glauopsyche lygdamus* is called the Silvery Blue (Opler 1999, 245). The Xerces Society (q.v.) takes its name from this butterfly (www.xerces.org).

[after Xerxes (French spelling) < Xerxes, King of Persia from 486–465 BC]

- **glowworm** *n.*

1. A wingless bioluminescent adult female or a bioluminescent larval firefly (McDermott 1948, 7).
2. A European beetle (*Lampyris* sp.) with bioluminescent larvae and wingless females (Michaelis 1963).
3. A bioluminescent adult, or larval, firefly (Michaelis 1963).

See Lampyridae.

syn. glowfly (Michaelis 1963)

cf. bioluminescence, firefly, luciferin

- ***Harmonia axyridis* Pallas, 1773; Multicolored Asian Lady Beetle** *n.* A lady beetle (Coccinellidae) native to Eastern Asia characterized by highly variable adult-color patterns.

syn. Asian Lady Beetle, Halloween Lady Beetle, Japanese Lady Beetle (Weeden 1999), Southern Lady Beetle (Marshall 2000)

Comment: This beetle has the reputation of a beneficial nuisance (Baird 2000, 14–15). It controls aphids, psyllids, and other pests of shrubs and trees; however, it is a problem when it overwinters in large groups in buildings, and it might be reducing population sizes of native lady beetles. People introduced *H. axyridis* into California in the early 1900s and into eastern U.S. and Nova Scotia in the late 1970s and early 1980s as a biocontrol agent. It is currently found throughout much of the Conterminous U.S. and in parts of Southern Canada (Bernard 1994, Lyon 1995, Kowalsick 1998, Weeden 1999, Baird 2000).

- ***Hemiphlebia mirabilis* Selyes, 1869** *n.* A damselfly which is locally endemic in Australia and the only living member of Hemiphlebiidae a basal superfamily of Odonata (New 2009, 14).

- ***Hesperia comma* (Linnaeus, 1758), Common Branded Skipper** *n.* A taxonomically complex, Holarctic butterfly (Hesperiidae) (Opler et al. 2009; New 2009, 75, 110).

syn. Silver-spotted Skipper (New 2009, 110)

Comments: In North American, the nonscientific name for *Epargyreus clarus* is also the Silver-spotted Skipper (Glassberg 1999, 146). *Hesperia comma laurentina* (Lyman, 1892) is called the Laurentian Skipper (Opler and Krizek 1984, 226).

- **Hymenoptera** *n.* An insect order characterized by four wings with tiny hooks (hamuli) in winged forms, holometabolous metamorphosis, mandibulate mouthparts, and usually five-segmented tarsi and well-developed ovipositors (Borror et al. 1989, 665).

Comments: Hymenoptera contains Ants, Bees, Sawflies, and other wasps and is the second largest insect order (Buchmann and Nabhan 1996, 248).

- ***Hypochrysops piceatus* Kerr, Macqueen, & Sands, 1969; Bull Oak Jewel Butterfly** *n.* An endangered butterfly (Lycaenidae), native to Queensland, Australia, whose larvae consumes only the fabaciad *Jacksonia sternbergiana* (Queensland Government 2006; New 2009, 76, 150).

- ***Icaricia icarioides fenderi* Macy, 1931; Fender's Blue Butterfly** *n.* An endangered butterfly (Lycaenidae) native to Oregon, U.S. (Black et al. 2005; New 2009, 123, 149, 189).

Comment: Alien, invasive plants are threatening this butterfly because they threaten its larval food plant (Black et al. 2005). Within a population, each larva requires about 40 leaves of *Lupinus sulphureus kincaidii*, and each adult requires 20 mg sugar (Schultz and Dlugosch 1999 in New 2009, 150).

- ***Isoptera, Termites*** *n.* An order of eusocial insects with about 1900 species worldwide (Borror et al. 1989, 234–236).

syn. White-ants (a misleading synonym because Termites are distantly related to Ants) (Borror et al. 1989, 234)

cf. caste

Comments: Termites probably evolved from a cockroach-like ancestor, possibly in the late Permian Period about 200 Ma ago (Borror et al. 1989, 234–236). The earliest known termites are about 120 Ma old and from the Cretaceous Period. A normal termite colony has a king and queen, soldiers (except in a few genera), and workers. Myriads of flagellated protists, or bacteria in some species, in a termite's digestive tract digest the cellulose that the termite consumes in the form of plant material. Without its gut symbionts, a termite will continue to feed but will starve to death.

- **Lampyridae, Fireflies, Lightningbugs Lightning-bugs** *n.* A beetle family of over 2,000 named species characterized by having a pronotum that extends forward over an individual's head; soft, flexible elytra; and light organs in many species (Borror et al. 1989, 432; Stanger-Hall et al. 2007, 33).

See Animalia: femme fatale, glowworm.

cf. Animalia: glowworm; bioluminescence; molecule: luciferin

Comments: Lightning bug (term in the U.S., Michaelis 1963) and lightningbug (Borror et al. 1989, 432; given in this reference as one word because a lightningbug is a beetle, not a true bug) are synonyms for firefly. A glow-worm, *q.v.*, is a bioluminescent female or larval lampyrid. Lampyrid light use as a sexual signal may have originated one or four times followed by nine or four losses (Stanger-Hall et al. 2007, 33). Figure 8 shows a mating pair of *Photinus pyralis* (Linnaeus, 1767) with the female's facing upwards.

- **Lepidoptera** *n.* An insect order characterized by small labra, body and wing scales, small or lacking maxillary palps, usually no mandibles, sucking mouthparts, and well-developed labial palps (Borror et al. 1989, 588–589).

Comment: This order contains butterflies and moths.

- **Linepithema humile (Mayr, 1868), Argentine Ant** *n.* An ant (Formicidae) that is native to Southern South America and is in many parts of the world and spreading to new areas (Krushelnicky and Joe 1997; Wild 2004, 1204; New 2009, 125).

cf. Formicidae

syn. *Iridomyrmex humilis* (former name, Krushelnicky and Joe 1997)

Comments: Argentine Ants are decimating native-ant faunas in many parts of the world through competitive exclusion (Christian 2001, 635–636). This Ant invaded the South African fynbos community (*q.v.*) and changed the composition of the plant community by reducing the densities of plant species with large seeds. The Argentine Ant caused this reduction by eliminating many native ant species that dispersed the seeds of these plants, and this non-native ant does not disperse the seeds.

- **Lucanus cervus Linnaeus, 1758** *n.* A Eurasian stag beetle (Lucanidae) that is becoming less

common and can take up to 6 yr to reach maturity (New 2009, 33).

- ***Lycaeides melissa samuelis* (Nabokov, 1944), Karner Blue Butterfly** *n.* An endangered butterfly (Lycaenidae), flagship subspecies native to the U.S. (Packer et al. 1998, 320; U.S. Fish and Wildlife Service 2009c; fig. 42 in this book).

syn. Karner Blue

Comment: People are managing this butterfly in many sites, and the Toledo Zoo established a captive breeding program for this species. Conservationists re-introduced this butterfly in the Kitty Todd Nature Preserve, Ohio (The Nature Conservancy 2009; fig. 37 in this book).

- ***Lycaena dispar* (Haworth, 1803), Large Copper Butterfly** *n.* A butterfly (Lycaenidae) native to Europe (New 2009, 147; Mazzei et al. 2010, illustrations).

Comments: The world's longest insect re-introduction program is perhaps for this species (Pullin et al. 1995 in New 2009, 184). People started making serious re-establishment attempts for this butterfly in the United Kingdom in 1926 and, although, people have continued the project, its success is still elusive.

- ***Musca domestica* Linnaeus, 1758; House Fly** *n.* A common household fly (Muscidae) that occurs in many parts of the world and is a disease vector (King and Stansfield 1985).

Comment: Researchers have studied pesticide resistance in this species (King and Stansfield 1985).

- ***Neonympha mitchellii* French, 1889; Mitchell's Satyr Butterfly** *n.* A rare, endangered, U.S., satyrine nymphalid butterfly (New 2009, 73).

Comment: Butterfly collecting and an associated market for specimens may have threatened this species (U.S. Fish and Wildlife Service 1997 in New 2009, 131).

- ***Nicrophorus americanus* Olivier, 1790; American Burying Beetle** *n.* An endangered U.S., black-and-red, carrion-feeding, beetle (Silphidae) that declined dramatically over 90% of its original range (Line 1996, C1, C4, illustrations; New 2009, 41).

Comment: This species was once widespread in Eastern U.S., but disappeared from all areas but Block Island, Rhode Island by 1947 (Line 1996, C1, C4). This species still occurs in six states west of the Mississippi River. The reason(s) for the decline remain(s) unknown (New 2009, 43).

- **Noctuidae, Noctuid Moths, Owlet Moths** *n.* Moths characterized by having forewings, each usually with one areole, a Cu vein that appears four-branched, a stout body usually with many long, narrow scales, metathoracic tympana that point outward or posteriorly, and ocelli in most species (Covell 1984, 77, many plates; Borror et al. 1989, 657, illustrations).

Comments: Noctuidae is the largest moth family with about 20,000 species worldwide and 2,900 species in North America. Noctuids include Armyworm Moths, Bird-dropping Moths, Borer Moths, Dagger Moths, Darts, Deltoid Noctuids, Flower Moths, Groundlings, *Heliothis zea* (a major pest species), Looper Moths, Midgets,

- Foresters, Owlets, Pinions, Sallows, Underwing Moths, Zales (Covell 1984).
- ***Ocybadistes knightorum* (Lambkin & Donaldson, 1994), Black Grass-dart Skipper** *n.* An endangered butterfly (Hesperiidae) that is native to the coastal, subsaline peatland in central New South Wales, Australia (New 2009, 78, 149). *Comments:* Larvae of this species consume only one known food, the grass *Alexfloydia repens* (New 2009, 21).
- ***Orachrysops niobe* (Trimen, 1862), Brenton Blue** *n.* A butterfly (Lycaenidae) native to the Southern Cape Coast of South Africa (New 2009, 206). *Comment:* A person rediscovered *O. niobe* in 1977 after no one evidently saw this species for about 100 yr (New 2009, 207). Conservationists worked for over 4 yr to save this species' habitat of about 3 ha from development into a group of holiday houses (New 2009, 207). [Brenton after Brenton-on-the-Sea, South Africa]
- ***Ornithoptera alexandrae* (Rothschild, 1907), Alexandra's Birdwing Butterfly** *n.* A rare, threatened butterfly (Papilionidae) which is endemic to Papua New Guinea and the world's largest butterfly based on measurements of adults (New 2009, 68, 209). *Comments:* This species is a flagship and umbrella species for wider conservation of primary forests in the Oro Province, Papua New Guinea (New 2009, 209). This butterfly is also one of the few insects that is a specific focus of a foreign-aid program.
- ***Ornithoptera richmondia* Gray, 1853; Richmond Birdwing Butterfly** *n.* A vulnerable butterfly (Papilionidae) native to Australia, whose larvae ordinarily consume two native species of *Parastolochia* (Aristolochiaceae) (New 2009, 61). *Comment:* Female *O. richmondia* lay their eggs on the invasive South American vine *Aristolochia elegans* in Australia (Queensland Government 2007; New 2009, 122). This vine is a threat to *O. richmondia* because its larvae die when they eat leaves of *A. elegans*.
- ***Orthoporus dorsovittatus*** *n.* A millipede native to Venezuela that protects itself with secreted defensive chemicals — two kinds of benzoquinones (Valderrama et al. in Angier 2000, 5 December, D5; illustration). *Comments:* Capuchin Monkeys find this millipede and place it in their mouths although it might be painful and toxic (Valderrama et al. in Angier 2000, 5 December, D5).
- ***Papilio aristodemus ponceanus* Schaus, 1911; Schaus' Swallowtail** *n.* A swallowtail-butterfly subspecies (Papilionidae) originally native to Miami and the Florida Keys, U.S. and now found only in the Keys (Opler and Krizek 1984, 47, illustration; Daerr 1999, 39, illustration). *syn. Heraclides aristodemus ponceanus* (New 2009, 70). Schaus' Swallowtail (New 2009, 24). *Comments:* Habitat loss and pesticides nearly caused this subspecies to go extinct (Daerr 1999, 39). Thomas Emmel saved it from extinction by breeding it and releasing individuals into their natural habitats. About 1,200 of these insects were alive in 1999. This is one of the

- few butterflies known to stop in mid-air and fly backwards as part of predator evasion. [Latin *papilio*, butterfly; *aristodemus*, after Aristodemus, a king and hero in the war at Messenia, 716 B.C.; *ponceanus*, after Ponce de Léon, Spanish statesman and explorer; Schaus, after William Schaus, physician and butterfly enthusiast who came to Miami in 1898 to treat yellow-fever victims and named this butterfly (Opler and Krizek 1984, 47; Daerr 1999, 39)]
- ***Papilio homerus* Fabricius, 1793; Homerus Swallowtail** *n.* A rare butterfly (Papilionidae) which is endemic to Jamaica, now occurs as only two small populations, and is the largest swallowtail in the New World (Riley 1975, 105; New 2009, 69).
- ***Papilio machaon* Linnaeus, 1758; Old World Swallowtail** *n.* A swallowtail butterfly (Papilionidae) native to Eurasia, North America, and Northern Africa (Tilden and Smith 1986, 119). *Comment:* There is a fen-dwelling subspecies (*P. m. britannicus*) native to the United Kingdom (New 2009, 186). Re-introduction of this species to Wicken Fen, United Kingdom failed (New 2009, 188, 201).
- **Papilionidae, Swallowtail Butterflies** *n.* A butterfly family with about 573 species with medium through very large adults (New 2009, 15). *Comment:* Conservationists and others are concerned about the currently low numbers of individuals in many papilionid species (New 2009, 15).
- ***Paralucia pyrodiscus lucida* (Crosby, 1951), Eltham Copper Butterfly** *n.* A rare, ant-associated, butterfly subspecies (Lycaenidae) from Australia (State of Victoria 2009). *Comments:* *Paralucia pyrodiscus* associates with different species of *Notoncus* ants in different parts of its range (New 2009, 97). *Paralucia pyrodiscus lucida* is dependent on conservation measures in Victoria because all of its few remaining populations occur in small, isolated urban habitat remnants that are vulnerable to succession (New 2009, 99, 152). Victoria established a dedicated butterfly reserve for *P. p. lucida* in 1989 using government and public funds (Braby et al. 1999 in New 2009, 208). [Copper, referring to the metallic coppery color of this species' wings; Eltham, after Eltham, an outer suburb of Melbourne, Australia]
- ***Pheidole megacephala* (Fabricius 1793), Big-headed Ant** *n.* A small-ant species (Formicidae) that is perhaps native to Southern Africa and now occurs throughout temperate and tropical zones of the Earth (Global Invasive Species Database 2006a). *syn. Atta testacea* Smith 1858; *Formica edax* Forskal, 1775; *Formica megacephala* Fabricius, 1793; *Myrmica suspiciosa* Smith, 1859; *Myrmica trinodis* Losana, 1834; *Oecophthora perniciosa* Gerstacker, 1859; *Oecophthora pusilla* Heer, 1852; Brown House Ant, Coast Brown Ant, *Grosskopfameise* (German), Lion Ant (Global Invasive Species Database 2006). *Comments:* This species is a serious threat to biodiversity, is an agricultural pest that harvests seeds and protects crop-eating insects,

- and chews on irrigation and telephone cabling and electrical wires (Global Invasive Species Database 2006).
- ***Phengaris*** *n.* A genus of butterflies (Lycaenidae) containing species that are native to Eurasia and Europe (Higgins and Riley 1970, 263–266; Mazzei et al. 2010, illustrations).
syn. Maculinea (former name)
cf. 2species: umbrella species
Comment: The European species are of conservation concern, and their larvae consume plants when they are younger and consume ant larvae when they are older (Higgins and Riley 1970, 263–266). Species in Europe are *Phengaris alcon* (Linnaeus, 1758) (Alcon Blue), *P. arion* (Linnaeus, 1758) (Large Blue), *P. nausithous* (Bergstrasser, 1779) (Dusky Large Blue), *P. rebeli* (Hirschke, 1904) (Mountain Alcon Blue), and *P. teleius* (Bergstrasser, 1779) (Scarce Large Blue) (Chinery 1989, 60–62).
 - ***Plecia nearctica* Hardy, 1940; Lovebug** *n.* A fly species (Bibionidae) found in Southeastern U.S. and Central America (Denmark and Mead 2008).
Comments: *Plecia nearctica* has two main flight periods in Florida: late April – May and late August – September (Cherry and Raid 2000, Denmark and Mead 2008). Its larvae feed on decomposing organic matter; adults consume nectar. The adults can be a nuisance to motorists because these flies congregate over highways in groups of thousands, vehicles collide with them and kill them, the flies splatter on the vehicles, reduce visibility through windshields on which they splatter, clog air-intake valves, and etch vehicle paint with their slightly acidic body fluids.
[Lovebug < after the fact that pairs stay in copula for hours, often when they are in flight]
 - ***Polistes (Polistes) dominulus* Christ, 1791; Dominulus Paper Wasp** *n.* A paper wasp (Vespidae) native to Eurasia which is now common in parts of North America (Dubatolov, 1999; <http://pisum.bionet.nsc.ru/szmn/Hymenop/Vespidae.htm>).
syn. Polistes gallicus auct., nec L.
 - ***Polposipus herculeanus* Solier, 1848; Frégate Island Giant Tenebrionid Beetle** *n.* A rare, critically endangered, arboreal, flightless beetle (Tenebrionidae) which is endemic to Frégate Island and is the world's largest beetle in its family (Mongabay.com 2006; New 2009, 69, 211).
 - ***Prionotropis hystrix rhodanica* Uvarov, 1923** *n.* A rare, flightless, pamphagine grasshopper (Acrididae) native to Southern France where its habitat loss due to agricultural-land conversion and quarrying occurs (New 2009, 158).
Comment: Sheep grazing helps to maintain this grasshopper's habitat (New 2009, 158).
 - ***Prodontria lewisi* Broun, 1904; Cromwell Chafer** *n.* A critically threatened beetle (Scarabaeidae) that now lives only in a 81-ha reserve in the Cromwell sandy loam dunes, New Zealand (Barratt 2007, 19).
 - ***Rhaphiomidas terminatus abdominalis* Cazier, 1941; Delhi Sands Flower-loving Fly** *n.* A fly (Mydidae) native to a sand-dune ecosystem in

southern California and the only fly on the U.S. endangered-species list (New 2009, 206).

Comments: People who wanted to build an industrial-enterprise zone in its habitat lost their legal case, but this species remains difficult to protect (Kingsley 2002 in New 2009, 206).

- ***Riekoperla darlingtoni* (Illies, 1968), Mt Donna Buang Wingless Stonefly** *n.* An Australian stonefly (Plecoptera) found in only a few small sites near the summit of Mt. Donna Buang (Australian Government Department of the Environment, Water, Heritage and the Arts 2009; New 2009, 25).

- ***Rodolia cardinalis* (Mulsant)** *n.* An Australian Lady Beetle (Coccinellidae) (Borror et al. 1989, 442).

Comment: Entomologists introduced this species into California, U.S., in the 1880s to control the Cottony-cushion Scale which threatened the citrus industry (Borror et al. 1989, 442). This beetle quickly reduced the population sizes of this Scale.

- ***Sasakia charonda* (Hewitson, 1863), Great Purple Emperor** *n.* A butterfly (Nymphalidae) that is sometimes recognized as Japan's national butterfly and is a conservation symbol in parts of Japan (New 2009, 44).

- ***Solenopsis invicta* Buren, 1972; Fire Ant** *n.* An ant species (Formicidae) that has small adults and that is native to South America; is an aggressive, generalist forager; and occurs in high densities, and dominates many food resources (Global Invasive Species Database 2006b).

syn. Solenopsis saevissima var. *wagneri* (Santschi), *Solenopsis wagneri* (Santschi), *fourmi de feu* (French), Red Imported Fire Ant (English), *rote importierte Feuerameise* (German) (Global Invasive Species Database 2006b).

Comments: This species now also occurs in Australia, New Zealand, Puerto Rico, South America, and the Virgin Islands, and it is a potential invader of many other parts of the world (Global Invasive Species Database 2006b).

- ***Somatochlora hineana* Williamson, 1931; Hine's Emerald Dragonfly** *n.* An endangered U.S. dragonfly (Corduliidae) (New 2009, 71, 202; United States Fish and Wildlife Service 2009b).
Comment: Trains and other vehicles may reduce population sizes of this species (United States Fish and Wildlife Service 2001 in New 2009, 121). At two locations of this insect, trains reduce their speeds during its flight season in an effect to reduce impact mortality.

- ***Speyeria idalia* (Drury, 1773), Regal Fritillary Butterfly** *n.* A striking, threatened, butterfly (Nymphalidae) native to the U.S. tallgrass prairies (New 2009, 154; Opler et al. 2009, illustrations).

- ***Sphingidae, Hawk Moths, Hummingbird Moths, Sphinx Moths*** *n.* A moth family characterized by connection of the radius and subcosta veins of hindwings by a cross vein (R_1) about opposite the middle of the discal cell, heavy adult bodies, and a long proboscis in most species (Borror et al. 1989, 652–653).

Comments: Synonymous names for members of the Sphingidae are hawk moth, hawkmoth,

sphingid, sphinx moth (Buchmann and Nabhan 1996, 247). Many sphingid species have tongues longer than their bodies. Sphingidae includes the Bumble-bee Moth, Tobacco Hornworm, and Tomato Hornworm. Hawkmoths are frequent pollinators.

[hawk, after the fast flight of adults in these moths; hummingbird, after hummingbird-like hovering behavior; sphinx, after the larvae of some species that look like sphinxes when they rear back the anterior parts of their bodies (Borror et al. 1989, 653)]

- ***Synemon plana* Walker, 1854; Golden Sun Moth** *n.* An endangered moth (Castiniidae) that lives in grasslands of Southeastern Australia (New 2009, 31, 195).

Comment: Larvae of *S. plana* might be consuming the invasive grass *Nassella neesiana* which appears to be displacing native grasses (Braby and Dunford 2007 in New 2009, 122).

- **Syrphidae, Flower Flies** *n.* A worldwide fly family characterized by having a spurious vein on each forewing between the radius and media veins (Animalia: Phylum Arthropoda: Group Hexapoda: Order Diptera) (Borror et al. 1989, 557).

syn. Hover Flies, Syrphid Flies

Comments: Some syrphid species are bee or wasp mimics; many syrphid species are important pollinators (Buchmann and Nabhan 1996, 255).

[Greek Syrphidae, *syrphos*, a kind of fly; English Flower Fly, after the frequent presence of many species on flowers; hover, after the habit of many species to hover over flowers and in territories]

- ***Thermobia domestica* (Packard, 1873), Fir-ebrat** *n.* A cosmopolitan silverfish (Lepismatidae) possibly originally from Eurasia (Milne and Milne 1997, 353).

Comments: This species often lives in buildings near warm through hot places, such as furnaces, heating pipes, and ovens (Milne and Milne 1997, 353). This insect consumes starchy organic matter, including book bindings and labels, human foods, and wallpaper glue (Borror et al. 1989, 174).

- ***Triatoma infestans* Klug, 1834** *n.* A species of assassin bug (Reduviidae) native to South America (www.biosci.ohio-state.edu/~parasite/triatoma.html, 2001, illustrations).

syn. *Baberio* (Huxley and Kettlewell 1965, 39, illustration), *Benchuca*, Great Black Bug of the Pampas, *Reduvius* (Darwin 1860, 331)

Comments: This insect is a principal carrier of *Trypanosoma cruzi* which causes Chagas' Disease. Part of Charles Darwin's health problems might have been caused by a possible case of Chagas' Disease that he acquired in Chile in March 1935 (Darwin 1860, xii).

- **Trilobitomorpha, Trilobites** *n.* An arthropod subphylum characterized by usually having hard exoskeletons and three-lobed bodies, each with a central lobe and two lateral lobes (Stanley 1989, 468; illustrations, figure 12-2, 123, 12-15, 12-16, 13-5 www.ualberta.ca/~kbrett/Trilobites.html, illustrations).

Comments: Trilobites lived from the Cambrian through the Permian Periods (Stanley 1989, 468). Trilobites in the Burgess Shale have soft parts preserved that are not preserved in fossils from other sites (Gould 1993, 55).

- **weta** *n.* *pl.* **weta** *n.* One of over 100 species of orthopterans (Anostostomatidae and Rhaphidophoridae), all endemic to New Zealand (New Zealand Department of Conservation 2009).

Comments: Some weta are very large insects up to 7.5 cm in body length (Gibbs 2009). Alien, invasive rats threaten weta populations.

[Maori, *wētā*, A name for a group of large, spiny, wingless, grasshopper-like insects (Gibbs 2009)]

- ***Wyeomyia smithii* Coquillett, 1901; Pitcherplant Mosquito** *n.* A North American mosquito (Culicidae) native to Canada and the U.S. whose larvae live in the fluid inside hollow leaves of *Sarracenia purpurea* (Purple Pitcherplant) (Bradshaw and Lounibos 1977, 546).

Comment: This mosquito is a model organism for the study of photoperiodism and a keystone predator in the fluid of *S. purpurea* leaves (Armbruster et al. 1999, 509; Peterson et al. 2008, 2257).

- **Phylum Aschelminthes, Round Worms** *n.* An animal phylum characterized by having a bilaterally symmetrical, cylindrical, elongated, and unsegmented body and a pseudocoelom (Curtis 1983, 1081).

syn. Nematoda (Curtis 1983, 1081)

Comments: Aschelminthes has about 12,000 named species, and perhaps up to 500,000 total species, including Hookworms, Nematodes, and Vinegar Eels (Curtis 1983, 1081).

- ***Caenorhabditis elegans*** *n.* A small, soil nematode worm (Rhabditidae), about 1 mm long native to temperate regions (<http://elegans.swmed.edu/>, 2001; www.ncbi.nlm.nih.gov, 2001)

cf. apoptosis

Comments: Sydney Brenner began using this worm to study the genetics of development and neurobiology (<http://elegans.swmed.edu/>, 2001). There are now over 1,000 researchers who use this worm as a model organism (Campbell 1996, 979, illustration). It normally lives in soil, but is easily grown in petri dishes. This worm has a transparent body which enables researchers to see its internal anatomy during its development, ending in 959 cells (Campbell 1999, 391–392). Because this worm's cells arise from its zygote in exactly the same way from individual to individual, researchers have been able to reconstruct the entire ancestry of every cell in an adult worm, its complete cell lineage. At 20°C, this species has a life cycle of 3.5 days. It usually reproduces as a self-fertilizing hermaphrodite, and has two X-chromosomes per cell, plus five pairs of autosomes. Loss of an X-chromosome by meiotic nondisjunction leads to the production of a male. Mating hermaphrodites with males provides a method of genetic analysis. This species has about 100,000,000 base pairs and 18,424 genes (Wade 2001, 11 April, D4). Online information on this animal includes the *C. elegans*

Genome Database (ACEDB) (www.sanger.ac.uk/Projects/C_elegans) and Wormbase (<http://wormbase.sanger.ac.uk/>, 2001).

Phylum Brachiopoda, Brachiopods *n.* Double valved marine animals that use a loop-shaped structure with tentacles for suspension feeding (Stanley 1989, 646).

syn. Lampshells

Comment: Brachiopods lived on Earth from the Cambrian Period through the present time (Stanley 1989, 646).

■ **Class Articulata, Articulate Brachiopods** *n.* Brachiopods that have teeth that lock their valves together (Stanley 1989, 647; illustration, 10, 315, 322–323, 346, 388).

Comments: Articulata have fewer species than the Inarticulata (*q.v.*). Articulata lived from the Cambrian Period through today (Stanley 1989, 647).

■ **Class Inarticulata, Inarticulate Brachiopods** *n.* Brachiopods that do not have teeth that lock their valves together (Stanley 1989, 646; illustration, 320).

Comment: Articulata lived from the Cambrian Period through today (Stanley 1989, 647).

Phylum Chordata, Chordates *n.* An animal phylum with about 52,000 living species characterized by organisms that each has a hollow dorsal nerve cord, gill slits, and a notochord (*q.v.*) some time in its development (King and Stansfield 1985).

■ **Class Agnatha, Jawless Fish** *n.* A chordate class of about 45 living species characterized by being aquatic, and having developed brains enclosed by cartilage and notochords reduced to tissue between vertebrae; usually having tails; and having no legs or wings (Curtis 1983, 1084).

Comment: Fish are in the Classes Acanthodii, Agnatha, Chondrichtyes, Osteichthyes, and Placodermi.

■ **Class Amphibia, Amphibians** *n.* A chordate class of about 4,000 living species, containing frogs, salamanders, and toads, characterized by having developed brains enclosed by bone; eggs unprotected by embryonic membranes or shells; incomplete double blood circulation; legs; notochords reduced to tissue between vertebrae; often having tails; and usually having both aquatic and terrestrial stages, gills in young and lungs in adults, and naked skin (Curtis 1983, 1085; Souder 1998, A3).

Comment: Amphibian numbers started markedly declining in many parts of the world in the late 1970s (Souder 1998, A3).

Acanthostega Jarvik, 1952 *n.* A very early tetrapod genus (Amphibia) thought to be similar to the first amphibian (Zimmer 1995, 117, illustrations).

cf. Ichthyostega, Sarcopterygii

Comments: Fossils of this species date to 360 Ma ago (Zimmer 1995, June). Säve-Söderberg and Jarvis found the first *Acanthostega* fossils in Greenland in 1933. *Acanthostega* has eight digits on its forelimbs, a pair of prongs on the back of its skull, hips, a scarum, fins on the dorsal and ventral sides of its tail, probably had an internal-gill system, and may have been exclusively aquatic.

Researchers also found a tetrapod 5 Ma older than *Acanthostega*.

[Greek *akantha*, thorn + *stegos*, roof; spine plate; referring to a pair of prongs on the back of *Acanthostega*'s head (Zimmer 1995, June, 123)]

axolotl *n.*

1. *Seridon pisciforme*, Proteidae, Amphibia (Oxford English Dictionary 1972, entries from 1786).

Note: This species from Mexican lakes retains external gills throughout its life.

2. The neotene of salamander species including *Ambystoma tigrinum mavortium* (Conant 1958, 213, illustration, 259; Stebbins 1996, 33, illustration, Plate 2).

Comment: Other salamander species have neotene individuals (Stebbins 1996).

[Aztec *axolotl*, the common name for *Seridon pisciforme* (Oxford English Dictionary 1972); Spanish, *nahautl*, servant of water (Michaelis 1963)]

Bufo marinus Linnaeus, 1758; Marine Toad *n.* A large toad (Bufonidae) originally from Mexico through Brazil (Associated Press 1996, 22 September, 29).

Comments: Humans introduced this Toad into Australia, Florida, Hawai'i, Philippines, and Puerto Rico as a biocontrol agent for sugarcane pests in the 1930s (Associated Press 1996, 22 September, 29). This Toad is not a good biocontrol agent and has become a pest for reasons including it eats cat and dog food, kills and sickens dogs with its venom, and scares people.

Ichthyostega (ik thee o STEG ah, IK thee OHS teg ah) *n.* An extinct genus of early terrestrial amphibians characterized by an osteolepiform body shape with a streamlined, broad, flat, fish-like head; bulky body; a small fin on the dorsum of its tail; and unusually massive ribs (Benton 1990, 51–53; Zimmer 1995, 120).

Comments: *Ichthyostega* probably lived in water part of the time and waddled when moving on land. It had sharp fangs, suggesting that it ate centipedes, insects, millipedes, rhipiditians, and scorpions. This tetrapod held the distinction of being the earliest known one until J. Clack discovered *Acanthostega* and other workers discovered tetrapods predating *Acanthostega* (Zimmer 1995, June, 120). Gunner Säve-Söderberg found the first *Ichthyostega* fossil (a skull in the mountain Celsius Bjerg, Greenland in 1931) which dates to 360 Ma (Zimmer 1995).

[Greek *ichthyo*s, fish + *stega*, plate; referring to the roof of this amphibian's skull which is shaped like that of a fish; named by G. Säve-Söderberg (Zimmer 1995, 121)]

leopard frog *n.* One of seven species of *Rana* including *Rana blairi*, *Rana chiricahuensis*, and *Rana pipiens* (Alcock 2006, 167).

Comment: In the past, researchers placed all seven species in *Rana pipiens* (Alcock 2006, 167).

salamander *n.* An amphibian characterized by clawless toes, gelatinous eggs; and smooth, sometimes slimy skin (Order Urodela) (Cohn 1996, H1).

syn. lizard (in West Virginia, pers. obs.); spring lizard (in Appalachian areas, Cohn 1996, H1). *Comments:* The greatest salamander diversity occurs in the Southern Appalachian Mountains of the U.S. (Cohn 1996, H6). Most adult salamanders are under 6 in long, although the aquatic Hellbender can grow up to 2 ft long. The Tiger Salamander, which grows up to 13 in long, is the world's largest terrestrial salamander. Adults of about 220 salamander species do not have lungs or gills. They absorb oxygen and emit carbon dioxide through their skins and mucous membranes in their mouths. Adults of another 170 species, either have gills throughout their lives or develop lungs at maturity.

■ **Amphioxus, Lancets** *n.* A genus of about 20 species that comprise Subphylum Cephalochordata, characterized by having notochords which run from anterior through posterior ends of these animals, tails, and gill slits (Max Plank Institute for Molecular Genetics, 2003).

Comments: *Amphioxus* species are intermediate between tunicate tadpole larvae and jawless vertebrates (Hagfish and Lampreys) (Max Plank Institute for Molecular Genetics, 2003). *Amphioxus* lacks brains, eyes, hearts, skulls, and vertebral columns. This genus includes *Amphioxus lanceolatum* Pallas, 1774 (= *Branchiostoma lanceolatum* Pallas, 1744). *Amphioxus* adults are up through 1 in long. This genus occurs in all seas where its members burrow into sand and swim freely after disturbance.

■ **Class Aves, Birds** *n.* A chordate class, containing extinct toothed birds and about 8,000 extant toothless ones, characterized by having bills, complete double blood circulation, developed brains enclosed by bone, eggs protected by embryonic membranes or shells, feathers, homeothermy, legs, notochords reduced to tissue between vertebrae, tails, and wings (Curtis 1983, 1085).

Alex *n.* An individual of *Psittacus erithacus* Linnaeus, 1758 (African Gray Parrot, Psittacidae) that was a subject of experiments on thinking undertaken by Irene Pepperberg (Smith 1999, A1, illustration).

Comments: Alex identified 50 different objects and recognized quantities up to 6 and understands bigger and smaller and same and different according to Pepperberg (Smith 1999, A1, A17). Alex was about 31 yr old when he unexpectedly died in 2007 (Alex Foundation 2010). A female African Gray Parrot, Lindsay Kalin McGihon, has coloration that is similar to Alex's coloration (fig. 16).

Anser anser, Greylag Goose *n.* A European goose (Anseridae) (King and Stansfield 1985). *Comment:* Researchers, including Konrad Lorenz, studied imprinting and other behavior of this bird (King and Stansfield 1985).

Apteryx, Kiwis *n.* A bird genus (Apterygiformes) native to New Zealand and characterized by

having species that are ground-feeding, nocturnal, and wingless (Kiwi Recovery Program 2002, illustrations). *Comments:* There are four Kiwi species *C Apteryx australis* (two varieties, Haast Tokoeka and Southern Tokoeka), *A. baastii* (Great Spotted Kiwi), *A. mantelli* (two varieties, North Island Brown Kiwi and the Okarito Brown Kiwi), and *A. owenii* (Little Spotted Kiwi) (Kiwi Recovery Program 2002). About 95% of Kiwis die in the wild before they reach adulthood, most being killed by alien Domestic Cats and Stoats. The Kiwi Recovery Program (including Operation Nestegg) is working to stop extinction of Kiwis in the wild. "The Kiwi" is the national emblem of New Zealand.

Archaeopteryx *n.* An extinct, European bird genus (Archaeopterygidae) from the Jurassic Period (King and Stansfield 1985).

Archaeornis *n.* An extinct bird genus from the Jurassic Period, characterized by having a long, feathered tail with many vertebrae; teeth; and three free digits with claws on each wing (King and Stansfield 1985).

Archaeornithes, Early Toothed Birds *n.* Birds, including *Archaeopteryx* spp., that lived in the Jurassic Period, and characterized by having skeletons that resemble some dinosaur taxa and teeth; contrasted with Neornithes (Stanley 1989, 651).

Columba livia Gmelin, 1789; Domestic Pigeon, Pigeon, Rock Dove *n.* An Old World bird (Columbidae) with a chunky body; short, rounded tail; and typically bluish-gray plumage with back-and-white markings (Udvardy and Farrand 1994, 545–546, Plate 360).

Comments: People often domesticate this species as a pet and for food and sport; there are several artificial strains. For example, the Homing Pigeon is a strain bred for quickly returning to its roost when artificially released at a distance from its home; the Pouter, for displaying its plumage; and the Tumbler, for its ability to perform aerial acrobatics (Brown 1975, 12).

Confuciusornis sanctus *n.* A Cretaceous bird from China with a long boney tail, needle-sharp claws on its wings, and a toothless beak, and dating from 143–132 Ma ago (Lianhai Hou and Alan Feduccia in Zimmer 1996, January, 50, photograph).

Corvus brachyrhynchos Brehm, 1822; American Crow *n.* A North American bird (Corvidae) with black plumage, and a fan-shaped tail, stocky body, and stout bill (Udvardy and Farrand 1994, 635–636, Plate 673).

syn. Common Crow

Comments: *Corvus brachyrhynchos* are becoming more common in urban areas, where many people consider them to be pests (Brody 1997, C1). Most states of the U.S. protect *C. brachyrhynchos*, classifying them as game birds without a hunting season. These birds help conspecifics, play, and have complex vocal communication.

Cuculidae, Cuckoos *n.* A nearly-worldwide bird family (Passeriformes) with 143 species

characterized by having conspecific females and males with similar plumage, slender bodies with long tails and zygodactyl feet (Peterson 1980, 182, illustrations; Bull and Farrand 1998, 540).

See animal sounds: cuckoo; cuckoo.

Comments: Cuculidae includes Anis, Black-billed Cuckoo, European Cuckoo, Roadrunner, and Yellow-billed Cuckoo (Bull and Farrand 1998, 540). Some of the Old-World species lay their eggs in nests of other bird species that rear their young. American Cuckoos lay their eggs in their own nests.

[Old French *cucu, coucou*, imitative word]

Drepanidae, Honeycreepers *n.* A Hawaiian bird family (Passeriformes) with 23 species characterized by being perching, small, and tree-dwelling birds (Buchmann and Nabhan 1996, 247).

Comments: Drepanidae is native to forests of the Hawaiian Islands (Buchmann and Nabhan 1996, 247). Some of these species are pollinators. About eight drepanid species are lately extinct (Austin 1971, 183).

Enantiornithines, Opposite Birds *n.* A group of birds that lived in the Cretaceous and characterized by having fat, fleshy tails and foot bones partially fused from their tops down and usually having teeth; contrasted with Archaeornithes and Neornithes (Stanley 1989, 651; Zimmer 1995, 40–41).

Geospizinae, Darwin's Finches *n.* A finch subfamily (Thraupidae) that includes the 14 species of Darwin's Finches of the Galápagos Islands, Ecuador (King and Stansfield 1985).

Comments: These Finches arose from a single ancestral species which appeared on the Islands as Charles R. Darwin first suggested. These birds have differently-shaped and sized bills that correlate with their food types (King and Stansfield 1985).

[Darwin's Finch, coined by P. R. Lowe (1936 in Jackson 1993, 191)]

Gymnogyps californianus, Shaw, 1797; California Condor *n.* An endangered North American predaceous bird (Cantharidae) characterized by having a bare head, black plumage, and a wingspan up through 9.5 ft, making it the largest North American bird of prey (Peterson 1990, 182; Udvardy and Farrand 1994, 426, Plate 328).

Comments: Conservationists captured 27 *G. californianus* for a captive breeding program in the 1980s (Kenworthy, 1996a, C10). In 1999, there were 162 *G. californianus* with 113 in captivity, 29 flying free in California, and 20 in Arizona near the Grand Canyon (Whitaker 1999, A7).

Hirundo rustica Linnaeus, 1758; Barn Swallow *n.* An insectivorous bird (Hirundinidae) that nests in pairs or small colonies inside farm buildings, under bridges, inside culverts, and other protected places (National Geographic Society 1994, 298).

Comment: This socially monogamous species occurs in Eurasia and North America (National Geographic Society 1994, 298). Adults have

long, forked tails. Males with longer tails have higher paternity in their mates' broods and more offspring from extrapair bonds than males with short tails (Saino et al. 1997, 562).

Neornithes, Modern Birds *n.* Birds that lived in the late Mesozoic Era through today and are characterized by having foot bones that are partially fused from the bottom up and having no teeth; contrasted with Archaeornithes (Stanley 1989, 651; Zimmer 1995, 40–41).

Sinornis santensis *n.* A fully volant, perching, extinct, sparrow-sized bird from China, known from a 135-Ma-old fossil (Barinaga 1992, 796; Feduccia 1993, 791).

Sturnus vulgaris Linnaeus, 1758; European Starling *n.* A primarily black bird (Sturnidae) native to Eurasia (Bull and Farrand 1998, plates 606, 633).

Comments: People have kept *S. vulgaris* as pets for about 2,500 yr. This species often imitates sounds of other birds, mammals including Humans; and in some cases, machinery. A common call of *S. vulgaris* sounds like the name the Dutch use for it: *spreeuuw*. Both sexes have iridescent feathers during their breeding season. In 1890, Eugene Schieffelin, who wanted all of the birds mentioned by William Shakespeare in his writing to live in the U.S., released 60 *S. vulgaris* in Central Park, New York (Pancake 2000, C1). By 2000, about 200 million *S. vulgaris* inhabited the U.S., and this species is now a major alien, invasive species in many other parts of the world as well.

Trochilidae, Hummingbirds, Hummingbirds *n.* A New-World bird family with about 340 species, characterized by being extremely specialized for feeding on nectar from tubular blossoms and having glittering, iridescent plumage (Trochiliformes) (Austin 1971, 118; Udvardy and Farrand 1994, 575, many plates; Buchmann and Nabhan 1996, 248).

Comments: Hummingbirds are the only known birds that can fly backwards. They hover in front of flowers and sip nectar and pick insects off substrates while flying (Udvardy and Farrand 1994, 575). Many species migrate along nectar corridors, some are important pollinators, and some use traplining (Buchmann and Nabhan 1996, 248). Hummingbird species richness is highest in the Andes Mountains.

Zenaida macroura (Linnaeus, 1758), Mourning Dove *n.* A brownish, Central and North American bird characterized by having a trim body with a long tail tapering to a point (Columbiformes: Columbidae) (Scott 1994, 224).

Comments: This is a widespread and Human-hunted species in the U.S. which breeds in both suburban and wild areas (Scott 1994, 224). This species shows a broken-wing display (Basket et al. 1993, 167) and has different vocalizations including a "mournful" *ooowoo-woo-woo-woo*, often heard at a distance.

■ **Class Chondrichthyes, Cartilaginous Fishes** *n.* A chordate class with about 575 living species, including Rays and Sharks, characterized

by being aquatic, having developed brains enclosed by cartilage, notochords reduced to tissue between vertebrae, and tails; and having no bones, legs, or wings (Curtis 1983, 1084).

Comments: Fishes are in the Classes Acanthodii, Agnatha, Chondrichthyes, Osteichthyes, and Placodermi. An earlier classification placed all fishes in the Class Pisces (Curtis 1983, 1084). People are over-fishing many shark species (Warrick 1996, 31 December, A2). A fishing ban protects Basking Sharks, Big-eye Sharks, Sand Sharks, Tiger Sharks, Whale Sharks, White Sharks, and other shark spp.

■ **Class Mammalia, Mammals** *n.* A chordate class with about 4,000 living species characterized by having complete double blood circulation, developed brains enclosed by bone, fur, homeothermy, legs (sometimes arms), live birth (except for Monotremes), milk-producing glands, notochords reduced to tissue between vertebrae, placentas (in Eutherians), pouches in females (Metatherians), and tails (Curtis 1983, 1085; Strickberger 1996, 417).

marine mammals *n.* Members of the Order Cetacea (Dolphins, Porpoises, Whales) and Sirenia (Dugongs, Manatees) and some members of Carnivora (Obenidae, Walrus; Phocidae, Seals) (Wade et al. 2010, 327).

Piltdown Man *n.* A fossil forgery composed of a doctored Orangutan jaw and a Human cranium (Milner 1990, 363; Milner 1996, 101).

Comments: William Dawson and Teilhard de Chardin found Piltdown Man and a bone shaped like a cricket bat in a gravel pit at Piltdown, Sussex, England, in 1912, 25 mi from Charles Darwin's home (Milner 1990, 363–364; Milner 1996, 101). Many people, including some reputable scientists, were fooled into thinking that this forgery was a missing link between Nonhuman Apes and Humans. William Dawson proclaimed the skull a new species; researchers at the British Museum authenticated the skull and named it *Eoanthropus dawsonii*, Dawson's Dawn Man. In 1912, a newspaper headline read: Missing Link Found. C. Darwin's Theory Proved. In 1952, a newspaper headline read: Piltdown Ape-man a Fake C Fossil Hoax Makes Monkeys Out of Scientists. The British Museum's Kenneth Oakley devised a new method for determining whether ancient bones were the same age, using a radioactive fluorine test. Critics used Piltdown Man as an example of the weakness of evolutionary anthropology. Some creationists proclaimed that all evolutionary science is false. The British Parliament proposed a vote of "no confidence" in the scientific leadership of the British Museum. The motion failed to carry when a Member of Parliament reminded his colleagues that politicians had "enough skeletons in their own closets." Possible creator(s) of the Piltdown hoax include William Dawson, Teilhard de Chardin, and Sir Arthur Conan Doyle. However, Brian Gardiner and Andrew Currant appear to have solved the mystery (Menon 1997, 34). They concluded that Martin

A. C. Hinton, Keeper of Zoology at the British Museum, 1936–1945, created Piltdown Man. In 1975, workmen found a box of bones in a trunk with the initials M.A.C.H. in a loft in the Museum. These bones were dipped in acid and stained with manganese and iron oxides, as were Piltdown Man's bone. The cricket-bat shaped bone was a carved elephant femur. Hinton's possible motivation for the hoax was to embarrass Arthur Smith Woodward, Keeper of Paleontology at the Museum, who would not give him a salary. Hinton became a respected scholar and did not find it appropriate to confess.

Subclass Prototheria (syn. Protheria)

□ ***Morganucodon* W. G. Kühne, 1949** (mor gan NOOK oh don) *n.* A Triassic mammalian genus (Morganucodontidae) (Benton 1991, 31–33).

Comments: *Morganucodon* is known from complete skeletons in caves in South Wales, Bristol Region, United Kingdom (Benton 1991, 31). Members of this genus were 2.5 cm long, had complete secondary palates, large eye sockets (suggesting nocturnal behavior), possible fur, specialized teeth (canines, incisors, molars, premolars), and two sets of teeth (suggesting suckling by its young). Many small openings in their snout bones suggest that nerves passed to sensory whiskers.

[after Morgan + Greek *dont*, tooth; Morgan's tooth (Benton 1991, 141)]

Subclass Theria

□ Infraclass Eutheria

● Order Artiodactyla (Even-toed Ungulates)

○ ***Blue Babe*** *n.* A 36,000-yr-old, mummified Pleistocene male Bison unearthed at a placer gold mine just north of Fairbanks, Alaska, in 1979 (Bovidae) (Guthrie 1990, 1).

[blue, after the blue color of the mineral Vivianite that dusted and formed crystals on the dried skin of this mummy, Guthrie 1990, 79]

○ ***Cervus canadensis* (Erxleben, 1777), Elk, Wapiti** *n.* A large North American deer (Cervidae), possibly the same species as the Old World *C. elaphus* (Burt 1980, 215).

○ ***Dolly*** *n.* The first *Ovis aries* (Domestic Sheep) cloned from a mature sheep cell (Specter and Kolata 1997, A20, photograph).

Comments: Dolly is the first reported case of a cloned mammal using the nucleus of differentiated cell (Specter and Kolata 1997, A20; Campbell et al. 1999, 394). The mature cell came from a sheep mammary gland. cf. clone

[after the singer Dolly Parton, famous for her mammary cells (Specter and Kolata 1997, A20)]

○ ***Odocoileus virginianus* Zimmermann, 1780; White-tailed Deer** *n.* A deer (Cervidae) native to North, Central, and South America, characterized by having mainly grayish brown, reddish brown, or tan fur; a large tail with long white fur on its underside;

and white fur around its eye and inside its ears and on its belly and nose (Whitaker 1996, 834–835; ADW Team 2001).

syn. Virginia Deer, Whitetail (Whitaker 1996, 834)

Comments: *Odocoileus virginianus* has become very common in parts of the U.S., where it is controlled by removal to new sites, and killing by hunters and sharpshooters (Kuznik 1998, 38; Associated Press 2000, A23; Eggen 2000, A-28). There may be as many as 15 million *O. virginianus* in North America (ADW Team).

● Order Carnivora

○ *Ailuropoda melanoleuca* David, 1869; Giant Panda

n. An endangered bear native to Central and Western China and characterized by a unique wrist bone (which functions as a feeding thumb) and black-and-white fur (Ursidae) (<http://pandas.si.edu/facts/bearfacts.html>, 2000).

syn. Panda

Comments: About 1,000 Giant Pandas remain in the wild (<http://pandas.si.edu/facts/bearfacts.html>, 2000). They are active primarily at night; eat almost exclusively bamboo, but also other plant species, carrion, fish, and occasional small rodents. The cubs are very small and helpless at first, but can care for themselves in 1 yr after birth. Adults weigh up to 350 lb. About 140 Pandas live in zoos and breeding centers around the world, mostly in China. Ling-Ling (female, 1969–1992) and Hsing-Hsing (“shing-shing,” male, 1971–1999) came to the U.S. National Zoo in 1972 as gifts of friendship from the People’s Republic of China. Ling-Ling produced five cubs which each lived no longer than 5 days. Tian Tian (male) and Mei Xiang (female) arrived at the National Zoo in 2000. Private funders paid China \$1 million per yr for Panda conservation in return for the loan of the new Panda pair.

○ *Canis familiaris*, Domestic Dog

n. A mammal (Canidae) derived from the Wolf by artificial breeding (King and Stansfield 1985).

syn. Dog, pooch (slang)

Comments: There are more than 100 Dog breeds (King and Stansfield 1985). Researchers have extensively studied the genetic control of dog social behavior and other areas of Dog biology. I include a few of these breeds below. The Beagle is a small, short-coated, short-legged, droopy-eared Dog bred for rabbit hunting (Brown 1975, 12). The Greyhound is a tall, slender, smooth-coated Dog bred for its ability to run rapidly over open country. The Pointer is a smooth-haired, usually white Dog with brown spots, bred for its ability to scent and point silently at game birds without making them fly away. The Portuguese Water Dog (= Algarvian Water Dog, *Cão de Água Algarvio*, *Cão de Água Português*, *Cão Pescador Português*, Portie, Portuguese Fishing Dog) is bred

for working with fishermen (Roig-Franzia 2009, A1; American Kennel Club 2010). The current First Dog of the U.S. which lives in the White House is Bo, a Portuguese Water Dog. The Sheep Dog (= Shepard Dog, Shepherd’s Dog) is a Dog bred for shepherding (Brown 1975, 12), e.g., a Collie or an Old English Sheep Dog (Michaelis 1963). The Terrier is a small, active, wiry Dog bred for its ability to go down Fox and Badger burrows and persistent pursuit of prey (Michaelis 1963; Brown 1975, 12). The Thievish Dog is a Dog bred to be essentially barkless and used by game poachers who hunt mainly at night.

○ *Canis latrans* Say, 1823; Coyote

n. A large predatory North American mammal (Canidae) found in Alaska, much of Canada, and all of contiguous U.S. (Whitaker 1996, 684).

syn. American-jackal, Prairiewolf

Comment: *Canis latrans* and *C. familiaris* interbreed and produce Coydogs (Whitaker 1996, 684). In Western U.S., removal of large predators such as Coyotes results in an increase of smaller predators (such as Domestic Cats, Gray Foxes, Raccoons, Striped Skunks, and Virginia Opossums) which in turn results in a reduction in numbers of scrub birds (Sæther, 1999, 510).

[Latin *Canis*, dog; *latrans*, barking, after its barking vocalizations accompanied by howling; Nahautl Indian *coyotl*, Coyote]

○ *Felis catus* (Linnaeus, 1758), Domestic Cat

n. A felid species frequently kept as a pet by Humans.

syn. Cat, *Felis domesticus*

cf. organization: Alley Cat Allies, People for the Ethical Treatment of Animals (Appendix 2)

Comments: *Felis catus* might be a descendant of *F. silvestris silvestris*, the African Wild Cat (Dewey 2004). Pet and feral (= free-ranging, stray) *F. catus* are often common, effective predators of smaller animals, especially in suburbia and adjacent areas (Crooks and Soulé 1999, 563). *Felis catus* probably kill over 1 billion birds and over 3 billion other vertebrate animals annually in the U.S. (Gerald Winegrad in Proulx 1997, A3). In 1991, a Cougar in California might have contracted feline leukemia by eating feral *F. catus*. Rabies is now more common in *F. catus* than in Domestic Dogs. Because *F. catus* do not carry a specific rabies virus as bats, Common Raccoons, and Domestic Dogs do, some people who have died of bat rabies might have contracted this disease from *F. catus* bites. Feral and pet *F. catus* caused 39 native Australian birds and mammals to go extinct, locally extinct, or near extinct in the wild (Mydans 1997, A1). Each pet *F. catus* kills about 25 native animals per year. Each feral *F. catus* kills about 100 native animals per year.

○ *Felis concolor* Linnaeus, 1771; Catamount

n. A large predatory mammal (Felidae) native to Central, North, and South America.

syn. Cougar, Mountain Lion, Panther
Comments: There might be as many as 30 *F. concolor* subspecies (Derr 1999, D2; The Florida Panther Society, <http://www.atlantic.net/~oldfla/panther/panther.html>; Wildlife Rescue Inc., www.stonehill.org/wrfccqk.htm). Females weigh up through 90 lb; males, 140 lb. Stephen O'Brien (in Derr 1999, D2) showed that *F. concolor* once had a single unbroken population throughout its former range. *Felis concolor* was the widest-ranging nonhuman mammal in the Americas.

- ***Felis concolor coryi*, Florida Panther** *n.* A subspecies of *Felis concolor* originally native throughout Southeastern U.S. (Derr 1999, 2 November, D2).

Comments: By 1970, the Florida Panther became a population with its original genes and those from introduced Costa Rican Panthers. For much related information see the web site of the Florida Panther Society.

- **Smokey Bear** *n.* A well-known symbolic bear used to promote the prevention of forest fires in the U.S. (Evans 1995, B3; Oregon Department of Forestry, 2001, illustrations).

Comments: People created Smokey Bear in 1945 which had the famous slogan, "Remember, only you can prevent forest fires" (Evans 1995, B3). Rudolph Wendelin drew Smokey Bear many times and transformed him from a cub in baggy pants into an adult bear with a long snout, claws, and fangs. In 1946, Wendelin defanged, declawed, and softened Smokey's image. Wendelin later transformed Smokey's claws into fingers and had him carry a shovel, and wear a ranger's hat and a belt buckle. People saved an American Black Bear cub from a New Mexico fire in 1950, and dubbed him Smokey. He was a popular attraction at the U.S. National Zoological Park for 20 yr until he died in 1976. The U.S. Forest Service has an animatronic Smokey Bear in its headquarters building (Kaelin 2001, A13).

- **Order Chiroptera, Bats** *n.* A chordate order with about 900 species of mammals characterized by the presence of wings (paper-thin, elastic membranes extending from the sides of an individual's body, legs, and tail that are back and belly skin extensions) and true flight (Reader's Digest Association 1971, 411; Graham 1994, 52; Allen 1996, 639).

cf. analysis: auditory-scene analysis; behavior: foraging; echolocation
Comments: Bats are the only true flying mammals (Allen 1996, 639). The oldest bat fossil is from about 60 Ma ago, and the oldest Megachiropteran fossil is from about 35 Ma ago (Graham 1994, 10). Researchers debate whether Bats arose from one (shrew-like), or two (a shrew-like and flying-lemur-like), ancestral stocks (Graham 1994, 10–11). Researchers classify

echolocating bats as constant-frequency bats (= CF bats) and frequency-modulating bats (FM bats) (Moss and Surlykke 2001, 2208). The CF bats use signals in a narrow frequency band (= "constant frequency"), and the FM bats use signals in a broad frequency band.

- **Megachiroptera, Megachiropterans** *n.* A bat suborder characterized by feeding mainly on fruit and nectar, having no echolocation, and having a claw on the first and second finger of each wing (Reader's Digest Association 1971, 411).

syn. Megabats

Comments: Megachiroptera contains one family which includes the Flying-foxes and Old World Fruit-eating Bats (Reader's Digest Association 1971, 411). Recent studies challenge the traditional classification of Bats into Megachiroptera and Microchiroptera, and those studies produced different Bat classifications and phylogenies (Springer et al. 2001, Knapp and Gardner 2002, Teeling et al. 2002).

- **Microchiroptera, Microchiropterans** *n.* A bat suborder characterized by feeding mainly on insects, fish, and frogs, and less frequently fruit in some species; having echolocation; and having a claw on the first finger of each wing (Reader's Digest Association 1971, 411).

syn. Microbats

Comment: Microchiroptera contains 16 families, including the Bumble Bee Bat which weighs less than a U.S. penny (Reader's Digest Association 1971, 411).

- **Order Lagomorpha (Hares, Pikas, Rabbits)**

- ***Oryctolagus cuniculus* Linnaeus, 1784; Domestic Rabbit** *n.* A European rabbit species (Lagomorpha: Leporidae) characterized by having a hopping gait; a short bob-tail; long, mobile ears; usually a grayish-brown coat, and white fur on the underside of its belly and tail (ARKive 2004).

syn. European Rabbit, Old World Rabbit

Comments: People have bred about 80 varieties of this species which markedly vary color, fur type, size, and other features (Tislerics 2000). This species was confined to the Iberian Peninsula and small areas of France and northwest Africa during the last ice age. Humans have taken this Rabbit to many parts of the world, and wild populations of this species currently occur on all continents except Asia and Antarctica. *Oryctolagus cuniculus* causes significant environmental damage in some parts of the world (Berman 2004).

- **Order Primates (Apes, including Humans; Monkeys)**

Comments: Family Hominidae (Hominids) includes Modern Humans (*Homo sapiens*) and many other species that are primarily based on artifact, fossil, or both kinds of evidence such as *Ardipithecus ramidus*, *Australopithecus africanus*, and *Homo habilis*. Physical anthropologists have named over 10 such hominid species, but some researchers question whether

- these anthropologists had enough data to make many of the species designations. Although the names might not designate actual species, I include some of them in this book because they are useful “handles” for the forms of extinct life and the names are historically important.
- **Abang** *n.* A male Orang-utan that made a knife by striking off a flint flake from a stone core with a hammerstone (Milner 1990, 1).
Comment: Abang practiced and made thinner and sharper flakes and learned how to steady the stone core with his feet (Milner 1990, 1). He cut rope with the knives.
 - **Ardipithecus ramidus** *n.* An omnivorous, woodland, hominid species that lived 4.4 Ma ago in the Afar Rift Region in North-eastern Ethiopia and Kenya (Alberts 2009, 17; White et al., 2009, 64).
Comment: This species evidently fed both in trees and on the ground (White et al., 2009, 64).
 - **Chilecebus carrascoensis** *n.* The oldest known New-World monkey (Anonymous 1995a, 31, skull photograph).
Comments: John Flynn and André Wyss found a skull of this species in the Chilean Andes in 1994 (Anonymous 1995, 31). Its molars and the shape of its ear region indicate that New World Monkeys originated in Africa. Primates immigrated into South America before 28 Ma.
 - **Chimp, Chimpanzee** See Animalia: Chordata: Mammalia: *Pan troglodytes*.
 - **Clovis People** *n.* Possibly the first people who lived in the Americas (Gibbons 1997, 1256).
Comment: The Clovis People, were big-game hunters who came over the Bering Land Bridge and then swept rapidly through the Americas about 11,500 yr before the present (Gibbons 1997, 1256). The Monte-Verde People might have come to the Americas before the Clovis People.
 - **consulting arborist** *n.* A person who specializes in care of trees and other plants and makes professional diagnoses of arboricultural issues in view of environmental concerns (American Society of Consulting Arborists 2010).
 - **Eosimias, Dawn Monkey** *n.* An extinct anthropoid primate genus from China (Beard in Culotta 1995, 1851).
Comments: *Eosimias* appears to be a transitional primate between Prosimians and more-derived Anthropoidea, which lived about 45 Ma ago, weighed about 1 oz, was probably nocturnal, and fed on fruit and insects (Gebo et al. 2000, 276; Wilford 2000, 16 March, A1).
 - **Gorilla beringei Matchie, 1903; Mountain Gorilla** *n.* A Gorilla species with two named subspecies native to Africa (Knight 2000).
Comments: There are about 358 living *G. beringei* in nature (Fisher, 2001, A3). *Gorilla b. beringei* is the population in the

Virunga Volcanoes Area of the Democratic Republic of Congo, Rwanda, and Uganda, studied by Diane Fossey (Knight 2000). The Bwindi Gorilla is a population of about 325 individuals in Uganda’s Bwindi (Impenetrable) Forest. *Gorilla b. diehli* (Cross River Gorilla) is a population of a few hundred individuals.

- **Gorilla gorilla gorilla Savage, 1847; Western Lowland Gorilla** *n.* A gorilla subspecies native to Cameroon, the Central African Republic, Congo (Brazzaville), Equatorial Guinea, Gabon, and southeast Nigeria (Knight 2000, 21 November).
Comments: Western Lowland Gorillas live in tropical forests where they eat bamboo shoots, bark, fruit, leaves, and vines (especially *Galium* sp.) and live up to 35 yr in the wild (Turco and Gruner 1999). A “silverback” is an older male Gorilla with gray and white hairs on his back and that is the highest ranking male in his group (Immelman and Beer 1989, 290). Silverbacks can weigh up to 400 lb. They are usually gentle and peaceful, but become aggressive in protecting their troops.
- **Gorilla gorilla graueri, Eastern Lowland Gorilla** *n.* A Gorilla subspecies native to the former Zaire through west of Lake Edward and Lake Tanganyika, with at least 10,000 living individuals (Knight 2000; Fisher 2001, A3).
- **hacker** *n.*
 1. A person who modifies a computer program, usually illegally, poorly, or both (Gookin and Wang 1995, 173).
 2. A person who works on a computer in a proficient way but is not regarded as a computer professional (Gookin and Wang 1995, 173).
- **H. M.** *n.* A person of unspecified sex who received drastic brain surgery to cure his severe epilepsy in 1953 (Lemonick 1999, 56).
Comments: Surgeons removed parts of H. M.’s temporal lobes including his, or her, hippocampus (Lemonick 1999, 56). This destroyed his ability to form new long-term memories. H. M. has reasonably good short-term memory and shows implicit memory. He has no permanent memory of what happened to him since 1953.
- **Homo sapiens sapiens, Modern Man** *n.* The only member of Hominidae still living on Earth; contrasted with prehuman, non-human animal, and nonhuman organism.
syn. *Homo sapiens*, Human, Man, Modern Human (Some workers consider *Homo sapiens* to be divided into Archaic Humans and Modern Humans, without the subspecies *H. s. sapiens*. Therefore, *Homo s. sapiens* becomes a synonym for *H. sapiens*.)
adj. human, Human
cf. *Ardipithecus*, *Australopithecus*, Hominidae, *Homo*, Ice Man, prehuman (Appendix 1, table)
Comments: Benton (1995, 52) lists *Homo sapiens* as a species of ape. Some workers

- call all members of Hominidae “Humans.” There are over 6 billion Humans alive on Earth today who are markedly stressing many ecosystems.
- [Old French *humain* < Latin *humanus*]
- **Ice Man** *n.* A 5,300-yr-old, Neolithic man preserved in ice in the Schnals Valley, the Alps, Italy, near the province of South Tyrol (Menon 1995, 57, photos of head; Fowler 1997, 13, photo).
 - syn. Ötzi (Tyrolian name, after Ötztal near Ice Man’s discovery site (Fowler 1997, 13)
 - Comments:* Hikers found Ice Man in 1991 when his body emerged from a glacier (Rensberger 1992c, A1; Menon 1995, 57). He and his belongings including copper-headed ax, food, and medicines were very well preserved making him an extraordinary find. He was about 5 ft and 4 in tall and around 35 yr old. He might have been a herdsman, hunter, prospector, or a shaman overcome by an early snowfall. Ice Man has a severely shrunken brain that indicates he was exposed to drying sun and wind when ice did not cover him.
 - **Imo** *n.* The “monkey genius;” a female Japanese Macaque, *Macaca fuscata*, that started traditions of washing Sweet Potatoes and placer mining of Wheat grains when she was a juvenile (Kawamura 1954 in Wilson 1975, 170).
 - **Inca Girl** The frozen body of an Inca girl who died on Mount Ampato, Peru, about 500 yr ago (Menon 1996, January, 22–23).
 - Comments:* Johan Reinhard found the girl in 1995 (Menon 1996, January, 22–23). She was 12 to 14 yr old when other Incas killed her on the summit of Mount Ampato as a human sacrifice. They buried her inside a stone platform with ritual offerings. Reinhard also found two other bodies in the area.
 - **Java Man** *n.* A population of *Homo erectus* represented by bones from Java (Wilford 1999, 7 September, A1).
 - Comments:* Java Man is the first discovered fossil of this species; the Dutch physician Eugène Dubois found them in 1891 (Wilford 1999b, A1, A21).
 - [Java Man, after the location of this fossil, coined by Dubois (Wilford 1999b, A21)]
 - **Jernigan, Joseph Paul; The Visible Man** A 38-yr-old man whose body anatomy is computerized based on photographs and other images of thin slices of his corpse (Dowling 1996a, illustrations).
 - cf.* Visible Woman
 - Comments:* Jernigan was a prisoner sentenced to death who willed his body to science (Dowling 1996a). His corpse had a missing appendix, testicle, and tooth. Victor Spitzer, David Whitlock, and colleagues froze his body and cut it into 1,878 slices. The CAT scans, MRIs, and photographs comprise 15 gigabytes of information, which fills 15,000 floppy disks or 23 CD-ROM discs. Computer users can view Jernigan’s virtual image from any angle and at any depth.
 - **Kanzi** *n.* A male Bonobo (1980–) that recognizes about 384 human words and communicates with Humans by pointing to symbols that represent the words (Great Ape Trust 2010; 2010, 36–37, including a photograph of Kanzi).
 - Comments:* Kanzi is the first member of his species to acquire language as human children do by being exposed to it (Great Ape Trust 2010). He is the first nonhuman ape that demonstrates receptive competence of spoken English. Kanzi communicates in sentences, creates new English names for objects, and is adept at stone tool making. [Swahili, *kanzi*, treasure]
 - **Koko** *n.* A female Lowland Gorilla that is part of a study of American Sign Language, Ameslan (www.koko.org, 2000).
 - syn. Hanabi-Ko
 - Comments:* Koko was born in 1971 in the San Francisco Zoo, California, U.S. (www.koko.org, 2000). The Gorilla Foundation reports that she has a working vocabulary of over 1,000 signs, understands about 2,000 words of spoken English, typically constructs statements averaging three through six words, shows an I.Q. of 70 through 95 based on Human I.Q. tests, communicates in Ameslan with a male Lowland Gorilla Michael, and has favorite things.
 - [Japanese *Hanabi-Ko*, Fireworks Child]
 - **!Kung** *n.* The Bushmen of Southern Africa (Wilson 1975, 287).
 - [Bushman *!kung*, human beings]
 - **Macaca mulatta** (Zimmermann, 1780), **Rhesus Macaque, Rhesus Monkey** *n.* An Old-World monkey from India (King and Stansfield 1985).
 - Comment:* This Monkey is an important research primate and the original source of the Rh antigen (King and Stansfield 1985). [New Latin, *Rhesus* < Greek *Rhēsos*, a mythical king of Thrace]
 - **Michael** *n.* A male Lowland Gorilla that is part of a study of American Sign Language (www.koko.org, 2000).
 - Comments:* Michael was born in 1973 in Cameroon, Africa (www.koko.org, 2000). The Gorilla Foundation reports that he has a working vocabulary of 600 signs and has favorite things.
 - **Mitochondrial Eve** *n.* A common female ancestor of living *Homo sapiens sapiens* who lived in Africa about 200,000 yr ago and whose existence was reported by Cann et al. (1987) based on their study of Human mitochondrial DNA (Barinaga 1992, 687).
 - cf.* hypothesis: African-origin hypothesis of Human mitochondrial DNA evolution
 - Comments:* Wilson and Cann (1992, 70) suggest that Mitochondrial Eve was one of 10,000 people who lived at her time. Some workers doubt her existence because they conclude the original work on her was statistically flawed (Barinaga 1992, 686; Templeton 1992, 737; Hedges et al. 1992, 738).

- [mitochondrial, from analysis of Human mitochondrial DNA; Eve, after the first woman in the Bible]
- **Monte Verde People** *n.* Possibly the first people who lived in the Americas (Gibbons 1997, 1256).
Comment: The Monte Verde People, lived in huts with wooden frames and animal-hide roofs at least 12,500 yr ago in Chile (Thomas Dillehay in Gibbons 1997, 1256). The Clovis People might have come to the Americas before the Monte Verde People.
 - **nerd** *n.* A person who is socially inept, foolish, ineffectual, or a combination of these characters (Morris 1982).
Comments: Kinds of nerds include “computer nerd,” “congressional-staff-tax nerd;” “fumbling nerd;” “geeky nerd (a somewhat repetitive term);” “outcast nerd;” “unsmiling, charmless, uptight nerd;” “sexually-obsessed nerd;” and “stingy nerd” (Frerking 1997, B5). Some people categorize engineers, scientists, or students who major in science as nerds, even though many of these people are the opposite of “nerd” as defined above. *If I Ran a Zoo* by Dr. Seuss (1950) includes a nerd who is a Seuss version of a grumpy professor. The popular movie *Independence Day* portrays a lead scientist as a nerd.
[probably an alteration of nut, a crazy person (Morris 1982)]
 - **Nim Chimpsky** *n.* A *Pan troglodytes* that learned a large number of hand gestures that represent words in American Sign Language and appeared to use signs combined grammatically into sentences (Waal 1989, 48; Smith 1999, A17).
Comments: This Chimp did not make the “sentences” on his own, but instead was cleverly imitating his teacher, Herbert Terrace, who famously repudiated his own earlier studies of this animal of the 1970s (Smith 1999, A17).
[after Naom Chomsky, linguist at the Massachusetts Institute of Technology]
 - ***Pan paniscus* Schwarz, 1929; Bonobo** *n.* An endangered ape native to the former Zaire between the Rivers Kasai and Zaire characterized by having a completely black face as an adult and a lighter build than *Pan troglodytes* (Primates: Pongidae).
syn. Pigmy Chimpanzee
[Greek *Pan*, God of the Hills, Flocks, Forests, Pastures, and Sportsmen; African *chimpanzee*; *paniskos*, diminutive of *Pan*]
 - ***Pan troglodytes* (Blumenbach, 1775), Chimpanzee** *n.* An endangered ape native to Central and West Africa from Senegal through Tanzania (Primates: Pongidae).
cf. Animalia: Chordata: Mammalia: Nim Chimpsky
Comments: *Pan troglodytes* subspecies are *P. t. schweinfurthii* (Eastern Africa), *P. t. troglodytes* (Central Africa), possibly *P. t. vellerosus* (Southern Nigeria and Western Cameroon), and *P. t. verus* (Western Africa) (Stein 1997, 25 August, A2). *Pan troglodytes* live in deciduous forests, humid evergreen forests, and savannas (Turco and Gruner 1999). They eat flowers, fruits, nuts, seeds, and less often birds and other small vertebrates. Individual *P. troglodytes* live up to 50 yr in the wild. They live in social groups, each with an alpha male. They make and use tools, including rocks as nut crushers and sticks as levers, probes, and weapons. The Tacugama Chimpanzee Sanctuary in Sierra Leone rescued a rare albino *P. troglodytes* (named Pinky) (Farah 2001, A10). *Pan troglodytes* and Humans are about 99% genetically similar (King in Campbell et al. 1999, 224).
[Greek *Pan*, God of the Hills, Flocks, Forests, Pastures, and Sportsmen; African *chimpanzee*; *troglodytes*, hole dweller]
 - **Poloyo Skull** *n.* A skull of *Homo erectus* from Poloyo, Java (Wilford 1999b, A1).
Comments: This skull is probably from a male, has a high forehead atypical of this species, shows differential development of the two sides of its brain, and has a Broca cap that suggests a potential for higher language processing, although this species may have had only simple verbal ability (Wilford 1999b, A1, A21). Possibly, a farmer found this skull and sold it to a collector in 1997. It reappeared in the Maxilla and Mandible, a shop in New York City, in 1999.
 - ***Pongo abelii* Lesson, 1827; Sumatran Orangutan** *n.* An endangered ape (Pongidae) native to Borneo and Sumatra characterized by having grasping feet and hands, long arms, and long reddish-brown fur (Turco and Gruner 1999).
Comments: *Pongo abelii* live in lowland and upland tropical rain forests and peat swamp forests and spend most of their time in trees where they often locomote by brachiation (Turco and Gruner 1999). They eat primarily fruit (including Breadfruit, Jackfruit, Langsat, Rambutan, and Wild Plum), also bark, flowers, insects and other small invertebrates, leaves, seeds, and shoots, and they live up to 60 yr in the wild. A mature male has cheek flaps and a throat pouch used in making “long calls,” which advertise his exact location. Such a male may have a long, flowing mustache and beard. *Pongo abelii* might go extinct in nature in 20 yr (Ferber 2000, 19 May, 1147). Their population dropped from about 315,000 in 1900 to 6,500 in 1999.
[Malay *orang-utan*, old man of the forest]
 - **Princess** *n.* An Orangutan studied by Biruté Galdikas and Gary Shapiro (Galdikas 1995, 400).
Comments: Shapiro taught Princess more than 30 signs of sign language (Galdikas 1995, 400).
 - ***Semnopithecus entellus* (Dufresne, 1797), Common Langur** *n.* An Old World monkey (Cercopithecidae) native to India, Kashmir, Nepal, Pakistan, Southern Tibet, and Sri Lanka (Constable, 1998, A18; www.selu.com/~bio/PrimateGallery, 1999).

syn. Gray Langur, Hanuman Langur
cf. -cide: infanticide

Comments: Millions of Hanuman Langurs once roamed India's forests (Constable, 1998, A18). In 1983, fewer than 200,000 remained. People protect the Tughluqabad Monkeys (= Hanuman Langurs) at the Tughluqabad Ruins around the clock. Many people feed these monkeys as a way of making offerings to the Hindu Monkey God. Status: CITES — Appendix I; U.S. ESA-Endangered.

[Hanuman, after *Hanuman*, the Hindu Monkey God]

- **silverback** *n.* An older male Gorilla with gray to white hairs on his back (Immellmann and Beer 1989, 290).

Comment: A male becomes a silverback when he becomes sexually mature at about 13 yr of age (Fisher 2001, TR12). One, or more, silverbacks head a Gorilla troop.

- **Trimates, The** *n.* The founding mothers of the contemporary field primatology: Dian Fossey, Biruté Marija Filomena Galdikas, and Jane Goodall (Morell 1993a, 420; Galdikas 1995, 65).

Comments: Jane Goodall, who studied Chimpanzees, was the first researcher to begin her field work. Dian Fossey was second and studied Mountain Gorillas, and Biruté Galdikas was the third and studied Orangutans. Galdikas (1995) describes the other two Trimates and their work.

- **Visible Woman** *n.* An anonymous 59-yr-old woman whose body anatomy is being computerized based on photographs and other images of thin slices of her corpse (Dowling 1997, 47).

cf. Animalia: Class Mammalia: Subclass Theria: Infraclass Eutheria: Order Primates: Jernigan, Joseph Paul

Comments: The Visible Woman died of a heart blockage that did not affect her body's appearance (Dowling 1997, 47). Victor Spitzer and colleagues froze her body and cut it into 5,189 slices.

- **Washoe** *n.* A research Chimpanzee that learned sign language (Galdikas 1995, 400).

- **Yanomamo** *n.* A group of 27,000 Native Americans who occupy forest around the Orinoco River at the border of Brazil and Venezuela (Mann 2001, 416–421, illustrations).

syn. Yanoama, Yanomami, Yanomamö (names from different dialects) (Mann 2001, 416)

Comments: Yanomamo live in 300 scattered, ring-shaped village compounds in the forest (Mann 2001, 416). They are the least westernized peoples on Earth. Anthropologists have worked with them since the 1960s. Patrick Tierney charges in this book *Darkness in El Dorado* that some anthropologists conducted flawed research on and mistreated Yanomamo.

● **Order Proboscidea (Elephants)**

- ***Elephas maximus* Linnaeus, 1758; Asian Elephant; Asiatic Elephant** *n.* A large Asian mammal (Elephantidae) characterized by its prehensile trunk, tusks, and other features.

Comments: China executed several Elephant poachers in the 1990s (Faison 1998, 9). A pair of Elephant tusks sells for about \$10,000 per pair. Land mines have killed or maimed many Asian Elephants in Thailand and elsewhere (Mydans 2001, A8). *Elephas iolensis* was the predominant elephant species in Africa in the late Pleistocene Epoch (Roca et al. 2001, 1474). Kahl and Santiapillai (2005) present a 32-page, referenced, online glossary of terms related to Elephants.

- ***Loxodonta africana* (Blumenbach, 1797), African Elephant** *n.* A living mammal (Elephantidae) native to Africa.

Comments: In the past, taxonomists divided *L. africana* into more than a dozen species, but later coalesced them into one species. Currently there are three delineated species of Elephants from Africa, including *L. africana* and *L. cyclotis* (African Forest Elephant) (Roca et al. 2001, 1473; Vogel 2001, 1414; Alcock 2006, 166).

● **Order Rodentia (Rodents)**

- ***Eomys quercyi*** *n.* An extinct rodent (Rodentia) that lived about 26 Ma ago with a gliding membrane similar to that of a flying squirrel (Burkart Engesser in Anonymous 1996, June, 28, illustration).

Comments: A fossil from Enspel, Germany, shows the outline of this rodent's fur and gliding membrane (Anonymous 1996, June, 28, illustration).

- ***Heterocephalus glaber* Rüppell, 1842; Naked Mole Rat** *n.* A social rodent (Bathyergidae) native to Ethiopia, Kenya, and Somalia characterized by having a pink wrinkled skin with sparse individual hairs, a very loose skin that enables it to turn its body inside its skin when crawling in narrow burrows (D. Ciszek 1996, www.personal.umich.edu/~cberger/syllabusfolder/animaldiversity, illustration).

- ***Mus musculus* Linnaeus, 1758; House Mouse** *n.* An Asian mouse species (Muridae) (King and Stansfield 1985; Whitaker 1996, 664–665).

Comments: Researchers have extensively used *M. musculus* in laboratory studies, including those in behavior and genetics, and have produced many inbred lines by brother-sister matings (King and Stansfield 1985). Commonly used strains include Albino (A, Ak, BALB, R_m), Agouti (C3H, CBA), Black (black, C₅₇, C₅₈), Dilute Brown (DBA/2), and Dilute Brown Piebald (I). *Doogie* is a transgenic strain of *M. musculus* engineered by scientists to have greater learning ability than ordinary laboratory Mice (Lemonick 1999, 54; Tang et al. 1999, 64, 68).

[Latin *Mus*, mouse; Sanskrit *musha*, thief; *Doogie*, after the television show *Doogie*

- Howser, M.D.*, about a young man of superior intelligence who is a M.D.]
- ***Rattus norvegicus* (Berkenhout, 1769), Brown Rat** *n.* An Asian rodent (Musidae) (Whitaker 1996, 659).
syn. Common Rat, Norway Rat, Sewer Rat, Water Rat (Whitaker 1996, 659)
Comment: *Rattus norvegicus* probably originated in Central Asia and spread across Europe in the 16th through 18th centuries. It arrived in North America in boxes of grain brought by Hessian troops in about 1776 (Whitaker 1996, 660). White laboratory Rats are albino *R. norvegicus* (King and Stansfield 1985).
 - ***Rattus rattus* Linnaeus, 1758; Black Rat** *n.* A putative Southeast Asian rodent (Musidae) (Whitaker 1996, 662).
syn. Roof Rat, Ship Rat (Whitaker 1996, 662)
Comment: *Rattus rattus* probably originated in Southeast Asia and across Europe before *Rattus norvegicus*' arrival in the 16th century (Whitaker 1996, 662). It arrived in Central and South America in the mid-16th century, evidently carried there aboard Spanish ships, and in North America in 1609 with the Jamestown colonists.
 - **Infraclass Metatheria, Metatherians** *n.* A therian mammalian infraclass of about 260 species characterized by having bones that support external pouches, and short development of young in wombs followed by further development in external pouches (present in most species); and no nerve tissue that connects brain hemispheres (Reader's Digest Association 1971, 409).
syn. Marsupialia, Marsupials
Comments: Australia is the current center of metatherian diversity (Reader's Digest Association 1971, 409).
 - **Benjamin** *n.* The *Thylacinus cynocephalus* (Tasmanian-tiger) that died in the zoo in Hobart, Australia in 1936, and may have been the last living member of this species (Bergamini 1964, 94, photo; Drollette 1996, 32).
 - ***Tarsipes spenserae* Gray, 1942; Honey Possum** *n.* An Australian metatherian mammal (Tarsipedidae) (Buchmann and Nabhan 1996, 247).
Comments: *Tarsipes spenserae* have long protrusible tongues used for feeding on nectar and pollen and occur in Southwestern Australia (Buchmann and Nabhan 1996, 247). They are excellent pollinators.
 - ***Thylacinus cynocephalus* Harris, 1808; Tasmanian-tiger** *n.* A possibly still extant, nocturnal, predatory marsupial (Dasyuridae) from Tasmania (and originally Australia and New Guinea) with a wolf-like body shape and head (Drollette 1996, 32–33, illustration).
syn. Tasmanian Tiger, Tasmanian Wolf (Bergamini 1964, 94); Thylacine (Michaelis 1963); Dog-faced Dasyurus, Opposum Hyena, Wolf Opposum, Zebra Wolf (www.zoo.utas.edu.au/profiles.html, 2000)

cf. Benjamin

Comments: This is the largest known living marsupial carnivore in the 20th century; it was up to 160 cm long including a 50-cm-long tail and consumed Wallabies and other mammals (Bergamini 1964, 94; E. Guiler, www.zoo.utas.edu.au/thylacine, 2000). Aborigines, vagabonds, and wild Dogs might have killed the majority of Tasmanian-tigers, but a few might still be alive (Drollette 1996, 32–34).

[Latin *thyla*, pouch; *cinus*, dog; *cymo*, wolf; *cephalus*, head; pouched dog with a wolf's head; English Tiger, after brown vertical stripes on its back and tail]

■ **Class Chondrichthyes, Cartilaginous Fish**

■ **Class Osteichthyes, Boney Fish** *n.* A chordate class of about 20,000 living species characterized by being aquatic, and having developed brains enclosed by bone, notochords reduced to tissue between vertebrae, and tails; and having no legs or wings (Curtis 1983, 1084).

Comment: Fishes are in the Classes Acanthodii, Agnatha, Chondrichthyes, Osteichthyes, and Placodermi. An earlier classification placed all fishes in the Class Pices (Curtis 1983, 1084).

Cichlidae *n.* A family of about 105 genera and 1,300 species native to Africa (including Madagascar), Central America, India, Iran, Israel, North America, South America, Sri Lanka, Syria, West Indies (Kullander 2005).

Comment: African cichlids are an example of explosive evolution (*q.v.*), and environmental changes eliminated cichlid species in some African lakes (Seehausen 1997, 1808).

***Danio rerio* (Hamilton, 1822); Zebra Danio** *n.*

A tropical, freshwater fish species (Cyprinidae) native to Bangladesh, India, Nepal, and Pakistan (www.fishbase.org, 2000, illustration).

syn. Zebrafish (Campbell et al. 1999, 391)

Comments: The Zebra Danio is a model organism for studies of development and genetics (Campbell et al. 1999, 391). Its generation time is from 2 through 4 mo. By 24 hr after fertilization, most of the tissues and early versions of its organs have formed, and by 48 hr, a tiny fish hatches out of its egg case. This species has a transparent embryo which enables a researcher to detect abnormalities visually (Butler 2000, 503), long regions of synteny (where gene order is similar to that in Humans), and about 1.7 billion base pairs in its genome. Researchers at the U.S. National Institutes of Health produced The Interactive Atlas of Zebrafish Vascular Anatomy (<http://mgchd1.nichd.nih.gov:8000/zfatlas/Intro%20Page/intro1.html>, 2001).

***Gambusia holbrooki* Girard, 1858; Eastern Mosquitofish** *n.* A fish (Poeciliidae) native to Eastern North America (Bisazza et al. 2001, 59; Murdy et al. 1997, 129; Texas Natural History Collections 2001).

Comments: People introduced *G. holbrooki* into California, Hawai'i, and many countries outside of the U.S. for mosquito control. This fish caused decline in native fish numbers

in Australian nonriverine habitats (Unmack 2001). *Gambusia affinis* (Baird & Girard) (Western Mosquitofish = Guayacón) is native to Western North America (Texas Natural History Collections 2001). People have widely introduced *Gambusia* species as mosquito biocontrol agents, and there is a correlation with the presence of these fish with decreased odonate richness in Australia and Hawai'i (New 2009, 126).

***Gasterosteus aculeatus* Linnaeus, 1758; Three-spined Stickleback** *n.* A fish (Gasterosteidae) native to both fresh and salty water in Eurasia and North America (www.fishbase.org, 2001). *Comment:* Many researchers have used this fish species in studies of evolutionary biology, including Candolin (1999).

***Lates niloticus* (Linnaeus, 1758); Nile Perch** *n.* An African brackish and freshwater fish (Centropomidae) native to the Congo, Lake Chad, and the Volta and Niger River Systems in Africa (Lycos Encyclopedia of Animals, <http://versaware.animalszone.lycos.com/>, 2000; www.fishbase.org, 2000, illustration). *Comments:* *Lates niloticus* is a snook, not a true perch (Lycos Encyclopedia of Animals, <http://versaware.animalszone.lycos.com/>). People introduced this fish into Lake Victoria, Africa, in the 1950s (Vick 1999, 22 September, A28). It greatly changed the Lake's ecosystem by consuming many native cichlid fishes which eat algae (American Museum of Natural History 1999, <http://www.gambit.co.za/corporate/fishingafrica/boards/fishreport/messages/542.html>). Now Lake Victoria is frequently choked with algal blooms, and *L. niloticus* mostly feeds on a freshwater shrimp species. The introduced fish originated from Lakes Albert and Turkana which contain three *Lates* species, and it has never been entirely clear which of these became established in Lake Victoria, or indeed whether the Lake Victoria population is derived from hybridization between *Lates* species (Hauser, 1999, illustrations). A Nile Perch can weigh up to 240 kg. Commercial sizes often are 3 through 6 kg. This fish is the most important food fish in Africa.

***Latimeria chalumnae* J. L. Smith, 1939; Coelacanth** (SEEL uh kanth) *n.* A South African and South Asian fish (Order Crossopterygii; Suborder Coelacanthini) (Thomson 1991, 13–14; 35, illustration).

Comment: Researchers knew Coelacanths only from Cretaceous fossils (about 70 Ma old and which were probably different species than the living one) until Marjorie Courtenay-Latimer obtained a specimen from a fisherman in 1938 (Thomson 1991, 13–14). People have caught about 200 Coelacanths since 1938. Some people call this fish a living fossil. Crossopterygiians are related to ancestors of Amphibia.

[*Latimeria*, after M. Courtenay-Latimer; *chalumnae*, after the Chalumna River, Cape Province, South Africa, which is near the

estuary where a fisherman caught the 1938 specimen).

Poeciliidae, Livebearers *n.* A family of Boney Fish of 22 genera and 140 species native to central and southern U.S., Central America, and South America, and distinguished by giving live birth and having gonopodia (*q.v.*) (Murdy et al. 1997, 129).

Comments: Poeciliidae contains the Eastern Mosquitofish, Guppy, and Sailfin Molly, Topminnows, and their kin (Boschung et al. 1995, 516, Murdy et al. 1997, 129). Many researchers have used poeciliids, especially Guppies and Swordtails, for studies of social learning and sexual selection (Bisazza et al. 2001, 59). Populations of some nonnative poeciliids are established in the U.S.

[Livebearers after the females' giving birth to "live" young (= fry, not eggs)]

■ **Class Reptilia, Reptiles** *n.* A chordate class, containing Crocodiles, Lizards, Snakes, and Turtles, with about 6,000 living species characterized by having eggs enclosed by protective embryonic membranes and shells; developed brains enclosed by bone, incomplete double blood circulation, legs (and sometimes arms), lungs, notochords reduced to tissue between vertebrae, skin usually covered with scales, and tails (Curtis 1983, 1085).

Comments: Reptilia is polyphyletic in some classifications because it contains Classes Aves and Mammalia. In the legal reptile business, the U.S. imported 1.8 million live reptiles in 1997, worth about \$US 7 million and exported 9.7 million valued at \$13.2 million (Cooper 1999, A23). There is a thriving black market in illegal reptiles.

***Boiga irregularis* Merrem, 1802; Brown Tree Snake** *n.* A snake (Colubridae) native to Australia and Asia (Reptilia).

Comments: *Boiga irregularis* feeds on many species of birds and small lizards and mammals (Claiborne, 1997, 23 August, A6). Adults reach up to 8 ft long. It is originally from Indonesia, Northern Australia, Papua New Guinea, and the Solomon Islands. This snake first appeared in Guam in the 1950s, became abundant, and is extinguishing many native animal species on this island due to its predation. This snake is also an important threat to other areas of the world, including Hawai'i.

***Geochelone elephantopus* (Harlan, 1827); Galápagos Tortoise** *n.* A species of large tortoise (Testudinidae) native to the Galápagos Islands, Ecuador (Milner 1990, 279).

syn. Testudo indica, T. nigra (former names)

Comments: Individuals of this species can live over 200 yr (Milner 1990, 279). Sailors and others consumed over 200,000 of these Tortoises. Lonesome George is the last Galápagos Tortoise, *Geochelone elephantopus abingdoni*, from Pinta Island and is in a pen on Santa Cruz Island (Milner 1990, 279). No one found a mate of his population for him. Other populations of this species are surviving well due to conservation efforts. Charles

R. Darwin first encountered this species on 17 September 1835 (Darwin 1860, 375).

Troodontidae *n.* A dinosaur family of medium-sized, Cretaceous coelurosaurian theropods, native to China and North America (Lambert 1983, 148; Xu et al. 2002, 780).

syn. Troödontidae (Lambert 1983, 148)

Comments: The small, bird-like troodontid *Sinovenator changii* lived about 130 Ma ago in the Early Cretaceous Period (Xu et al. 2002, 780). Later troodontids were larger than this earlier species and did not have avian skeletal features. Birds may have evolved from a sister group of the early troodontids.

[*Troodon*, Greek wounding tooth, after the sharp teeth of this genus (Lambert 1983, 148)]

***Terrapene carolina* Linnaeus, 1758; Eastern Box Turtle** *n.* A land turtle (Emydidae), up to 6.5 in long, native to North America (Southern Maine through Georgia and west through Michigan, Illinois, and Tennessee) (Conant 1958, 44).

Phylum Ciliophora *n.* A phylum that contains one species, *Symbion pandora*, which has a funnel-like, round mouth and seems to live exclusively on lobster mouthparts (established by Peter Funch and Reinhardt Kristensen in Anonymous 1996, March, 24, illustration).

[Greek, *cyclo*, small wheel; *phereum*, to carry (Anonymous 1996, March, 24, illustration)]

Phylum Mollusca *n.* An animal phylum of about 93,000 known species that is characterized by species with soft bodies without hard skeletons and contains the Clams, Mussels, Octopi, Oysters, Slugs, Snails, and Squids (Campbell and Reece 2005, 640).

Comment: Many molluscan species have protective shells (Campbell and Reece 2005, 640).

■ ***Dreissena polymorpha* (Pallas, 1771), Zebra Mussel** *n.* A mollusc native to Southern Europe and Asia that people accidentally introduced into the U.S. Great Lakes Area in the ballast of a European tanker in the 1980s (Alden et al. 2007, 50).

Comment: This species forms dense groups that crowd out native spaces and clog pipes and screens (Alden et al. 2007, 50). Beaches, such as those of Lake Erie, can become covered with shells of this mussel (pers. obs.).

Pigeon See Animalia: Phylum Chordata: Class Aves: *Columba livia*.

Pigmy Chimpanzee See Animalia: Phylum Chordata: Class Mammalia: Subclass Theria: Infraclass Eutheria: Order Primates: *Pan paniscus*.

Pitcherplant Mosquito See Animalia: Phylum Arthropoda: *Wyeomyia smithii*.

Polposipus herculeanus See *Polposipus herculeanus*.

Pouter See Animalia: Phylum Chordata: Class Aves: *Columba livia*.

Pre-Ediacaran metazoa *n.* Metazoa that date before the Ediacara Epoch (Doolittle et al. 1996, 473).

Princess See Animalia: Phylum Chordata: Class Mammalia: Subclass Theria: Infraclass Eutheria: Order Primates: Princess.

Prodontria lewisi See Animalia: Phylum Arthropoda: *Prodontria lewisi*.

Regal Fritillary Butterfly See Animalia: Phylum Arthropoda: *Speyeria idalia*.

Reptiles See Animalia: Phylum Chordata: Reptilia.

Rhaphiomidas terminatus abdominalis See See Animalia: Phylum Arthropoda: *Rhaphiomidas terminatus abdominalis*.

Richmond Birdwing Butterfly See Animalia: Phylum Arthropoda: *Ornithoptera richmondi*.

Riekoperla darlingtoni See Animalia: Phylum Arthropoda: *Riekoperla darlingtoni*.

Rock Dove See Animalia: Phylum Chordata: Class Aves: *Columba livia*.

Rodolia cardinalis See Animalia: Phylum Arthropoda: *Rodolia cardinalis*.

Roof Rat See Animalia: Phylum Chordata: Class Mammalia: Subclass Theria: Infraclass Eutheria: Order Rodentia: *Rattus rattus*.

Rosy Marsh Moth See Animalia: Phylum Arthropoda: *Coenophila subrosea*.

Sasakia charonda See *Sasakia charonda*.

Schaus' Swallowtail See Animalia: Phylum Arthropoda: *aristodemus ponceanus*.

scout bee See Animalia: Phylum Arthropoda: Group Apiformes: scout bee.

Sewer Rat See Animalia: Phylum Chordata: Class Mammalia: Subclass Theria: Infraclass Eutheria: Order Rodentia: *Rattus norvegicus*.

Sheep Dog See Animalia: Phylum Chordata: Class Mammalia: Subclass Theria: Infraclass Eutheria: Order Carnivora: *Canis familiaris*.

Ship Rat See Animalia: Phylum Chordata: Class Theria: Infraclass Eutheria: Order Rodentia: *Rattus rattus*.

Silvery Blue See Animalia: Phylum Arthropoda: *Glaucoopsyche lygdamus xerces* (comment).

Small Ant-blue Butterfly See Animalia: Phylum Arthropoda: *Acrodipsas myrmecophila*.

Smokey Bear See Animalia: Phylum Chordata: Class Mammalia: Subclass Theria: Infraclass Eutheria: Order Carnivora: Smokey Bear.

Solenopsis invicta See *Solenopsis invicta*.

Somatochlora hineana See Animalia: Phylum Arthropoda: *Somatochlora hineana*.

Southern Pine Beetle See Animalia: Phylum Arthropoda: *Dendroctonus frontalis*.

Speyeria idalia See Animalia: Phylum Arthropoda: *Speyeria idalia*.

Stalk-eyed Flies See Animalia: Arthropoda: Diopsidae.

Starry-sky Beetle See Animalia: Phylum Arthropoda: *Anoplophora glabripennis*.

stem metazoa *n.* The ancestor of Metazoa (Animals).

cf. Animalia: Metazoa

Comment: The stem metazoan might have had few cell types and no cell walls, epithelia sealed by tight junctions that isolated its internal cavities from its external environment, collagenous extracellular structural elements, and no mineralization (Gerhart and Kirschner 1997, 19).

sterzelnde bee See Animalia: Phylum Arthropoda: Apiformes: *sterzelnde* bee.

Stingless Bees See Animalia: Phylum Arthropoda: Group Apiformes: Apidae.

- Strunus vulgaris** See Animalia: Phylum Chordata: Class Aves: *Sturnus vulgaris*.

Yanoama, Yanomami, Yanomamo, Yano-mamö See Animalia: Phylum Chordata: Class Mammalia: Subclass Theria: Infraclass Eutheria: Order Primates: Yanomamo.

Zebra Danio, Zebrafish See Phylum Chordata: Class Osteichthyes: *Danio rerio*.

Zebra Mussel See Phylum Mollusca: *Dreissena polymorpha*.

► **Kingdom Fungi, Fungi** *n.* An eukaryan kingdom with six taxonomic divisions (also called phyla) and comprising heterotrophic, usually multicellular organisms with cell walls (often with chitin); distinguished from Kingdoms Animalia, Plantae, and Protista (Curtis 1983, 1078).

Comments: Researchers have named about 72,000 fungus species, and they include Mildews, Molds, and Mushrooms (Gibbs 2001, 44). There may be as many as 1,500,000 extant fungus species. The filamentous forms consist basically of a continuous mycelium which becomes septate (partitioned off) in certain taxa and at certain stages of their life cycles. Reproductive cycles often include both asexual and sexual phases. Most fungus taxa are haploid, with diploid zygotes. Yeasts are unicellular ascomycetes. Fungi might have first appeared on Earth about 1,576 Ma ago (Heckman et al. 2001, 1131). The oldest known fungus fossil is about 460 Ma old and from the Guttenberg Formation near Madison, Wisconsin, U.S. (Stein, 2000, A9). This is about the time that plants moved from the ocean onto land, and fungi might have formed mycorrhizal associations with these plants. Some workers place slime molds in Kingdom Protista, others place them in Kingdom Fungi (as does this book) (Campbell et al. 1999, A-5). About 20% of all known extant fungus species form symbiotic associations with cyanobacteria, green algae, or both photobionts (Lutzonl et al. 2001, 937). I also include fungus-like organisms such as *Phytophtthora infestans* under Fungi in this book.

[Latin *fungus*, mushroom, akin to sponge]

A CLASSIFICATION OF KINGDOM FUNGI^a

- I. Phylum Ascomycota (*Pencillium*, Sac Fungi, Yeast, etc.)
- II. Phylum Basidiomycota (Mushrooms, Rusts, Smuts, etc.)
- III. Phylum Blastocladiomycota
- IV. Phylum Chytridiomycota (Zooporic Fungi)
- V. Phylum Glomeromycota (Arbuscular Mycorrhizal Fungi and relatives)
- VI. Phylum Neocallimastigomycota
- VII. Phylum Zygomycota (Bread Molds, *Rhizopus*, *Mucor*, etc.)

^a There are many classifications of Fungi. This classification is from the Tree of Life (Blackwell et al. 2007). The authors present an evolutionary tree of fungus taxa, and the tree does not place Microsporidia, *Olpidium brassicae*, and *Rozella* spp. in phyla. This tree is subject to change as new data appear. Many workers place Slime Molds in Kingdom Fungi; Patterson (2000) places them in Protista (*sensu lato*) in Ramicristates in which includes most kinds of amoebae (including Dictyostelid and Myxomycete Slime Molds and Hyperamoebae).

Acrasiomycota, Cellular Slime Molds *n.* A fungus phylum characterized by having a feeding stage that consists of solitary cells that function individually and aggregate and function as a unit when their food is depleted; distinguished from Phylum Myxomycota, Plasmodial Slime Molds (Campbell et al. 1999, 532).

Comment: When acrasiomycot cells aggregate, they retain their cell walls (Campbell et al. 1999, 532).

Aeroaquatic Hypomycetes *n.* A fungus taxon that lives in water and produces conidia above a water surface (Dubey 1995, 34).

Aquatic Hypomycetes *n.* A fungus that lives in water (Dubey 1995, 34).

Armillaria gallica Marxm. & Romagn, Honey

Mushroom *n.* An European and North American fungus (Physalacriaceae) that is parasitic and saprophytic on some tree species (McKnight and McKnight 1987, Plate 15).

syn. *Armillaria bulbosa* (Barla) Kile & Watling, Shoestring Root Rot, and other names

Comments: Individuals of this fungus can grow very large, and one individual can weigh over 220,000 lb and occupy over 37 acres (Anderson et al. 1992 in Rensberger 1992, 2 April, A1). This fungus inhabits hardwood forests throughout Eastern North America and Europe (Rensberger 1992, A1). In comparison an adult Blue Whale weighs up to 250,000 lb. *Armillaria ostoyae* has the largest known fungus individuals (K. Russell and T. Shaw in Rensberger 1992, 2 April, A1). It occurs in southwestern Washington, covers 1,500 acres, and is up to 1,000 yr old. The largest living organism might be *Populus tremuloides* (Plantae), *q.v.* *Armillaria gallica* is a saprophyte and a parasite of trees.

Baker's Yeast See *Saccharomyces cerevisiae*.

Cellular Slime Molds See Fungi: Acrasiomycota.

Dog-vomit Mold See Fungi: *Fuligo septica*.

Entomophaga maimaiga Humber, Shimazu, Soper, and Hajek, 1988 *n.* A fungus (Entomophthorales) that consumes arthropods, primarily *Lymantria dispar* (Gypsy Moths) (Humber et al. 1988, 229; Valenti 1998, 20).

Comments: This fungus currently causes drastic population declines of *L. dispar* and evidently negligible impact on related nontarget Lepidoptera in North America (Valenti 1998, 20–21). People originally introduced *E. maimaiga* into the U.S. in 1910 from Japan. It began to make great impacts on *L. dispar* populations in the 1980s. It is unclear whether the original strain or new strain of this fungus is presently affecting *L. dispar*, how this fungus will affect *L. dispar* populations in the future, and what indirect effects it will have on other *L. dispar* consumers.

Fuligo septica (Linnaeus) Wiggers, Scrambled-egg Slime *n.* A common North American plasmodial slime mold that forms a white to yellow "mushroom" (= spore-producing mass) of irregular form and which becomes crusty and blackish within (Physaceae) (Lincoff 1981, 845, plate 559).

syn. Wet-cookie Mold, Dog-vomit Mold (Higgins 2000, 15 June, H9, illustration).

Comments: Many researchers placed this species in Kingdom Fungi. Patterson (2000) places this species in Protista (*sensu lato*) in Ramicristates. *Fuligo*

septica consumes bacteria in and on leaf litter compost, logs, mulch, and stumps; and it migrates onto living plants (Lincoff 1981, 845). *Nectria violacea* (Violet Nectria, a cup fungus) consumes *F. septica*. Some people eat cooked *F. septica* which tastes somewhat like almonds.

fungus *n., pl. fungi, funguses* A member of Kingdom Fungi (*q.v.*).

Imposter Fungus See *Puccinia monoica*.

lichen *n.* A symbiotic association of a green-alga (Chlorophyta) and a fungus species (as in most kinds of lichens) or a cyanobacterium and a fungus species (Campbell and Reece 2005, 621).

Comments: Workers classify lichens as Crustose Lichens, Foliose Lichens, and Fruticose Lichens (Hale 1961, 7–17). Although they are obviously combinations of two species, researchers give them genus and species names, *e.g.*, *Umbilicaria mammulata*. A lichen's fungus (the mybiont) holds onto a substrate, and its alga, or bacterium, which is a photobiont, photosynthesizes, producing carbohydrates used by both parties of its symbiosis (Kritcher and Morrison 1998, 206–207). Researchers debate whether lichen partners are equal partners; one might derive more benefits from the association than the other. Lichens are important in early succession in some habitats. Most lichen-forming fungi are ascomycetes; few lichen-forming fungi are basidiomycetes.

A CLASSIFICATION OF LICHENS

- I. Crustose Lichens
- II. Foliose Lichens
- III. Fruticose Lichens

Microsporidium spp. *n.* A group of amitochondriate eukaryotes, now affiliated with Fungi (Gray et al. 1999, 1480).

Myxomycotina See Fungi: Myxomycota.

Myxomycota, Plasmodial Slime Molds *n.* A fungus phylum characterized by having a feeding stage that is an amoeboid mass (= plasmodium); distinguished from Phylum Acrasiomycota, Cellular Slime Molds (Campbell et al. 1999, 532).

syn. Myxomycotina (Lincoff 1981, 843)

Comments: The plasmodium is a single mass of cytoplasm undivided by membranes and contains many nuclei (Campbell et al. 1999, 532). Several hundred species occur in North America with about 50 species in a particular location. Species of Myxomycota include *Fuligo septica* (*q.v.*).

Neotyphodium *n.* A genus of entophytic fungi (Clavicipitaceae) (Omacini et al. 2001, 78).

Comments: *Neotyphodium* spp. form mutualistic associations with many species of grasses (Omacini et al. 2001, 78). Infections of these fungi are asymptotic and are transmitted exclusively through host-plant seeds. These fungi produce alkaloids (*q.v.*) that protect their host plants from insect and vertebrate grazers.

Phytophthora infestans (Montagne) de Bary, 1876 *n.* A fungus (Pythiaceae) that causes the very destructive and infectious disease of *Lycopersicon esculentum* (Tomato) and *Solanum tuberosum* (Potato) called Late Blight (McGrath 2009a, b, c, illustrations).

Comments: *Phytophthora infestans* also parasitizes some other members of the Solanaceae (Nightshade Family) such as the introduced *Solanum dulcamara* in the U.S. (McGrath 2009b). *Phytophthora infestans* damage to Potatoes led to the Irish Potato Famine in the 1840s. The U.S. had a Late Blight epidemic in 2009. *Lycopersicon esculentum* (Mountain Magic) is evidently resistant to *P. infestans* (Barber 2009, WK10).

Plasmodial Slime Molds See Fungi: Myxomycota.

Puccinia monoica Arth., **Imposter Fungus** *n.* A rust fungus (Pucciniaceae) that causes its crucifer hosts to form pseudoflowers that mimic co-occurring flowers such as the buttercup *Ranunculus inamoenus* Greene (Roy and Raguso 1997, 414; Schaechter 2002, illustration).

Comments: The pseudoflowers are very similar in appearance to buttercup flowers, but they have a distinctly different scent from those flowers (Roy and Raguso 1997, 14). Bees and flies that visit the pseudoflowers transport spermatia of the fungi. Roy et al. (1998) found that *Puccinia monoica* is a complex of four species.

Saccharomyces cerevisiae, **Baker's Yeast, Yeast** *n.* A unicellular fungus (Saccharomycetaceae) (Campbell et al. 1999, 188; www.umu.se/myconet/Myconet.html, 2001).

syn. Brewer's Yeast, *Candida robusta* (anamorph), Lager Beer Yeast, *Saccharomyces capensis*, *Saccharomyces italicicus*, *Saccharomyces oviformis* (www.ncbi.nlm.nih.gov, 2001)

Comments: Researchers use Baker's Yeast as a model organism for biological studies, including biochemistry, cell biology, and genetics. People have also used this fungus for making beer, bread, and wine for thousands of years (Campbell et al. 1999, 188). Yeast databases include *Saccharomyces* Genome Database (SGD, http://genome-www.stanford.edu/Saccharomyces, 2001), and Yeast Proteome Database (YPD) (www.proteome.com/daabases/index.html, 2001). This fungus has two mating types (sometimes called "sexes").

terrestrial geofungus *n.* A fungus that lives in soil (Dubey 1995, 34).

Wet-cookie Mold See Fungi: *Fuligo septica*.

Yeast See *Saccharomyces cerevisiae*.

► **Kingdom Plantae, Plants** *n.* An eukaryotic kingdom with organisms characterized by having chloroplasts, fertilization, involuntary motion (in almost all species), meiosis, multicellularity, no nervous systems, photosynthetic nutrition, rigid cell walls of cellulose and other polysaccharides; distinguished from Kingdoms Animalia, Fungi, and Protista (Oxford English Dictionary 1972, entries from 1551; Michaelis 1963; Curtis 1983, 387).

syn. Metaphyta

Comments: There are about 288,000 species of living plants which include about 250,000 Anthophytes (Flowering Plants) (Campbell and Reece 2005, 578). I include a few plant taxa below.

plant *n.*

1. An organism with rigid cell walls that is usually autotrophic and without voluntary motion; distinguished from an animal, fungus, and protistan (Oxford English Dictionary 1972, entries from 1551; Michaelis 1963); a member of Kingdom Plantae.

2. A herbaceous plant, rather than a bush or tree (Oxford English Dictionary 1972, entries from 1551; Michaelis 1963).

3. A member of the Kingdom Plantae; an organism with these characteristics: eukaryotic cells with nuclear envelopes, mitochondria, chloroplasts (in almost all species); cell walls of cellulose and other polysaccharides; fertilization and meiosis; photosynthetic nutrition (in almost all species); multicellularity; and no nervous system (Curtis 1983, 387; Lincoln et al. 1985).

Note: This definition seems appropriate for wide use.

cf. animal, -cole, -phile, -phobe

Comment: Curtis (1983, 387) tabulates the traits of Animals, Fungi, Plants, Prokaryotes, and Protists. [Old English *plante* < Latin *planta* sprout, slip, cutting, graft]

A CLASSIFICATION OF PLANTS (KINGDOM PLANTAE)^a

- I. Group Nonvascular Plants^b (Bryophytes, in the broad sense)
 - A. Phylum Anthocerophyta (Anthocerophytes = Hornworts)
 - B. Phylum Bryophyta (Bryophytes = Mosses)
 - C. Phylum Hepatophyta (Hepatophytes = Liverworts)
 - D. Phylum Takakiophyta (Takakiophytes, extinct)
- II. Group Vascular plants (Tracheophyta = Tracheophytes, plants with phloem and xylem)
 - A. Group Seedless Plants (plants that produce spores, not seeds)
 1. Phylum Lycophyta (Lycophytes = Clubmosses), 7 orders
 - a. *Asteroxylon* (extinct)
 - b. *Lepidodendron* (extinct)
 - c. *Lycopodium*
 - d. *Selaginella*
 - e. *Zosterophyllum* (extinct)
 2. Phylum Psilotophyta (Psilotophytes = Wiskferns)
 3. Phylum Progymnospermophyta (Progymnospermatophytes, extinct)
 4. Phylum Pterophyta (Pterophytes = Ferns), 10 orders
 5. Phylum Rhyniophyta (Rhyniophytes, extinct)
 6. Phylum Sphenophyta (Sphenophytes = Horsetails), 3 orders
 - a. *Calamites* (extinct)
 - b. *Equisetum*
 7. Phylum Trimerophytophyta (Trimerophytophytes, extinct)
 8. Phylum Zosterophyllophyta (Zosterophyllophytes, extinct)
 - B. Group Seed Plants (plants that produce seeds)
 1. Phylum Pteridospermophyta (Pteridospermophytes = Seedferns)
 2. Group Gymnospermae (Gymnosperms)
 - a. Phylum Coniferophyta (Coniferophytes = Conifers, includes Baldcypress, Cypress, Dawn Redwood, Douglas Fir, False Cedars, Firs, Hemlocks, Junipers, Larches, Pines, Redwood, Sierra Bigtree, Spruces, True Cedars, Yews), 2 orders
 - b. Phylum Cycadophyta (Cycadophytes = Cycads)

- c. Phylum Ginkgophyta (Ginkgophytes = Ginkgos), 2 orders
- d. Phylum Gnethophyta (Gnetophytes = Gnetae), 1 order
- 3. Group Angiospermae (= Angiosperms, Phylum Anthophyta, Magnoliophyta, Flowering Plants), 2 classes, 31 orders
 - a. Class Dicotyledonae (Dicots, includes Buttercups, Cacti, Daisies, Legumes, Magnolias, Mallows, Maples, Melons, Mustards, Parsleys, Poppies, Potatoes, Roses, Spurges, Waterlilies, Willows)
 - (1) Order Asterales (Asters and kin, includes Chrysanthemums, Daisies, Ragweeds)
 - (2) Order Lamiales (Mints and kin)
 - (3) Order Magnoliales (Magnolias, Tuliptrees, and kin)
 - (4) Order Piperales (Black Pepper, Lizard-tails, and kin)
 - (5) Order Rosales (Briars = *Rubus* spp., Cherries, Hawthornes, Legumes, Peaches, Plums, and kin)
 - (6) Order Umbellales (Parsnips and kin)
 - (7) Order Urticales (Elms, Hackberries, Nettles, and kin)
 - b. Class Monocotyledonae (Monocots including Bromeliads, Irides, Lilies, Orchids, Palms, Rushes, Sedges, and kin)
 - (1) Order Arales (Aroids)
 - (2) Order Liliales (Amaryllids, Irides, Lilies, Narcissus, Squills, Tulips, and kin)
 - (3) Order Orchidales (Orchids)
 - (4) Order Poales (Grasses, Rushes, and Sedges)

^a Taylor and Taylor (1993), Campbell and Reece (2005). Taxa not listed as extinct are still extant (living). Cleal and Thomas (1999) and others present an alternative classifications of many vascular plant taxa.

^b Some moss species have food- and water-conducting tissue which is not xylem or phloem, respectively.

- **Alerce** See Plantae: *Fitzroya cupressoides*.
- **Alpine Skypilot** See Plantae: *Polemonium viscosum*.
- **Amborella trichopoda** Baill. *n.* A woody, flowering plant (Amborellaceae, an early angiosperm family) native to New Caledonia (Weiss 1999, A5; Kenrick 1999, 358).

Comments: This species probably belongs on the earliest branch of the flowering plant evolutionary tree (Brown 1999, 990, illustration; Weiss 1999, A5; Floral Genome Project Consortium, 2004, illustration). *Amborella trichopoda* is a shrub with 5–8 spirally arranged tepals per flower, greenish-yellow flowers, red fruit, and no petals or xylem vessels.

- **Amorphophallus titanum** (Becc.) Becc. ex Arang., **Titan Arum** *n.* A bulbous, herbaceous perennial (Araceae) from the lowland rainforests of Sumatra thought to have the largest unbranched inflorescence in the world (Huntington Library, Art Collections, and Botanical Gardens 1999, University of Connecticut 2007).

syn. Bunga Bangkai (= Corpse-flower)

Comments: Italian botanist Odoardo Beccari found *A. titanum* in Sumatra in 1878 (Huntington Library, Art Collections, and Botanical Gardens 1999, Pickrell 2003). Since that time *A. titanum* flowered in many botanical gardens, and often drew many Human observers. The inflorescence can reach about 9 ft tall. When the flowers are open, an inflorescence emits a smell of a mixture of rotten eggs and fish and burnt sugar. A spadix can heat up through 90°F.

- **Anacardiaceae, Cashew Family** *n.* A dicot family (Order Sapindales) with about 77 genera and about 600 species mainly in the tropics and subtropics in both the New and Old Worlds (Heywood 1978, 197–198).

Comments: People obtain food, lacquer, spices, tannins, and turpentine from species of this family (Heywood 1978, 197–198). Members of this family include the Cashew and Mango, Poison-ivy, and Sumacs.

- **Angiospermae, Angiosperms** (ANG ee owe SPERM mee, ANG ee owe SPERMS) *n.* A seed-bearing, tracheophyte plant group characterized by having flowers and fruits, composed of a seed(s) enclosed in an ovary (ies); distinguished from Gymnospermae (Campbell 1999, 567–569, illustration; Strickberger 2000, 314).

Comments: There are about 235,000 living angiosperm species (Campbell 1996, 550, 564). Most species have vessel elements which carry water, rather than tracheids which occur in Conifers. Angiosperms have xylem reinforced by fiber cells which are specialized for support and which evolved from tracheids. Fossil angiosperms date back to 120 Ma ago (Wilford 1995, C1).

[Greek *angeion*, vessel, container; *sperma*, seed; referring to the fact that angiosperm seeds are enclosed in fruits, usually with fleshy tissue]

- **Angraecum sesquipedale** See Plantae: Orchidaceae: *Angraecum sesquipedale*.

- **Anthophyta, Flowering Plants** (AN tho FIGHT ah, an THOHF it tah) *n.* The only division in Angiospermae (Campbell 1996, 564, illustration; Strickberger 2000, 314–315).

cf. Plantae: Angiospermae

[Greek *anthos*, flower + *phyton*, plant]

- **Apple** See Plantae: *Malus xpumila*.

- **Arabidopsis thaliana** (Linnaeus) Gustav Heynhold, **Mouse-ear Cress** (ah RAB ih DOP sis THAL lee an ah) *n.* A small, fast-growing annual (Brassicaceae) native to Asia, Europe, and Northwestern Africa (Fernald 1950, 710; Weiss 1995, A3).

cf. gene (table)

syn. Common Wall Cress (Campbell et al. 1999, 391, illustration), Thale Cress (Wood 1999, January, 26), Thale-cress (National Center for Biotechnology Information, www.ncbi.nlm.nih.gov/htbin-post/Taxonomy/, 2001). The National Center for Biotechnology Information prefers the name “thale cress.”

Comments: This plant is a major model organism used for understanding plant development and genetics (Weiss 1995, A3). It can grow from seed to maturity in about 8 weeks in the laboratory, but often has a longer life cycle in the

field (Scheiner and Callahan 1999, 1709–1710). In Tennessee, this plant is strictly a winter annual that germinates in late autumn, grows throughout the mild winter, starts flowering in the spring, and flowers and fruits throughout spring. In England and New England, this plant germinates, flowers, and fruits in autumn. This species and has about 20,000 genes and no “junk DNA.” Researchers sequenced the entire genome of this plant in 2000, and it is becoming an important research model for ecology and evolution, as well as genetics (Pennisi 2000, 15 December, 2055). Fletcher (1995) contains photographs of many of its floral mutants. [Latin *Arabis* + *opsis*, resembling the genus *Arabis*; *thaliana*, after Johann Thal, who described this species in the 16th century]

■ ***Archaefructus liaoningensis* Sun, Dilcher, Zheng, and Zhou, 1999** *n.* An early angiosperm represented by a fossil 145 Ma old (Archaeagnolidae) (Sun et al. 1999, 1692; illustration, 1693).

cf. Plantae: *Amborella*

Comments: This species is from Western Liaoning Province, Northeast China (Sun et al. 1999, 1692). Its fossil includes carpels that enclose ovules, a major character of Angiospermae, and this fossil evidently represents the oldest known angiosperm. Some researchers have putatively identified fossils from the Triassic, Jurassic, and Cretaceous Periods as angiosperms, which do not have such carpels. [Greek *archae*, ancient; *fructus*, fruiting; *liaon-ingensis*, after the Liaoning Province, China]

■ ***Aristolochia elegans* Mast., Elegant Dutchman’s-pipe** *n.* A vine (Aristolochiaceae) native to Brazil on which mother *Ornithoptera richmondia* (Papilionidae), *q.v.*, in Australia lay their eggs “by mistake,” and whose larvae die when they eat the plant (Queensland Government 2007; New 2009, 61).

syn. *Aristolochia littoralis* D. Parodi, Calico Flower, Calico-flower, Elegant Dutchman’s Pipe

■ **Atlantic White Cedar** See Plantae: *Chamaecyparis thyoides*.

■ ***Boswellia carteri*** See Plantae: Burseraceae (comment).

■ ***Bromus tectorum* L., Cheatgrass** *n.* A Eurasian annual grass species (Poaceae) (Morrow and Stahlman 1984, 2; <http://ianrwww.unl.edu/ianr/jgg/grasses/dbpub.htm>).

syn. Downy Brome

Comments: People introduced *B. tectorum* into the U.S. in the late 1800s (Kenworthy 1999, 15 November, 1999, A11); it is now an important weed in Canada, Mexico, and the U.S. By 1999, *B. tectorum* dominated millions of acres in Western U.S., where it has greatly changed communities, by displacing Blue Bunch Wheat Grass, Bottle Brush Squirrel-tail Grass, Great Basin Wild Rye, Idaho Fescue, and Indian Rice Grass. *Bromus tectorum* is a major weed in alfalfa fields, grass-seed fields, over-grazed rangeland, winter-wheat fields, and other crop lands. This species totally changed the fire regime of the area from a 50–100-yr interval to a 5–10-yr interval. The more frequent fires do not allow sagebrush and the organisms that depend on

it to regenerate, and they increase erosion because they kill plant roots which hold soil in place. The Great Basin Restoration Initiative, proposed by the Bureau of Land Management, would attempt to restore native vegetation to areas of the Great Basin now dominated by *B. tectorum*.

■ ***Bryophyta, Bryophytes*** (BREYE oh FIGHT ah, breye OHF ih tah, BREYE oh FIGHTS) *n.*

1. A plant division comprising Hornworts, Liverworts, and Mosses and characterized by having food-conducting tissue that is not phloem, gametangia, water-conducting tissue that is not xylem, waxy cuticles, and zygotes (Campbell 1996, 553; Strickberger 2000, 300).

2. A plant division comprising Mosses (Campbell 1996, 553).

syn. Mosses

Notes: Hornworts, Liverworts, and Mosses might not be closely related groups (Campbell 1996, 553). Most plant biologists continue to use “bryophyte” to designate all three groups.

Comment: There are about 10,000 living moss species (Campbell 1996, 550).

[Latin *bryum*, moss + *phyta*, plant]

■ ***Bucket Orchid*** See Plantae: Orchidaceae: *Coryanthes*.

■ ***Bunga Bangkai*** See Plantae: *Amorphophallus titanum*.

■ ***Bursera simaruba*** See Plantae: Burseraceae (comment).

■ ***Burseraceae, Bursera Family*** *n.* A dicot family (Order Sapindales) with about 17 genera and about 500 species in the New World and Old World tropics and subtropics (Heywood 1978, 196–197).

Comments: Trees of this family are common in the main story of lowland dipterocarp forests of central and southern Malaya (Heywood 1978, 196–197). Frankincense comes from *Boswellia carteri* (Somaliland) and some other species; myrrh, *Commiphora* spp. (Arabia, Ethiopia); and varnish, *Bursera* spp. (Mexico). *Bursera simaruba* (Gum Elemi, Gumbo-limbo) is a fast-growing tree native to the Bahamas, Central America, South Florida, and the West Indies (Rose et al. 1984, 42).

■ ***bush*** *n.* A low, treelike, or thickly branching shrub; distinguished from forb, shrub, and tree (Michaelis 1963).

See bush (main section).

cf. habitat: forest

■ ***California Redwood*** See Plantae: *Sequoia sempervirens*.

■ ***Cannabis indica* Linnaeus, Marijuana** *n.* A wind-pollinated, annual, herbaceous dicot (Cannabinaceae) native to Asia.

syn. *Cannabis indica*, Dope, Grass, Hashish, Hemp, Mary-Jane, Pot, Weed

Comments: People use this species as a recreational and medicinal drug. In 1999, drought conditions in Maryland and Virginia, U.S., caused tended, illegal *C. indica* plants to be more evident as green plants among browned drought-stressed ones (Gray 1999, 28 August, B1). This enabled authorities to find and seize an increased number of these plants. *Cannabis*

- sativa* is another Asian species grown for its fiber and drug component, and this species grows wild in parts of the U.S. (Fernald 1950, 555).
 [Greek *Cannabis*, possibly from Persian *Kanab*; *indica*, from India]
- **Cashew** See Plantae: Anacardiaceae (comment).
 - **Cashew Family** See Plantae: Anacardiaceae.
 - **C₄ plant** *n.* A photosynthetic plant species that prefaces its Calvin cycle with a mode of carbon fixation that forms the four-carbon compound malate as its first product; contrasted with “C₃ plant” (Campbell et al. 1999, 182).
Comments: C₄ plants include *Saccharum* sp. (sugarcane) and *Zea mays* (Corn) (Campbell et al. 1999, 183). Such plants have unique leaf anatomy correlated with C₄ photosynthesis.
 [C₄, after the fact that the plant makes the four-carbon compound malate as its first product]
 - **Chamaecyparis thyoides** (Linnaeus) L. Britton, E. E. Sterns, and J. F. Poggemberg; **Atlantic White Cedar** *n.* A North American coniferous tree (Cupressaceae) (Fernald 1950, 58).
 [Greek *chamai*, on the ground; *cyparissos*, cypress; *thyoides*, like *Thya* or *Thuja*]
 - **Cheatgrass** See Plantae: *Bromus tectorum*.
 - **Chinese Redwood** See Plantae: *Metasequoia glyptostroboides*.
 - **Claytonia virginica** L., **Spring-beauty** *n.* A perennial herbaceous plant (Portulacaceae) native to the Eastern U.S. and Southeastern Canada (Fernald 1950, 610).
syn. spring beauty, Spring Beauty
Comment: This spring ephemeral has heliotrophic flowers (LaPlaca Reese and Barrows 1980, 685).
 [Claytonia after John Clayton, ?–1773, early North American botanist; *virginica*, of Virginia]
 - **Clubmosses** See Plantae: Lycophyta.
 - **Comet Orchid** See Plantae: Orchidaceae: *Angraecum sesquipedale*.
 - **Commiphora** See Plantae: Burseraceae (comment).
 - **Coniferophyta, Coniferophytes, Conifers** (CON nih fer oh FIGHT ah, con nih fihr AHF ih tah, CON ih fers) *n.* A gymnosperm division that lived from the Lower Carboniferous Period through the present and is characterized by evergreen foliage (in most species), seed-bearing cones, and xerophytic leaves (Campbell 1996, 557, illustration; Cleal and Thomas 1999, 142; Strickberger 2000, 314).
Comment: Coniferophyta includes Cordaitales, Taxales, and Volziales (Stewart and Rothwell 1993, Chapter 28–29). There are about 550 extant conifer species (Campbell 1996, 550). A Bristlecone Pine, named Methuselah, is more than 4,000 yr old.
 [Latin *conus*, cone + *ferre*, to bear + Latin *phyta*, plant]
 - **Cooksonia** (COOK sown nee ah) *n.* A plant genus of several extinct species, possibly in the Rhyniophyta, and historically regarded as the oldest vascular plant genus (Taylor and Taylor 1993, 191–192; Strickberger 2000, 304, illustration).

Comments: Researchers found *Cooksonia* fossils in Africa, Asia, Australia, Europe, North America (Taylor and Taylor 1993, 191). *Cooksonia* and other cooksonioids might represent a highly artificial group of plants that include ancestral stock of both bryophytes and vascular plants.

- **Corn** See Plantae: *Zea mays*.
- **Corpse-flower** See Plantae: *Amorphophallus titanum*.
- **Coryanthes** See Plantae: Orchidaceae: *Coryanthes*.
- **cryptogam** *n.*
 1. A member of the former division of plants Cryptogamia that has no carpels or stamens, propagates by spores, and includes Algae, Bryophyta, Charophyta, Chlorophyta, Fungi, Lycophyta, Progymnospermphyta, Psilophyta, Pterophyta, Rhiniophyta, and Sphenophyta (Michaelis 1963).
 2. A plant that lacks true seeds and flowers; contrasted with phanerogam (Michaelis 1963).*syn.* cryptophyte
adj. cryptogamic, cryptogamous
 [French *cryptogame*, ultimately from Greek *kryptos*, hidden; *gamos*, marriage]
- **C₃ plant** *n.* A photosynthetic plant species that fixes carbon via ribulose bisphosphate carboxylase (= rubisco, RUBP carboxylase), the Calvin-cycle enzyme that adds CO₂ to ribulose bisphosphate (RuBP); contrasted with C₄ plant (Campbell et al. 1999, 182).
Comment: C₃ plants include Rice, Soybean, and Wheat (Campbell et al. 1999, 182).
 [C₃, after the fact that the first organic product of carbon fixation is a three-carbon compound, 3-phosphoglycerate]
- **Cycadophyta, Cycadophytes, Cycads** (SYE CAD oh FIGHT ah, SEYE cah DOHF fah tah, SEYE CAD oh FIGHTS, SEYE CADS, SEYE cads) *n.* A gymnosperm phylum characterized by having large, motile sperm; pinnately compound leaves; separate female and male cones; seeds born on cone scales; and woody stems (Lawrence 1951, 356; Campbell 1996, 560; 561, illustration; Strickberger 2000, 311, illustration; 314).
Comment: There are about 100 living cycad species (Campbell 1996, 550). People prize Cycads as landscape plants and collectors' items which some people steal (Higgins 2005, H1). The Cycad Society (www.cycad.org) has a large, highly informative Website.
 [Greek cycad, *kykas*, -ados, the name for an African plant + *phyton*, plant]
- **Datura** *n.* A genus (Solanaceae) with species having hawk-moth-pollinated, large, nocturnal, sweetly scented, white flowers (Buchmann and Nabhan 1996, 248).
Comment: Researchers performed classical studies of polysomy on Jimsonweed (*Datura stramonium* L., 1753) (King and Stansfield 1985).
 [Arabic *Tatorah*, Hindustani *Dhatural*]
- **Dicotyledonae, Dicots** (DI COT oh LEE don ee, DI COTS) *n.* A plant class in Phylum Anthophyta found throughout the world and characterized by having two cotyledons per seedling,

stem vascular bundles in rings, and floral parts usually in multiples of fours or fives; netlike, palmate, or pinnate leaf venation; and true secondary growth with vascular cambia; distinguished from Monocotyledonae (Curtis 1983, 1080; Chapter 28, illustrations).

Comments: There are about 170,000 extant Dicot species (Curtis 1983, 1080).

- **Dionaea muscipula Sol. ex J. Ellis, Venus'-fly-trap** *n.* A carnivorous plant (Droseraceae) native to North and South Carolina, U.S., and characterized by having leaves with long, narrow marginal teeth which close around arthropod prey (Lawrence 1951, 529).

Comments: John Bartram found *D. muscipula* in North American in about 1765. Horticulturalists have developed cultivars of this species including 'Akai Ryu,' 'Big Mouth,' 'Dingley Giant,' 'Fine Tooth x Red,' and 'Royal Red' (Best Carnivorous Plants 2002).

[*Dione*, mother of Venus (goddess of love); *muscipula*, little fly]

- **Dipterocarpaceae, Dipterocarps** *n.* A plant family found in Africa, India, South America, and Southeast Asia (Angiospermae: Malvales) (Blundell 1999, 32).

Comment: Many dipterocarp species are tall, some growing up to 230 ft; canopy-emergent; and the more common trees in certain Asian rainforests (Buchmann and Nabhan 1996, 2451; Blundell 1999, 32).

- **Domestic Apple** See Plantae: *Malus sylvestris*.

- **Downy Brome** See Plantae: *Bromus tectorum*.

- **Eichornia crassipes (Mart.) Solms, Water-hyacinth** *n.* A South American, aquatic, floating, perennial herb (Pontederiaceae) (Bell and Taylor 1982, 48).

Comments: This species was, or is, a troublesome, highly invasive weed in bodies of water in many parts of the world including Florida and Lake Victoria, Africa (Vick 1999, A25). For example in Lake Victoria it greatly affected the electrical power production, fishing industry, spread of water-related human disease, and transportation. Two weevil species *Neochetina bruchi* and *N. eichhorniae*, introduced into the Lake in 1997, greatly reduced the population size of this plant.

- **Elegant Dutchman's-pipe** See Plantae: *Aristolochia elegans*.

- **Entandrophragma** *n.* A genus of 35 species of plants (Meliaceae) native to tropical and South Africa (Schmidt 1994–2000, 21 November 2000).

Comments: This genus includes trees that produce wood called "cedar" or "mahogany" in the lumber trade (Quammen 2000, 22, 26–27; Schmidt 1994–2000, 21 November 2000). Species include *E. angolense* (Tiamo), *E. candolieri* (Kosipo, Sipo), and the premium African hardwoods *E. cylindricum* and *E. utile* (Sapele).

- **Ferns** See Plantae: Pterophyta.

- **Fitzroya cupressoides (Molina) I. M. Johnston, 1924; Patagonian Cypress** *n.* A long-lived gymnospermous tree (Cupressaceae) native to Argentina and Chile (Earle 2000, illustrations;

Lentner 2000, illustration; Moore 2000, 532, illustration).

syn. *Alerce*, *Sequoia* of South America and many other synonyms (Earle 2000)

Comments: This conifer, which can live over 3,600 yr, is the second longest-lived tree known (Moore 2000, 532). The Bristlecone Pine is longest-lived tree.

[Spanish *Alerce*]

- **forb** *n.*

1. A weed, or other herb, that is not a grass (Michaelis 1963).

2. A nongrassy herb; an herb that is not a grass, rush, or sedge; contrasted with herb (Allaby 1994).

Comment: Forb is contrasted with alga and nonseed plants including clubmoss, horsetail, and moss and the seed plants grass, herb, shrub, and tree.

[Apparently from Greek *phorbe*, fodder]

- **Giant Sequoia** See Plantae: *Sequoiadendron giganteum*.

- **Gnetophyta, Gnetophytes** (KNEE toh FIGHT ah, knee TOHF ah tah, KNEE toh FIGHTS) *n.* A gymnosperm phylum characterized by compound staminate strobili in some species, double fertilization in *Ephedra* which also occurs in Angiosperms, opposite whorled leaves, and vessels in secondary wood, (Lawrence 1951, 368; Campbell 1996, 557, illustration; Strickberger 2000, 314).

syn. Gnetae (Campbell 1996, 550).

Comment: There are about 70 living gnetophyte species (Campbell 1996, 550). Genera include *Ephedra*, *Gnetum*, and *Welwitschia*.

[New Latin *gnetum* + Greek, *phyton*]

- **Golden Aspen** See Plantae: plant: *Populus tremuloides*.

- **grass** *n.*

1. A species in the Poaceae (Grass Family).
2. Broadly, a grass (Poaceae), rush (Juncaceae), or a sedge (Cyperaceae).

Comment: Grass is contrasted with the nonseed plants including Clubmosses, Horsetails, and Mosses; the seed plants forbs, herbs, shrubs, and trees; and the protist Algae.

- **Gum Elemi, Gumbo-limbo** See Plantae: Burseraceae (comment).

- **Gymnospermae, Gymnosperms** (JIM no SPERM ee, JIM no SPERMS) *n.* A seed-bearing, tracheophyte group characterized by having no enclosed chambers (ovaries) in which seeds develop; gymnosperm seeds are not in fruits and are called "naked;" distinguished from Angiospermae (Campbell 1996, 560; 561, illustration; Strickberger 2000, 307).

Comment: Gymnospermae contains Coniferophyta, Cycadophyta, Ginkgophyta, Gnetophyta, and Pteridospermophyta. There are about 721 living gymnosperm species (Campbell 1996, 550). Gymnospermae might be a polyphyletic group (Arnold 1948 in Stewart 1983, 229), or Gymnospermae might be a monophyletic group derived from a progymnosperm ancestor (Beck 1976 in Stewart 1983, 229). The first gymnosperms appeared in the Devonian Period.

[Greek *gymnos*, naked + *sperm*, seed; referring to seeds which are not enclosed in fruits as in angiosperms]

■ ***Helianthus*** *n.* A genus (Asteraceae) with about 80 species of annual and perennial herbaceous plants native to Central America, Chile, North America, and Peru (Brickell and Zuk 1996, 504).

[Greek *helios*, sun; *anthos*, a flower]

■ ***Helianthus annuus* subsp. *texanus*** *n.* An annual herbaceous plant (Asteraceae) native to Texas. *Comments:* This subspecies appears to be a natural hybrid of *H. annuus* and *H. debilis* subsp. *cucumerifolius* (each with haploid numbers of 17) that is backcrossed with *H. annuus* according to Kim and Rieseberg (1999, 965). Under laboratory conditions, these researchers produced backcross progeny using these same two species that resemble natural *H. a.* subsp. *texanus*. The introgression of just three small chromosomal blocks appears to be sufficient to recover most of the phenotype of *H. a.* subsp. *texanus* in the backcross experiment.

■ **herb** *n.*

1. A nonwoody plant that withers and dies away after flowering (Michaelis 1963).
2. A small, nonwoody, seed-bearing plant whose aerial parts all die back to the ground at the end of each growth season (Allaby 1994).
3. A plant which may be an annual, biennial, or perennial that does not have hard, woody stems or such stems that overwinter and produce new plant parts that sprout during the warm season (inferred from Usher 1996, 179).

syn. herb (Brown and Brown 1984; Usher 1996, 179)

Comments: Herb is contrasted with alga and nonseed plants including clubmoss, horsetail, and moss and the seed plants grass, shrub, and tree and contrasted with woody plant (Michaelis 1963). Definition 3 is the most accurate one because herbs do not necessarily die after flowering (as indicated in def. 1), and herbs are not necessarily small plants (as indicated in def. 2). Some herbs such as banana species, grow over 15 ft tall; some canna species, over 8 ft tall; and some *Heliconia* species up to 29 ft tall (Berry and Kress 1991). These plants have trunk-like main stems composed of leaf bases, not woody stems. Many perennial tropical herbs eventually die back to the ground sometime after they flower, not necessarily at the end of a growing season. In annual species, entire plants die at the end of each season.

[Latin *herba*, grass, herbage]

■ **Himalayan Balsam** See Plantae: *Impatiens glandulifera*.

■ **honey plant** *n.* A plant whose nectar, honeydew, or both is used by *Apis mellifera* (Western Honey Bees) for honey production (inferred from Pellett 1978).

major-honey plant *n.* A kind of honey plant from which *Apis mellifera* (Western Honey Bees) frequently store surplus honey, that is honey not quickly consumed by the colony

that produces it; contrasted with minor-honey plant (inferred from Pellett 1978).

Comments: Some kinds of plants are always minor honey plants. Other kinds can be major, or minor, honey plants depending on their abundances, genetic strains, geographic locations, weather conditions, or a combination of these factors (Pellett 1978, 12–14).

■ **minor-honey plant** *n.* A kind of honey plant from which *Apis mellifera* (Western Honey Bees) do not, or infrequently, store surplus honey, i.e., honey not quickly consumed by the colony that produces it; contrasted with major-honey plant, *q.v.* (inferred from Pellett 1978).

■ **Horsetails** See Plantae: Sphenophyta.

■ ***Impatiens glandulifera* Royle, Himalayan Balsam** *n.* A pink-flowered, herbaceous plant (Balsaminaceae) (Nilsson and Berggren 2002, 789).

syn. Indian Balsam, Ornamental Jewelweed, Policeman's-helmet

Comment: People brought this species to Europe as a garden flower, and it is now an aggressive, alien species in European riparian ecosystems (Nilsson and Berggren 2002, 789). This species is also invasive in 12 U.S. states (United States Department of Agriculture 2007).

■ **invasive plant** *n.* An alien plant that thrives in a location in which it is not native, e.g., *Taraxacum officinale* (Common Dandelion), a Eurasian species that now grows in many other parts of the world.

cf. bioinvasion

Comments: Hundreds of invasive-plant species occur in the U.S. (www.state.va.us/~dcr/dnh/invlist.htm). The Invasive Plants Alert (IPA) is an outreach program funded by the Biodiversity Convention Office, Environment Canada, with in-kind support provided by the Canadian Nature Federation. Its site includes much information on *Alliaria petiolata* (Garlic-mustard) and other invasive-plant species in North America (www.infoweb.magi.com/~ehaber/alert.html). Invasive plants are a worldwide, multibillion-dollar problem.

■ ***Ipomoea*, Morning-glory, Morning Glory** *n.* A cosmopolitan dicot genus (Convolvulaceae) of about 600 species (Clegg and Durbin 2000, 7016).

Comments: *Ipomoea* has annual and perennial species, most of which are herbaceous (Clegg and Durbin 2000, 7016). *Ipomoea purpurea* (Common Morning-glory, Morning-glory) is native to Central Mexico, and is currently widespread in Southeastern U.S. This species has few floral color morphs in its native habitats and many floral color morphs in the U.S. Most of the flower color variants are due to transposable elements (*q.v.*). *Ipomoea nil* (Japanese Morning-glory) is in the same subgenus as *I. purpurea* and has similar floral-color genetics. Floral color of *I. purpurea* is a promising model for evolutionary studies at the molecular, genetic, morphological, and adaptation levels.

■ **Jimsonweed** See Plantae: *Datura*.

■ **Leyland Cypress** See Plantae: *X Cupressocyparis leylandii*.

- ***Limnanthes alba* Benth., Meadowfoam** *n.* A small, herbaceous winter-spring annual (Limnanthaceae) native to Northern California and Southern Oregon, U.S. (www.csl.gov.uk/ienica/data/meadow.html, 2001; www.manukahoney-usa.com/MeadowfoamHoney.html, 2001).
Comment: People grow this bee-pollinated plant for the polyunsaturated oil in its seeds and for its vanilla-flavored honey (www.csl.gov.uk/ienica/data/meadow.html, 2001).
 [Meadowfoam, after a typical canopy of flowers that can cover patches of soil]
- ***Liriodendron tulipifera* L., Tuliptree** *n.* A deciduous North American tree (Magnoliaceae) characterized by having large green, orange, and yellow flowers.
syn. Tulip Poplar, Tulip Tree, tulip tree, Yellow Poplar (Alden et al. 2007, 38)
Comment: The preferred nonscientific name for this species is Tuliptree because it is not a poplar (Salicaceae, Willow Family), and “tree” is not a taxonomic unit.
- **London Plane Tree** See Plantae: *Platanus xacerifolia*.
- **Longleaf Pine** See Plantae: *Pinus palustris*.
- **Lycophyta, Lycophytes** (LEYE koh FIGHT ah, LEYE KOPH fah tah, LEYE ko FIGHTS) *n.* A seedless tracheophyte group characterized by having microphylls, roots, and sporophylls (leaves specialized for reproduction) (Campbell 1996, 557, illustration; Strickberger 2000, 314).
syn. Clubmosses, groundpines (for *Lycopodium*)
Comment: There are about 100 living lycophyte species (Lawrence 1951, 337).
 [Greek *lykos*, wolf + plant]
- ***Lygodium microphyllum* (Cav.) R. Br., Old-World Climbing Fern** *n.* A climbing fern (Schizeaceae) from China, east India, Southeast Asia, and tropical Africa (Mirsky 1999, 24).
Comment: This invasive fern is choking out native organisms in Southern Florida (Mirsky 1999, 24). An Australian moth and a Thai sawfly consume this plant.
- ***Lythrum salicaria* L., Purple Loosestrife** *n.* A bright, magenta-flowered, perennial forb (Lythraceae) native to Eurasian fens and riversides (Nilsson and Berggren 2002, 789).
Comment: *Lythrum salicaria* is now an abundant, aggressive, alien, invasive species in North America (including 43 U.S. states) where it thrives in almost any kind of wetland and forms stands that crowd out many species of native plants and their associated organisms (Nilsson and Berggren 2002, 789; United States Department of Agriculture 2007). Although *L. salicaria* can cause ecological disasters, its flowers are visited by many kinds of pollinating insects (pers. obs.).
- **Maize** See Plantae: *Zea mays*.
- **major-honey plant** See Plantae: honey major-honey plant.
- ***Malus x pumila* P. Mill., Domestic Apple** *n.* A hybrid tree (Rosaceae) which is the source of many of the apples of commerce such as *Malus ‘Cameo’*, *Malus ‘Fuji’*, *Malus ‘Golden Delicious’*, *Malus ‘Granny Smith’*, *Malus ‘MacIntosh’*, *Malus ‘Red Delicious’*, and *Malus ‘Winesap’* (United States Department of Agriculture, 2007).

Comments: There are many nonscientific and scientific names for *M. x pumila*. One parent of *M. x pumila* is likely to be *Malus sieversii* from Eurasia (Volk et al. 2007). *Malus x pumila* now grows wild in many parts of the U.S. (United States Department of Agriculture, 2007).

- **Mango** See Plantae: Anacardiaceae (comment).
- **Marijuana** See Plantae: *Cannabis indica*.
- **Meadowsweet** See Plantae: *Limnanthes alba*.
- ***Metasequoia glyptostroboides* Miki ex Hu and Cheng, 1948; Dawn Redwood** *n.* A coniferous tree (Taxodiaceae) currently native to western Hupeh and adjacent Szechwan Provinces southward to the Hills of western Huan Province, China (Hu 1980, 41; Stewart and Rothwell 1993, 432–433; Metasequoia.org, 2000).
syn. Chinese Redwood, Shui Sa (= Water-fir, Chinese name)
cf. fossil: living fossil
Comments: The genus *Metasequoia* is known from fossils as old as ca. 70 Ma (Stewart and Rothwell 1993, 432–433). It grew in both western North America and northern Asia during the early and middle Tertiary Era (Hu 1980, 65). Scientists thought that this genus went extinct about 20 Ma ago, until Miki reported living trees in China in 1941. Researchers found over 6,000 trees of *M. glyptostroboides* growing naturally in China since 1947; currently people cultivate this species in many areas of the world (Metasequoia.org, 2000).
 [Greek *meta*, akin to + *Sequoia*, a gymnosperm genus; *glyptostroboides*, after *Glyptostrobus*, the Chinese Swamp Cypress, which *M. glyptostroboides* resembles. Dawn, after the possibly erroneous hypothesis that *M. glyptostroboides* is an ancestral *Metasequoia* species; Redwood, after this species similarity to Redwood (Metasequoia.org, 2000)]
- **minor-honey plant** See Plantae: honey minor-honey plant.
- **Monarch-of-the-East** See Plantae: *Sauromatum guttatum*.
- **Monocotyledonae, Monocots** (MON oh COT il LEE don eee, MON OH cots) *n.* A plant class in Phylum Anthophyta found throughout the world and characterized by species that have one cotyledon per plant, no true secondary growth with vascular cambia, scattered stem vascular bundles, floral parts usually in multiples of threes, and “parallel” leaf venation; distinguished from Dicotyledonae (Curtis 1983, 1080; Chapter 28, illustrations).
Comments: There are about 65,000 extant Monocot species (Curtis 1983, 1080).
- **Morning-glory, Morning Glory** See Plantae: *Ipomoea*.
- **Mosses** See Plantae: Bryophyta.
- **Mouse-ear Cress** See Plantae: *Arabidopsis thaliana*.
- ***Nicotiana*** *n.* A genus in the Solanaceae (Lawrence 1951, 694).
Comments: People grow *Nicotiana tabacum* (Tobacco) for use in cigars, cigarettes, pesticides, and other products and other *Nicotiana* spp. as ornamentals.
cf. post-translational gene silencing

- [after Jean Nicot, who introduced tobacco to France in 1560]
- **Northern Red Oak** See *Quercus rubra*.
 - **Old-World Climbing Fern** See Plantae: *Lygodium microphyllum*.
 - **Oncidium** See Plantae: Orchidaceae: *Oncidium*.

- **Ophrys** See Plantae: Orchidaceae: *Ophrys*.
- **Orchidaceae, Orchids** *n.* A monocot family characterized by having flowers with three sepals, three petals including one modified into a labellum which is often larger and more showy than the other two petals, a column (a fleshy, club-shaped fusion of female and male reproductive organs), and one anther with two through eight pollinia (Shuttleworth et al. 1970, 45; Orchidales, Encyclopaedia Britannica Online, www.eb.com, 2000).

Comments: Below an orchid's anther is its stigma on its column. A single orchid fruit (= capsule) can contain over a million tiny seeds (Shuttleworth et al. 1970, 4–5; Orchidales, Encyclopaedia Britannica Online (www.eb.com, 2000).

Orchidaceae contains over 25,000 described species and over 25,000 artificial hybrids; it might be the largest plant family based on number of species. Orchid plants are from about 1 in through over 25 ft tall. Most species grow as nonparasitic epiphytes; others grow in the ground; and one species *Rhizanthella gardneri* is evidently a saprophyte that grows and flowers underground.

Most orchid species set seeds after cross-pollination, and many species are each pollinated by only one or a few kinds of insects. Many kinds of orchid flowers have constructions that cause insect floral visitors to contact and pick up pollinia. Bees pollinate *Catasetum* spp., *Coryanthes macrantha*, *Cycnoches* spp., *Cypripedium* spp., *Gongora* spp., *Ophrys* spp., *Orchis* spp., and others; gnats and mosquitoes, *Pterostylis* spp.; butterflies, *Epidendrum secundum*; hummingbirds, *Comparettia falcata*, *Elleanthus capitatus*, and *Laelia milleri*; sphinx moths, *Angraecum sesquipedale*; male wasps, *Chiloglottis* spp.; male *Andrena* bees, *Ophrys* spp.

Orchids as a group use floral color, floral movement in the wind, floral shape, nectar, or a combination of these attributes as their major attractant(s) of pollinators. Orchids that provide nectar, do not provide all of the food that their pollinators use for feeding themselves and their young as do many other plant species. Many orchid species are nectarless, and attract pollinators usually by deceptive attractants such as bright colors, fragrances, and pseudopollen. Some genera readily hybridize and produce viable seeds under artificial conditions, including *Brassavola*, *Cattleya*, and *Laelia* which produce *XBrassocattleya*, *XBrassolaeliacattleya* and *XLaeliacattleya*.

Orchidaceae is economically important as a source of folk medicine and cures, many kinds of horticultural plants, seasoning from leaves, and vanilla (from three species of the genus *Vanilla*). Many orchid species are illustrated

in Jay's Internet Orchid Species Encyclopedia and links to this site (www.orchidspecies.com, 2000).

cf. copulation: pseudocopulation
[Greek *orchis*, testicle, after some orchid species that have ribbed, thickened stems that resemble Human testicles]

Angraecum sesquipedale Thours, 1822; Star-of-Bethlehem Orchid *n.* An perennial species (Orchidaceae) from Malagasy Republic characterized by having white petals, flowers with a star-like form, and a nectar spur almost 12 in long (Shuttleworth et al. 1970, 152, illustration; www.orchidspecies.com, 2000).

syn. Comet Orchid and other names (www.orchidspecies.com, 2000).

Comments: Darwin (1862) predicted that this orchid is pollinated by a moth with a tongue long enough to reach nectar at the end of its nectar spur (Shuttleworth et al. 1970, 152). Researchers later found the moth *Xanthopan morgani praedicta* (Sphingidae) whose tongue is long enough to reach the nectar of this species, but not yet observed to pollinate it.

Coryanthes Hooker, 1831; Bucket Orchids *n.* An orchid genus from Honduras and Guatemala through Brazil and Peru that comprises 15 species characterized by having extremely complex flowers each with two faucet glands that fill its bucket-like labellum with liquid (Shuttleworth et al. 1970, 100, illustration; www.orchidspecies.com, 2000).

Comments: Male euglossine bees (*Euglossa* and *Eulaema*) are attracted to the strong odor of the fleshy margins a *Coryanthes* labellum which they scratch (Orchidales, Encyclopaedia Britannica Online, www.eb.com, 2000). Some of these bees fall into the liquid. When a bee crawls through the flower's spout-like aperture between its column and labellum, his only escape, he may pick up a pollinium which he may deposit on another flower, effecting cross-pollination. A *Coryanthes* flower stops emitting scent within minutes of its pollinia removal (O'Toole and Raw 1991, 152). Euglossines no longer find it attractive, until its starts emitting scent again in about 1 day when its stigma is receptive. This floral behavior evidently promotes cross-pollination.

Dendrophylax lindenii (Lindley) Bentham ex Rolfe, Ghost Orchid *n.* An epiphytic, endangered orchid native to Cuba and Florida, U.S., characterized by flat, cord-like photosynthetizing roots, greatly reduced leaves and stems, and fragrant, white flowers, each with a long nectar spur (Brown and Folsom 2005, 80; Little 2010; Subrahmanyam 2010).

syn. Frog Orchid, Palm Polly, *Polyrhiza lindenii*, White Frog Orchid, and other names

Comments: This orchid plays a pivotal role in the non-fiction book The Orchid Thief (Orlean 1998) and the film called Adaptation that is based on the book.

[*lindenii* after Belgian plant collector Jean Jules Linden who saw this orchid for the first time in Cuba in 1844]

Oncidium Swartz, 1800 *n.* An orchid genus from the Caribbean Area, Central America, Florida, and South America and having over 750 species (Shuttleworth et al. 1970, 126, illustrations; www.orchidspecies.com, 2000). *Comments:* Male *Centris* bees evidently perceive flowers of some *Oncidium* spp. as territorial intruders. They strike at the flowers in flight, and pick up pollinia in the process (Orchidales, Encyclopaedia Britannica Online, www.eb.com, 2000).

Ophrys Linnaeus, 1753 *n.* An orchid genus with about 30 species in Eurasia and North Africa, and characterized by having metallic-colored, hairy flowers that resemble insects (Shuttleworth et al. 1970, 4–5, illustration; www.orchidspecies.com, 2000).

Comments: *Ophrys apifera* (Bee Orchid) and *O. insectifera* (Fly Orchid) are common European species (Shuttleworth et al. 1970, 4–5). Male bees and wasps pollinate these *Ophrys* through pseudocopulation, *q.v.*

Vanilla Miller, 1754; **Vanilla Orchids** *n.* An orchid genus that produces the vanillin used as a spice (Orchidales, Encyclopaedia Britannica Online, www.eb.com, 2000; www.orchidspecies.com, 2000).

Comment: *Vanilla planifolia* is the main species from which people obtain vanillin; people also cultivate *V. pompona* and *V. tahitensis* for this compound (Orchidales, Encyclopaedia Britannica Online, www.eb.com, 2000). [New Latin < Spanish *vainilla*, diminutive of *vaina*, sheath, pod < Latin *vagina*, sheath; after its pods that contain its seeds]

■ **Paleoclusia chevalieri** (Crepet and Nixon, 1998) *n.* A dicot (Clusiaceae) known from 90-Ma-old fossils from the Old Crossman Pit, New Jersey (Yoon 1999, 21 December, D1, illustration).

Comment: This species has resin ducts in its flowers that might have produced a resin used by bees (Yoon 1999, 21 December, D1).

■ **Patagonian Cypress** See Plantae: *Fitzroya cupressoides*.

■ **Pericopsis** *n.* A genus of seven species (Fabaceae) native to the Carolina Islands and Palau, Ceylon, and tropical Africa (Schmidt 1994–2000).

syn. Afrormosia

Comments: The five species native to tropical Africa yield afrormosia wood. One species native to Ceylon yields a cabinet wood known as nedun, and one species is found on Palau and the Carolina Islands (Schmidt 1994–2000). *Pericopsis elata* from Africa produces a highly valuable wood (Quammen 2000, 22).

■ **Petunia** *n.* A genus in Solanaceae (Lawrence 1951, 694).

cf. post-translational gene silencing

Comments: There are many *Petunia* cultivars.

■ **phanerogam** *n.*

1. A plant that produces seeds; a seed plant; contrasted with cryptogam (Lawrence 1951, 764).

syn. spermatophyte

Note: Phanerogams include Anthophyta, Coniferophyta, Cycadophyta, Ginkgophyta, Gnetophyta, and Pteridopermophyta.

2. A member of the former division of plants Phanerogamia that includes plants with flowers and seeds; distinguished from cryptogam (Michaelis 1963).

adj. phanerogamic, phanerogamous
[French *phanérogame*, ultimately from Greek *phaneros*, visible; *gamos*, marriage]

■ **Pinus palustris** Mill., **Longleaf Pine** *n.* A gymnospermous tree (Pinaceae) native to Southeastern U.S. (Grimm 1962, 45, 46, iii).

syn. Longleaf Yellow Pine, Southern Yellow Pine (Little 1980, 291)

Comments: Forests of Longleaf Pines are now rare (Raver 2000: D8). In the 1700s, 100-ft-tall trees of this species covered about 85 million acres from Virginia through Florida. Individuals of this species withstand fires that kill faster-growing pine species in its native range.

■ **Platanus xacerifolia**, **London Plane Tree** *n.* A tree (Platanaceae) that may be a hybrid of the Eastern Sycamore (*P. occidentalis*) and the Oriental Plane Tree (*P. orientalis*) (Queens University 2002), a variant of *P. orientalis*, or an intraspecific hybrid within *P. orientalis* (Chengappa 2002).

syn. P. xhispanica, P. xhybrida

Comments: People often plant London Plane Trees along roads and in city parks because they can withstand urban conditions. Variants of the London Plane Tree include *P. xacerifolia* 'Augustine Henry'; *P. xacerifolia* 'Liberty'; *P. xacerifolia* (London Form), London Plane Tree, *P. xacerifolia* 'Pyramidalis'; and *P. xacerifolia* 'Suttnerii,' Variegated London Plane Tree.

■ **Poales, Grasses** *n.* The historic taxonomic order that contains Cyperaceae (Sedges), Juncaceae (Rushes), and Poaceae (syn. Gramineae, grasses *sensu stricto*), and other allied families (Lawrence 1951, 386).

syn. Glumiflorae, Graminales (Lawrence 1951, 386)

Comment: The Tree of Life (<http://www.tolweb.org/Commelinanae/21340>, 2009) does not include the taxonomic name "Poales" and its synonyms.

[Greek *poa*, grass]

■ **Poison-ivy** See Plantae: Anacardiaceae (comment).

■ **Polemonium viscosum** Nuttall, **Alpine Skyilot** *n.* A long-lived polycarpic, herbaceous plant (Polemoniaceae) native to mountains in Washington, Oregon, Nevada east through the Rocky Mountain Region from New Mexico through Alberta (Spellenberg 1979, 672, illustration; Galen 1996, 120; Schneider 2001, illustration).

syn. Sky Pilot (Spellenberg 1979, 672)

Comments: Flower shape of this species varies with altitude, with corolla flare's (the distance between opposite corolla lobes) increasing 12% over an elevational gradient of 500 m (Galen 1996, 120). Natural selection caused by bumble bees can cause a rapid evolutionary change of a 9% increase in corolla flare in one season.

[Skypilot, after the high habitat of this species (Spellenberg 1979, 672)].

■ ***Populus tremuloides* Michaux, Trembling Aspen** *n.* A widespread, North American, clonal, pioneer, short-lived tree (Salicaceae) (Little 1996, 344–345; Matthews 1998, 5 October, A3).

syn. Golden Aspen, Quaking Aspen

cf. Fungus: *Armillaria*

Comments: This species grows often as pure stands in western mountains and in an altitudinal zone below fir-spruce forests covering millions of acres in North America (Little 1996, 344–345; Matthews 1998, 5 October, A3). Conifers replace this species in succession. It is a major organism in ecosystems that harbor many other organisms. Much plant undergrowth occurs in Golden-Aspen forests. This species leaves more water in the ground than conifers, and therefore, allows more water to flow into streams and other bodies of water. Golden Aspens reproduce primarily by cloning. One clone in southern Utah covers 106 acres, contains about 47,000 stems, and weighs about 6,000 tons, possibly making it the largest living organism.

■ **Progymnospermophyta, Progymnosperms** (PRO JIM no SPERM oh FIGHT ah, PRO JIM no SPERM AF ah tah, PRO JIM no SPERMS) *n.* An extinct plant phylum characterized by gymnospermic secondary wood and pteridophytic reproduction (Beck 1969 in Stewart 1983, 216–229, illustrations; Campbell 1996, 562, illustration; Strickberger 2000, 311, illustration).

[Greek *pro*, before + *gymnos*, bare + *sperm*, seed + *phyton*, plant]

■ **Psilophyta, Psilophytes** (SEYE lo FIGHT ah, SEYE LAHF ah tah) *n.* A seedless-tracheophyte group characterized by having lateral sporangia and no leaves or roots (Campbell 1996, 557, illustration; Strickberger 2000, 304).

Comment: There are about 10–13 living psilophyte species (Campbell 1996, 550).

[Greek *psilos*, bare, smooth + *phyton*, plant]

■ **Pterophyta, Ferns, Pterophytes** (TARE oh FIGHT ah, TARE AHF ah tah, TARE oh FIGHTS) *n.* A seedless-tracheophyte phylum characterized by having catapulting sporangia often arranged in clusters called sori and megaphylls (Campbell 1996, 558, illustration; Strickberger 2000, 307).

syn. Class Filicinae (Lawrence 1951, 342), Pteridophyta (Brown and Brown 1984, 1), Pteridophytes (Michaelis 1963)

Comment: There are about 12,000 living fern species in many genera (Campbell 1996, 550).

[Greek *pteron*, feather + *phyton*, plant; referring to feathery leaves of some species]

■ **Purple Loosestrife** See Plantae: *Lythrum salicaria*.

■ **Purple Pitcherplant** See Plantae: *Sarracenia purpurea*.

■ **Quaking Aspen** See Plantae: *Populus tremuloides*.

■ ***Quercus alba* Linnaeus, 1753; Eastern White Oak** *n.* A long-lived, deciduous tree (Fagaceae) native to Canada and the U.S. and characterized by leaves with rounded lobes and a fruit with a shallow, bowl-shaped cup with tubercu-

late, puberulent scales and an ovoid through ellipsoid acorn (Fernald 1950, 543).

syn. Stave Oak, White Oak

[Latin *Quercus* < Celtic *quer*, beautiful; *cuez*, tree; *alba*, white, possibly referring to the whitish undersides of its mature leaves]

■ ***Quercus rubra* Linnaeus, 1753, Northern Red Oak** *n.* A long-lived, deciduous tree (Fagaceae) that is native to Canada and the U.S. and characterized by leaves with pointed lobes and a fruit cup with fine, closely appressed scales that is very much shorter than its ovoid through ellipsoid acorn (Fernald 1950, 546).

syn. Red Oak

[Latin *Quercus* < Celtic *quer*, beautiful; *cuez*, tree; *rubra*, red, perhaps referring to the reddish color of this species' autumnal leaves]

■ **Redwood** See Plantae: *Sequoia sempervirens*.

■ **Rhyniophyta, Rhyniophytes** (REYE nee oh FIGHT ah, REYE nee AHF ih tah; REYE NEE oh FIGHTS) *n.* An extinct, seedless, tracheophyte group characterized by having fossils indicating that it was the first to inhabit land; no leaves or roots; and terminal sporangia (Campbell 1996, 556, illustration; Strickberger 2000, 304).

[after Rhynie, Aberdeenshire, Scotland, near where some rhyniophyte fossils occur + Greek *phyton*, plant]

■ ***Sarracenia purpurea* Linnaeus, Purple Pitcher-plant** *n.* A long-lived, rosette-forming, perennial, carnivorous plant (Sarraceniaceae) native to Canada and Eastern U.S. (Ellison et al. 2004, 1930).

Comments: The fluid within a leaf of *S. purpurea* is a microecosystem with many species including *Wyeomyia smithii* (Pitcherplant Mosquito), *q.v.* (Peterson et al. 2008, 2257).

■ ***Sauromatum guttatum* (Wall.) Schott, 1832; Voodoo-lily** *n.* A herbaceous aroid (Araceae) from the Himalaya Mountains characterized by an inflorescence with a maroon spadix, green spathe with maroon spots, and an odor of Domestic Cow manure (Araceae) (Brickell and Zuk, 1996, 936; Vascular Tropicos Nomenclatural Database, 1999).

syn. *Sauromatum guttatum* var. *venosum* (Aiton) Engl., 1920, *S. venosum* (Aiton) Kunth, 1841, Monarch-of-the-East

Comments: Researchers have investigated heat production of inflorescences of *S. guttatum* (Skubatz and Kunkel 1999, 841, and references therein). Its floral odor attracts flies and other meridivorous arthropods, some of which pollinate it. This plant can flower from a corm in a humid atmosphere without soil, and some people grow this species as a curiosity. The inflorescence produces a fruity scent in its basal area and a scent of Domestic Cow manure in its distal area (pers. obs.).

■ **Sequoia of South America** See Plantae: *Fitzroya cupressoides*.

■ ***Sequoiadendron giganteum* (Lindley) Buchholz, Giant Sequoia** *n.* A coniferous tree (Cupressaceae) native to California, U.S. (Coombes 2002, 82).

Comment: This species grows up through 80 m tall (Coombes 2002, 82).

- ***Sequoia sempervirens* (D. Don) Endlicher, California Redwood, Redwood** *n.* A coniferous tree (Cupressaceae) native to California and Oregon, U.S. (Coombes 2002, 82).
Comment: This species grows up through 100 m tall, making it the tallest tree species (Coombes 2002, 82).
- **shrub** *n.*
1. A low, woody perennial plant with persistent stems and branches springing from its base; contrasted with forb, grass, subshrub, tree, and woody vine (Michaelis 1963).
 2. A woody plant that branches below, or near, the ground level into several main stems; has no main trunk; and whose branches do not ordinarily die back at the end of each growing season (Allaby 1994).
 3. A woody-plant species that grows under 15 ft (inferred from Farrar 1995, viii).
- syn. bush* (Allaby 1994)
cf. Plantae: bush
Comments: Brockman (1968, 13) notes that a shrub is usually shorter than 15 ft. A convenient rule-of-thumb for discriminating shrubs from trees, is to consider a woody plant a tree if it is more than 15 ft tall, and a shrub if it is less than 15 ft tall.
[Old English *scrybb*, brushwood]
- subshrub** *n.* A woody plant that is smaller than a shrub, produces wood only at its base, has abundant growth branching upwards from its base, and whose upper stems die back at the end of each growing season (Allaby 1994).
- **Shui Sa** See Plantae: *Metasequoia glyptostroboides*.
- **Sky Pilot** See Plantae: *Polemonium viscosum*.
- **Southern Longleaf Pine** See Plantae: *Pinus palustris*.
- **Southern Yellow Pine** See Plantae: *Pinus palustris*.
- **Sphenophyta, Horsetails, Sphenophytes** (SPHEN oph fight ah, sphen NOHF ah tah) *n.* A seedless-tracheophyte group characterized by having jointed stems; tiny, or no, leaves in extant species; and terminal sporangia (Campbell 1996, 556, illustration; Strickberger 2000, 306).
Comment: There are about 25 living sphenophyte species all in the genus *Equisetum* (Lawrence 1951, 336).
[Greek *sphenos*, wedge; perhaps after the shape of the strobilus in some species]
- **Spring-beauty, spring beauty** See Plantae: *Claytonia virginica*.
- **Star-of-Bethlehem Orchid** See Plantae: Orchidaceae: *Angraecum sesquipedale*.
- **Sumacs** See Plantae: Anacardiaceae (comment).
- **tamarisk** See Plantae: *Tamarix*.
- **Tamarix L., Tamarisk** *n.* A genus of 54 species of trees and shrubs (Tamaricaceae) native to the Mediterranean Region, Middle East, and North Africa (Nilsson and Berggren 2002, 789).
Comment: These plants are highly aggressive, alien species that have replaced many trees and their associated organisms in Australia and Southwest U.S. (Nilsson and Berggren 2002, 789). Eleven species have invaded the U.S.,

and the genus now occurs in 36 states (United States Department of Agriculture 2007).

- ***Taxus baccata* Linnaeus, European Yew** *n.* A slow-growing, evergreen coniferous tree (Taxaceae) native to England, Ireland, and northern European east through northern Iran (Earle 2001, The Royal Forestry Society 2001).

Comments: *Taxus baccata* sometimes forms almost pure stands, with excellent examples on the chalk at Kingley Vale, the South Downs near Chichester, and in the Irish Republic at Muckross, in Killarney National Park, on the limestone pavement (Earle 2001; Mina di Sospiro 2001, 168, illustration; The Royal Forestry Society 2001). The Fortingall Yew in Perthshire, Scotland might be 2,000 yr old. The Tisbury Yew in Wiltshire and the Crowhurst Yew in Surrey, England, are said to be about 4,000 yr old, but without supporting scientific data. Yew wood is among the denser of all conifers, is elastic, and was once used for making dagger handles, long bows, and spears. The Yew is an immortality symbol. Past Europeans planted Yews as acts of sanctification near to where they expected to be buried. Over the centuries, people often planted Yews in churchyards and as an ornamental trees elsewhere. The anti-cancer drug taxol comes from *Taxus*. Mina Di Sospiro (2001) wrote a delightful multifaceted story told by a Yew (portrayed as the most intelligent forest organism) that lived over 2,000 yr in an Irish forest.

- **Titan Arum** See Plantae: *Amorphophallus titanum*.

- **Tobacco** See Plantae: *Nicotiana* (comment).

- **Tracheophyta, Vascular Plants** (TRAY key o FIGHT ah, tray key AHF ah tah) *n.* A plant group characterized by having phloem and xylem (Campbell 1996, 555–556; Strickberger 2000, 303).

Comment: There are about 248,746 living tracheophyte species (Campbell 1996, 550).

[Greek *trachea*, windpipe + plant, referring to fluid-conducting cells]

- **tree** *n.*

1. A perennial woody plant usually with a single, self-supporting trunk of considerable height and with branches and foliage growing at some distance above the ground; contrasted with herb, shrub, and woody vine (Michaelis 1963).

2. Any shrub or plant that assumes treelike shape or dimensions, e.g., a banana “tree” (Michaelis 1963).

3. A woody-plant that is at least 15 ft tall at maturity and has a well developed crown and a single trunk at least several inches in diameter (Brockman 1968, 13).

4. A woody plant with a single main stem (its trunk) that is unbranched near the ground and whose branches do not ordinarily die back at the end of each growing season (Allaby 1994).

5. A woody perennial plant species that reaches a height of at least 15 ft (4.5 m); contrasted with shrub (Farrar 1995, vii).

Comments: Most tree species have trunks that are unbranched near the ground in older plants. Saplings (= young trees) are often branched

near the ground. *Tilia americana* (American Basswood) and trees that sprout from stumps often have several main trunks.

[Old English *trēow*, *trīow*, *trēo*]

■ **Trembling Aspen** See Plantae: *Populus tremuloides*.

■ **Triurids** *n.* Very early monocots known from 90-Ga-old fossils from the Old Crossman Pit, New Jersey (Yoon 1999c, D1, illustration).

cf. Plantae: *Paleoclusia chevalieri*

Comment: Triurids are leafless, without chlorophyll, saprophytic, and possibly ancestors of Monocotyledonae (Yoon 1999c, D20).

■ **Tuliptree** See Plantae: *Liriodendron tulipifera*.

■ **Vanilla** See Plantae: Orchidaceae: *Vanilla*.

■ **Vanilla Orchids** See Plantae: Orchidaceae: *Vanilla*.

■ **Vascular Plants** See Plantae: Tracheophyta.

■ **Venus'-flytrap** See *Dionaea muscipula*.

■ **Voodoo-lily** See Plantae: *Sauromatum guttatum*.

■ **Water-fir** See Plantae: *Metasequoia glyptostroboides*.

■ **Water-hyacinth** See Plantae: *Eichornia crassipes*.

■ **Welwitschia mirabilis** Hook f., *Welwitschia* *n.* A gymnosperm (Gnetophyta: Welwitschiaceae) native to the Namib Desert in southwestern Africa (The Botany Greenhouse, University of Wisconsin, Madison, 2000; Wayne's Word, 2000, illustrations).

Comments: This plant has a peculiar morphology — a caudex (= trunk) that produces only two leaves (each with a basal meristem) and a very long taproot (The Botany Greenhouse, University of Wisconsin, Madison, 2000). The taproot anchors the plant and does not absorb or transport water. Mature leaves are up to 8 ft long and 3 ft wide. It almost never rains where this plant grows, and it obtains water from dew absorbed by stomata on upper leaf surfaces.

■ **White Oak** See *Quercus alba*.

■ **woody plant** *n.* A plant that has woody stems that overwinter and from which new plant parts sprout during the warm season; contrasted with herbaceous plant (inferred from Usher 1996, 179).

Comments: Woody plants include shrubs, trees, and some vining species (Brown and Brown 1972).

■ **X*Cupressocyparis leylandii* (A. B. Jackson and Dallimore) Dallimore and A. B. Jackson, Leyland Cypress** *n.* A natural hybrid between the conifers *Chamaecyparis nootkatensis* [(D. Don) Spach] (Nootka Cypress) and *Cupressus macrocarpa* Hartw. (Monterey Cypress) both natives of Western U.S. (Choukas-Bradley and Alexander 1987, 103; White 1995, 62).

Comments: This hybrid appeared in England (White 1995, 63). A person planted hybrid seeds from ovules of Nootka Cypress and pollen of Monterey Cypress in 1888. Offspring are fast growing and relatively disease free. Hybrids from ovules of Monterey Cypress and pollen of Nootka Cypress also occur. Their seeds are usually sterile. 'Leighton Green,' 'Haggerston Grey,' and 'Naylor's Blue' are cultivars. People frequently plant Leyland Cypresses in the U.S.

[Greek *Cupressus*, *kuo*, to produce; *parisos*, equal (-sided tree); *Chamaecyparis*, *chamae*, small; *cyparis*, cypress (White 1995, 62). Leyland, after C. J. Leyland, owner of Haggerston Hall where a person grew the first clones of this tree. 'Leighton Green' and 'Naylor's Blue,' after Mr. Naylor of Leighton Hall, brother-in-law of C. J. Leyland. 'Haggerston Grey,' after Haggerston Hall]

■ **Yew** See Plantae: *Taxus baccata*.

■ **Zea mays Linnaeus, Corn** *n.* An annual, herbaceous, cultivated grass (Poaceae) consumed by Humans and other organisms.

syn. Indian Corn (King and Stansfield 1985), Maize

Comment: Five commercial varieties of Corn are Dent Corn, Flint Corn, Flour Corn, Popcorn, and Sweet Corn (King and Stansfield 1985).

► **Protista** *n.*

1. A kingdom that includes many unicellular eukarya, such as Algae, Amoebeae, Flagellated Protozoa, and Multicellular Algae (table below); distinguished from Kingdoms Animalia, Fungi, and Plantae.

syn. Protocista (King and Stansfield 1985)

2. A kingdom that includes Alveolata (Apicomplexans, Ciliates, and Dinoflagellates) and Euglenozoa (Euglenoids and Kinetoplastids) (Campbell et al. 1999, 525).

cf. plankton: zooplankton

Comments: Classification of organisms within the Kingdoms Fungi, Plantae, and Protista has been in a state of flux for decades. Protista (in its broad sense) has about 55,000 living species and about 35,000 known extinct species (Curtis 1983, 1076). Protista is the kingdom with the most phylogenetic diversity within Domain Eucarya; many of the evolutionary relationships among Protistan taxa await discovery (Gray et al. 1999, 1476). Some researchers currently restrict Protista to fewer taxa than it formerly contained and place the remaining taxa into Kingdoms Archaezoa (Diplomonads, Microporidians, and Trichomonads) and Chromista (Stramenopila with Brown Algae, Diatoms, Golden Algae, and Water Molds and Red Algae (Rhodophyta) and part of Green Algae), place historical members of the Protista into five kingdoms and no longer use the name "Protista," or use some other classification of these historical members. The classifications below are historical ones. Some researchers placed the Algae and Fungi in a former broad Kingdom Plantae (Plants). Currently, some researchers place Fungi into their own Kingdom, and some of the Algae into Plantae. For convenience, I include historical members of Protista and use "protistan" in its broad sense below.

CLASSIFICATIONS OF KINGDOM PROTISTA

Classification 1^a

- I. Phylum Actinopoda (Heliozoans, Radiolarians, aquatic)
- II. Phylum Chlorophyta (Green Protists, algae including *Chlamydomonas*, *Closterium*, *Eudorina*, *Euglena*, *Gonium*, *Pandorina*, *Protococcus*, *Scenedesmus*, and *Volvox*)
- III. Phylum Chrysophyta (Yellow-green Protists, algae including *Dinobryon*)

- IV. Phylum Ciliophora (Ciliates including *Paramecium* and *Stentor*)
- V. Phylum Gamophyta (Filamentous Green Alga Protists including *Spirogyra* and *Zygnema*)
- VI. Phylum Rhizopoda (Amoebas)
- VII. Phylum Sporozoa (Sporozoans)
- VIII. Phylum Xanthophyta (Filamentous Green Alga Protists, including *Vacheria*)
- IX. Phylum Zoomastigina (Zoomastigotes, including Choanoflagellates and Trypanosomes)

Classification 2^b

- I. Phylum Antinopoda (Radiolaria, Heliozoans, and Radiozoans)
- II. Phylum Apicomplexa (Sporozoa, Apicomplexans, and Sporozoans)
- III. Phylum Charophyta (Charophytes, Stoneworts)
 - A. *Chara*
 - B. *Nitella*
- IV. Phylum Chlorophyta (Green Algae)
 - A. *Fritschia tuberosa*
 - B. *Spirogyra*
 - C. *Ulva*
- V. Phylum Chrysophyta (Golden Algae, including Diatoms)
- VI. Phylum Ciliophora (Ciliates)
- VII. Phylum Dinoflagellata (Dinoflagellates)
- VIII. Phylum Euglenophyta (Euglenoids)
- IX. Phylum Foraminifera (Foraminiferida, Forams, Foraminiferans)
 - X. Phylum Phaeophyta (Brown Algae)
- XI. Phylum Rhizopoda (Naked Amoebas and Shelled Amoebas)
- XII. Phylum Rhodophyta (Red Algae)
- XIII. Phylum Zoomastigophora (Zooplankton)
- XIV. No assigned phylum
 - A. “closed-mitosis flagellate”
 - B. “open-mitosis flagellate”
 - C. prototrich
 - D. zooflagellate

^a Rainis and Russell (1986).

^b Strickberger (1996).

acritarch *n.* One of a group of heterogeneous phytoplankton species that lived on Earth from about 500–1,800 Ma ago (Gerhard & Krischner 1997, 11; illustration, 12).

Comment: Acritarchs comprise the earliest known group of eukaryotic morphological fossils (Gerhard & Krischner 1997, 11). An Acritarch might not be the first eukaryote, but Acritarchs were a major form of eukaryotes for 1 Ga. Acritarchs are represented by fossils that are larger than typical prokaryotes, show evidence of a life cycle of encystment and release, and have elaborately sculpted cell walls reminiscent of dinoflagellates. Acritarchs may be closely related to prasinophytes, very early green algae. Australian acritarch deposits contain steranes (*q.v.*).

alga *n., pl. algae* An individual organism, or taxon, within the Group Algae (inferred from Campbell et al. 1999, 525).

adj. alga, algal, algae (colloquial, not preferred)

Comments: Many people confuse the singular and plural forms of “alga” in conversation. In many parts of the world, algae are major organisms in

many ecosystems, and some species may become significant sources of biofuels.
[Latin *alga*, seaweed]

Algae *n.* A protistan group that includes Chlorophyta, Dinoflagellata, Euglenophyta, Gamophyta, Phaeophyta, Rhodophyta, and Xanthophyta (King and Stansfield 1985).

Comment: Algae are photosynthetic organisms, and algal individuals range from single cells through large multicellular kelps up to 80 m long. Some researchers now place some chlorophytans into Kingdom Plantae (Campbell et al. 1999, 525). Some current work places different algal groups into different new kingdoms as discussed under “Protista.”

Amoeba proteus Pallas (Leidy) *n.* A rhizopod protistan (King and Stansfield 1985).

syn. *Chaos difluens* (Schaeffer)

Comment: Researchers use this giant protozoan for microsurgical nuclear transplants (King and Stansfield 1985).

chlorophyte *n.* A eukaryote that performs oxygenic photosynthesis using chlorophyll *b* (Tomitani et al. 1999, 161).

Comment: Chlorophytes include Green Algae and most plants (Tomitani et al. 1999, 161).

Ciliophora, Ciliophorans *n.* A phagotrophic protistan phylum characterized by diploidy, many cilia, nuclear dimorphism in most species, pellicles with aveoli, and sex involving conjugation (Strickberger 1996, 312).

[Latin *cilium*, eyelash + *phora*, bearing; referring to having cilia]

flagellate *n.* A protistan with one or more flagella.

■ **“closed-mitosis flagellate”** *n.* A haploid, flagellated protistan whose nuclear membrane remains during its mitosis; contrasted with “open-mitosis flagellate” (Strickberger 1990, 274).

Comment: “Closed-mitosis flagellate” may have given rise to Metazoa (Strickberger 1990, 274, phylogeny illustration).

■ **“open-mitosis flagellate”** *n.* A haploid, flagellated protistan whose nuclear membrane disappears during its mitosis; contrasted with “closed-mitosis flagellate” (Strickberger 1990, 275).

Comment: “Open-mitosis flagellates” may have given rise to zooflagellates which may have given rise to Metazoa; also, they may have given rise to Chlorophyta which may have given rise to Plantae (Strickberger 1990, 275, phylogeny illustration).

■ **prototrich** *n.* Ancestral heterotrophic flagellate with aerobic respiration, meiosis, mitochondria, mitosis, and no histones (Strickberger 1996, 313).

Comment: A prototrich might have evolved into a closed-mitosis flagellate, or an open mitosis flagellate, that in turn gave rise to the ancestor of Kingdom Animalia (Strickberger 1996, 313).

■ **zooflagellate** *n.* A free-living, or parasitic, protistan with flagella and no sexual reproduction, including opalinids (Strickberger 1996, 313).

Foraminifera, Foraminiferans *n.* A protistan phylum of single-celled marine species with skeletons (= tests) through which projections of protoplasm extend (Stanley 1989, 644).

Comment: Most foraminiferans are benthic; a few (Superfamily Globigerinacea) are planktonic

(Stanley 1989, 644). Some researchers unite Foraminifera, Amoeba and kin, and Radiolarians in the Phylum Sarcodina. Foraminiferans lived from the Cambrian Period through today.

Giardia **Kunstler, 1882** *n.* A genus (Heximitidae) of several protistan (*sensu lato*) species, each individual with a cytoskeleton, flagella, and two separate nuclei and possibly no mitochondria and plastids (Brody 1999, D7; Campbell et al. 1999, 524; Elmendorf et al. 2003, 3).

cf. organelle: mitosome

Comments: *Giardia* are basal eukaryotes that infect some bird and mammal species (Knight 2004, 236). *Giardia intestinalis* (= *G. duodenalis*, *G. lamblia* (Lambl, 1859) Kofoid & Christiansen, 1915), which has different subtypes, causes giardiasis in *Castor canadensis* (North American Beavers), Humans, and some other mammal species (Campbell et al. 1999, 524–525; Caramello 2005, illustrations). Human giardiasis is called “Beaver Fever” because researchers traced an outbreak in Humans in Canada to water contaminated with *C. canadensis* excrement (Brody 1999, 97). Researchers debate whether *Giardia intestinalis* has mitochondria in the form of mitosomes, *q.v.* (Knight 2004, 236).

Mixotricha paradoxa **Sutherland, 1933** *n.* A protistan (Devescovinidae) with undulipodia (= cilia) and no mitochondria; that inhabits guts of the Australian termite *Mastotermes darwiniensis*; and that is a combination of thousands of small, hairlike spirochete bacteria (*Treponema* sp.) and hundreds of larger ones (*Canaleparolina darwiniensis*), surface rod bacteria, and thousands of internal spherical bacteria (Margulis and Sagan 2001, 39–40, illustration).

Comments: *Mixotricha paradoxa* has five different genomes of once independent organisms (Margulis and Sagan 2001, 41).

cf. -genesis: biogenesis: symbiogenesis

[*Mixotricha paradoxa*, paradoxical being with mixed-up hairs, after the erroneous idea that this species swims by simultaneously using both its cilia and flagella; named by M. L. Sutherland]

Plasmodium *n.* A protistan genus in the family Plasmodiidae (King and Stansfield 1985).

Comment: *Plasmodium falciparum* causes the most dangerous kind of malaria, subtertian malaria, in

Humans (King and Stansfield 1985). *Plasmodium malariae* produces benign quartan malaria; *P. vivax*, benign tertian malaria. *Anopheles* mosquitoes transmit these protists.

prasiophyte *n.* An extant, ancestral, unicellular green alga which has both a cyst and quadriflagellate motile phase (Gerhart and Kirschner 1997, 11).

Protozoa *n.* An informal name for a protistan that lives primarily by ingesting food, an animal-like mode of nutrition (Campbell 1987, 536).

Comment: Protozoa includes Rhizopoda, Actinopoda, Foraminifera, Sporozoa, Zoomastigina, and Ciliophora (Campbell 1987, 536–539).

[Greek *proto*, first; *zoon*, animal]

Reclinomonas americana **Flavin & Nerad, 1993** *n.* A flagellated, heterotrophic protozoan (Gray et al. 1999, 1476).

Comment: This species has the most bacterium-like mitochondrial genome known (Gray et al. 1999, 1476).

Tetrahymena *n.* A genus of 29 species of unicellular protists (Tetrahymenidae) (Gerhart and Kirschner 1997, 23)

Comments: *Tetrahymena* species are virtually morphologically identical and are defined by their sexual incompatibility (Gerhart and Kirschner 1997, 23). They differ widely in fundamental molecular markers such as isozymes and sequences of 5S ribosomal RNA.

Toxoplasma gondii **(Nicolle & Manceaux, 1908)** *n.* A protistan (Sarcocystidae) that causes a disease in *Enhydra lutris* (Sea Otters), *Felis catus* (Domestic Cats), Humans, *Mus musculus* (House Mice, Laboratory Mice), and other mammals, possibly including more than 60 million people in the U.S. (Centers for Disease Control and Prevention 2007).

Comment: *Felis catus* is the main vector of this disease (Centers for Disease Control and Prevention 2007).

Trypanosoma Gruby, 1843 *n.* A genus of flagellated protozoa (Order Trypanosomatida) (King and Stansfield 1985).

Comment: Trypanosome species cause African sleeping sickness and Chagas’ Disease in Humans (King and Stansfield 1985).

APPENDIX 2. COMPANIES, ORGANIZATIONS, AND SOCIETIES CONCERNED WITH ANIMAL BEHAVIOR, ANIMAL WELFARE, CONSERVATION, ECOLOGY, EVOLUTION, AND RELATED SUBJECTS

A partial list of these groups is below, with definitions for many of them. Most of these groups have Web sites replete with information about themselves. The Conservation Directory (published by the National Wildlife Federation and updated annually) is an excellent reference on conservation organizations.

♦ **Academy of Natural Sciences (ANS)** *n.* An international museum, founded in 1812, that undertakes research and public education that focus on our environment and its diverse species, and has the mission to expand knowledge of nature through discovery and to inspire stewardship of our environment (Academy of Natural Sciences 2002).

♦ **Achievement Rewards for College Scientists Foundation (ARCS Foundation)**

♦ **African Pollinator Initiative**

♦ **Agriculture Network Information Center (AgNIC)** *n.* A voluntary alliance of the National Agricultural Library (NAL), land-grant universities and other agricultural organizations, in cooperation with citizen groups and government agencies (www.agnic.org, 2001).

Comments: The AgNIC focuses on providing agricultural information in electronic format over the World Wide Web via the Internet (www.agnic.org, 2001). One of AgNIC's objectives is that member participants take responsibility for small vertical segments of agricultural information (including applied, basic, and developmental research, extension, and teaching activities in the agricultural, food, forestry, physical and social sciences, and renewable natural resources) and develop Web sites and reference services in specific subject areas. The collective AgNIC Web resource benefits all members in ways that they cannot achieve on their own, thus justifying the local costs of participation.

♦ **Alaska Department of Fish and Game**

♦ **Alice Ferguson Foundation**

♦ **Alley Cat Allies (ACA)** *n.* An organization, founded in 1990, that advocates and implements humane treatment of feral *Felis catus* (www.alleycat.org, 1999).

cf. Animalia: *Felis catus* (Appendix 1)

♦ **Alliance for Climate Protection** *n.* A not-for-profit, advocacy group whose mission is "to persuade the American people — and people elsewhere in the world — of the importance and urgency of adopting and implementing effective and comprehensive solutions for the climate crisis" (Balz and Eilperin 2007, 13 October, A9; Alliance for Climate Protection 2007).

♦ **Alliance for Sustainable Jobs and the Environment**

♦ **American Academy of Allergy, Asthma, and Immunology (AAAAI)** *n.* An organization, founded in 1943, that is the largest professional, medical, speciality organization representing allergists, allied health professionals, immunologists, and other physicians with a special interest in allergy (American Academy of Allergy, Asthma, and Immunology 1998, S-1; www.aaaai.org, 1999).

♦ **American Association for the Advancement of Science (AAAS) (Triple-A-S)** *n.* An not-for-profit, professional society, founded in 1848, dedicated to the advancement of scientific and technological excellence across all disciplines, and to the public's understanding of science and technology (www.aaas.org, 1999).

Comments: In 1999, the AAAS had more than 143,000 members who were engineers, science educators, scientists, policymakers, and others dedicated to scientific and technological progress in service to society; as well as many affiliated organizations (www.aaas.org, 1999). According to the AAAS Constitution, its mission is to further the work of scientists, facilitate cooperation among them, foster scientific freedom and responsibility, improve the effectiveness of science in the promotion of human welfare, advance education in science, and increase the public's understanding and appreciation of the promise of scientific methods in Human progress. AAAS is among the older societies in the U.S. Many of today's most prestigious and influential scientific societies have their historical origins in the AAAS. For example, groups such as the American Chemical Society (founded in 1876), the American Anthropological Association (1902), and the Botanical Society of America (1906), all grew out of informal gatherings at AAAS annual meetings or from established AAAS Sections.

♦ **American Association of Botanical Gardens and Arboreta (AABGA)**

♦ **American Association of Zoological Parks and Aquariums (AZA)** *n.* A national association, founded in 1924, that is dedicated to promoting responsible animal care and exhibition by zoos and is strong advocacy group of preservation of captive wildlife species (Buchmann and Nabhan 1996, 263; www.aza.org, 1999).

Comments: The AZA represents virtually every professionally-operated aquarium, oceanarium, wildlife park, and zoological park in North America as well as over 5,500 individual members (www.aza.org, 2000). Further, on behalf of its 183 accredited zoos and aquariums throughout North America, AZA promotes education and habitat protection programs and manages cooperative Species Survival Plans (SSPs) for over 135 endangered species (www.aza.org, 1998).

♦ **American Bird Conservancy**

♦ **American Bryological and Lichenological Society**

♦ **American Cetacean Society**

♦ **American Fern Society**

♦ **American Institute of Biological Sciences (AIBS)** *n.* A society, founded in 1947, dedicated to advancing the biological sciences and their application to human welfare, fostering and encouraging research and education in the biological sciences, including agricultural, environmental, and medical sciences (www.aibs.org, 1999).

Comments: Many biologically-oriented societies affiliate with the AIBS.

- ♦ **American Museum of Natural History (AMNH)**
- ♦ **American Ornithologists' Union**
- ♦ **American Pet Association (APA)** *n.* An organization, founded in 1991, that is an independent, national humane organization dedicated to promoting responsible pet ownership through action, education, and services (www.apapets.com/index3, 2000).
- ♦ **American Phytopathological Society**
- ♦ **American Psychological Association (APA)** *n.* A society whose mission is to "advance psychology as a science and profession and a means of promoting human welfare" (www.apa.org, 2000).
- ♦ **American Psychological Society (APS)** *n.* A society, founded in 1988, whose mission is to "promote, protect, and advance the interests of scientifically oriented psychology in research, application, and the improvement of human welfare" (www.psychological-science.org, 2000).
- ♦ **American Society for Gravitational and Space Biology**
- ♦ **American Society for Photobiology**
- ♦ **American Society for the Prevention of Cruelty to Animals**
- ♦ **American Society of Agronomy**
- ♦ **American Society of Limnology and Oceanography**
- ♦ **American Society of Mammalogists**
- ♦ **American Society of Naturalists** *n.* A society, founded in 1883, that advances and diffuses knowledge of organic evolution and other broad biological principles to enhance the conceptual unification of the biological science (www.amnat.org, 1999). *Comments:* The ASN publishes *The American Naturalist, AN*. Since its inception in 1867, the *AN* has been one of the world's highly renowned, peer-reviewed publications in ecology, evolution, and population and integrative biology research (www.amnat.org, 1999). This journal addresses topics in community and ecosystem dynamics, evolution of sex and mating systems, organismal adaptation, and genetic aspects of evolution, and in particular emphasizes sophisticated methodologies and innovative theoretical syntheses.
- ♦ **American Society of Plant Physiologists**
- ♦ **American Society of Plant Taxonomists**
- ♦ **American Society of Primatologists**
- ♦ **American Type Culture Collections**
- ♦ **Animal Behavior Society (ABS)** *n.* A society, founded in 1964, that promotes and encourages the biological study of animal behavior in the broadest sense, including studies at all levels of organization using both descriptive and experimental methods under natural and controlled conditions. *Comments:* The ABS encourages both research studies and the dissemination of knowledge about animal behavior through publications and educational programs and activities (www.animalbehavior.org, 1999).
- ♦ **Appalachian Mountain Club** *n.* A club, founded in 1876, that promotes the protection, enjoyment, and wise use of the mountains, rivers and trails of Northeastern U.S. (www.outdoors.org, 1999). *Comment:* This Club is the U.S.'s oldest conservation and recreation organization, and had over 80,000 members in 1999 (www.outdoors.org, 1999). This Club believes that the mountains and rivers have an intrinsic worth and also provide recreational opportunity, spiritual renewal, and ecological and economic health for the Northeastern U.S. This Club encourages people to enjoy and appreciate the natural world because we believe that successful conservation depends on this experience.
- ♦ **Archbold Biological Station**
- ♦ **Arizona-Sonora Desert Museum** *n.* A museum in the Sonoran Desert of southern Arizona which is the home to things including the Forgotten Pollinators Public Awareness Campaign, the Desert Alert Program, animal and plant exhibits, and pollinator gardens (Buchmann and Nabhan 1996, 263).
- ♦ **Army Corps of Engineers**
- ♦ **Association for Biodiversity Information (ABI)** *n.* An independent, nonprofit organization dedicated to providing information for protecting the diversity of life on Earth (www.abi.org). *Comments:* The "ABI works in partnership with 85 independent Natural Heritage programs and Conservation Data Centers that gather scientific information on rare species and ecosystems in the U.S., Latin America, and Canada (the Natural Heritage Network)" (www.abi.org). The "ABI is a leading source for the biodiversity information that is essential for effective conservation action."
- ♦ **Association for the Study of Animal Behavior**
- ♦ **Association for Tropical Biology**
- ♦ **Association of Biodiversity Information**
- ♦ **Association of College and University Biology Educators**
- ♦ **Association of Ecosystem Research Centers**
- ♦ **Association of Southeastern Biologists**
- ♦ **Association of Systematics Collections**
- ♦ **Audubon Naturalist Society (ANS)** *n.* A society founded in 1897, that works "to increase the enjoyment and appreciation of the natural world and to preserve and protect the treasures" of the Washington D.C., Metropolitan Region (www.AudubonNaturalist.org, 1999).
- ♦ **Avida Artificial Life Group, Avida Group** *n.* A group of students, professors, and other researchers founded in 1993 and interested in the study of the fundamental properties of living and evolving systems (<http://www.krl.caltech.edu/avida/>). *Comments:* The Avida Group is based at the California Institute of Technology (<http://www.krl.caltech.edu/avida/>). Christoph Adami heads the group, and founded it with C. Titus Brown and Charles Ofria with the writing of the initial version of the Avida software.
- ♦ **Arizona-Sonora Desert Museum**
- ♦ **Association of Zoos and Aquariums**
- ♦ **Bat Conservation International (BCI)** *n.* An organization that seeks to promote bat conservation by increasing public awareness of their ecological importance (Buchmann and Nabhan 1996, 264).
- ♦ **Bioacoustic Research Program at Cornell University**
- ♦ **Biological Resources Division of the U.S. Geological Survey (BRD)** *n.* Part of the U.S. Geological Survey whose "mission is to work with others to provide the scientific understanding and technologies needed to support the sound management and conservation of U.S. biological resources" (www.biology.usgs.gov, 1999). *cf.* Geologic Division of the U.S. Geological Survey *Comments:* The BRD started the Ornithological Office in the Entomology Division of the U.S. Department of Agriculture in 1885 (www.biology.usgs.gov, 1999). As the years progressed, this organization became

the Division of Ornithology and Mammalogy (1886), the Division of Biological Survey (1896), Bureau of Biological Survey (1905) which became part of the U.S. Fish and Wildlife Service in the Department of the Interior (1939), National Biological Service (1993), and the Biological Resources Division in the U.S. Geological Survey (1996). A main goal of the BRD is to make data and other information on the U.S.'s biological resources more accessible to more people; other goals are explained in its website.

- ◆ **Biological Sciences Curriculum Study**
- ◆ **BioQUEST Curriculum Consortium**
- ◆ **BIOSIS**
- ◆ **Blandy Experimental Farm**
- ◆ **Born Free Foundations**
- ◆ **Botanical Society of America**
- ◆ **Botanical Society of Washington** *n.* An organization formed in 1901 by the union of the Botanical Seminar and the Washington Botanical Club (www.fred.net/kathy/bsw.html, 2001).

Comment: This Society has met continuously since 1901, and membership is available to all persons having an interest in Botany and the other plant sciences (www.fred.net/kathy/bsw.html, 2001).
- ◆ **Butterfly Conservation Initiative**
- ◆ **Canadian Department of Fisheries and Oceans**
- ◆ **Center for Applied Biodiversity Science**
- ◆ **Center for Environmental Education**
- ◆ **Center for the Study of Evolution and the Origin of Life (CSEOL)** *n.* A group, established in 1985 and devoted to encourage and carry out scholarly activities relating to evolution (broadly defined as evolution of the Cosmos, the Solar System, Earth, environment, and life including Humans) with particular emphasis on the multidisciplinary nature of the science (<http://www.igpp.ucla.edu/cseol/welcome.html>, 2001).

Comment: People formally organized the CSEOL under the auspices of the University of California Institute of Geophysics and Planetary Physics (IGPP) (<http://www.igpp.ucla.edu/cseol/welcome.html>, 2001).
- ◆ **Centers for Disease Control and Prevention, The (CDC)** *n.* A U.S. agency whose mission is "to promote health and quality of life by preventing and controlling disease, injury, and disability" (www.cdc.gov/aboutcdc.html, 2000).

Comment: The CDC performs many of the administrative functions for the Agency for Toxic Substances and Disease Registry (ATSDR), a sister agency of CDC, and is one of eight federal public health agencies within the Department of Health and Human Services (www.cdc.gov/aboutcdc.html, 2000).
- ◆ **Chesapeake Bay Foundation**
- ◆ **Chicago Zoological Society**
- ◆ **CITES Secretariat (UNEP)** *n.* The regulatory body that controls the trade in endangered species and products derived from their harvest (Buchmann and Nabhan 1996, 264).
- ◆ **ClimateQuest**
- ◆ **Commission for Environmental Cooperation**
- ◆ **Conservation and Research Center** *n.* Part of the U.S. Smithsonian Institution, founded in 1975, which performs world-class research in animal conservation (Levine, 2001, A1; Smithsonian Institution 2001).
- ◆ **Conservation International (CI)** *n.* A field-based, nonprofit organization "that protects the Earth's biologically richest areas and helps the people who

live there improve their quality of life" (www.conservation.org/, 2000).

Comment: Conservation International "uses science, economics, policy, and community involvement to promote biodiversity conservation in tropical rain forests and other endangered ecosystems worldwide" (www.conservation.org/, 2000).

- ◆ **Conservation International Center for Biodiversity and Conservation**
- ◆ **Convention on International Trade in Endangered Species of Wild Fauna and Flora, The (CITES)** *(sigh TEASE) n.* A group of 175 countries that ban commercial international trade in an agreed list of endangered species and regulate and monitor trade in others that might become endangered (www.wcmc.org.uk/CITES, which includes the Convention Text (Convention on International Trade in Endangered Species of Wild Fauna and Flora 2008; CITES 2009).

See treaty: Convention on International Trade in Endangered Species of Wild Fauna and Flora.
- ◆ **Cooper Ornithological Society**
- ◆ **Coordinating Group of Alien Pest Species** *n.* A U.S. group that is composed of 14 governmental agencies and private groups that drafted a 10-point "Silent Invasion" action plan to improve alien pest prevention and control programs (Claiborne, 1997, 23 August, A6).
- ◆ **Cornell Laboratory of Science**
- ◆ **Danish Research Foundation**
- ◆ **Defenders of Wildlife**
- ◆ **Defense Advanced Research Program Agency (DARPA)**
- ◆ **Department of Defense (DOD)**
- ◆ **Dian Fossey Gorilla Foundation International**
- ◆ **Disney Conservation Initiatives**
- ◆ **Disney Wildlife Conservation Fund**
- ◆ **Earl and Ethyl B. Myers Oceanic Trust**
- ◆ **Earth Institute** *n.* An organization at Columbia University, U.S., whose "overarching goal is to help achieve sustainable development primarily by expanding the world's understanding of Earth as one integrated system" (Earth Institute 2008).
- ◆ **Earth Island Institute**
- ◆ **Earth Policy Institute**
- ◆ **Earth Sangha**
- ◆ **Earthwatch Institute**
- ◆ **Ecological Society of America (ESA)** *n.* A nonpartisan, not-for-profit society of scientists, founded in 1915, to stimulate sound ecological research, clarify and communicate the science of ecology, and promote the responsible application of ecological knowledge to public issues (www.esa.sdsc.edu, 1999).

Comments: ESA's 7,600 members conduct research, teach, and work to provide the ecological knowledge needed to solve environmental problems that include biotechnology, ecological restoration, ecosystem management, habitat alteration and destruction, natural resource management, ozone depletion and global climate change, species extinction and loss of biological diversity, and sustainable ecological systems (www.esa.sdsc.edu, 1999).
- ◆ **Entomological Society of America (ESA)** *n.* A not-for-profit, educational society, established in 1889, "to promote the science of entomology in all of its subdisciplines for the advancement of science and the benefit of society both at the national and

international levels, to publish and encourage publications pertaining to entomology, and to assure cooperation both locally and globally in all measures leading to these ends" (constitution and bylaws, www.entsoc.org, 1999).

Comments: The ESA has more than 7,400 members who are consultants; educators; extensional personnel; researchers and scientists from agricultural departments, colleges and universities, health agencies, private industries, and federal and state governments; and students (www.entsoc.org, 1999).

♦ **Entomological Society of Washington** *n.* A not-for-profit organization, founded in 1884, whose objectives "are to promote the study of entomology in all its aspects and to cultivate mutually advantageous relations among those in any way interested in entomology" (Gurney 1976, 225; Entomological Society of Washington, Bylaws, 1996, 610).

Comments: Members operate this Society exclusively for scientific and educational purposes (Entomological Society of Washington 1996, 610). This Society's publications include the Proceedings of the Entomological Society of Washington.

♦ **Environmental Careers Organization (ECO)** *n.* A national, nonprofit, educational organization, founded in 1972, whose "mission is to protect and enhance the environment through the development of diverse leaders, the promotion of careers, and the inspiration of individual action" (www.eco.org/, 2000).

Comment: The ECO accomplishes its mission through internships, career advice, career products, and research and consulting (www.eco.org/, 2000).

♦ **Environmental Defense (ED)** *n.* A not-for-profit organization, founded in 1967, that provides assistance with economic, legal, and scientific issues related to conservation biology and pesticide abuse (Buchmann and Nabhan 1996, 264; www.edf.org, 1999).

Comment: The old name for this organization is Environmental Defense Fund, EDF (Stevens 2000, 27 February, D1).

♦ **Environmental Protection Agency**

♦ **Environment Canada**

♦ **European Pollinator Initiative**

♦ **European Society for Evolutionary Biology**

♦ **Evolution of Terrestrial Ecosystems Consortium, The (ETE Consortium)** *n.* Researchers at the University of California at Santa Barbara, University of Helsinki, U.S. National Museum of Natural History, and elsewhere, that oversee all aspects of the Evolution of Terrestrial Ecosystems Database (*q.v.*) (<http://eteweb.lscf.ucsb.edu/>, 2000).

Comments: The members share a conviction that long-term patterns of evolutionary change cannot be fully understood without knowledge of changes in ecology (at many scales) over geologic time periods, and an understanding of the interaction between ecological and evolutionary processes (<http://eteweb.lscf.ucsb.edu/>, 2000). Thus, the Consortium is interested not only in how the environment has changed, but how ecosystems themselves have changed, and how evolution has occurred in its ecological context over the last 400 Ma.

♦ **Federal Bureau of Reclamation**

♦ **Fish and Wildlife Foundation**

♦ **Fisheries Innovation Program**

♦ **Food and Agriculture Organization of the United Nations (FAO)** *n.* An organization, founded in 1945, that leads international efforts to

eliminate human hunger (Food and Agriculture Organization of the United Nations 2008).

Comments: The FAO serves both developed and developing countries and acts as a neutral forum where all nations meet as equals to negotiate agreements and debate policy (Food and Agriculture Organization of the United Nations 2008). The FAO is also a source of knowledge and information, and helps developing countries and countries in transition to modernize and improve agriculture, forestry, and fisheries practices and ensure good nutrition for all. Since its founding, the FAO gave special attention to developing rural areas, home of 70% of the world's poor and hungry people.

♦ **Friends of Dyke Marsh (FODM)** *n.* A not-for-profit organization, founded in 1975, that promotes the preservation of Dyke Marsh Wildlife Preserve, Virginia, and its biota (www.dykemarsh.org).

Comment: This Preserve has species-rich habitats including a tidal fresh-water marsh along the Potomac River and associated low forest and swamp forest.

♦ **Friends of the Earth**

♦ **Friends of the Everglades** *n.* A society founded in 1969 by Marjory Stoneman Douglas whose mission is "to protect, restore, and preserve the Greater Kissimmee-Okeechobee-Everglades Ecosystem, and the water that is the lifeblood of the world's only Everglades" (<http://www-everglades.org/about.html>, 2000). *Comment:* Douglas originally started this organization to stop a jetport from being built in Big Cypress and the organization was able do so (<http://www-everglades.org/about.html>, 2000). It currently has about 6,000 members.

♦ **Friends of the National Zoo (FONZ)** *n.* "A nonprofit organization of individuals, families, and organizations who are interested in helping to maintain the status of the Smithsonian National Zoological Park as one of the world's great zoos, to foster its use for education, research, and recreation, to increase and improve its facilities and collections, and to advance the welfare of its animals" (*Zoogoer* January/February 1999, 4).

Comments: FONZ publishes the magazine *Zoogoer*.

♦ **Genentech Inc.** *n.* A company in South San Francisco, CA, which is the world's first biotechnology company (Gillis 2000, 30 December, A14).

Comments: Genentech produced huge supplies of human insulin for treating diabetes and human growth hormone for treating dwarfism (Gillis 2000, 30 December, A14). This company received patents for the human genes involved with these molecules.

♦ **Georgetown University Center for the Environment**

♦ **Global Warming International Center (GWIC)** *n.* An international body that disseminates information on global warming science and policy, serving governmental, non-governmental organizations, and industries in more than 120 countries (www.globalwarming.net).

Comments: It sponsors research supporting the understanding of global warming and its mitigation (www.globalwarming.net). Among its best known projects are the Global Treeline Projects (GTP), Greenhouse Gas Reduction Benchmark (GHGRB), Himalayan Reforestation Project (HRP), and Extreme Event Index (EEI). The GWIC sponsors the annual Global Warming International Conference & Expo, and the Executive Workshop on Industry Technology and Greenhouse

Gas Emission, which facilitates international exchange and provides the most up-to-date hands-on workshop for corporation and utilities executives. The Global Warming International Conference & Expo occurred in the U.S. in April 2000.

♦ **Goddard Institute for Space Studies**

♦ **Golden Lion Tamarin Association**

♦ **Gorilla Foundation** *n.* An organization that promotes teaching Ameslan (American Sign Language) to two Lowland Gorillas, Koko and Michael, *q.v.* (Appendix 1) (www.koko.org, 2000).

Comments: This Foundation supports the Gorilla Language Project (= Project Koko), the longest continuous inter-species communications project of its kind, and promotes international conservation (www.koko.org, 2000).

♦ **Green Commuting**

♦ **Greenpeace**

♦ **Hubbs-Sea World Research Institute**

♦ **Human Genome Organization**

♦ **Humane Society of the United States**

♦ **Humboldt Field Research Institute** *n.* A non-profit organization committed to quality educational programs in natural history taught for advanced students (<http://maine.maine.edu/~eaglhill/AGENINF.html>, 2001).

Comments: This Institute's former name is Eagle Hill Field Research Station, and it is located near Steuben on the coast of Maine, U.S. (<http://maine.maine.edu/~eaglhill/AGENINF.html>, 2001). The Institute publishes the *Northeastern Naturalist*.

[after the 19th-century, natural scientist and explorer Alexander von Humboldt (1769–1859)]

♦ **Institute of Ecosystem Studies**

♦ **Institute for Genomic Research, The (TIGR)**

♦ **Institute for Human Origins**

♦ **Intergovernmental Panel on Climate Change (IPCC)** *n.* An organization established in 1988 by the World Meteorological Organization (WMO) and the United Nations Environment Programme (UNEP) to study global climate change (IPCC, 2007).

Comments: The IPCC assesses "on a comprehensive, objective, open and transparent basis the scientific, technical and socio-economic information relevant to understanding the scientific basis of risk of Human-induced climate change, its potential impacts and options for adaptation and mitigation" (IPCC, 2007). "The IPCC does not carry out research nor does it monitor climate related data or other relevant parameters." The Panel bases its assessment mainly on peer-reviewed and published scientific and technical literature. In the last 2 decades, the IPCC issued a series of increasingly grim reports assessing issues surrounding climate change (Gibbs and Lyall, 2007, 13 October, A13).

♦ **International Association for Landscape Ecology, U.S. Region**

♦ **International Bee Research Association (IBRA)** *n.* A not-for-profit organization, founded in 1949, that is devoted to advancing apicultural education and science worldwide (Buchmann and Nabhan 1996, 264).

Comments: The IBRA was formed in 1949 and serves as a central clearinghouse for all published information on bees of the world (with a focus on apiculture and the study of Western Honey Bees). Members and visitors can access its world-class library. The IBRA sponsors numerous international scientific colloquia and conferences and publishes scientific journals

on beekeeping including Apicultural Abstracts, Bee World, and the Journal of Apicultural Research.

♦ **International Council for Bird Preservation** *n.* An organization that determines the conservation and protection status of bird species worldwide (Buchmann and Nabhan 1996, 265).

♦ **International Council for the Exploration of the Seas (ICES)**

♦ **International Ecotourism Society**

♦ **International Fund for Animal Welfare**

♦ **International Gorilla Conservation Program**

♦ **International Marine Mammal Association**

♦ **International Money Fund (IMF)** *n.* An international organization of 185 member countries, established to promote international monetary cooperation, exchange stability, and orderly exchange arrangements; to foster economic growth and high levels of employment; and to provide temporary financial assistance to countries to help ease balance of payments adjustment (International Money Fund 2008).

♦ **International Society for Applied Ethology**

♦ **International Society for Comparative Psychology**

♦ **International Society for Ecological Economics**

♦ **International Society for Ecological Modeling**

♦ **International Society for Ecosystem Health**

♦ **International Society of Arboriculture (ISA)**

n. A nonprofit organization that supports tree-care research around the world and is dedicated to the care and preservation of shade and ornamental trees (International Society of Arboriculture 2007).

♦ **International Society of Chemical Ecology**

♦ **International Society of Malthus**

♦ **International Union for the Conservation of Nature and Natural Resources (IUCN)** *n.*

The primary coordinating agency for international conservation efforts, founded in 1948 (Buchmann and Nabhan 1996, 265; www.iucn.org).

Comments: The IUCN has many nations among its members and publishes directories of environmental specialists and maintains the Red List of organisms that are endangered to some degree and which is a guideline for policy makers (Buchmann and Nabhan 1996, 265; Stevens 1996, 17 September, C1).

♦ **International Union for the Conservation of Nature and Natural Resources (IUCN) SCC South Asian Invertebrate Specialist Group**

♦ **International Union for the Conservation of Nature and Natural Resources (IUCN), The World Conservation Union**

♦ **International Whaling Commission**

♦ **Island Foundation**

♦ **Jane Goodall Institute**

♦ **John Muir Institute for Environmental Studies**

♦ **Kansas Entomological Society, Central States Entomological Society**

♦ **Karst Waters Institute (KWI)** *n.* "A 501 (c)(3) nonprofit institution whose mission is to improve the fundamental understanding of karst water systems through sound scientific research and the education of professionals and the public" (www.karstwaters.org, 2001).

Comments: This Institute's activities include the initiation, coordination, and conduct of research, the

sponsorship of conferences and workshops, and occasional publication of scientific works (www.karstwaters.org, 2001). The Institute publishes a semiannual newsletter titled *KWI Conduit* which is available online. The KWI site has a large glossary.

- ◆ **Lady Bird Johnson Wildflower Center**
- ◆ **Laurel Foundation**
- ◆ **League of Conservation Voters**
- ◆ **Lubee Bat Conservancy**
- ◆ **Marine Biological Laboratory**
- ◆ **Mesoamerican Ecotourism Alliance**
- ◆ **Monarch Butterfly Sanctuary Foundation (MBSF)** *n.* An organization, established in 1997 by scientists and educators, to help preserve the overwintering sites of Monarch butterflies in the Oyamel Forest in central Mexico (Monarch Butterfly Sanctuary Foundation, 2000).
- ◆ **Monarch Watch**
- ◆ **Monell Chemical Senses Center**
- ◆ **Mountain Lake Biological Station**
- ◆ **Mycological Society of America**
- ◆ **NASA Specialized Center of Research and Training in Exobiology (NSCORT)** *n.* A center that conducts research in exobiology (the study of the origin, evolution, and distribution of life in our Universe); trains young scientists for research careers in Exobiology and related areas; and communicates with scientists, students and the general public about exobiology (Doebler, 2000, 18; <http://exobio.ucsd.edu/>, 2000).
- Comment:* NSCORT is a consortium among the University of California, San Diego (UCSD), The Scripps Research Institute (TSRI), and The Salk Institute (SALK).
- ◆ **National Academy of Sciences (NAS)** *n.* An organization, created by the U.S. Congress in 1863, to advise the U.S. government in scientific and technical matters (www.nas.org, 1999).
- Comments:* The NAS's sibling organizations are the National Academy of Engineering, the Institute of Medicine, and the National Research Council (www.nas.org, 1999). The Academies and the Institute are honorary societies that elect new members to their ranks each year. The Institute of Medicine also conducts policy studies on health issues, but the National Research Council conducts the bulk of the institute's science-policy and technical work. These nonprofit organizations provide a public service by working outside the framework of government to ensure independent advice on matters of science, technology, and medicine.
- ◆ **National Association of Biology Teachers**
- ◆ **National Association of Conservation Districts**
- ◆ **National Audubon Society** *n.* The premier birding organization that was founded in 1905 in the U.S. and is active in public educational outreach, scientific research, and wildlife conservation (Buchmann and Nabhan 1996, 265; www.audubon.org, 1999).
- Comment:* Different U.S. states have their own branches of this society.
- ◆ **National Bioethics Advisory Commission**
- ◆ **National Center for Science Education** *n.* An organization, founded in 1981, "to provide a central information and resource clearinghouse, helping to coordinate the efforts of people working at state and local levels to preserve the integrity of science education" (<http://www.natcenscied.org>, 2002).

Comment: This organization's Homepage includes many links to site of biological (especially evolutionary) interest.

- ◆ **National Climatic Data Center**
- ◆ **National Gardening Association**
- ◆ **National Geographic Society**
- ◆ **National Institute for Environmental Renewal (NIER)** *n.* An organization, founded in 1994, to support environmental renewal and economic development throughout the U.S. (www.nier.org, 1999).
- ◆ **National Institute for the Environment (NIE)** *n.* An institute, proposed to the U.S. Congress by the NIE Committee, whose goal would be to "to improve the scientific basis for making decisions on environmental issues" (www.nie.org, 1999).
- Comments:* In October 1999, the CNIE publicly endorsed the report of the National Science Board which recommends implementing nearly all of the activities proposed for a NIE (www.nie.org, 1999). The CNIE suspended its call for the creation of a NIE to work in support of the NSF initiative.
- ◆ **National Museum of Natural History (NMNH)**
- ◆ **National Oceanic and Atmospheric Administration (NOAA)** *n.* A U.S. organization whose mission is to describe and predict changes in the Earth's environment, and conserve and wisely manage the U.S.'s coastal and marine resources (<http://www.noaa.gov>, 2001).
- Comment:* NOAA's strategy consists of seven interrelated Strategic Goals for environmental assessment, prediction and stewardship (<http://www.noaa.gov>, 2001). NOAA's main Website has many pages regarding world weather including daily reports, as well as links to many other NOAA Websites.
- ◆ **National Parks and Conservation Association (NPCA)**
- ◆ **National Research Council (NRC)**
- ◆ **National Wildlife Federation (NWF)** *n.* A leading advocate for wildlife preservation (Buchmann and Nabhan 1996, 265).
- Comment:* The NWF publishes *International Wildlife*, *National Wildlife*, *Ranger Rick*, *The Conservation Directory*, and *Your Big Backyard*.
- ◆ **National Zoological Park, Smithsonian Institution**
- ◆ **Natural Heritage Trust**
- ◆ **Natural Resources Defense Council**
- ◆ **Natural Resources of Defense Council, Inc. (NRDC)** *n.* An organization that uses both legal and scientific methods to influence and monitor government actions and proposed legislation affecting conservation issues and pesticide abuse (Buchmann and Nabhan 1996, 265).
- ◆ **Natural Resource Solutions**
- ◆ **New York Zoological Society** *n.* An organization that leads in wildlife conservation and related research (Buchmann and Nabhan 1996, 266).
- ◆ **North American Butterfly Association (NABA)** *n.* A not-for-profit organization of North American amateur and professional lepidopterists who are actively engaged in the conservation and protection of endangered and threatened Lepidoptera and their habitats (Buchmann and Nabhan 1996, 265).
- Comment:* The NABA "educates the public about the joys of nonconsumptive, recreation 'butterflying'" (Buchmann and Nabhan 1996, 266).
- ◆ **North American Heather Society**

- ♦ **Northern Environmental Protection Branch of the Department of Indian Affairs and Northern Development (Canada)**
- ♦ **Ocean Science Venture Fund**
- ♦ **Olympic Coast National Marine Sanctuary**
- ♦ **1 Sky**
- ♦ **Orangutan Foundation International (OFI)**
n. A society that supports the study of wild Orangutans in Central Indonesian Borneo and the repatriation of ex-captive wild-born Orangutans back into their native forests, has an educational outreach program for children, and assists needy people near Camp Leaky, Indonesia (N. Briggs in Turco and Gruner, 1999; www.nss.net/orangutans, 2000).
Comment: The OFI successfully returned over 200 formerly-captive Orangutans into the forest and cared for over 60 orphaned Orangutans after the severe fires in Borneo in 1977 (www.nss.net/orangutans, 2000).
- ♦ **Organization for Economic Co-operation and Development (OECD)** *n.* An international organization, founded in 1961, of 30 countries that accept the principles of representative democracy and free-market economy (Organization for Economic Co-operation and Development 2008).
syn. *L'Organisation de coopération et de développement économiques (OCDE)* (French)
Comments: The OECD also shares expertise and exchanges views with more than 100 other countries (Organization for Economic Co-operation and Development 2008). For more than 40 yr, OECD has been one of the world's larger and highly reliable sources of comparable statistics and economic and social data. The OECD also monitors trends, analyses and forecasts economic developments, and researches social changes, or evolving patterns, in agriculture, environment, taxation, technology, trade, and more. The OECD provides a setting where governments compare policy experiences, coordinate domestic and international policies, identify good practices, and seek answers to common problems.
- ♦ **Organization for Tropical Studies (OTS)**
- ♦ **Organization of Biological Field Stations**
- ♦ **People for the Ethical Treatment of Animals (PETA)** *n.* An international, not-for-profit organization, founded in 1980, that promotes the animal-rights movement, and attempts to eradicate all animal cruelty (Adams 1995, F1; www.peta-online.org, 1999).
Comments: PETA uses tactics including running ads about treatment of animals used in experimentation (naming Universities, labs, etc.), investigating animals used in lab studies, and terrorizing its perceived enemies (Adams 1995, F1, F4).
- ♦ **Pew Center on Global Climate Change**
- ♦ **Phi Sigma Biological Sciences Honor Society**
- ♦ **Phoenix Landing Foundation** *n.* A nonprofit, all-volunteer organization established to promote and protect the welfare of Parrots, especially those with an extensive lifespan (<http://www.phoenixlanding.org/index.html>).
- ♦ **Pig Veterinary Society** *n.* A society, founded in 1963, that exists to assist its members in the care of Pigs (www.pigjournal.co.uk/society.htm 2000).
Comment: This society's publications include *The Pig Journal* and *The Casualty Pig* (www.pigjournal.co.uk/society.htm, 2000).
- ♦ **Plant Conservation Alliance**
- ♦ **Plant Gene Resources of Canada**

- ♦ **Pollen Bee Foundation, Inc.**
- ♦ **Pollinator Partnership**
- ♦ **Population Connection** *n.* A U.S. national not-for-profit organization (formerly called Zero Population Growth, ZPG), founded in 1968, that works to slow population growth and achieve a sustainable balance between our Earth's people and its resources (www.zpg.org, 1999; www.populationconnection.org).
Comments: The Population Connection seeks to protect our environment and ensure a high quality of life for present and future generations (www.zpg.org, 1999). Population Connection's education and advocacy programs aim to influence public policies, attitudes, and behavior on national and global population issues and related concerns. Human population estimates are 1 billion in 1804, 5 billion in 1987, 6 billion on about 12 October 1999, and 6,293,840,652 in March 2003 (www.y6b.org).
- ♦ **Potomac Conservancy** *n.* An action-oriented land trust, founded in 1993, that works with landowners to conserve the beauty and integrity of the Potomac River especially from Georgetown (Washington, D.C.) through Harpers Ferry, WV (Richard W. Fox, Conservancy flier, 1998; www.potomac.org).
- ♦ **Potomac River Basin Consortium, Inc.**
- ♦ **Poultry Science Association**
- ♦ **Purple Martin Conservation Association (PMCA)** *n.* A U.S. nonprofit organization dedicated to the conservation of *Progne subis* (Purple Martins) through scientific research, state of the art management techniques, and public education, with the goal of increasing *Progne subis* populations throughout North America.
- ♦ **Québec Society for the Biological Study of Behavior**
- ♦ **Rain Forest Action Network (RAN)** *n.* A not-for-profit organization, founded in 1985, that works to protect Earth's rainforests and support the rights of their inhabitants through education, grassroots organizing, and non-violent direct action (www.ran.org, 1999).
Comments: RAN is member-and-volunteer based and coordinates its activities with environmental and human-rights organizations around the world. Over 150 Rainforest Action Groups (RAGs) were associated with the RAN in 1999. It has played a key role in strengthening the worldwide rainforest conservation movement through supporting activists in tropical countries as well as organizing and mobilizing consumers and community action groups throughout the U.S. (www.ran.org, 1999).
- ♦ **Rain Forest Alliance** *n.* An international not-for-profit organization, incorporated in 1987 and dedicated to the conservation of tropical forests for the benefit of the global community (www.rainforest-alliance.org, 1999).
Comments: Its mission is to develop and promote economically viable and socially desirable alternatives to the destruction of this endangered, biologically diverse natural resource (www.rainforest-alliance.org, 1999). It pursues this mission through education, research in the social and natural sciences, and the establishment of cooperative partnerships with businesses, governments, and local peoples. This Organization had 14,000 members in 1999.
- ♦ **Research Council of Canada**
- ♦ **Rocky Mountain Biological Station (RMBL)**
- ♦ **Roots and Shoots**

- ◆ **Save America's Forests** *n.* An organization, founded in 1990, composed of a coalition of groups throughout the U.S. working together to protect each other's local forests and forests throughout the world and a network of individual citizens who want to save forests, and a nationwide campaign to end clear cutting and protect and restore the U.S. natural forests (www.saveamericasforests.org, 2001).
- ◆ **Save Nature**
- ◆ **Save the Manatee Club** *n.* A group in Florida, U.S., with about 30,000 members that works to stop manatees from going extinct, founded in 1981 (Booth 1992, 3 May, 3A; www.savethemanatee.org).
Comment: "Drunken and idiotic boaters" are manatees' greatest enemies (Booth 1992, 3 May, A3).
- ◆ **Scripps Institution of Oceanography**
- ◆ **Search for Extraterrestrial Intelligence Institute (SETI Institute)** *n.* A private group, founded in 1984, whose mission "is to explore, understand and explain the origin, nature, prevalence and distribution of life in the universe" (SETI Institute 2002).
Comment: The SETI Institute is searching for alien civilizations with the huge dish antenna at Arecibo, Puerto Rico (Broad 2000, D4). People have spent over \$US million in the search for extraterrestrial intelligence.
- ◆ **Seeds of Diversity Canada**
- ◆ **Ship and Ocean Foundation of Japan**
- ◆ **Sierra Club** *n.* An organization, founded in 1892 by John Muir, through which the Sierra Club Foundation advances the preservation and protection of our natural environment by empowering the citizenry, especially democratically-based grassroots organizations, with charitable resources to protect our environment (www.sierraclub.org, 1999).
Comments: The Sierra Club lost its tax-exempt status in 1966, on the grounds that it had become a political organization (Severo 2000, C22). The Club is active on many conservation fronts. It sued the Hawai'i Tourism Authority in the Hawai'i Supreme court in an attempt to force the Agency to perform a statewide environmental assessment in view of the fact that about 7 million tourists visit Hawai'i annually and stress its natural habitats (McDowell 2000: A3).
- ◆ **Sigma Xi** *n.* An international honor society for science and engineering founded in 1886 (www.sigmaxi.org).
Comments: Sigma Xi has more than 80,000 members in over 500 chapters at colleges and universities, industrial research centers and government laboratories (www.sigmaxi.org). Sigma Xi hosts an array of programs and activities including *American Scientist* (magazine), a 75-yr-old Grants-in-Aid of Research Program, a number of prestigious prizes and awards, and the College of Distinguished Lecturers.
- ◆ **Smithsonian Institution (SI)** *cf.* Smithsonian Tropical Research Institute
- ◆ **Smithsonian Institution National Zoological Park, Green Team Tips** (<http://nationalzoo.si.edu/Publications/GreenTeam/>)
- ◆ **Smithsonian Tropical Research Institute (STRI)** *n.* A part of the Smithsonian Institution's research program with marine terrestrial research stations in Columbia and Panamá and research conducted in many parts of the world (www.si.edu/organiza/centers/stri/about.htm).
Comment: STRI became a separate part of the Smithsonian Institution in 1966. STRI's web site provides a wealth of information about it.
- ◆ **Society for Conservation Biology**
- ◆ **Society for Ecological Restoration**
- ◆ **Society of Environmental Toxicology and Chemistry**
- ◆ **Society for Industrial Microbiology**
- ◆ **Society for Integrative and Comparative Biology** [originally the American Society of Zoologists (1903-1995)]
- ◆ **Society for Mathematical Biology**
- ◆ **Society for Neuroscience**
- ◆ **Society for the Psychological Study of Men and Masculinity (SPSMM)** *n.* A society founded in 1990, "of men and women dedicated to promoting the critical study of how gender shapes and constricts men's lives and committed to the enhancement of men's capacity to experience their full human potential" (www.indstate.edu/spsmm/, 2000).
Comment: The SPSMM is a Division of the American Psychological Association (APA) (www.indstate.edu/spsmm/, 2000).
- ◆ **Society for the Study of Evolution (SSE)**
- ◆ **Society for the Study of Sex (SSS)**
- ◆ **Society for the Study of the Origin and Evolution of Life (SSOEL)**
- ◆ **Society of Nematologists**
- ◆ **Society of Systematic Biologists**
- ◆ **Society of Toxicology**
- ◆ **Society of Vertebrate Paleontology**
- ◆ **Society of Wetland Scientists**
- ◆ **Sonoran Arthropod Studies Institute (SASI)** *n.* A not-for-profit organization that promotes educational outreach and research on the biology of native Sonoran Desert arthropods (Buchmann and Nabhan 1996, 266; www.sasionline.org, 1999).
Comment: The SASI offers training workshops for in-service teachers, hosts the annual "Invertebrates in Captivity" Conference, publishes a members' magazine (Backyard BUGwatching) and a newsletter (The Instar), operates The Arthropod Discovery Center in the Tucson Mountains, and sponsors members' events (Buchmann and Nabhan 1996, 266).
- ◆ **Sophia Sachs Butterfly House**
- ◆ **Southern Appalachian Botanical Society**
- ◆ **Southwest Fisheries Science Center**
- ◆ **Starfire** *n.* A U.S. organization whose mission is to end abusive, harsh methods in all aspects of Domestic Dog training (www.starfire-rapport.com/starfire, 2001).
Comments: Starfire shows Dog owners how to succeed with positive, humane, state-of-the-art techniques (www.starfire-rapport.com/starfire, 2001). Starfire also provides free feature articles of national Dog breeding publications, publishes pamphlets and training manuals and related products, and volunteers for canine rescue groups.
- ◆ **Student Conservation Association (SCA)** *n.* The U.S.'s largest and oldest provider of national and community conservation service opportunities and outdoor education and career training for youth (Student Conservation Association, 1999).
Comment: SCA volunteers and interns annually perform more than 1,000,000 hr of conservation service in forests, national parks, refuges, and urban areas in all 50 U.S. states (Student Conservation Association, 1999).
- ◆ **Swedish Species Information Centre** *n.* An organization that serves as a focal point for Swedish biodiversity information with the main goals of collecting, evaluating, and maintaining data on threatened

organisms including a Red List and Red Data Books (ArtDatabanken 2010).

♦ **Tacugama Chimpanzee Sanctuary** *n.* An organization that rehabilitates orphaned and abused Chimpanzees in Sierra Leone (Farah 2001, A10).

Comments: Most of the Chimpanzees arrive as babies whose mothers are killed by Humans who eat them (Farah 2001, A10).

♦ **The Nature Conservancy (TNC)** *n.* An organization, founded in 1951, that is dedicated to the preservation of biota by means of habitat preservation through local, private, and state land acquisition, and an extensive array of wildlife refuges and plant-protection sites (Buchmann and Nabhan 1996, 265; www.tnc.org, 1999).

Comment: The Nature Conservancy is the world's largest private conservation organization; it maintains extensive databases on the distribution of rare species in the Americas, especially North America (Buchmann and Nabhan 1996, 265; Levy 2000, 20 May, B6).

♦ **Torrey Botanical Society**

♦ **Tree Care Industry Association (TCIA)** *n.* An organization, established in 1938, whose mission is to aid tree-care companies by accrediting the companies, developing safety and education programs, establishing standards of tree-care practice, and providing management information for arboriculture farms around the world (Tree Care Industry Association 2010). *syn.* National Arborist Association (former name)

♦ **Union of Concerned Scientists**

♦ **United Nations Educational, Cultural, and Scientific Organization, UNESCO**

♦ **United States Agency for International Development**

♦ **United States Botanic Garden**

♦ **United States Department of Agriculture Forest Service**

♦ **United States Department of Agriculture Natural Resources Conservation Service**

♦ **United States Department of Agriculture Systematic Entomology Laboratory**

♦ **United States Department of Interior, Bureau of Land Management**

♦ **United States Department of Interior, National Park Service**

♦ **United States Department of Interior, National Park Service, Center for Urban Ecology**

♦ **United States Energy Information Administration**

♦ **United States Environmental Protection Agency**

♦ **United States Federation for Culture Collections**

♦ **United States Fish and Wildlife Service (FWS)**

♦ **United States Fish and Wildlife Service Plant Conservation Alliance**

♦ **United States Geological Survey Biological Resources Division**

♦ **United States Geological Survey Geologic Division** *n.* Part of the U.S. Geological Survey whose chief function is to undertake geologic and mineral-resource surveys and mapping for the Department of the Interior (www.geology.usgs.gov, 1999).

cf. Biological Resources Division of the U.S. Geological Survey

♦ **United States Geological Survey National Biological Information Infrastructure**

♦ **United States Geological Survey Pautuxent Wildlife Research Center**

♦ **United States Green Building Council**

♦ **United States Fish and Wildlife Service**

♦ **United States Landcare**

♦ **United States Marine Mammal Commission**

♦ **United States National Fish and Wildlife Foundation**

♦ **United States National Marine Mammal Laboratory**

♦ **United States National Oceanic and Atmospheric Administration (NOAA)**

♦ **United States National Oceanic Partnership Program**

♦ **United States National Research Council (NRC)**

♦ **University of Maryland, Conservation Biology**

♦ **University of Michigan Biological Station (UMBS)** *n.* A biological field station in the northern part of Michigan's Lower Peninsula (University of Michigan Biological Station 2003).

Comments: Researchers have published hundreds of studies based on work done at the UMBS (University of Michigan Biological Station 2003). This Station offers courses throughout the year; its summer courses started in 1908.

♦ **University of Ottawa Institute of the Environment**

♦ **University of Virginia Department of Environmental Science**

♦ **Virginia Institute of Marine Science**

♦ **Voice Yourself**

♦ **Washington Biologists' Field Club**

♦ **Weed Science Society of America**

♦ **Weed Warriors**

♦ **Whale and Dolphin Conservation Society (WDCS)**

♦ **Wikimedia Foundation** *n.* An organization with about 30 staff members and hundreds of thousands of volunteers worldwide who contribute content to the Wikimedia projects such as Wikimedia Commons, Wikipedia, and Wikispecies which contain information including much biological and other scientific information. (<http://wikimediafoundation.org/wiki/Home>, 30 November 2009).

♦ **Wilderness Society** *n.* A U.S.-based organization that works to protect all U.S. wild public lands (Society flier, 1999).

Comments: This Society watches over national forests, parks, and refuges, and wilderness areas (Society flier, 1999).

♦ **Wild Farm Alliance**

♦ **Wildlife Conservation Society (WCS)** *n.* A society founded in 1895 whose mission is to save

wildlife and wild lands throughout the world (www.wcs.org, 2000).

Comment: The WCS is headquartered at the Bronx Zoo, New York, and combines the resources of wildlife parks in New York with field projects around the globe to inspire care for nature, provide leadership in environmental education, and help sustain our planet's biological diversity (www.wcs.org, 2000).

♦ **Wildlife Defense Fund (WDF)**

♦ **Wildlife Habitat Council**

♦ **Wildlife Management Institute**

♦ **Wildlife Society**

♦ **Wildlife Trust**

♦ **Woods Hole Oceanographic Institute**

♦ **World Conservation Monitoring Centre** *n.*

An organization that monitors the global wildlife trade, the status of endangered species, the use of natural resources, and conserved and protected areas worldwide (Buchmann and Nabhan 1996, 267; www.wcmc.org.uk, 1999).

♦ **World Health Organization (WHO)**

♦ **World Parrot Trust** *n.* An international organization, founded in 1989, whose aim is to support the survival of parrot species in the wild and the welfare of captive birds everywhere (<http://www.worldparrot-trust.org//index.htm>).

♦ **World Resources Institute**

♦ **World Watch Institute**

♦ **World Wide Fund for Nature**

♦ **World Wide Web Consortium (W3C, W3 Consortium)** *n.* An organization, founded in 1994 by Tim Berners-Lee, as "a neutral open forum where

companies and organizations to whom the future of the Web is important come to discuss and to agree on new common computer protocols" (www.w3.org/People/Berners-Lee).

Comments: The W3C has been a center for making decisions by consensus, designing, and raising issues, and also a vantage point from which to view evolution of the World Wide Web. The W3C is based at the *Institut National pour la Recherche en Informatique et Automatique*, (INRIA), France; Keio University, Japan; and Massachusetts Institute of Technology, U.S.

♦ **World Wildlife Fund (WWF)** *n.* A major conservation organization, founded in 1961, with branches throughout the world and active in both management and scientific research within many national parks with branches throughout the world (Buchmann and Nabhan 1996, 267).

syn. World Wildlife Fund for Nature (Buchmann and Nabhan 1996, 267; www.worldwildlife.org)

♦ **Xerces Society** *n.* An international, not-for-profit organization that focuses on the conservation of insects and other invertebrates, especially butterflies (Buchmann and Nabhan 1996, 267; www.xerces.org).
cf. Animalia: Lepidoptera: *Glaucoopsyche lygdamus xerces*

Comments: The Xerces Society publishes the informative, beautifully illustrated newsletter *Wings*.

[Xerces, after the Xerces Blue Butterfly that evidently went extinct in California in the 1940s]

♦ **Zero Population Growth (ZPG)** See Population Connection.

APPENDIX 3. COMPUTER DATABASES

♦**database** *n.* A data collection.

See *Caenorhabditis elegans* (comment), *Saccharomyces cerevisiae* (comment) (Appendix 1).

cf. inventory

Comments: Thousands of public databases are now on the Internet. I list selected online databases below and describe many of them. Certain Web sites provide access and links to selected databases. For example, PubMed provides access to primarily medically-related bibliographic references and also provides access and links to the integrated molecular biology databases included in the National Center for Biotechnology Information's Entrez retrieval system. These databases contain assemblies of complete genomes, DNA and protein sequences, population study data sets, and 3-D protein structure data in an integrated system.

Animal Diversity Web (ADW) *n.* An online database of animal natural history, distribution, classification, and conservation biology at the University of Michigan (<http://animaldiversity.ummz.umich.edu/other/overview.html>, 2000).

Comments: The ADW contains thousands of species accounts about individual animal species (<http://animaldiversity.ummz.umich.edu/other/overview.html>, 2000). Depending on the taxon, this database includes a combination of one or more of the following: illustrations including photographs, movies, a sound recording(s), and text. The site does not guarantee the accuracy of the text descriptions, which are written by students. Professional biologists wrote the descriptions of levels of organization above the species level, especially phyla, classes, and in some cases, orders and families. Hundreds of hyperlinked pages and images illustrate the traits and general biology of these groups.

AntWeb *n.* A Website which provides tools for exploring the diversity and identification of ants (Hymenoptera: Formicidae) (<http://www.antweb.org/>).

Comments: AntWeb developed the tools to encourage the study of ants, to facilitate the use of ants in inventory and monitoring programs, and to provide ant taxonomists with access to images of type specimens (<http://www.antweb.org/>). AntWeb covers all ant genera of the world.

Biodiversity Database of the Washington, D.C., Area (BDWA)

Botanical Dermatology DataBase (BoDD) *n.* An electronic re-incarnation of Michell, J. and A. Rook (1979, *Botanical Dermatology*, Greengrass Limited, Vancouver, Canada) that lists names of fungi and plants and their effects on Humans (Schmidt 1994–2000, 21 November 2000).

Catalogue of New World Grasses (Poaceae) *n.*

A searchable database on grasses of the New World from Alaska and Greenland through Tierra del Fuego (<http://mobot.mobot.org/W3T/Search/nwgc.html>).

Data Base of the Occurrence and Distribution of Pesticides in Chesapeake Bay *n.* A database that compiles most of the pesticide residue data measured in biota, groundwater, sediment, surface microlayer, and surface water of the Chesapeake Bay, U.S., from 1976 to 1994 (www.agnic.org/cbp, 2001).

Digital Morphology Library *n.* A “dynamic archive of information on digital morphology and high-resolution computed tomography of biological specimens” (<http://digimorph.org/>).

Comment: This Website has “spectacular imagery and animations and details on the morphology of many representatives of the Earth's biota.”

Discover Life *n.* A database of organism keys, photographs, and related material presented for educational purposes (<http://www.discoverlife.org/>).

Dr. Duke's Phytochemical and Ethnobotanical Databases (www.ars-grin.gov/duke/index.html, 2001)

Encyclopedia of Life Science *n.* The largest single reference course published in the biological sciences with over 3,000 specially commissioned and peer-reviewed articles written by 5,000 scientists (www.els.net, 2000).

Evolution of Terrestrial Ecosystems Database (ETE Database) *n.* A computerized database for research in evolutionary paleoecology (<http://eteweb.lscf.ucsb.edu/>, 2000).

Comment: The database attempts to consolidate and organize the fossil evidence concerning land biotas in a form that can aid the research objectives of the Evolution of Terrestrial Ecosystems Consortium (*q.v.*).

FishBase *n.* A very large, relational database that contains almost all known fish species (www.fishbase.org, 2000).

Comments: FishBase includes much information on fish taxa, photographs, and so forth. The International Center for Living Aquatic Resources Management (ICLARM) (in collaboration with the Food and Agriculture Organization of the United Nations, FAO, and many other partners, and with support from the European Commission, EC) developed FishBase (www.fishbase.org, 2000).

FlyBase *n.* A comprehensive database for information on the genetics and molecular biology of *Drosophila* (<http://flybase.bio.indiana.edu:82/>, 2000).

Comments: FlyBase includes data from the Drosophila Genome Projects and data from the literature. FlyBase is a joint project with the Berkeley and European Drosophila Genome Projects (<http://flybase.bio.indiana.edu:82/>, 2000).

Flora of the Washington-Baltimore Area (<http://nmnhwww.si.edu/botany/projects/dcflora/>, 2001)

Fossil Record 2 *n.* A database of fossils that includes all groups of algae, animals, fungi, plants, protists, and microbes, including 7,186 families or family-equivalent taxa (Benton 1995, 53).

GDB See database: Genome Database.

GenBank *n.* The genetic sequence database of the U.S. National Institutes of Health, which is an annotated collection of all publicly available DNA sequences (www.ncbi.nlm.nih.gov/web/Genebank/index.html).

Comments: Genbank had approximately 3,400,000,000 bases in 4,610,000 sequence records as of August 1999 (GenBank website). In August 2010, Genbank had approximately 106,533,156,756 bases in 108,431,692

sequence records in the traditional GenBank divisions. GenBank is part of the International Nucleotide Sequence Database Collaboration, composed of the DNA DataBank of Japan (DDBJ), the European Molecular Biology Laboratory (EMBL), and GenBank at National Center for Biotechnology Information which exchange data daily.

Genome Database (GDB) *n.* The official central repository for genomic mapping data that result from the Human Genome Initiative, *q.v.* (www.gdb.org/, 2000).

Comments: In 1999, the Bioinformatics Supercomputing Centre (BiSC) at the Hospital for Sick Children in Toronto, Ontario, Canada, assumed the GDB's management (www.gdb.org/, 2000). The Genome Database (*q.v.*) supports the Human Genome Initiative by storing and managing data generated worldwide by researchers engaged in the gene-mapping effort of the Human Genome Project (*q.v.*). The GDB's mission is to make available to scientists an encyclopedia of the human genome that is being constantly revised and updated to reflect the current state of scientific knowledge. Although the GDB has historically focused on gene mapping, as the Genome Project moves from mapping to sequence to functional analysis, the GDB's focus will broaden. Researchers are developing project extensions in the representation of sequence-level genome content, including sequence variations, along with richer descriptions of function and phenotype.

Globin Gene Server *n.* A prototype database of sequence alignments and experimental results for the beta-like globin gene cluster of Mammals (globin.cse.psu.edu/, 2001).

Gymnosperm Database *n.* A database (initiated in 1997) that contains worldwide data for all gymnosperm species and higher-ranked taxa, including Conifers, Cycads, and their allies (<http://www.geocities.com/~earlecj/intro.html>, 2000).

Integrated Risk Information System (IRIS) *n.* A database of human health effects that may result from exposure to various substances found in our environment (Environmental Protection Agency 2001). **Comment:** The U.S. Environmental Protection Agency initially developed IRIS in response to a growing demand for consistent information on chemical substances for use in risk assessments, decision-making and regulatory activities (Environmental Protection Agency 2001).

Internationale Paläoklima-Datenbank, International Paleoclimate Database (PKDB)

n. A database that contains worldwide data for the Quaternary Period (<http://www.pkdb.uni-hohenheim.de/index.html>, 2000).

Comment: Researchers developed this database from 1991 through 1998, and it includes literature in 15 languages and many Web links (<http://www.pkdb.uni-hohenheim.de/index.html>, 2000).

Mouse Genome Database (MGD) *n.* A database of information on mouse genetic markers, molecular segments, phenotypes, comparative mapping data, experimental mapping data, and graphical displays for genetic, physical, and cytogenetic maps (www.informatics.jax.org/mgihome/MGD/, 2000).

Comments: The MGD is updated daily. Since it first became available on the WWW, the MGD has continued to evolve, expanding its data coverage, improving data handling, and providing several new data

manipulation and display tools (www.informatics.jax.org/mgihome/MGD/, 2000).

MGD See database: MGD.

Native American Ethnobotany Database *n.*

A database of drugs, foods, dyes, and fibers used by Native North American Peoples (www.umd.umich.edu/cgi-bin/herb/, 2001).

Comment: The current edition has a total of over 44,000 items (www.umd.umich.edu/cgi-bin/herb/, 2001). This represents uses by 291 Native American groups of 4,029 species from 243 plant families.

NatureServe *n.* A database of authoritative conservation information on more than 50,000 animals, plants, and ecological communities of the U.S. and Canada (NatureServe 2000).

Comments: NatureServe provides scientific and common names, conservation status and needs, distribution maps, life histories, and other information on organisms (NatureServe 2000). This database is a product of the Association for Biodiversity Information in collaboration with the Natural Heritage Network.

Nearctica *n.* A gateway of Internet sites regarding the natural world of North America; the sites include databases and courses (<http://www.nearctica.com/index.html>, 2000).

Organelle Genome Database (GOBASE) *n.*

Information on mitochondrial genomes on the Internet (Gray et al. 1991, 1477; www.megasun.bch.umontreal.ca/gobase/).

Plant Fossil Record, Version 2.2 (PFR2.2) *n.*

Information on Protista on the Internet (Gray et al. 1991, 1477; www.megasun.bch.umontreal.ca/protists/).

Protist Image Database *n.* Information on Protista on the Internet (Gray et al. 1991, 1477; www.megasun.bch.umontreal.ca/protists/).

The Arabidopsis Information Resource (TAIR) *n.* A database of all 117 million bases of the genome of *Arabidopsis thaliana* (www.arabidopsis.org/home.html, 2000).

Comments: One can search this database by genetic markers, people, and other options. The TAIR site includes a mapper tool that compares the sequence with genetic and physical maps and job and meeting postings, and links.

The Interactive Fly *n.* A cyberspace guide to *Drosophila* genes and their roles in development (Brody 2000).

Tree of Life (TOL) *n.* A database with illustrations, dendograms, and lists of taxa on the Internet (Maddison and Maddison 1998).

Comments: The TOL's basic goals are to increase education about and appreciation of biological diversity; present a modern scientific view of the evolutionary tree that unites all organisms on Earth; and provide a uniform and linked framework in which to publish electronically information about the evolutionary history and characteristics of all groups of organisms, and a life-wide data base and searching system about characteristics of organisms, and a means to find taxon-specific information on the Internet, both taxonomic and otherwise (Maddison and Maddison 1998, goals page). David and Wayne Maddison put a prototype of the Tree of Life on line in 1994 (Maddison and Maddison 1998, history page). The base pages and others of the tree are in a computer in Tucson, Arizona, and other pages are in other computers at other locations. Peers review pages of the TOL before

they are available on the Internet. As of January 1996, the TOL had over 120 contributors.

TreeBASE *n.* A relational database being developed to manage and explore information on phylogenetic relationships (www.herbaria.harvard.edu/treebase/).

Comments: TreeBASE's main function is to store published phylogenetic trees and data matrices according to its Website. "It also includes bibliographic information on phylogenetic studies, and some details on taxa, characters, algorithms used, and analyses performed." TreeBASE is designed to allow retrieval and recombination of trees and data from different studies, and researchers can be explored interactively using trees included in the database. TreeBASE, therefore, provides a means of assessing and synthesizing phylogenetic knowledge.

Universal Virus Database (ICTVdB) *n.* A database of world viruses (<http://life.anu.edu.au/viruses/html>, 2000).

Comments: The Research School of Biological Science (of the Institute of Advanced Studies, Australian National University) maintains this database for the International Committee on Taxonomy of Viruses (ICTV) and incorporates the VIDEdb of plant viruses with this database (<http://life.anu.edu.au/viruses/html>, 2000). The directory of the ICTVdB is Index Virum, "a list of approved virus names linked to virus descriptions coded from information in Virus Taxonomy: The Sixth Report of the International Committee on Taxonomy of Viruses. Murphy et al. (eds) Springer (1995), and includes updates

subsequently approved by ICTV. It also incorporates the plant virus database VIDEdb and is illustrated with EM pictures, diagrams and images of symptoms contributed by virologists around the world." This database contains an alphabetical list of ICTV-approved virus families and genera, and much information on many of the viruses.

Vascular Tropicos Nomenclatural Database

(VAST Nomenclatural Database) *n.* A database produced by the Missouri Botanical Garden which includes information on full plant names and references regarding the plants (<http://mobot.mobot.org/Pick/Search/pick.html>).

[VAST, acronym for VASCular Tropicos]

Virginia Twin Registry *n.* One of the world's larger data banks on human twins (Allen 1998, 22).

Virtual Library (VL) *n.* A catalog of information sites on the World Wide Web (www.vlib.org, 2000).

Comments: Tim Berners-Lee first conceived and ran the VL; Arthur Secret later expanded and managed the VL (www.vlib.org, 2000). Over 200 volunteers maintain central catalog pages and information pages. The VL is the oldest catalog on the Web and includes high-quality guides to particular Web areas including many on science and technology.

Weeds Gone Wild *n.* Online data on alien invasive plants throughout the U.S. which includes fact sheets on many of these plants species (<http://www.nps.gov/plants/alien/index.htm>).

Comment: This database is produced by the Plant Conservation Alliance's Alien Plant Working Group (<http://www.nps.gov/plants/alien/index.htm/>).

"This dictionary departs from other standard dictionaries... in that every definition is drawn from a cited reference; many have several. This allows readers who want to see how these terms were used in the context of a scholarly article or monograph to find the full citation in the bibliography at the back of the book and to retrieve the reference in a library. Definitions are, however, complete enough to give readers the full meaning of terms.... Highly recommended for all college, university, and public libraries."

R. G. Sabin, Rice University, CHOICE, September 2001 Vol. 39 No. 01

"Having the opportunity to field lots of questions from docents, keepers, curators, etc. has made me appreciate references that are easy to use and provide answers to their questions. This book, the second edition from CRC Press, does just that.... Educators, docents, keepers, curators, and librarians will find this book useful. Highly recommended for zoos and aquariums."

Thane G. Johnson, Library News for Zoos and Aquariums, June 2001 – Page 16

Providing a common ground and platform for precise scientific communication in animal behavior, ecology, evolution, and related branches of biology, **Animal Behavior Desk Reference: A Dictionary of Animal Behavior, Ecology, and Evolution, Third Edition** contains more than 800 new terms and definitions, 48 full color figures, and thousands of additions and improvements.

Using a dictionary format to present definitions in a standard, easily accessible manner, the book's main body emphasizes conceptual terms, rather than anatomical parts or taxonomic terms, and focuses on nouns, rather than verbs or adjectives. Term hierarchies are handled with bulleted entries and terms with multiple definitions are included as superscripted entries. All sources are cited and most are paraphrased to conform to uniform style and length.

Devoted to the precise and correct use of scientific language, this third edition of a bestselling standard enables students and scientists alike to communicate their findings and promote the efficient advancement of science.
